1. Introduction

1.1 Introduction

About This Document

This is the Contract Document package for interpretive signage at the Bureau of Reclamation’s Administration Building’s xeric garden in Boulder City, Nevada. It includes:

- design drawings
- text & graphics

Please note there is a Fabrication Specification for this work under separate cover that will for a part of the Contract Documents set.

1.2 How to read this document

- Design Drawings are provided for costing and approval of design by BOR. They are NOT FOR CONSTRUCTION
- It is the responsibility of the Fabricator to provide shop drawings for all signage and supports as part of this work.
- Text & Graphics are provided for costing and reference for BOR approval of text and image use.
- Each draft graphic layout is preceded by a text sheet. Please review the text sheet for accurate copy.
- If the text in the graphic layout and text sheet differ, the copy in the text sheet takes precedence.
- Text has been edited based on BOR feedback of the Contract Documents (100%) package November 22, 2024.
- All images are for placement only (FPO) and are used to convey interpretive intent. Final images will be coordinated between the Designer and BOR staff during the Production-Ready Graphic file stage.
- BOR feedback and edits to text and imagery will be implemented as part of the Production-Ready Graphic file stage (PRF) with proofs provided to BOR for final sign-off prior to printing.

2. Site Plan

Site Plan

NOTE: All signage locations to be confirmed with BOR/LGA on site once pathways and seating areas are completed.

D - TEASER

E - PLANT ID

Graphic Patterns

Inspired by botanical elements from the Nevada desert, these patterns will be cut out of metal, as well as used as a simple tone-on-tone graphic element on some of the smaller signs. This patterning creates visually cohesive signage, keeping visitors grounded. Abstracted shapes hint at layers beneath the soil, and how water and roots play a vital part in the xeriscaped lawn. Patterns will evolve as the design process continues.

Managing Water in the West

Reclamation’s mission is to manage, develop, and protect water and related resources.

The Homestead Act of 1862 encouraged people to settle the vast — but dry — West. People claimed up to 160 acres of land but had to improve the land through cultivation. These western farmers needed reliable water sources to irrigate crops.

Before Reclamation, some western farmers sought consistent access to water; others endured seasonal flooding. (Above) Windmill on a ranch surrounded by cows.

The U.S. Reclamation Service was created in 1902 to bring water to dry areas in the West. Supporters thought these programs would encourage people to settle in the West by providing important resources. For example, they created jobs in construction and farming, built towns and roads, and helped set up schools and homes, making the West a friendlier place for families and newcomers.

From 1902 to 1907, Reclamation began about 30 water-related projects in the West. (Right) Oregon’s Stanfield Diversion Dam, 1907.

During the Great Depression (1929–1941), Congress authorized over 40 New Deal projects, including Hoover Dam. Re-named in 1923, the Bureau of Reclamation constructed many of the dams, canals, and hydropower plants that continue to provide water and power to people living in the western United States.

One of Reclamation’s best-known projects, Hoover Dam, provides electricity, water storage, and flood protection to farmers, cities, and homes in Southern Nevada, Southern California, Arizona, and Mexico. (Left) Downstream face of Hoover Dam during construction, circa 1935.

