1.2 GENERAL REQUIREMENTS

- a. Section 23 30 00 HVAC AIR DISTRIBUTION applies to work specified in this section
- b. Section 23 05 48.19 SEISMIC BRACING FOR HVAC applies to work specified in this section.
- c. Section 40 05 13.96 WELDING PROCESS PIPING applies to work specified in this section.
- d. Submit Records of Existing Conditions consisting of the results of Contractor's survey of work area conditions and features of existing

structures and facilities within and adjacent to the jobsite.  
Commencement of work constitutes acceptance of the existing conditions.

- e. Include with Equipment Foundation Data for piping systems all plan dimensions of foundations and relative elevations, equipment weight and operating loads, horizontal and vertical loads, horizontal and vertical clearances for installation, and size and location of anchor bolts.
- f. Submit Fabrication Drawings for pipes, valves and specialties consisting of fabrication and assembly details to be performed in the factory.
- g. Submit Material, Equipment, and Fixture Lists for pipes, valves and specialties including manufacturer's style or catalog numbers, specification and drawing reference numbers, warranty information, and fabrication site information. Provide a complete list of construction equipment to be used.
- h. Submit Manufacturer's Standard Color Charts for pipes, valves and specialties showing the manufacturer's recommended color and finish selections.
- i. Include with Listing of Product Installations for piping systems identification of at least 5 units, similar to those proposed for use, that have been in successful service for a minimum period of 5 years. Include in the list purchaser, address of installation, service organization, and date of installation.
- j. Submit Record Drawings for pipes, valves and accessories providing current factual information including deviations and amendments to the drawings, and concealed and visible changes in the work.
- k. Submit Connection Diagrams for pipes, valves and specialties indicating the relations and connections of devices and apparatus by showing the general physical layout of all controls, the interconnection of one system (or portion of system) with another, and internal tubing, wiring, and other devices.
- l. Submit Coordination Drawings for pipes, valves and specialties showing coordination of work between different trades and with the structural and architectural elements of work. Detail all drawings sufficiently to show overall dimensions of related items, clearances, and relative locations of work in allotted spaces. Indicate on drawings where conflicts or clearance problems exist between various trades.

### 1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Material, Equipment, and Fixture Lists; G

SD-02 Shop Drawings

Record Drawings; G  
Connection Diagrams; G  
Coordination Drawings; G  
Fabrication Drawings; G  
Installation Drawings; G

SD-03 Product Data

Pipe and Fittings; G  
Piping Specialties; G  
Emergency Eyewash and Shower; G  
Valves; G  
Miscellaneous Materials; G  
Supporting Elements; G  
Equipment Foundation Data; G

SD-04 Samples

Manufacturer's Standard Color Charts; G

SD-05 Design Data

Pipe and Fittings; G  
Piping Specialties; G  
Emergency Eyewash and Shower; G  
Valves; G

SD-06 Test Reports

Hydrostatic Tests; G  
Air Tests; G  
Valve-Operating Tests; G  
Drainage Tests; G  
Pneumatic Tests; G  
Non-Destructive Electric Tests; G  
System Operation Tests; G

SD-07 Certificates

Record of Satisfactory Field Operation; G

List of Qualified Permanent Service Organizations; G

Listing of Product Installations; G

Records of Existing Conditions; G

Surface Resistance; G

Shear and Tensile Strengths; G

Temperature Ratings; G

Bending Tests; G

Flattening Tests; G

Transverse Guided Weld Bend Tests; G

SD-10 Operation and Maintenance Data

Operation and Maintenance Manuals; G

#### 1.4 QUALITY ASSURANCE

##### 1.4.1 Material and Equipment Qualifications

Provide materials and equipment that are standard products of manufacturers regularly engaged in the manufacture of such products, which are of a similar material, design and workmanship. Provide standard products in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year use includes applications of equipment and materials under similar circumstances and of similar size. Ensure the product has been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2 year period.

##### 1.4.2 Alternative Qualifications

Products having less than a two-year field service record are acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturer's factory or laboratory tests, can be shown.

##### 1.4.3 Service Support

Ensure the equipment items are supported by service organizations. Submit a certified list of qualified permanent service organizations for support of the equipment which includes their addresses and qualifications. Select service organizations that are reasonably convenient to the equipment installation and able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

##### 1.4.4 Manufacturer's Nameplate

Provide a nameplate on each item of equipment bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent is not acceptable.

#### 1.4.5 Modification of References

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer.

##### 1.4.5.1 Definitions

For the International Code Council (ICC) Codes referenced in the contract documents, advisory provisions are considered mandatory, the word "should" is interpreted as "shall." Reference to the "code official" is interpreted to mean the "Contracting Officer." For Navy owned property, interpret references to the "owner" to mean the "Contracting Officer." For leased facilities, references to the "owner" is interpreted to mean the "lessor." References to the "permit holder" are interpreted to mean the "Contractor."

