1 INTRODUCTION AND PURPOSE

1.1 Introduction

The Army has developed and implemented the Integrated Personnel and Pay System – Army (IPPS-A), a Web-based tool, available 24 hours a day, accessible to Soldiers, Human Resources (HR) professionals, Combatant Commanders, personnel and pay managers, and other authorized users throughout the Army.

Team CACI has been selected as the System Integrator (SI) to maintain successful deployment of IPPS-A.

1.2 Document Purpose

The purpose of this document is to provide a comprehensive guide of the roles and permissions to be used during IPPS-A Increment II.

1.3 Document Overview

This document applies to all activities specific to IPPS-A Increment II Roles and Permissions design and development. This includes detailed information on both technical and functional subcategories, roles, and permissions for each application of the IPPS-A Increment II solution.

User types are defined in IPPS-A as Self-Service, Authorized, and Privileged. Self-Service and Authorized Users are assigned roles and permissions inside the IPPS-A application. Privileged Users access IPPS-A at the system-level through either the production virtual desktop interface (PROD VDI) or the out-of-band virtual desktop interface (OOB VDI). Roles and permissions for Privileged Users access are controlled by assignments to zones, environments, VDI group, and provisioning to specific tools within the Tools Enclave. Privileged non-PeopleSoft roles and permissions are documented in Appendix F and Appendix G:.

Figure 1-1 highlights the overall vision regarding the general user types within IPPS-A. Soldiers entering IPPS-A can be assigned two different user types: Member or Person of Interest (POI). All soldiers will be Members and can access only their own record and information. The POI User Type consists of Government civilians, sister service members, contractors, Foreign Nationals, Local Nationals, and Foreign Military. These users will need access to IPPS-A for various reasons, which may include approving HR-related transactions or supporting Soldiers within their supported organization(s).

Enterprise Access Management Services – Army (EAMS-A)-S Secret Internet Protocol Router Network (SIPRNet) (EAMS-A-S) maintains the Sensitive Activities (SA) Annex for this document.

Figure 1-1 R3 IPPS-A General User Types

Figure 1-2 provides a hierarchical view of how the seven categories of user roles (Member, Commander/Manager, HR Professional, Payroll Professional, Functional System Admin, Maintenance System Admin, National Provider, and Data Security) devolve down to actions conducted within IPPS-A. All soldiers will be members. Commanders and Managers will have access to their subordinates' records based on Row-Level Security and have the ability to approve and transact. HR Professionals will have expanded access to act as HR business partners at various echelons. Payroll Professionals will access data and run reports pertaining to members. Functional System Administrators will support the setup and configuration of existing and future capabilities. Maintenance System Administrators will support the preservation and integrity of the IPPS-A system. The lower-level sub-categories are groupings of capabilities within IPPS-A for a user to conduct his/her duties. The Data Security Category works in conjunction with row-level security to expand or restrict Member data access. An elevated Member may have one or more of the Data Security roles to access specific Members in addition to the functional roles from their user type.

Figure 1-2 Proposed Hierarchical View of User Types

The subcategories are groupings of capabilities within IPPS-A for a user to conduct his/her duties. The subcategories are mapped to PeopleSoft roles within IPPS-A to help users assign capabilities in the system. These mappings of subcategories to roles are captured in Appendix D:. The user types, Functional System Admin is related to the configuration for specific components roles, and Maintenance System Admin is related to system sustainment/support technical roles behind the scenes. These technical roles are listed in Appendix G:.

2 NAMING CONVENTION

A naming convention is an agreed-upon scheme for identifying nomenclature. It consists of a set of rules for choosing the character sequence when creating a name. IPPS-A implements a standard naming convention for roles and permissions (or the application equivalent). The sections below describe the naming convention by application.

2.1 PeopleSoft Applications

Each PeopleSoft Application (e.g., Human Capital Management [HCM], Enterprise Learning Management [ELM], and Customer Relationship Management [CRM]) follows the same convention for naming roles and permission lists. The naming convention consists of a program identifier, application, module, and a description of the role functionality. The following sections contain the syntax for the naming of roles and permission lists.

