

ANNEX D: CLOUD ENTERPRISE SERVICES GUIDANCE

**Version 5.2
31 May 2018**

TABLE OF CONTENTS

Section	Description	Page
	Revision Summary	ii
1.0	Introduction.....	1
2.0	Guidance	2

REVISION SUMMARY

<i>Version</i>	<i>Revision Date</i>	<i>Revision Summary</i>
1.0	2/26/2016	Initial Release
4.1	8/5/2016	Updated classification/portion marking to support push to SBU
5.0	9/30/2016	Changed title to clarify role with Enterprise Services Catalog
5.2	5/31/2018	Changed Enterprise Services Catalog information

Annex D: Cloud Enterprise Services

1.0 INTRODUCTION

NGA is making available a selection of services and tools to help secure, monitor and enhance activities' cloud operations. Examples of these services include: host based security, hardened Amazon Machine Images (AMI), software configuration management, and audit and logging. These Enterprise Services are provided by IT/IS, AIT and Amazon Web Services (AWS) via Commercial Cloud Services (C2S) across the cloud domains. The NGA cloud environment offers potential efficiencies through consolidation of these services.

A complete list of current NGA Cloud Enterprise Services can be found in the [Enterprise Services Catalog](#) within the [ATLAS](#). C2S provided service descriptions are available through [AWS](#) and ordered through the AWS Management Console. Additionally, the roadmap for future C2S services that can be used by activities for planning purposes is available on the [C2S Services and Feature Roadmap](#). Note that not all AWS products currently available in the commercial space on the unclassified domain are available on C2S. Activities should establish service commonality across all domains, to maintain uniformity of services and customer experience.

Detailed procedures specifically for implementation of services within the NGA enclave of C2S or a vendor specific best practice is available on the [Cloud Information Portal](#). This portal page will be updated as new services are released and procedures are revised.

The [Enterprise Services Catalog](#) contains sections with notations for mandatory services and availability across all three domains; which are:

- [Base Services](#) identifies the Infrastructure Service Provider (ISP) services available to users as they deploy their cloud environments. Mandatory services include: Cloud Access Portal (CAP), AMIs, configuration management (i.e., Chef, Puppet), license, IP and patch management, and VPC management services.
- [Data Services](#) provided to store and manage enterprise data for ingest, conditioning, access and lifecycle management, including OpenDataStore (ODS) and data transfer services (e.g., Snowball).
- [GEOAxis Services](#) provided by ASPs/ISPs for authentication services to NGA throughout all domains, including CAP, Entitlement Management Support, and Secure Token Services (STS).
- [Enterprise Management Services](#) provides end-to-end service delivery and performance of mission capabilities, including asset management, monitoring, auditing, and visualization tools.
- [AWS](#) provided by the Cloud Solution Provider (CSP) for data transfer, computation, storage, performance management, and authentication services throughout the cloud environment.
- [Platform Services](#) provide a platform and suite of tools for application employment, including a Chargeback Financial Model (CFM), PCF and NDAAS.

- API Management Services provide services for the management of Application Programming Interfaces (APIs).
- DEVOPS Services provide lifecycle development and test services for Continuous Integration (CI) and Continuous Development (CD) operations, including the Redmine, Gitlab and Jenkins services.
- Security Protection Services provide a suite of tools to ensure end-to-end service delivery and mission support, including security monitoring and alerting.
- Transport Services provide a suite of tools to ensure end-to-end service delivery and mission support, including firewalls, logs, and computer virus protection.
- IC GovCloud Services are provided by the government CSP (i.e., NSA) for data ingest, content query and metadata services, analytic computation, storage, platform services, and authentication services throughout the cloud environment.
- Additional Services are provided by CSPs and ASPs as supplemental capabilities or services considered for future implementation into the cloud environment.
- AWS UC Services are services provided by Amazon for the commercial cloud environment.

2.0 GUIDANCE

Guidance: *The C2S contract shall require “Certified” funding for all C2S services for the entire period of performance when operating within the cloud environment.*

Each activity is required to complete an Air Force Form 9 (AF9). The AF9 must pass PRISM/GEO-F validation and be routed in PRISM for review/approval by the NGA Cloud PMO. Instructions and an example of a completed AF9 can be found on the NGA Cloud Information Portal within Phase One of the process.

Guidance: *Activities shall order enterprise services throughout the C2S Activity Process using the Cloud Adoption Template (CAT) or the AWS Management Console inside the cloud environment.*

The NGA’s phased cloud adoption process, workflow, documentation (i.e. [CAT](#)), and procedural guidance for deploying to the cloud environment can be found on the [NGA Cloud Information Portal](#).