##### 1.4.5.2 Administrative Interpretations

For ICC Codes referenced in the contract documents, the provisions of Chapter 1, "Administrator," do not apply. These administrative requirements are covered by the applicable Federal Acquisition Regulations (FAR) included in this contract and by the authority granted to the Officer in Charge of Construction to administer the construction of this project. References in the ICC Codes to sections of Chapter 1, are applied as appropriate by the Contracting Officer and as authorized by his administrative cognizance and the FAR.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

Handle, store, and protect equipment and materials to prevent damage before and during installation in accordance with the manufacturer's recommendations, and as approved by the Contracting Officer. Replace damaged or defective items.

#### 1.6 ELECTRICAL REQUIREMENTS

Furnish motors, controllers, disconnects and contactors with their respective pieces of equipment. Ensure motors, controllers, disconnects and contactors conform to and have electrical connections provided under Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Furnish internal wiring for components of packaged equipment as an integral part of the equipment. Extended voltage range motors is not permitted. Provide controllers and contactors with a maximum of 120 volt control circuits, and auxiliary contacts for use with the controls furnished. When motors and equipment furnished are larger than sizes indicated, include the cost of additional electrical service and related work under the section that specified that motor or equipment. Provide power wiring and conduit for field installed equipment under and conform to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

#### 1.7 INSTRUCTION TO GOVERNMENT PERSONNEL

When specified in other sections, furnish the services of competent instructors to give full instruction to the designated Government personnel in the adjustment, operation, and maintenance, including

pertinent safety requirements, of the specified equipment or system. Provide instructors thoroughly familiar with all parts of the installation and trained in operating theory as well as practical operation and maintenance work.

Give instruction during the first regular work week after the equipment or system has been accepted and turned over to the Government for regular operation. The number of man-days (8 hours per day) of instruction furnished is as specified in the individual section. When more than four man-days of instruction are specified, use approximately half of the time for classroom instruction. Use other time for instruction with the equipment or system.

When significant changes or modifications in the equipment or system are made under the terms of the contract, provide additional instruction to acquaint the operating personnel with the changes or modifications.

## 1.8 ACCESSIBILITY

Install all work so that parts requiring periodic inspection, operation, maintenance, and repair are readily accessible. Install concealed valves, expansion joints, controls, dampers, and equipment requiring access, in locations freely accessible through access doors.

## PART 2 PRODUCTS

### 2.1 PIPE AND FITTINGS

Submit equipment and performance data for pipe and fittings consisting of corrosion resistance, life expectancy, gage tolerances, and grade line analysis. Submit design analysis and calculations consisting of surface resistance, rates of flow, head losses, inlet and outlet design, required radius of bend, and pressure calculations. Also include in data pipe size, shape, and dimensions, as well as temperature ratings, vibration and thrust limitations minimum burst pressures, shut-off and non-shock pressures and weld characteristics.

#### 2.1.1 Type BCS, Black Carbon Steel

Ensure pipe 1/8 through 12 inches is Schedule 40 black carbon steel, conforming to ASTM A53/A53M.

Ensure pipe 1/8 through 10 inches is Schedule 40 seamless or electric-resistance welded black carbon steel, conforming to ASTM A53/A53M, Type E, Grade B (electric-resistance welded). Grade A should be used for permissible field bending, in both cases.

Ensure pipe 12 through 24 inches is 0.375-inch wall black carbon steel, conforming to ASTM A53/A53M, Type E, Grade B (electric-resistance welded).

Ensure fittings 2 inches and under are 150-pounds per square inch, gage (psig) working steam pressure (wsp) banded black malleable iron screwed, conforming to ASTM A197/A197M and ASME B16.3.

Ensure unions 2 inches and under are 250 pounds per square inch, wsp female, screwed, black malleable iron with brass-to-iron seat, and ground joint, conforming to ASME B16.39.

Ensure fittings 2-1/2 inches and over are Steel butt weld, conforming to

ASTM A234/A234M and ASME B16.9 to match pipe wall thickness.

Ensure flanges 2-1/2 inches and over are 150-pound forged-steel conforming to ASME B16.5, welding neck to match pipe wall thickness.

## 2.1.2 Type CPR, Copper

### 2.1.2.1 Type CPR-A, Copper Above Ground

Ensure tubing 2 inches and under is seamless copper tubing, conforming to ASTM B88, Type L (hard-drawn for all horizontal and all exposed vertical lines, annealed for concealed vertical lines).

Ensure fittings 2 inches and under are 150-psig wsp wrought-copper solder joint fittings conforming to ASME B16.22.

Ensure unions 2 inches and under are 150-psig wsp wrought-copper solder joint, conforming to ASME B16.22.