BUREAU OF RECLAMATION

Exhibit	B3-1 Local Water Use and Conservation
Draft Content	[HEADING] The West’s Water Lifeline [SUMMARY] Safeguarding the sustainability of the Colorado River Basin is a vital task for the Bureau of Reclamation. [DETAIL] Managed through a system of canals and dams, the Colorado River is the main source of water for agriculture, fisheries, ecosystems, industries, cities, and hydropower production across much of the West. This sustaining river is a collection of water from melted snowpack and runoff from the Rocky Mountains. [CAPTION] ○ The Bureau of Reclamation manages the Colorado River in the West to provide water and hydropower for millions of people across seven western states. Reclamation also delivers water to Mexico as part of the 1944 Utilization of Waters of the Colorado and Tijuana Rivers and of the Rio Grande Treaty. ○ Beginning in 2000, severe drought and aridification, driven by climate change, led to a reduction in snowpack and spring runoff. As a result, stream flow decreased, rain and snow patterns shifted, and less water entered the Colorado River System. Simultaneously, the high demand from communities and agriculture exacerbated the situation. The combination of these factors resulted in the decline of Lake Mead’s reservoir storage from nearly full to about half full within five years. [DETAIL] The Bureau of Reclamation manages the Colorado River Basin for the American people. The agency funds water conservation projects, improving efficiency in agriculture and urban areas through upgrades in irrigation systems and water-saving technologies. Reclamation works with Tribes, states, the country of Mexico, and the diverse communities that rely on the Colorado River to ensure long-term tools and strategies are in place for water management. On this site, Reclamation xeriscaped this lawn, keeping over two million gallons of water in Lake Mead annually. [CAPTION] ○ Reclamation’s Colorado River System sustainability efforts support communities — like this one — that rely on it.

The West's Water Lifeline

Safeguarding the sustainability of the Colorado River Basin is a vital task for the Bureau of Reclamation.

Managed through a system of canals and dams, the Colorado River is the main source of water for agriculture, fisheries, ecosystems, industries, cities, and hydropower production across much of the West. This sustaining river is a collection of water from melted snowpack and runoff from the Rocky Mountains.

Beginning in 2000, severe drought and aridification, driven by climate change, led to a reduction in snowpack and spring runoff. As a result, stream flow decreased, rain and snow patterns shifted, and less water entered the Colorado River System. Simultaneously, the high demand from communities and agriculture exacerbated the situation. The combination of these factors resulted in the decline of Lake Mead's reservoir storage from nearly full to about half full within five years.

The Bureau of Reclamation manages the Colorado River in the West to provide water and hydropower for millions of people across seven western states. Reclamation also delivers water to Mexico as part of the 1944 Utilization of Waters of the Colorado and Tijuana Rivers and of the Rio Grande Treaty.

The Bureau of Reclamation manages the Colorado River Basin for the American people. The agency funds water conservation projects, improving efficiency in agriculture and urban areas through upgrades in irrigation systems and water-saving technologies. Reclamation works with Tribes, states, the country of Mexico, and the diverse communities that rely on the Colorado River to ensure long-term tools and strategies are in place for water management. On this site, Reclamation xeriscaped this lawn, keeping over two million gallons of water in Lake Mead annually.

Reclamation's Colorado River System sustainability efforts support communities — like this one — that rely on it.

Exhibit	B4.A-1 Boulder City Story
Draft Content	[HEADING] Boulder City: A Community Born from Hoover Dam [SUMMARY] <i>From a humble start, dam workers and their families built a modern city with lasting charm.</i> [DETAIL] The Boulder Canyon Project included plans for homes and businesses to support the men and families who came to Nevada to build Hoover Dam. But those seeking employment arrived before Boulder City could be completed. Far from any established towns or cities, they built makeshift homes and camped along the river, creating a community known as Ragtown. As dam construction began, workers lived in temporary camps while the town took shape. Eventually, tree-lined streets offered much-needed shade, and well-organized neighborhoods made for easy navigation. After long workdays, residents relaxed in parks, pool halls, and the air-conditioned theater. This tight-knit community thrived, and is a lasting legacy tied to the engineering marvel of Hoover Dam. [CAPTIONS] The city’s extensive planning had design standards for commercial buildings, including the arcaded facades that still provide visitors and residents much-needed shade, 1932. Children gather for a photo in Ragtown, circa 1931. Boulder City, circa 1931.

Children gather for a photo in Ragtown, circa 1931.

Boulder City: A Community Born from Hoover Dam

From a humble start, dam workers and their families built a modern city with lasting charm.

The Boulder Canyon Project included plans for homes and businesses to support the men and families who came to Nevada to build Hoover Dam. But those seeking employment arrived before Boulder City could be completed. Far from any established towns or cities, they built makeshift homes and camped along the river, creating a community known as Ragtown.

