AERONAUTICAL PRODUCTION SYSTEM (APS)

CONCEPT OF OPERATIONS (CONOPS)

VERSION 1.0
26 AUG 2020

UNCLASSIFIED

Office Mission

The Aeronautical Navigation Office (SF) produces timely, relevant and accurate aeronautical Geospatial Intelligence (GEOINT), on-line and on-demand, to meet user's flight safety and national security needs.

System Functional Mission

The Aeronautical Production System (APS) provides a single repository of all NGA digital aeronautical product holdings; provide users the ability to access and retrieve, in both graphical and textual form, any stored aeronautical product and/or associated metadata; and support generation of graphic and selected aeronautical products. Within the APS is the capability to output digital products to various media types as requested by both internal and external customers. The APS subsystems are used to collect, store, maintain, and produce worldwide aeronautical data to a variety of military, civilian, and foreign customers.

NGA Products Produced Using System

Flight Information Publications (FLIP), Digital Aeronautical Flight Information File (DAFIF), Automated Air Facilities Information File (AAFIF), Digital Vertical Obstruction File (DVOF), Airfield Foundation Data (AFD), Airfield Imagery Support Compile, process, and maintain worldwide aeronautical safety of navigation data and products.

Collect from a variety of host nation producers and other means; enhance source as required using imagery and other intelligence sources. Maintain aeronautical Geospatial Intelligence (GEOINT) databases and products used by the DoD aviation community and national policy makers. Provide DoD aviation mission planners and aircrews digital Aeronautical GEOINT, legacy hardcopy publications, and aeronautical applications for mobile devices. Support operational DoD and partners with material encompassing all phases of flight from pre-planning to enroute operations, to mission completion. Provide a data-centric environment that allows users to extract tailored digital information to meet a variety of mission requirements.

Concept of Operations

Aeronautical Analysts and Aeronautical Imagery/Feature Analysts perform database maintenance utilizing the Aeronautical Application Suite (AAS), the Aeronautical Obstruction Environment (AOE) software, and assorted COTS, GOTS, and custom code for imagery analysis within the Aeronautical Production System (APS) production system. These software, hardware, and databases are used by the Aeronautical Safety of Navigation Office (SFA) to store and maintain the data mandated by Safety of Navigation statutory requirements and requirements as the res-prod for airfield data within the Intelligence Community (IC). This data contains over 70 million records essential to the SFA mission; all of which may be updated every 28 days.