Provide brazing rod with Classification BCuP-5, conforming to AWS A5.8/A5.8M.

Use solder, alloy Sb-5, conforming to ASTM B32.

## 2.2 PIPING SPECIALTIES

Submit equipment and performance data for piping specialties consisting of corrosion resistance, life expectancy, gage tolerances, and grade line analysis. Submit design analysis and calculations consisting of surface resistance, rates of flow, head losses, inlet and outlet design, required radius of bend, and pressure calculations. Also include in data pipe size, shape, and dimensions, as well as temperature ratings, vibration and thrust limitations minimum burst pressures, shut-off and non-shock pressures and weld characteristics.

### 2.2.1 Air Vents

Provide manual air vents using 3/8-inch globe valves.

Provide automatic air vents on pumps, mains, and where indicated using ball-float construction. Ensure the vent inlet is not less than 3/4-inch ips and the outlet not less than 1/4-inch ips. Orifice size is 1/8 inch. Provide corrosion-resistant steel trim conforming to ASTM A276/A276M or ASTM A480/A480M. Fit vent with try-cock. Ensure vent discharges air at any pressure up to 150 psi. Ensure outlet is copper tube routed.

### 2.2.2 Dielectric Connections

Electrically isolate dissimilar pipe metals from each other by couplings, unions, or flanges commercially manufactured for that purpose and rated for the service pressure and temperature.

### 2.2.3 Expansion Vibration Isolation Joints

Construct single or multiple arch-flanged expansion vibration isolation joints of steel-ring reinforced chloroprene-impregnated cloth materials. Design joint to absorb the movement of the pipe sections in which installed with no detrimental effect on the pipe or connected equipment.

Back flanges with ferrous-metal backing rings. Provide control rod assemblies to restrict joint movement. Coat all nonmetallic exterior surfaces of the joint with chlorosulphonated polyethylene. Provide grommets in limit bolt hole to absorb noise transmitted through the bolts.

Ensure joints are suitable for continuous-duty working temperature of at least 250 degrees F.

Ensure joint, single-arch, movement limitations and size-related, pressure characteristics conform to FSA-0017.

#### 2.2.4 Hose Faucets

Construct hose faucets with 1/2 inch male inlet threads, hexagon shoulder, and 3/4 inch hose connection, conforming to ASME A112.18.1/CSA B125.1. Ensure hose-coupling screw threads conform to ASME B1.20.7.

Provide vandal proof, atmospheric-type vacuum breaker on the discharge of all potable water lines.

#### 2.2.5 Pressure Gages

Ensure pressure gages conform to ASME B40.100 and to requirements specified herein. Pressure-gage size is 3-1/2 inches nominal diameter. Ensure case is corrosion-resistant steel, conforming to any of the AISI 300 series of ASTM A6/A6M, with an ASM No. 4 standard commercial polish or better. Equip gages with adjustable red marking pointer and damper-screw adjustment in inlet connection. Align service-pressure reading at midpoint of gage range. Ensure all gages are Grade B or better and be equipped with gage isolators.

#### 2.2.6 Sight-Flow Indicators

Construct sight-flow indicators for pressure service on 3-inch ips and smaller of bronze with specially treated single- or double-glass sight windows and have a bronze, nylon, or tetrafluoroethylene rotating flow indicator mounted on an AISI Type 304 or 316 corrosion-resistant steel shaft. Body may have screwed or flanged end. Provide pressure- and temperature-rated assembly for the applied service. Flapper flow-type indicators are not acceptable.

#### 2.2.7 Sleeve Couplings

Sleeve couplings for plain-end pipe consist of one steel middle ring, two steel followers, two chloroprene or Buna-N elastomer gaskets, and the necessary steel bolts and nuts.

#### 2.2.8 Thermometers

Ensure thermometers conform to ASTM E1, except for being filled with a red organic liquid. Provide an industrial pattern armored glass thermometer, (well-threaded and seal-welded). Ensure thermometers installed 6 feet or higher above the floor have an adjustable angle body. Ensure scale is not less than 7 inches long and the case face is manufactured from manufacturer's standard polished aluminum or AISI 300 series polished corrosion-resistant steel. Thermometer range is 0 - 200. Provide thermometers with nonferrous separable wells. Provide lagging extension

to accommodate insulation thickness.

#### 2.2.9 Pump Suction Strainers

Provide a cast iron strainer body, rated for not less than 25 psig at 100 degrees F, with flanges conforming to ASME B16.1, Class 125. Strainer construction is such that there is a machined surface joint between body and basket that is normal to the centerline of the basket.

Ensure minimum ratio of open area of each basket to pipe area is 3 to 1. Provide a basket with AISI 300 series corrosion-resistant steel wire mesh with perforated backing.