2.1.1 PeopleSoft Roles

The role naming convention begins with an IPPS-A Program Indicator (IP) and establishes a tailored object. An underscore symbol follows as a separator. The next set of characters defines the application and module. An underscore symbol follows as a separator. The final set of characters is a description of the role functionality with an underscore between words for reader clarity. Table 2-1 provides a detailed view of the PeopleSoft-tailored role-naming convention.

Table 2-1 PeopleSoft-Tailored Role Naming Convention

PeopleSoft-Tailored Role Naming Convention				
IP	=	Program Indicator	→	2 Characters
_	=	Underscore	→	1 Character
HCM, CRM, ELM	=	Application	→	3 Characters
PY, SS, BEN	=	Module	→	2-3 Characters
_	=	Underscore	→	1 Character
PAYROLL_PROCESS	=	Description	→	Remaining Characters
Example → IP_HCMPY_PAYROLL_PROCESS				

2.1.2 Permission Lists

The permission list naming convention begins with IP and establishes a tailored object. An underscore symbol follows as a separator. The next set of characters defines the application and module. An underscore symbol follows as a separator. The next set of characters is a description of the permission list functionality. An underscore symbol follows as a separator. The final character defines the authorizations (e.g., V=View-only, C=Correction) allowed for the permission list. Please note that no character is being assigned to the end of permission lists where the authorization is Add or Update.

Table 2-2 provides a detailed overview of the PeopleSoft-tailored permission list naming convention.

Data Permission Roles follow the same convention for naming Roles. The naming convention consists of a program identifier, application, and a description of the role functionality. The following section contains the syntax for the naming of Data Permission Roles.

2.2 Identity and Access Manager (IAM)

The IAM naming convention consists of the application, module/resource, and a description of the role functionality.

2.2.1 Roles

The role naming convention begins with the application and establishes an object. The next set of characters defines the module/resource. The final set of characters is a description of the role functionality. Table 2-6 provides a detailed overview of the IAM-tailored role-naming convention.

2.3 Oracle Business Intelligence Enterprise Edition (OBIEE) and Oracle Business Intelligence Applications (OBIA)

OBIEE and OBIA follows the same convention for naming Roles. The naming convention consists of a program identifier, application, and a description of the role functionality. The following section contains the syntax for the naming of OBIEE and OBIA Roles.

2.3.1 OBIEE and OBIA Roles

The role naming convention begins with IP and establishes a tailored object. An underscore symbol follows as a separator. The next set of characters defines the application. An underscore symbol follows as a separator. The final set of characters is a description of the role functionality. Table 2-7 provides a detailed overview on the OBIEE and OBIA-tailored role naming convention.

3 DESIGN OF ROLES AND PERMISSIONS

The design of PeopleSoft roles and permissions are based on the IPPS-A System/Sub-System Specifications (S/SSs) and the needs of the Soldiers as communicated through the Functional Management Division (FMD). In addition, the design incorporates the specifications for being compliant with the appropriate Federal Information Security Management Act (FISMA), Federal Information System Controls Audit Manual (FISCAM), Financial Improvement Audit Readiness (FIAR), Defense Information Systems Agency (DISA) Security Technical Implementation Guide (STIG) access controls, and Department of Defense (DoD) Cybersecurity Policy. User roles and permissions restrict access to sensitive data inputs and outputs, to include personally identifiable information (PII) and payroll. Appendices D and E define user roles and permissions that restrict access to IPPS-A data.

Note: Any roles or permissions that are identified as vendor provided and required for the IPPS-A system are mitigated using the IPPS-A Plan of Action and Milestones (POA&M) process.

3.1 Roles Matrix

The Roles Matrix was created to support the program vision of grouping roles into various user types called subcategories. These subcategories made it easier for end users to identify the types of accesses required in the PeopleSoft applications and OBIEE. Appendix D: provides the Roles Matrix list.