Exhibit	B4B-1 City Plans
Draft Content	[HEADING] Community Planning Movement [SUMMARY] <i>Boulder City is the first fully developed experiment in new town planning.</i> [DETAIL] Originally run by the federal government, the town was designed by urban planner Saco R. DeBoer, who applied progressive city planning principles to the town’s design. DeBoer carefully organized Boulder City, separating areas for business, homes, and industry. Parks were included in the design, becoming a key feature of the town. The Reclamation Administration Building was placed at the center of a triangular layout, making it a focal point. Ultimately, rows of temporary houses to the south allowed families to settle in and form a close-knit community. To the west, permanent brick homes were built for dam engineers, while the business district thrived to the southwest along Nevada Highway. Over time, schools were added. Boulder City continues to thrive, leaving a lasting legacy from its role in the dam’s construction and ongoing operation. [CAPTION] • Boulder City, circa 1933. • Look at the map on the ground to see Reclamation’s final design for Boulder City, inspired by DeBoer.

Community Planning Movement

Boulder City is the first fully developed experiment in new town planning.

Originally run by the federal government, the town was designed by urban planner Saco R. DeBoer, who applied progressive city planning principles to the town's design. DeBoer carefully organized Boulder City, separating areas for business, homes, and industry. Parks were included in the design, becoming a key feature of the town. The Reclamation Administration Building was placed at the center of a triangular layout, making it a focal point.

Ultimately, rows of temporary houses to the south allowed families to settle in and form a close-knit community. To the west, permanent brick homes were built for dam engineers, while the business district thrived to the southwest along Nevada Highway. Over time, schools were added. Boulder City continues to thrive, leaving a lasting legacy from its role in the dam's construction and ongoing operation.

Look at the map on the ground to see Reclamation's final design for Boulder City, inspired by DeBoer.

Boulder City, circa 1933

Exhibit	B5-1 BOR Administration Building
Draft Content	[HEADING] Hope on the Hill [SUMMARY] <i>During the Great Depression, the Bureau of Reclamation Administration Building was a positive focal point of the town.</i> [DETAIL] [Part 1] Built between 1930 and 1932, the Administration Building is one of the oldest buildings in Boulder City. Reclamation and the city’s designer, Saco DeBoer, purposefully placed the building on this high hilltop at the top of the triangular-shaped town. [Part 2] The Administration Building, like Hoover Dam, was designed by architect Gordon B. Kaufman. When it was finished, it became the office for the dam’s Chief Construction Engineer and other staff. Next door is a dormitory that still stands today, which housed some single workers building Hoover Dam. [Captions] • Wilbur Park — across from the Administration Building — brought trees and shade to residents.

Hope on the Hill

During the Great Depression, the Bureau of Reclamation Administration Building brought a sense of purpose to residents.

Built between 1930 and 1932, the Administration Building is one of the oldest buildings in Boulder City. It was designed with help from Saco DeBoer's city plan and inspired by the architect of Hoover Dam, Gordon B. Kaufman. When it was finished, it became the office for the Chief Construction Engineer and other staff. Next door is a dormitory, that still stands today, which housed some single workers building Hoover Dam.

Reclamation and the city's designer, Saco DeBoer, purposefully placed the building on this high hilltop at the top of the triangular-shaped town. During the Depression, Reclamation created jobs by building Hoover Dam, attracting many people from near and far who sought work and a sense of hope to get through difficult times.

Wilbur Park — across from the Administration Building — brought trees and shade to residents.