Ensure mesh is capable of retaining all particles larger than 1,000 micrometer, with a pressure drop across the strainer body of not more than 0.5 psi when the basket is two-thirds dirty at maximum system flow rate. Provide reducing fittings from strainer-flange size to pipe size.

Provide a differential-pressure gage fitted with a two-way brass cock across the strainer.

Provide manual air vent cocks in cap of each strainer.

#### 2.2.10 Line Strainers, Water Service

Provide Y-type strainers with removable basket. Ensure strainers in sizes 2-inch ips and smaller have screwed ends; in sizes 2-1/2-inch ips and larger, strainers have flanged ends. Ensure body working-pressure rating exceeds maximum service pressure of installed system by at least 50 percent. Ensure body has cast-in arrows to indicate direction of flow. Ensure all strainer bodies fitted with screwed screen retainers have straight threads and gasketed with nonferrous metal. For strainer bodies 2-1/2-inches and larger, fitted with bolted-on screen retainers, provide offset blowdown holes. Fit all strainers larger than 2-1/2-inches with manufacturer's standard ball-type blowdown valve. Ensure body material is cast iron conforming to Class 30 ASTM A278/A278M. Where system material is nonferrous, use nonferrous metal for the metal strainer body material.

Ensure minimum free-hole area of strainer element is equal to not less than 3.4 times the internal area of connecting piping. Strainer screens perforation size is not to exceed 0.045-inch. Ensure strainer screens have finished ends fitted to machined screen chamber surfaces to preclude bypass flow. Strainer element material is Monel metal.

#### 2.2.11 Emergency Eyewash and Shower

ANSI/ISEA Z358.1, floor supported free standing unit with privacy curtain. Provide deluge shower head, stay-open ball valve operated by pull rod and ring or triangular handle. Provide eyewash dust caps and stay-open ball valve operated by foot treadle or push handle. Unit must deliver a minimum of 20 gpm of water at 30 psig flow pressure for 15 minutes. Eye wash unit must have a minimum of 0.4 gpm of water at 30 psig flow pressure for 15 minutes. Position eye wash nozzles 33 inches to 45 inches above finished floor. Provide copper alloy control valves. Provide an air-gap with the lowest potable eye wash water outlet located above the overflow rim by not less than the International Plumbing Code minimum. Provide a pressure-compensated tempering valve, with leaving water temperature setpoint adjustable throughout the range 60 degrees F to 95 degrees F. Provide packaged, UL listed, alarm system; including an amber

strobe lamp, horn with externally adjustable loudness and horn silencing switch, mounting hardware, and waterflow service within NEMA Type 3 or 4 enclosures.

## 2.3 VALVES

Submit equipment and performance data for valves consisting of corrosion resistance and life expectancy. Submit design analysis and calculations consisting of rates of flow, head losses, inlet and outlet design, and pressure calculations. Also include in data, pipe dimensions, as well as temperature ratings, vibration and thrust limitations, minimum burst pressures, shut-off and non-shock pressures and weld characteristics.

### 2.3.1 Ball and Butterfly Valves

Ensure ball valves conform to MSS SP-72 for flanged valves and MSS SP-110 for screwed-end valves for Figure 1B vertically split body, 1C top entry three piece body and are rated for service at not less than 175 psig at 200 degrees F. For valve bodies in sizes 2 inches and smaller, use screwed-end connection-type constructed of Class A copper alloy. For valve bodies in sizes 2-1/2 inches and larger, use flanged-end connection type, constructed of Class D, E, or F material. Balls and stems of valves 2 inches and smaller are manufacturer's standard with hard chrome plating finish. Balls and stems of valves 2-1/2 inches and larger are manufacturer's standard Class C corrosion-resistant steel alloy with hard chrome plating. Balls of valves 6 inches and larger may be Class D with 900 Brinell hard chrome plating. Ensure valves are suitable for flow from either direction and seal equally tight in either direction. Valves with ball seals held in place by spring washers are not acceptable. Ensure all valves have adjustable packing glands. Seats and seals are fabricated from tetrafluoroethylene.

Ensure butterfly valves conform to MSS SP-67 and are the lug type for mounting between specified flanges. Ensure valves are rated for 150-psig shutoff and nonshock working pressure. Select bodies of cast ferrous metal conforming to ASTM A126, Class B, and to ASME B16.1 for body wall thickness. Seats and seals are fabricated from resilient elastomer designed for field removal and replacement.

### 2.3.2 Drain, Vent, and Gage Cocks

Provide lever handle drain, vent, and gage cocks, ground key type, with washer and screw, constructed of polished ASTM B62 bronze, and rated 125-psi wsp. Ensure end connections are rated for specified service pressure.

Ensure pump vent cocks, and where spray control is required, are UL umbrella-hood type, constructed of manufacturer's standard polished brass. Ensure cocks are 1/2-inch ips male, end threaded, and rated at not less than 125 psi at 225 degrees F.