3.2 Process for Subcategories/Roles/Permissions

Figure 3-1 below depicts the process for submitting requests to IPPS-A during Sustainment. These requests may change the user's access within IPPS-A.

Figure 3-1 Sustainment Change Request Process

During Sustainment, when a change is related to roles and permissions, the Sustainment team will work with application security in implementing the updates.

Figure 3-2 highlights the roles and permission process.

Figure 3-2 Sustainment Process for Application Security and End User Changes

The following process steps during sustainment will result in roles and permissions changes:

- A need is identified via a ticket, FMD or PMO that results in a new subcategory, role, or permission is identified.
- The requestor within IPPS-A sustainment coordinates support with applications security to verify the need.
- Request and application security coordinates with the Application Security Governance Team.
- The requestor will follow the Engineering Change Request (ECR) process.
- The IPPS-A Program will review the ECR via the appropriate process.
- If the request is not approved, the requestor is notified of the decision. If approved, the request is assessed on whether a release is required due to down time.
- The requested changes are made in a non-production instance and tested to include regression testing if required.
- Once fully tested and ready, a migration is prepared and deployed.

- The role matrix needs to be properly updated to account for the changes.

3.3 Subcategory Prerequisites

Table 3-1 lists out the subcategory prerequisite that are necessary to have access to a user bundle. For example, if a user needs access to the Knowledge Manager Approver bundle, the user must have the Sustainment-App Sec bundle with the MSA Validator's approval.

4 APPLICATION ROLES

Application Roles in PeopleSoft are objects that link permissions and user profiles/user accounts. One or more roles are assigned to a user profile/user account according to the responsibilities of each user. A role is a collection of permissions that provide access to the functions required to perform specific job duties.

Additionally, segregation of duties (SOD) limits who can be involved in the business process within the Army to include HR operations within IPPS-A. An assessment of the roles to SOD rules will have an impact on which roles can be assigned to a user.

4.1 Base Roles Defined

This section describes IPPS-A base roles for PeopleSoft. The IPPS-A user population is made up of two user types: Member and Person of Interest (POI).

A Member is defined as an Army Soldier. A POI is a person who needs to access IPPS-A, but who is not a Member (e.g., Government Civilian, Government Contractor, or Military Member of another Branch of Service). Both Members and POIs will be granted base roles, allowing basic functionality within the system. Every user that accesses IPPS-A will be granted a base role.

4.2 Base Roles

Refer to Appendix G: for the listing of base roles.

4.3 Self-Service Roles Defined

The Self-Service role(s) grants a user access to view their data and to maintain specific items within the system that do not require approval and are specific to that user.

4.4 Self-Service Roles

Refer to Appendix G: for the listing of self-service roles.

4.5 Functional Roles Defined

The Functional role(s) grants a user access to a job function within the IPPS-A system (e.g., Training Instructor, Maintain Assignments, and Validator).

4.6 Functional Roles

Refer to Appendix G: for the listing of functional roles.

4.7 PeopleSoft Technical Roles Defined

The Technical role(s) grants a privileged user access to system support functions within the IPPS-A system (e.g., application administrator, security administrator, system developers, etc.).

4.8 PeopleSoft Technical Roles

Refer to Appendix G: for the listing of PeopleSoft technical roles.

4.9 Non-PeopleSoft Technical Roles

Refer to Appendix I: for the listing of non-PeopleSoft technical roles.

4.10 SOD Rules Impact

Refer to Appendix J: for the listing of SOD rules and PeopleSoft roles (if any) that could violate these rules.

Note: CDRL 03-007 Roles and Permissions Guide is being reworked due to a realignment of subcategories and roles.

More information regarding SOD can be found in Work Product (WP)-071, IPPS-A Segregation of Duties Framework (ISODF).