Exhibit	C2-1 Special Story - The Lawn's Evolution
Draft Content	[HEADING] Weed's Trees [SUMMARY] Wilbur Weed's landscape team planted a water-intensive lawn in front of the Administration Building. [DETAIL] Reclamation's city planner, Saco DeBoer, envisioned a thriving Boulder City filled with trees and plants to enhance the desert community. While the initial plan aimed for a lush landscape, Reclamation recognized the importance of water conservation and favored native, drought-tolerant plants better suited to the arid environment. Understanding the need to attract visitors to Boulder City, the Secretary of the Interior successfully advocated for funding to support the efforts of landscape architect Wilbur W. Weed, leading to beautifully designed spaces, including an expansive lawn on this hill. [Sidebar] For nearly a century, the Reclamation Administrative Building landscaping required more than two million gallons of water each year from the Boulder City water tower to sustain non-native trees and plants. Replacing the thirsty landscape with native and drought-tolerant vegetation highlights Reclamation's commitment to sustainable practices and the ongoing need for water conservation in desert communities. [CAPTION] Weed and his team planted black Arizona ash, Chinese elm, Carolina poplar, European sycamore, and other trees around town, 1931. Administration Building's lawn, 1933.

Weed's Trees

Wilbur Weed's landscape team planted a water-intensive lawn in front of the Administration Building.

Reclamation's city planner, Saco DeBoer, envisioned a thriving Boulder City filled with trees and plants to enhance the desert community. While the initial plan aimed for a lush landscape, Reclamation recognized the importance of water conservation and favored native, drought-tolerant plants better suited to the arid environment. Understanding the need to attract visitors to Boulder City, the Secretary of the Interior successfully advocated for funding to support the efforts of landscape architect Wilbur W. Weed, leading to beautifully designed spaces, including an expansive lawn on this hill.

Administration Building's lawn, 1933.

Weed and his team planted black Arizona ash, Chinese elm, Carolina poplar, European sycamore, and other trees around town, 1931.

For nearly a century, the Reclamation Administrative Building landscaping required more than two million gallons of water each year from the Boulder City water tower to sustain non-native trees and plants. Replacing the thirsty landscape with native and drought-tolerant vegetation highlights Reclamation's commitment to sustainable practices and the ongoing need for water conservation in desert communities.

Exhibit	C2-2 Special Story - The Lawn's Evolution
Draft Content	[HEADING] Reclamation Looks to the Future [SUMMARY] Reclamation has embraced a more natural desert landscape and with good reason. [Part 2] The Bureau of Reclamation decided to replace the historic yard with desert landscaping to align with its commitment to protecting water resources and shaping a sustainable future. By transforming a once-ordinary landscape into an eco-friendly and accessible space, we aim to conserve an estimated two million gallons of precious Colorado River water each year. The new design reflects the natural desert environment surrounding us and replaces a thirsty lawn with a diverse array of drought-tolerant and native vegetation. This smart transformation introduces resilient trees, shrubs, and plants that thrive in our arid climate, demonstrating that small changes can lead to significant impacts. Our xeriscape is not only beautiful but also practical. We've created pathways and sidewalk, ensuring everyone can enjoy the garden. Along the meandering paths, visitors will find inviting spots for community gatherings and field trips, fostering connections and appreciation for nature. Reclamation recognizes the historical significance of this site in Boulder City, and our new design honors the integrity of its historic staircase while also addressing modern needs. We have ensured Americans with Disabilities Act compliance and implemented water-saving measures, creating a space that respects the past while embracing sustainability for the future. [Sidebar] Xeric gardens are designed to thrive in arid climates, utilizing drought-resistant plants and materials. [CAPTIONS] ○ The prominent Boulder City water tower holds two million gallons of water — the same amount of water Reclamation saves annually.

Reclamation Looks to the Future

Reclamation has embraced a more natural desert landscape and with good reason.

The Bureau of Reclamation decided to replace the historic yard with desert landscaping to align with its commitment to protecting water resources and shaping a sustainable future. The new design reflects the surrounding desert environment, replacing lawns with drought-tolerant and native vegetation.

Reclamation recognizes the historical significance of this site, honoring the integrity of the historic staircase while also addressing modern needs. We have ensured Americans with Disabilities Act compliance and implemented water-saving measures, creating a space that respects the past while embracing sustainability for the future.