### 2.3.3 Gate Valves (GAV)

Ensure gate valves 2 inches and smaller conform to MSS SP-80. For valves located in tunnels, equipment rooms, factory-assembled equipment, and where indicated use union-ring bonnet, screwed-end type. Make packing of non-asbestos type materials. Use rising stem type valves.

Ensure gate valves 2-1/2 inches and larger, are Type I, (solid wedge disc, tapered seats, steam rated); Class 125 (125-psig steam-working pressure at 353 degrees F saturation); and 200-psig, wog (nonshock), conforming to MSS SP-70 and to requirements specified herein. Select flanged valves, with bronze trim and outside screw and yoke (OS&Y) construction. Make packing of non-asbestos type materials.

For gate valves 8-inches and larger, provide gate valve with integral 3/4-inch globe valve bypass. Bypass globe valve shall be at least the same pressure class as the main gate valve.

#### 2.3.4 Globe and Angle Valves (GLV-ANV)

Ensure globe and angle valves 2 inches and smaller, are 125-pound, 125-psi conforming to MSS SP-80 and to requirements specified herein. For valves located in tunnels, equipment rooms, factory-assembled equipment, and where indicated, use union-ring bonnet, screwed-end type. Ensure disc is free to swivel on the stem in all valve sizes. Composition seating-surface disc construction may be substituted for all metal-disc construction. Make packing of non-asbestos type materials. Ensure disk and packing are suitable for pipe service installed.

Ensure globe and angle valves, 2-1/2 inches and larger, are cast iron with bronze trim. Ensure valve bodies are cast iron conforming to ASTM A126, Class A, as specified for Class 1 valves under MSS SP-80. Select flanged valves in conformance with ASME B16.1. Valve construction is outside screw and yoke (OS&Y) type. Make packing of non-asbestos type materials.

#### 2.3.5 Standard Check Valves (SCV)

Ensure standard check valves in sizes 2 inches and smaller are 125-psi swing check valves except as otherwise specified. Provide lift checks where indicated. Ensure swing-check pins are nonferrous and suitably hard for the service. Select composition type discs. Ensure the swing-check angle of closure is manufacturer's standard unless a specific angle is needed.

Use cast iron, bronze trim, swing type check valves in sizes 2-1/2 inches and larger. Ensure valve bodies are cast iron, conforming to ASTM A126, Class A and valve ends are flanged in conformance with ASME B16.1. Swing-check pin is AISI Type or approved equal corrosion-resistant steel. Angle of closure is manufacturer's standard unless a specific angle is needed. Ensure valves have bolted and gasketed covers.

#### 2.3.6 Nonslam Check Valves (NSV)

Provide check valves at pump discharges in sizes 2 inches and larger with nonslam or silent-check operation conforming to MSS SP-125. Select a valve disc or plate that closes before line flow can reverse to eliminate slam and water-hammer due to check-valve closure. Ensure valve is Class 125 rated for 200-psi maximum, nonshock pressure at 150 degrees F in sizes to 12 inches. Use valves that are center-guided, globe-body type, fitted with flanges conforming to ASME B16.1. Valve body may be cast iron, or equivalent strength ductile iron. Select disks using manufacturer's standard bronze, aluminum bronze, or corrosion-resistant steel. Ensure pins, springs, and miscellaneous trim are manufacturer's standard

corrosion-resistant steel. Disk and shaft seals are Buna-N elastomer tetrafluoroethylene.

## 2.4 MISCELLANEOUS MATERIALS

Submit equipment and performance data for miscellaneous materials consisting of corrosion resistance, life expectancy, gage tolerances, and grade line analysis.

### 2.4.1 Bituminous Coating

Ensure the bituminous coating is a solvent cutback, heavy-bodied material to produce not less than a 12-mil dry-film thickness in one coat, and is recommended by the manufacturer to be compatible with factory-applied coating and rubber joints.

For previously coal-tar coated and uncoated ferrous surfaces underground, use bituminous coating solvent cutback coal-tar type, conforming to MIL-C-18480.

### 2.4.2 Bolting

Ensure flange and general purpose bolting is hex-head and conforms to ASTM A307, Grade B (bolts, for flanged joints in piping systems where one or both flanges are cast iron). Heavy hex-nuts conform to ASTM A563. Square-head bolts and nuts are not acceptable. Ensure threads are coarse-thread series.

### 2.4.3 Elastomer Caulk

Use two-component polysulfide- or polyurethane-base elastomer caulking material, conforming to ASTM C920.

### 2.4.4 Escutcheons

Manufacture escutcheons from nonferrous metals and chrome-plated except when AISI 300 series corrosion-resistant steel is provided. Ensure metals and finish conforms to ASME A112.19.2/CSA B45.1.