4.11 Non-PeopleSoft Technical Roles SOD Matrix

Refer to Appendix K: for Non-PeopleSoft Technical Roles SOD Matrix.

5 PERMISSIONS OR APPLICATION EQUIVALENT

Permissions are the lowest level of application components that define authorizations (access control attributes) for application security components (e.g., update, delete, display, etc.). A permission can be configured to be a group of authorizations that are linked to one or more roles. In addition, they are aligned with business processes that are used for specific user functions.

5.1 Base Permissions Defined

The Base permissions only allows a user to log into the IPPS-A system. Every user that accesses IPPS-A is granted a base permission list.

5.2 Base Permissions

Refer to Appendix G: for the listing of the base permissions.

5.3 Self-Service Permissions Defined

The Self-Service permissions grant a user access to view their data and to maintain specific items within the system that do not require approval and are specific to that user.

5.4 Self-Service Permissions

Refer to Appendix G: for the listing of self-service permissions.

5.5 Functional Permissions Defined

The Functional permissions grant a user access to specific functions that allow the user to perform tasks within the IPPS-A system.

5.6 Functional Permissions

Refer to Appendix G: for the listing of functional permissions.

5.7 Technical Permissions Defined

The Technical permissions secure the application system components and functions, such as batch scheduling, web libraries, interface touch points, etc.

5.8 Technical Permissions

Refer to Appendix G: for the listing of technical permissions.

5.9 System-Level Access

All system-level access is privileged. All PROD VDI users have access to all tools within the Tools Enclave; however, they must be provisioned users in each tool and within the specific zone and enclave before they can use the tool.

5.10 Zones and Enclaves

The IPPS-A system environment is divided into Zone B Development, Zone A Test, and Production which consists of Primary Data Center (PDC) and Secondary Data Center (SDC). PDC is also referred to as PROD and SDC is Continuity of Operations Plan (COOP). Within these zones are several enclaves that execute different functions (e.g., PDC consists of the

Transactional Enclave, Reporting Enclave, Operational Training Enclave, and the Institutional Training Enclave). Access requests and provisioning are handled by IPPS-A Cybersecurity. Further information can be found in the Account Access SOP.

6 DATA-LEVEL SECURITY

Data-Level Security refers to controlling access to the rows of data in an enterprise system. Data-Level Security is used to restrict user access to employee data based on the configuration of data security components that are tied to an organizational hierarchy and/or other data attributes. Data security permissions limit Member data to what a user will be able to view within IPPS-A. Using Roles and Permissions and Data Permissions Data-Level Security is defined in PeopleSoft HCM and is then provisioned to the User Profile in PeopleSoft.

6.1 Department Row-Level Security

Department row-level security will be the primary data segmentation functionality utilized in limiting which records a user may access. The row-level security will be requested via submission of CRM tickets, which will list the various types of nodes required. These will be assessed by the Application Security Team and then manually created in IPPS-A.

6.2 Non-Tree Based Security

Non-tree based security refers to securing data elements outside of the department security tree. Additionally, data elements also include multiple objects like page fields, codes, and member criteria. The addition of Active and Reserve components and new functional areas has presented functional scenarios where data elements do not conform to traditional component/page and/or a hierarchical data structure. Delivered functionality within PeopleSoft accommodates configuring multiple data elements within permission lists and roles.

6.3 Data Permissions

Data Permission Lists apply department security to users on the General tab of user profiles. Data Permissions leverages delivered Security by Permission List with Security Sets and Access Types to apply data elements in a modular way. Data elements like restriction code, waiver types, soldier grade and rank are secured and assigned using Data Permissions.

The IPPS-A Data Permissions for Job Family, Grade Range, Military Component, and Military Component Category values are being combined in a hybrid solution of new Security Access Types combined with Department (Security Set: PPLJOB; Security Access Type: 150) and Geographic Area (Security Set: PPLJOB; Security Access Type: 170) Hierarchy. The solution will combine the Peoplesoft “Security by Dept” and “Security by Permission List” solutions though a custom process to meet the IPPS-A requirement for these data elements within Data Permissions.