Our xeriscape is not only beautiful but also practical. We've created pathways and sidewalk, ensuring everyone can enjoy the garden. Along the meandering paths, visitors will find inviting spots for community gatherings and field trips, fostering connections and appreciation for nature.

Reclamation recognizes the historical significance of this site in Boulder City, and our new design honors the integrity of its historic staircase while also addressing modern needs. We have ensured Americans with Disabilities Act compliance and implemented water-saving measures, creating a space that respects the past while embracing sustainability for the future.

The prominent Boulder City water tower holds two million gallons of water — the same amount of water Reclamation saves annually.

Nevada Desert cactus and native plants

Xeric gardens are designed to thrive in arid climates, utilizing drought-resistant plants and materials.

Metalwork pattern to be further developed during PRF phase.

Graphic layouts are FPO

Exhibit	C1-1 Special Story - Hoover Dam
Draft Content	[Part 1] [HEADING] Tall Task [SUMMARY] With the West facing seasonal flooding and fights over water rights, Herbert Hoover saw a solution. [DETAIL] In 1921, then-Secretary of Commerce Herbert Hoover proposed the construction of a dam on the Colorado River. Not only would the dam control flooding and store water for irrigation, but it would also recover the cost of construction through the sale of hydroelectric power. Additionally, the water flowing downriver of the dam, and through canals, would quench the thirst of the West's growing population. [CAPTIONS] "The waters of this great river, instead of being wasted in the sea, will now be brought into use by man." — Herbert Hoover, 1932. On a very active construction site, workers built the 726-foot-tall dam, circa 1935. Seasonal swelling of rivers — from rain and snowmelt — flooded Californians, spurring action, 1928.

Seasonal swelling of rivers — from rain and snowmelt — flooded Californians, spurring action, 1928.

On a very active construction site, workers built the 726-foot-tall dam, circa 1935.

"The waters of this great river, instead of being wasted in the sea, will now be brought into use by man."
— Herbert Hoover, 1932.

Tall Task

With the West facing seasonal flooding and fights over water rights, Herbert Hoover saw a solution.

In 1921, then-Secretary of Commerce Herbert Hoover proposed the construction of a dam on the Colorado River. Not only would the dam control flooding and store water for irrigation, but it would also recover the cost of construction through the sale of hydroelectric power. Additionally, the water flowing downriver of the dam, and through canals, would quench the thirst of the West's growing population.

Exhibit	C1-2 Special Story - Hoover Dam
Draft Content	[HEADING] Massive Masterpiece [SUMMARY] Hoover Dam stands as an awe-inspiring structure, serving millions. Construction on the dam began during the Great Depression in 1931. Men from across the country came to work on the massive project. Full of hope during this challenging time, they worked through extreme working conditions, including temperatures well over 100 degrees. The dam spurred long-term growth and prosperity in the West through its delivery of water and electricity. To this day, Hoover Dam is an iconic symbol of American engineering excellence. It is a National Historic Landmark listed in the National Register of Historic Places. [CAPTIONS] Architect Gordon Kaufman designed the dam in the Art Deco style as seen in one of the dam’s spillways, circa 1935–1936. After the dam was complete, Lake Mead filled just as planned, circa 1940–1941. The turbine ring in front of you is a section from one of Hoover Dam’s turbines. There are 17 main turbines at Hoover Dam — eight on the Nevada wing of the power plant and nine on the Arizona wing.

Massive Masterpiece

Hoover Dam stands as an awe-inspiring structure, serving millions.

Construction on the dam began during the Great Depression in 1931. Men from across the country came to work on the massive project. Full of hope during this challenging time, they worked through extreme working conditions, including temperatures well over 100 degrees. The dam spurred long-term growth and prosperity in the West through its delivery of water and electricity. To this day, Hoover Dam is an iconic symbol of American engineering excellence. It is a National Historic Landmark listed in the National Register of Historic Places.

Architect Gordon Kaufman designed the dam in the Art Deco style as seen in one of the dam's spillways, circa 1935–1936.