Use one-piece escutcheons where mounted on chrome-plated pipe or tubing, and one-piece of split-pattern type elsewhere. Ensure all escutcheons have provisions consisting of internal spring-tension devices or setscrews for maintaining a fixed position against a surface.

### 2.4.5 Flashing

Ensure sheetlead conforms to ASTM B749, UNS Alloy Number L50049 (intended for use in laboratories and shops in general application).

Ensure sheet copper conforms to ASTM B370 and be not less than 16 ounces per square foot weight.

### 2.4.6 Flange Gaskets

Provide compressed non-asbestos sheets, conforming to ASTM F104, coated on both sides with graphite or similar lubricant, with nitrile composition, binder rated to 750 degrees F.

#### 2.4.7 Grout

Provide shrink-resistant grout as a premixed and packaged metallic-aggregate, mortar-grouting compound conforming to ASTM C404 and ASTM C476.

Ensure shrink-resistant grout is a combination of pre-measured and packaged epoxy polyamide or amine resins and selected aggregate mortar grouting compound conforming to the following requirements:

|                      |                 |                                              |
|----------------------|-----------------|----------------------------------------------|
| Tensile strength     |                 | 1,900 psi, minimum                           |
| Compressive strength | ASTM C109/C109M | 14,000 psi, minimum                          |
| Shrinkage, linear    |                 | 0.00012 inch per inch, maximum               |
| Water absorption     | ASTM C67/C67M   | 0.1 percent, maximum                         |
| Bond strength to     |                 | 1,000 psi, minimum steel in shear<br>minimum |

#### 2.4.8 Pipe Thread Compounds

Use polytetrafluoroethylene tape not less than 2 to 3 mils thick in potable and process water and in chemical systems for pipe sizes to and including 1-inch ips. Use polytetrafluoroethylene dispersions and other suitable compounds for all other applications upon approval by the Contracting Officer; however, do not use lead-containing compounds in potable water systems.

#### 2.5 SUPPORTING ELEMENTS

Submit equipment and performance data for the supporting elements consisting of corrosion resistance, life expectancy, gage tolerances, and grade line analysis.

Provide all necessary piping systems and equipment supporting elements, including but not limited to: building structure attachments; supplementary steel; hanger rods, stanchions, and fixtures; vertical pipe attachments; horizontal pipe attachments; anchors; guides; and spring-cushion, variable, or constant supports. Ensure supporting elements are suitable for stresses imposed by systems pressures and temperatures and natural and other external forces normal to this facility without damage to supporting element system or to work being supported.

Ensure supporting elements conform to requirements of ASME B31.3, and MSS SP-58, except as noted.

Ensure attachments welded to pipe are made of materials identical to that of pipe or materials accepted as permissible raw materials by referenced code or standard specification.

Ensure supporting elements exposed to weather are hot-dip galvanized or stainless steel. Select materials of such a nature that their apparent and latent-strength characteristics are not reduced due to galvanizing process. Electroplate supporting elements in contact with copper tubing with copper.

Type designations specified herein are based on MSS SP-58. Ensure masonry

anchor group-, type-, and style-combination designations are in accordance with CID A-A-1922, CID A-A-1923, CID A-A-1924, CID A-A-1925 , CID A-A-55614, and CID A-A-55615. Provide support elements, except for supplementary steel, that are cataloged, load rated, commercially manufactured products.

#### 2.5.1 Building Structure Attachments

##### 2.5.1.1 Anchor Devices, Concrete and Masonry

Ensure anchor devices conform to CID A-A-1922, CID A-A-1923, CID A-A-1924, CID A-A-1925, CID A-A-55614, and CID A-A-55615

For cast-in, floor mounted, equipment anchor devices, provide adjustable positions.

Do not use powder-actuated anchoring devices to support any mechanical systems components.

##### 2.5.1.2 Beam Clamps

Ensure beam clamps are center-loading MSS SP-58 Type 21, 28, 29, or 30.

When it is not possible to use center-loading beam clamps, eccentric-loading beam clamps, MSS SP-58 Type 25 or 27 may be used for piping sizes 2 inches and less and for piping sizes 2 through 10 inches provided two counterbalancing clamps are used per point of pipe support. Where more than one rod is used per point of pipe support, determine rod diameter in accordance with referenced standards.

##### 2.5.1.3 Type 19 and 23 C-Clamps

Torque Type 19 and 23 C-clamps in accordance with MSS SP-58 and have both locknuts and retaining devices furnished by the manufacturer. Field fabricated C-clamp bodies or retaining devices are not acceptable.

##### 2.5.1.4 Inserts, Concrete

Use concrete MSS SP-58 Type 18 inserts. When applied to piping in sizes 2 inches ips and larger and where otherwise required by imposed loads, insert and wire a 1-foot length of 1/2-inch reinforcing rod through wing slots. Submit proprietary-type continuous inserts for approval.