The major components of this solution are as follows:

- Two New Security Access Types associated w/ the PPLJOB Security Set
  - Security Access Type 150: Department
  - Security Access Type 170: Geographic Area
- Under Access Request Configuration, two New Bundles will be configured under the “Data Security” User Category.
  - DP_DEPT: Security Access Type 150 Roles
  - DP_GEOARR: Security Access Type 170 Roles

For more information, please reference the Data Permissions (Job Family/Grade/Military Component/Military Component Category/Geographic Area) Detailed Technical Design Document.

Please refer to Appendix L: for the full list of Data Permissions.

Appendix C: Glossary

Term	Definition
Access Control	The process of granting or denying specific request to 1) obtain and use information and related information processing services; and 2) enter specific physical facilities (e.g., federal buildings, military establishments, and border crossing entrances). SOURCE: FIPS 201; CNSSI-4009
Advance Security	Application of advanced security solutions Oracle Audit Vault, Database Vault, and Label Security
Agent Types	Types of adversarial operative that counterintelligence and cybersecurity members define as threats.
Anarchist	Someone who rejects all forms of structure, private or public, and acts with few constraints
Application	All COTS products that make up the functional IPPS-A system.
Attribute-Based Access Control (ABAC)	An access control paradigm whereby access rights are granted to users by using policies that combine attributes. Policies can use any type of attribute (user, resource, environment, etc.)
Auditing	Formal internal and external inspections and verifications to check whether DoD standards, guidelines, and policies are being followed, data capture and reporting is accurate, and all key performance indicator targets are being met.
Authentication	Authentication is the process of determining that a user's claimed identity is legitimate. This usually involves a user ID and password, but can include any other method of demonstrating identity, such as a smart card, retina scan, voice recognition, or fingerprints.
Authentication factor	A category of credential for identity verification. For Multi-Factor Authentication, each additional factor increases the assurance that an entity involved in some communication or requesting access to a system is who or what they are declared to be. The three most common categories are something you know (knowledge), something you have (possession) and something you are (inherence).
Authorized User	User with appropriate roles and permissions in excess of self-service.
Availability	Ensuring timely and reliable access to and use of information.
Business Rules	A rule that defines or constrains some aspect of a business structure.
Category	The program vision is comprised of three end user categories: Member, Commander/Manager, and HR Professionals. All Soldiers will be Members and can only access their record and information. Commanders/ Managers will have access to their subordinate records and have the ability to approve/transact. HR Professionals will have expanded access to act as HR business partners at various echelons.
Centric	Having (something) as a central interest, influence, subject, etc.
Civil Activist	Highly motivated but non-violent supporter of cause
Competitor	Business adversary who competes for revenues or resources (acquisitions, etc.)
Component Interface (CI)	A PeopleSoft CI is a PeopleTools definition created in PeopleSoft Application Designer. It enables synchronous access to a PeopleSoft component from another application. CIs can integrate PeopleSoft with another PeopleSoft application or external systems.
Confidentiality	Preserving authorized restrictions on access and disclosure, including means for protecting privacy and proprietary information.
Corrupt Government Official	Person who inappropriately uses his or her position within the government to acquire company resources
Credential	An object that authoritatively binds an identity (and optionally, additional attributes) to a token possessed and controlled by a person.
Cyber Vandal	Derives thrills from intrusion or destruction of property, without strong agenda
Data Masking	A method of creating a structurally similar but inauthentic version of an organization's data for purposes such as software testing and user training to protect actual data with a functional substitute when real data is not required
Data Miner	Professional data gatherer external to the company (includes cyber methods)

