

CONTROLLED UNCLASSIFIED INFORMATION

Single Source Justification (Simplified Acquisition)

Section A: General Contract Information

Project/Program Name: Common Aircraft Portable Reprogramming Equipment (CAPRE) Secure Memory Load Verifier (SLMV)

Section B: Description of the Supplies/Services Required

This requirement is for a qualified vendor to perform Electromagnetic Interference (EMI) testing services on the SMLV's new Network Interface Module (NIM). The specific task is to conduct a full EMI test on a production-representative NIM unit that includes the updated circuit board layout. The test results will be used to certify the final production design for fielding.

Section C: Justification for Soliciting from a Single Source or Brand Name

In accordance with RFO 6.103-1, "Only one responsible source and no other supplies or services will satisfy agency requirements," this acquisition is justifiably restricted to a single vendor. Engineered Test Systems (ETS) possesses unique capabilities and specialized experience that are essential to the successful and timely execution of this requirement. No other contractor can satisfy the government's need without causing unacceptable delays and introducing substantial technical and schedule risk to a mission-critical program.

Unique, In-depth Knowledge and Experience: The vendor successfully performed the initial EMI qualification testing on the original NIM design. Through this process, they developed a unique and unparalleled understanding of the NIM's specific design, its operational sensitivities, and its specific performance characteristics within a controlled test environment. This prior, hands-on expertise is not merely a matter of convenience; it represents a critical body of knowledge that cannot be replicated by another contractor without extensive and time-consuming reverse engineering of the test methodology.

Continuity of Testing Methodology and Data Integrity: The primary purpose of this re-test is to isolate and verify the impact of a minor, post-test circuit board modification. To achieve scientifically valid and comparable results, it is imperative to eliminate as many variables as possible between the original test and the re-test. The incumbent vendor possesses the original, validated test plan, uses the exact same test station, and can replicate the precise equipment setup from the initial testing. This ensures that any change in EMI performance is attributable only to the circuit board modification and not to variations in test equipment, setup, or procedure. No other vendor can offer this level of continuity, and using a different contractor would introduce new variables, potentially corrupting the data and invalidating the results.

Mitigation of Unacceptable Schedule Risk: The CAPRE SMLV program is obligated to deliver these units to meet a critical fielding schedule, and funds for this effort expire at the end of FY26. Engaging a new contractor would require them to develop a new test plan from scratch, procure and configure a test station, and familiarize themselves with the intricacies of the NIM. This process would introduce significant and unacceptable delays to the program schedule, jeopardizing the delivery timeline and risking the loss of allocated funds. The incumbent vendor's existing expertise and established test plan make them the only source capable of meeting the required completion date of Q3 FY26.

The use of any other source would result in a duplication of effort, a loss of data integrity, and unacceptable delays in fielding mission-critical equipment to the warfighter. Therefore, ETS is the only contractor with the unique combination of prior experience, established test procedures, and in-depth product knowledge required to perform this service within the required timeframe and to the necessary standard.