#### 2.5.2 Horizontal Pipe Attachments

##### 2.5.2.1 Single Pipes

Support piping in sizes to and including 2-inch ips by MSS SP-58 Type 6 solid malleable iron pipe rings, except that, use split-band-type rings in sizes up to 1-inch ips.

Support piping in sizes through 8-inch ips inclusive by MSS SP-58 Type 1, 3 or 4 attachments.

Use MSS SP-58 Type 1 and Type 6 assemblies on vapor-sealed insulated piping and have an inside diameter larger than pipe being supported to provide adequate clearance during pipe movement.

Where thermal movement of a point in a piping system 4 inches and larger would cause a hanger rod to deflect more than 4 degrees from the vertical

or where a horizontal point movement exceeds 1/2 inch, use MSS SP-58 Type 41, 44 through 46 or 49 pipe rolls.

Support piping in sizes larger than 8-inch ips with MSS SP-58 Type 41, 44 through 46 or 49 pipe rolls.

Use MSS SP-58 Type 40 shields on all insulated piping. Ensure area of the supporting surface is such that compression deformation of insulated surfaces does not occur. Roll away longitudinal and transverse shield edges from the insulation.

Provide insulated piping without vapor barrier on roll supports with MSS SP-58 Type 39 saddles.

Provide spring supports as indicated.

#### 2.5.2.2 Parallel Pipes

Use trapeze hangers fabricated from structural steel shapes, with U-bolts, in congested areas and where multiple pipe runs occur. Ensure structural steel shapes conform to supplementary steel requirements.

#### 2.5.3 Vertical Pipe Attachments

Ensure vertical pipe attachments are MSS SP-58 Type 8.

Include complete fabrication and attachment details of any spring supports in shop drawings.

#### 2.5.4 Hanger Rods and Fixtures

Use only circular cross section rod hangers to connect building structure attachments to pipe support devices. Use pipe, straps, or bars of equivalent strength for hangers only where approved by the Contracting Officer.

Provide turnbuckles, swing eyes, and clevises as required by support system to accommodate temperature change, pipe accessibility, and adjustment for load and pitch. Rod couplings are not acceptable.

#### 2.5.5 Supplementary Steel

Where it is necessary to frame structural members between existing members or where structural members are used in lieu of commercially rated supports, design and fabricate such supplementary steel in accordance with AISC 325.

### PART 3 EXECUTION

#### 3.1 PIPE INSTALLATION

Submit certificates for pipes, valves and specialties showing conformance with test requirements as contained in the reference standards contained in this section. Provide certificates verifying Surface Resistance, Shear and Tensile Strengths, Temperature Ratings, Bending Tests, Flattening Tests and Transverse Guided Weld Bend Tests.

Provide test reports for Hydrostatic Tests, Air Tests, Valve-Operating Tests, Drainage Tests, Pneumatic Tests, Non-Destructive Electric Tests and

System Operation Tests, in compliance with referenced standards contained within this section.

Fabricate and install piping systems in accordance with ASME B31.3, MSS SP-58, and AWS WHB-2.9.

Submit Installation Drawings for pipes, valves and specialties. Drawings include the manufacturer's design and construction calculations, forces required to obtain rated axial, lateral, or angular movements, installation criteria, anchor and guide requirements for equipment, and equipment room layout and design. Ensure drawings specifically advise on procedures to be followed and provisions required to protect expansion joints during specified hydrostatic testing operations.

Ensure connections between steel piping and copper piping are electrically isolated from each other. Dielectric pipe unions shall be installed to prevent galvanic corrosion. The dielectric unions shall have metal connections on both ends. The ends shall be threaded, flanged, or brazed to match adjacent piping. The metal parts of the union shall be separated so that the electrical current is below one percent of the galvanic current which would exist upon metal-to-metal contact. Gaskets, flanges, and unions shall be installed in accordance with manufacturer's recommendations.

Make final connections to equipment with unions or flanges installed every 100 feet of straight run. Install unions in the line downstream of screwed- and welded-end valves.

Ream all pipe ends before joint connections are made.

Make screwed joints with specified joint compound with not more than three threads showing after joint is made up.

Apply joint compounds to the male thread only and exercise care to prevent compound from reaching the unthreaded interior of the pipe.

Install screwed unions, welded unions, or bolted flanges wherever required to permit convenient removal of equipment, valves, and piping accessories from the piping system for maintenance.

Securely support piping systems with due allowance for thrust forces, thermal expansion and contraction. Do not subject the system to mechanical, chemical, vibrational or other damage as specified in ASME B31.3.

Ensure field welded joints conform to the requirements of the AWS WHB-2.9, ASME B31.3, and ASME BPVC SEC IX.