Term	Definition
Data Permission	Data Permissions are derived from the combination of Security Sets and Access Types in order to secure different types of data element based on selected criteria.
Data Permission Security	Controls the application data that a user is allowed to access in the PeopleSoft system. With application data security, data permissions can be set at the table level, row level, and field level.
Data Redaction	Suppressing sensitive data, such as any personally identifiable information (PII) that can be used on its own or with other information to identify or locate a single person or identify an individual in context
Defense in Depth	The practice of layering defenses to provide added protection to the component or software by placing multiple barriers between an attacker and the IPPS-A information resources. Defense in depth increases security by raising the effort needed in an attack to be successful.
Digital Identity	A set of identifiers (user attributes, characteristics) by which an entity is recognizable and distinguishable from any other entity.
Digital Signature	An asymmetric key operation in which the private key is used to digitally sign data and the public key is used to verify the signature. Digital signatures provide authenticity protection, integrity protection, and nonrepudiation. (Source: SP 800-63)
DoD Self-Service Logon (DS Logon)	A secure, self-service logon ID created by the Defense Manpower Data Center (DMDC) as an enterprise identity credential that grants individuals affiliated with the DoD or Department of Veterans Affairs (VA) access to websites using a single user ID and password. DS Logon supports the Personnel Identity Protection (PIP) Directive and National Institute of Standards and Technology (NIST) e-Authentication guidance providing high-level authentication assurance where CAC authentication is not available.
Elevated Access Request	Process within IPPS-A functionality where users can request elevated system privileges.
Employee, Disgruntled	Current or former employee with intent to harm the company
Entity	A subject (active element that operates on information or the system state) or an object (passive element that contains or receives information).
External User	A provisioned IPPS-A user accessing the system via a non .mil network
Federated Authentication	Allows members of one organization to use their authentication credentials to access a web application in another institution
Foundation Tables	Key tables to implement an enterprise-wide HRMS, which provide a structure to establish and maintain core organizational data, eliminate redundant data entry by providing default values, and help enforce data integrity by ensuring consistency. Foundation tables must be established for capturing data or processing personnel and payroll transactions in the system
GoldenGate	An Oracle application that allows replication, filtering, and transformation of data from one database to another database.
Governance	Ensures that DoD/Army needs, conditions, and options are evaluated to determine balanced, agreed-upon enterprise objectives to be achieved; setting direction through prioritization and decision-making and monitoring performance and compliance against agreed-upon direction and objectives.
Government Cyber Warrior	State-sponsored attacker with significant resources to affect major disruption on national scale
Government Spy	State-sponsored spy as a trusted insider, supporting idealistic goals
Groups	A collection of users to permit access to common functionality
HR Professional	A subset of authorized users working in Human Resources.
Identity Federation	An arrangement that can be made among multiple enterprises that lets subscribers use the same identification data to obtain access to the networks of all enterprises in the group
Information System Security Officer (ISSO)	Individual assigned responsibility for maintaining the appropriate operation security posture for an information system or program.
Integrity	Guarding against improper information modification or destruction and includes ensuring information non-repudiation and authenticity by always passing the ACID Test (Atomicity, Consistency, Isolation, Durability).
Internal Spy	Professional data gatherer as a trusted insider, generally with a simple profit motive

