

USSF/SSC/BMC3I Program Executive Office – Industry Day

LEO/MEO Sensing Program Office's Ground Based Radar Digitization (GBRD) Program

Title of Event: Ground Based Radar Digitization Program – On Site Visit Industry Day

Audience: Industry Representatives

When: 22 Apr 2026, 0900-1300 hours (Central /Local)

Where: Cavalier Space Force Station, 12810 91st St NE, Cavalier, ND 58220

Background: Strategically positioned around the globe, the United States Space Force's Ground Based Radars (GBRs) form a critical line of defense within the Ballistic Missile Defense System (BMDs).

These long-range, all-weather radars, located at Thule AB (Greenland), Beale AFB (California), Cape Cod SFS (Massachusetts), Clear SFS and Eareckson AS (Alaska), Cavalier SFS (North Dakota), and RAF Fylingdales (United Kingdom), provide vital early warning, tracking, and classification data for incoming ballistic missiles. Beyond early warning, the GBRs provide Integrated Tactical Warning and Attack Assessment (ITW/AA) to the National Command Authority and support the Space Surveillance Network.

GBRD supports the National Defense Strategy by continuing missile warning (MW), missile defense (MD), missile tracking (MT), and improving space domain awareness (SDA) capabilities. The Program will:

- Digitize eight radar sites to improve space domain awareness capabilities and address sustainment challenges and obsolescence.
- Enhance radar performance, including increased tracking capacity, extended range, and improved object classification.
- Transition to a government-owned, modular open system architecture with a high level of commonality between all radar back ends
- Add Missile Defense to PARCS

Purpose. United States Space Force (USSF) is seeking information from Industry regarding the modernization of Ground Based Radars (GBRs) under GBRD. This effort aims to digitize legacy radar systems to enhance space domain awareness, reduce sustainment costs, and address obsolescence issues. The USSF is particularly interested in solutions that:

1. **Leverage open system, non-proprietary architectures** to ensure future scalability and avoid vendor lock.
2. **Utilize Commercial Off-The-Shelf (COTS) technology** to minimize development risks and costs.
3. **Incorporate Cybersecurity compliance for modernized radar systems**

USSF/SSC/BMC3I Program Executive Office – Industry Day

LEO/MEO Sensing Program Office's Ground Based Radar Digitization (GBRD) Program

This event is intended to:

- Ensure synergy between the GBRD Program Office and Industry
- Allow Industry to provide feedback contributing to the requirements development process
- Learn more about the GBRD Program requirements and schedule
- Gain a better understanding of recent Industry developments and commercial opportunities
- Give Industry the opportunity to visit this unique weapon system

Learning Opportunities

This Industry Day event features a site ordination focused on the GBRD Program and to provide valuable learning opportunities and understanding of the current GBRs (technologies).

RSVP: tracy.anderson.4@spaceforce.mil and syd85.bal.gbrd@spaceforce.mil

Access Requirements:

- Due to space and time restriction limited to **one representative per company**.
- This site visit is designed for systems or integration engineers
- **Active US Government Secret Clearance Required**
- **Must complete site Access Visit Request Approval by 5 pm (EST) Apr 3, 2026:**

<https://dbids-global-enroll.dmdc.mil/preenrollui/#/landing-page>

EALs will submit to the 10 SWS Security Forces Distro at: 10sws.securityforces@us.af.mil

Security Managers: TSgt Arik Runyon and Sgt Troy Rodriguez

SMO Code: GM1SFDPK

- **For ease of processing each attendee needs to have their EAL # IOT allow security to verify at installation access point**
- **Site visit will be held between 0900hrs – 1300hrs (local)**
- **No one will be admitted past 0900hrs (local)**

Each interested offeror will be allowed a maximum of **one person** to attend and will only be permitted to enter the Restricted Area (RA) during assigned times. Check in at the Station Security Access point; a Security Forces team member will verify identification with provided information and direct individuals proceed and park in the designated parking area.

Site Restrictions During Site Visit: No photography or recording is permitted. Do not park in any undesignated areas or block thru traffic. Offerors will be expected to comply site security requirements. All offerors entering the RA are subject to a background investigation.

There are no electronics allowed in the building- if someone has a medical device that needs registered to enter the building, they will need to work with TSgt Runyon (contact email above) to get it registered. Additionally, it is worth noting that the site is not handicapped friendly.

Hosting Unit: Space Systems Command (SYD85/BAL) and 10th Space Warning Squadron, Mission Delta 4

*** For reference the Ground Based Radar Digitization Program is detailed in Notice ID FA872325RB003**