After the dam was complete, Lake Mead filled just as planned, circa 1940–1941.

Exhibit	C1-3 Special Story - Hoover Dam
Draft Content	[HEADING] Monumental Men [SUMMARY] <i>With grit, determination, and skill, workers crafted this enduring symbol of human achievement.</i> [CAPTIONS] - For five years, 5,000 men worked tirelessly to construct Hoover Dam, laboring around the clock with only two days off each year: Christmas and the 4th of July, circa 1932. - Workers blasted and dug three miles of diversion tunnels to harness and reroute the Colorado River, creating a dry worksite for the construction of the dam's base, 1934. - High-scalers climbed down the canyon walls on ropes, using jackhammers and dynamite to remove loose rock before construction could begin, circa 1931. - At peak performance, with remarkable coordination of men and materials, 16-ton buckets of concrete were placed every 78 seconds, 1934.

Monumental Men

With grit, determination, and skill, workers crafted this enduring symbol of human achievement.

For five years, 5,000 men worked tirelessly to construct Hoover Dam, laboring around the clock with only two days off each year: Christmas and the 4th of July, circa 1932.

Workers blasted and dug three miles of diversion tunnels to harness and reroute the Colorado River, creating a dry worksite for the construction of the dam's base, 1934.

High-scalers climbed down the canyon walls on ropes, using jackhammers and dynamite to remove loose rock before construction could begin, circa 1931.

At peak performance, with remarkable coordination of men and materials, 16-ton buckets of concrete were placed every 78 seconds, 1934.

BUREAU OF RECLAMATION

C1 Special Story - Hoover Dam - Panel layout overview

Panel separations - refer to design drawings

Seasonal swelling of rivers — from rain and snowmelt — flooded Californians, spawning action, 1920.

Tall Task

With the West facing seasonal flooding and fights over water rights, Herbert Hoover saw a solution.

In 1921, then-Secretary of Commerce Herbert Hoover proposed the construction of a dam on the Colorado River. Not only would the dam control flooding and store water for irrigation, but it would also recover the cost of construction through the sale of hydroelectric power. Additionally, the water flowing downriver of the dam, and through canals, would quench the thirst of the West's growing population.

On a very active construction site, workers built the 726-foot-tall dam, circa 1935.

"The waters of this great river, instead of being wasted in the sea, will now be brought into use by man."
— Herbert Hoover, 1932

Massive Masterpiece

Hoover Dam stands as an awe-inspiring structure, serving millions.

Construction on the dam began during the Great Depression in 1931. Men from across the country came to work on the massive project. Full of hope during this challenging time, they worked through extreme working conditions, including temperatures well over 100 degrees. The dam spurred long-term growth and prosperity in the West through its delivery of water and electricity. To this day, Hoover Dam is an iconic symbol of American engineering excellence. It is a National Historic Landmark listed in the National Register of Historic Places.

Architect Gordon Kaufman designed the dam in the Art Deco style as seen in one of the dam's spillways, circa 1935–1936.

After the dam was complete, Lake Mead filled just as planned, circa 1940–1941.

The turbine ring in front of you is a section from one of Hoover Dam's turbines. There are 17 main turbines at Hoover Dam — eight on the Nevada wing of the power plant and nine on the Arizona wing.

Monumental Men

With grit, determination, and skill, workers crafted this enduring symbol of human achievement.

For five years, 5,000 men worked tirelessly to construct Hoover Dam, laboring around the clock with only two days off each year: Christmas and the 4th of July, circa 1932.

Workers blasted and dug three miles of diversion tunnels to harness and reroute the Colorado River, creating a dry worksite for the construction of the dam's base, 1934.

High-scalers climbed down the canyon walls on ropes, using jackhammers and dynamite to remove loose rock before construction could begin, circa 1931.

At peak performance, with remarkable coordination of men and materials, 15-ton buckets of concrete were placed every 78 seconds, 1934.