Term	Definition
Internal User	A provisioned IPPS-A user accessing the system via the .mil network
Irrational Individual	Someone with illogical purpose and irrational behavior
Java Naming & Directory Interfaces (JNDI)	JNDI is a service that facilitates resources on a server to be referenced by a generic name by various applications, system processes, etc.
Keystore	A database that holds encrypted information and information on how to decrypt it.
Least Privilege	Limiting access through system administration to only authorization required to perform required functions. The goal is to reduce risk by limiting the number of people with access to critical system security controls—controlling who is allowed to enable or disable system security features or change privileges of users or programs.
Legal Adversary	Adversary in legal proceedings against the company, warranted or not
Member	A Soldier.
Metadata	Data that describes other data.
Mobster	Manager of organized crime organization with significant resources
Need-to-Know	The practice limiting authorized access to sensitive information where individuals whose need for the information has been verified.
Nonrepudiation	Assurance that the sender of information is provided with proof of delivery and the recipient is provided with proof of the sender's identity, so neither can later deny having processed the information. (Source: SP 800-60)
Notification	A method or means of delivering a message to a set of recipients. Notification system complexity often depends on organizational requirements and/or the types of messages sent. Types of notification options are *email* and *worklist* notifications (list of tasks assigned to a user).
Object	Passive information system-related entity (e.g., devices, files, records, tables, processes, programs, domains) containing or receiving information. Access to an object (by a subject) implies access to the information it contains.
Operation-Level Workflow	Workflow associated with operations that OUD is to grant to a user through a request.
PeopleCode	A proprietary language used by the PeopleSoft Enterprise component processor; it generates results based on existing data or user actions. Using various PeopleTools tools, external services are available to all PeopleSoft Enterprise applications wherever PeopleCode can be executed.
PeopleSoft User Synchronization	User profile synchronization involves setting up each PeopleSoft database in the enterprise to send and receive user profile updates through the Integration Broker. When you enter new profiles or modify and delete existing profiles on any publishing database and save, PeopleCode publishes a user profile service operation—which contains a user profile message—and routes the message to all subscribing nodes according to your specifications. The subscribing databases then update the user profile data with data from the publishing database.
Permission Lists	Groups of authorizations that are assigned to roles. Permission lists store sign-in times, page access, PeopleTools access, and so on. A permission list may contain one or more types of authorizations. The fewer types of permissions in a permission list, the more modular and scalable the implementation.
Person of Interest (POI)	An authorized user in IPPS-A who is not an employee (Member).
Personally Identifiable Information (PII)	Any information about an individual (such as name, social security number, biometric records) that can be used to recognize or trace an individual's identity alone, or when combined with any other personal information linked or linkable to an individual
Privileged User	A user who is authorized (and therefore trusted) to perform security functions or who has access to system control, monitoring, and administration functions (system administrator, database administrator, application administrator, security administrator, Information System Security Officer [ISSO], system programmers/developers, etc.)
Process Group	A group of application processes (performed in a defined order) that users can initiate in real time, directly from a transaction entry page.

Term	Definition
Process Scheduler	Enables the scheduling of recurring processes, the creation of jobs, scheduling and submitting process requests, managing batch processes, and reports.
Provisioning	Setting up an account for access and assigning the appropriate roles and security attributes to allow the user to perform assigned duties.
Radical Activist	Highly motivated, potentially destructive supporter of cause
Repository	In software development, a central file storage location used by version control systems to store multiple versions of files.
Request-Level Workflow	Workflows initiated by request service in SOA and performed as a part of a parent request. Contains High-Level information associated with the entire request.
Resource Type	Different application URIs to that a user can access.
Risk Management Framework (RMF)	An integrated organization-wide program for managing information security risk to organizational operations (i.e., mission, functions, image, and reputation), organizational assets, individuals, other organizations, and the Nation, resulting from the operation and use of federal information systems. The RMF replaces the DoD Information Assurance (IA) Certification and Accreditation Process (DIACAP) and manages the lifecycle cybersecurity risk to DoD information systems.
Role-Based Access-Control (RBAC)	A policy-neutral access control mechanism defined around roles and privileges
Roles	Intermediate objects that link user profiles to permission lists. The system can assign multiple roles to a user profile and can assign multiple permission lists to a role.
Row-Level Security	Controls access to individual rows of data stored within database tables through security views; enables you to specify the rows of data that a particular user is permitted to access.
Security Access Type	Security access types are ways of securing the data within a security set. Each security set has a number of security access types that can be enabled
Security Assertion Markup Language (SAML)	Security Assertion Markup Language is an XML-based, open-standard data format for exchanging authentication and authorization data between parties, in particular, between an identity provider and a service provider. SAML is a product of the Organization for the Advancement of Structured Information Standards (OASIS) Security Services Technical Committee.
Security Set	Security sets are groupings of data that is being secured. The sets differ by the origin of the transaction security data.
Segregation of Duties	A basic internal control that prevents or detects errors and irregularities by assigning to separate individuals' responsibility for initiating and recording transactions and custody of assets. Commonly used in large IT organizations so that no single person is in a position to introduce fraudulent or malicious code without detection.
Sensationalist	Attention-grabber who may employ any method for notoriety; looking for "15 minutes of fame"
Separation of Duties	A key internal control that prevents or detects errors and irregularities by assigning to separate individuals the responsibility for initiating and recording transactions and for the custody of information assets.
SetID	An identification code that represents a set of control table information or TableSets
Single Sign-On (SSO)	The process that allows a user to access multiple related but independent software systems or applications with one set of login credentials. The process validates the user for all applications to which they have access and eliminates further prompts when they switch software systems or applications during a single session.
Stale Request	A request that has failed, most likely because of a failed scheduled task (either because the Quarts trigger is failing/still processing, or the previous jobs failed).
Subcategory	Subcategories are groupings of capabilities within IPPS-A for a user to conduct his/her duties.
Subject	Generally, an individual, process, or device causing information to flow among objects or change to the system state.
System Development Lifecycle (SDLC)	Scope of activities associated with a system, encompassing system initiation, development and acquisition, implementation, operation and maintenance, and ultimate disposal that instigates another system initiation. Source: SP 800-34; CNSSI-4009

