

1. DESCRIPTION: The proposed solution will provide Lackland AFB with the requested coverage data study for JBSA. A technical team will survey 4400 .5x.5 mile grids in the San Antonio area and 5-mile military influence areas. The testing will include inbound and outbound testing. This testing will test the range and reliability of the 6 UHF R1 ASTRO Site Repeaters locations currently on base.

2. SPECIFICATIONS OF NEED: We currently lack the real-time, granular visibility required to identify and proactively address communication coverage gaps. This hinders infrastructure optimization and can lead to service disruptions. A new coverage analysis capability will enable data-driven decision-making, risk mitigation, and regulatory compliance. By accurately identifying coverage weaknesses, we can significantly improve service reliability and better support user needs. We do not have the means or capability to conduct such a survey ourselves.

3. IMPACT: As our training area expands and JBSA footprint grows we will continue to have areas where LMR communication is unavailable or spotty. Without knowing our current area of coverage and dead spots we put our Airmen and Mission partners in harms way and totally reliant on cell phones. This analysis will allow us to better support our customers and plan for the possibility of expansion to our network.
