

MEMORANDUM TO THE FILE

Subj: SOLE SOURCE DECISION

I. BACKGROUND:

1. FAR 12.102(a) Restricting Competition states for acquisitions valued at or below the simplified acquisition threshold (SAT), the contracting officer shall document the decision that only one source is available and the basis for the decision.
2. Since, no specific format or approval level is mandated by the FAR, this memorandum will serve as basis to support the sole source approach for subject requirement.

II. DESCRIPTION OF ITEM OR SERVICE AND BASIS FOR THE DECISION TO SOLE SOURCE:

Forward Deployed Regional Maintenance Center (FDRMC) provides maintenance, modernization and technical support to all U.S. Navy ships/water crafts assigned to the 5th and 6th Fleet operational areas at Naval Station Rota. As part of its regular operations, FDRMC is required to measure the health and effectiveness of the ship/water craft motors to ensure the assets are fully operational and determine whether repairs are required.

Due to regular wear and tear, FDRMC requires the direct replacement of its existing equipment to ensure DDG's are continuously monitored and operability is maintained. The following auxiliary equipment and associated software are required:

TRIO C10 Vibration Data Collector and Field Analyzer			
Item	Product Number	Product Name	Quantity
1	T2-K-AZI-UX10	GETAC C10 10 inch controller	2
2	T2-K-AZI-DP2H	2 Data processor DP-2	2
3	AZ-S-0416	1 Expert Alert 4.0 License	1

New auxiliary machinery and equipment shall be certification tested in accordance with GENERAL SPECIFICATION FOR OVERHAUL OF SURFACE SHIPS (GSO) SECTION 073 (Noise, Vibration and Resilient mounting).

Par. 073b.2.b. stablish: New or newly overhauled machinery included in the ship's vibration analysis (MVA) program shall satisfy vibration requirements of specific average machine values. Such programs are in compliance with NAVSEA S9073-AX-SPN-010/MVS and depend on the ship's applicable Vibration Test and Analysis Guide (VTAG) to identify machinery, provide pertinent measurement locations, numbering conventions, test conditions, manufacturer's configuration information, analysis ranges and major forcing frequencies.

The FLUKE / Azima DLI's vibration data collector and analyzer and associated Expert Alert Software is the only equipment that is fully compatible with the existing software infrastructure (VTAG) developed for the DDG platform. The DDG class, and RMCs, are utilizing Azima equipment for this reason. This VTAG, and associated historical data, are critical for performing accurate trend analysis and diagnosing machinery health issues. The use of any other equipment and software would render all past data and test conditions ineffective and require a complete renewal of the data stored for all DDG class ship's machinery compiled since the inauguration of the ships. The impact of starting new is inestimable. It would mean developing new data interference for the entire DDG class, establishing new baseline data for all machinery equipment, and providing new training to all qualified vibration test personnel. This new starting point would omit the historical data that is heavily relied upon to recognize changes of behaviors of the machinery, where failures would not be identified until actual machinery failure. This is an unacceptable mission failure for a forward deployed, fully operational asset.

In accordance with FAR 12.102-1 and 6.103-1 Only One Responsible Source, no other supplies or services will satisfy agency requirements. The contracting officer concludes only Fluke Reliability is capable of providing the required supplies. Without reliable equipment, the government would be unable to compare machinery health onboard the DDG class and determine if replacement is necessary. There would be a risk that the equipment could fail while taking entirely new sets of data. This could render machinery and equipment inoperable and may compromise the functionality of the DDGs ultimately putting mission schedules and service members aboard the ships at operational and physical risk.
