
DRAFT AOI-2026-001_BOS-IT

AOI Title: Base Operating Support-Information Technology (BOS-IT)

Set-Aside: Total 8(a) Small Business – 100%

Close Date: TBD

Evaluation of White Papers: TBD

AOI CO: TBD

This AOI aligns with the consolidation effort, under the CNECTS initiative, that aims to break down operational silos, drive significant efficiencies, and establish a proactive, resilient, and secure digital foundation. We are seeking partners who can move beyond legacy management paradigms and introduce modern, data-driven, and automated approaches to IT service delivery, engineering, and mission support:

Background

The current BOS-IT support is reactive, labor-intensive, and fragmented. Managing disparate legacy systems (copper cabling, analog voice) alongside modern networks creates high sustainment costs and slow response times. The current model lacks the proactive, predictive capabilities needed to ensure mission resilience against advanced cyber threats and dynamic operational tempos.

Technical Focus Areas (TFAs)

Offerors must propose solutions aligned with each of the TFAs. All submissions should emphasize the technical aspects of their approach, with deliverables expected to provide production-ready systems, but may include prototypes, models, and/or experimental frameworks.

TFA 1: AIOps for Predictive Network Operations:

Desired Capabilities:

- Implement Artificial Intelligence for IT Operations (AIOps) platform that ingests data from NIPR/SIPR networks, endpoints, and infrastructure to predict failures, automate root cause analysis, and recommend preventative actions before outages occur.

TFA 2: Unified Communications as a Service (UCaaS):

Desired Capabilities:

- Propose a unified platform to consolidate legacy telephony, Land Mobile Radio (LMR), and Giant Voice systems into a secure, IP-based solution that integrates voice, and messaging for seamless communication across the installation.

TFA 3: Digital Twin for Infrastructure Management:

Desired Capabilities:

- Create a dynamic digital twin of the base's physical plant infrastructure (fiber optic, copper, antennas). This model should be used for capacity planning, outage simulation, and optimizing new installation pathways.
-

Performance & Integration Considerations

Solutions must demonstrate a superior and innovative approach to enterprise IT management beyond standard industry practices. All TFAs are mission-critical focused; the Government seeks to assess feasibility, validate technical approaches, and inform transition paths for future IT capabilities.

Security Requirements

Phase I submissions shall be Unclassified. Subsequent phases may require submission and/or performance at higher classification levels, as specified in the AOI and any draft or final DD Form 254.

Submission Instructions & Evaluation

Per Attachments 1–2 (submission) and Attachment 6 (evaluation).

Funding Statement

The Government may fund all, some, or none of the proposed solutions, in whole or in part, subject to availability of funds.