Term	Definition
System-Level Access	All system-level access is privileged. All PROD VDI users have access to all tools within the Tools Enclave; however, they must be provisioned users in each tool and within the specific zone and enclave before they can use the tool.
TableSet	A means of sharing similar sets of values in control tables, where actual data values are different, but the table structure is the same
TableSet Sharing	Shared data stored in many tables based on the same TableSets. Tables that use TableSet sharing contain the SETID field as an additional key or unique identifier
Target System	The destination system/resource where user and role are provisioned.
Terrorist	Person who relies on the use of violence to support personal socio-political agenda
Thief	Opportunistic individual with simple profit motive
Time-out	A fixed period of time before a system disconnects a session, which occurs when the system detects no user activity
Transaction	An event initiated by a user or system process that is committed as a data record in the database
Trusted Reconciliation	The name given to the original source of user, roles, and role Membership
Trusted Source	A system with authoritative data that other systems can safely use.
Universal Resource Identifier	Universal Resource Identifier contains information about the component's location on the server.
User Profile / User Account	A visual display of attributes associated to a specific user that defines access authorizations.
Vendor	Business partner who seeks inside information for financial advantage over competitors
Virtual Desktop Infrastructure (VDI)	Virtualization technology that hosts a desktop operating system on a centralized server in a data center. A variation on the client-server computing model, sometimes referred to as *server-based computing*. Term was coined by VMware.
Workflow	Automated vital business tasks, integrating activities of multiple users into a single business process. Ties individual steps together so the system can coordinate activities
Worklist	An organized list of the work items awaiting a user's attention. Work items are selected from a worklist, and selecting an item automatically brings up the pages needed in order to work on it; bypassing any other navigational structure and work directly from the worklist.

Appendix D: Roles Matrix

The Role Matrix is a ‘view only’ page to display roles by subcategories. On one page, the user will be able to see all the subcategories and their related roles. The user can compare the roles between subcategories, see what roles each subcategory has, and see what subcategories each role has. This will assist with analysis, application security debugging, and ongoing maintenance. The figure below shows a sample of the role matrix, showing the subcategories at the top and roles on the left. Where these two table elements meet, if a subcategory contains the role, the user will see an ‘X’. The user can click on the subcategories at the top, to sort by the subcategory. The user can also download the information to an Excel spreadsheet for future viewing options. The navigation is: IPPSA Security > IPPSA Role Matrix.

	Role Name	MEMBER	PERSON OF INTEREST	PROGRAM SELF-SERVICE