Accomplish preheat and postheat treatment of welds in accordance with ASME BPVC SEC IX and ASME B31.3.

### 3.2 VALVES

Install valves in piping mains and all branches and at equipment where indicated and as specified.

Install valves to permit isolation of branch piping and each equipment

item from the balance of the system.

Install riser and downcomer drains above piping shutoff valves in piping 2-1/2 inches and larger. Tap and fit shutoff valve body with a 1/2-inch plugged globe valve.

Install valves unavoidably located in furred or other normally inaccessible places with access panels adequately sized for the location and located so that concealed items may be serviced, maintained, or replaced.

### 3.3 SUPPORTING ELEMENTS INSTALLATION

Install supporting elements in accordance with the referenced codes and standards.

Support piping from building structure. Do not support piping from roof deck or from other pipe.

Run piping parallel with the lines of the building. Space and install piping and components so that a threaded pipe fitting may be removed between adjacent pipes and so that there is no less than 1/2 inch of clear space between the finished surface and other work and between the finished surface of parallel adjacent piping. Arrange hangers on different adjacent service lines running parallel with each other in line with each other and parallel to the lines of the building.

Install piping support elements at intervals specified hereinafter, at locations not more than 3 feet from the ends of each runout, and not over 1 foot from each change in direction of piping.

Base load rating for all pipe-hanger supports on insulated weight of lines filled with water and forces imposed. Deflection per span is not exceed slope gradient of pipe. Ensure supports are in accordance with the following minimum rod size and maximum allowable hanger spacing for specified pipe. For concentrated loads such as valves, reduce the allowable span proportionately:

| <u>PIPE SIZE</u><br><u>INCHES</u> | <u>ROD SIZE</u><br><u>INCHES</u> | <u>STEEL PIPE</u><br><u>FEET</u> | <u>COPPER PIPE</u><br><u>FEET</u> |
|-----------------------------------|----------------------------------|----------------------------------|-----------------------------------|
| 1 and smaller                     | 3/8                              | 8                                | 6                                 |
| 1-1/4 to 1-1/2                    | 3/8                              | 10                               | 8                                 |
| 2                                 | 3/8                              | 10                               | 8                                 |
| 2-1/2 to 3-1/2                    | 1/2                              | 12                               | 12                                |
| 4 to 5                            | 5/8                              | 16                               | 14                                |
| 6                                 | 3/4                              | 16                               | 16                                |
| 8 to 12                           | 7/8                              | 20                               | 20                                |
| 14 to 18                          | 1                                | 20                               | 20                                |
| 20 and over                       | 1-1/4                            | 20                               | 20                                |

Install vibration isolation supports where needed. Refer to Section 23 05 48.19 SEISMIC BRACING FOR HVAC where A/C equipment and piping is installed.

Support vertical risers independently of connected horizontal piping, whenever practicable, with fixed or spring supports at the base and at intervals to accommodate system range of thermal conditions. Ensure risers have guides for lateral stability. For risers subject to expansion, install only one rigid support at a point approximately one-third down from the top. Place clamps under fittings unless otherwise specified. Support carbon-steel pipe at each floor and at not more than 15-foot intervals for pipe 2 inches and smaller and at not more than 20-foot intervals for pipe 2-1/2 inches and larger.

### 3.4 PENETRATIONS

Install effective sound stopping and adequate operating clearance to prevent structure contact where piping penetrates walls, floors, or ceilings into occupied spaces adjacent to equipment rooms; where similar penetrations occur between occupied spaces; and where penetrations occur from pipe chases into occupied spaces. Occupied spaces include space above ceilings where no special acoustic treatment of ceiling is provided. Finish penetrations to be compatible with surface being penetrated.

### 3.5 SLEEVES

Install sleeves where piping passes through roofs, masonry, concrete walls and floors.

Continuously weld sleeves passing through steel decks to the deck.

Ensure sleeves that extend through floors, roofs, load bearing walls, and fire barriers are continuous and fabricated from Schedule 40 steel pipe, with welded anchor lugs. Form all other sleeves by molded linear polyethylene liners or similar materials that are removable. Ensure diameter of sleeves is large enough to accommodate pipe, insulation, and jacketing without touching the sleeve and provides a minimum 3/8-inch clearance. Install a sleeve size to accommodate mechanical and thermal motion of pipe precluding transmission of vibration to walls and the generation of noise.

Pack the space between a pipe, bare or insulated, and the inside of a pipe sleeve or a construction surface penetration solid with a mineral fiber conforming to ASTM C553 Type V (flexible blanket), to 1,000 degrees F. Install this packing wherever the piping passes through firewalls, equipment room walls, floors, and ceilings connected to occupied spaces, and other locations where sleeves or construction-surface penetrations occur between occupied spaces. Where sleeves or construction surface penetrations occur between conditioned and unconditioned spaces, fill the space between a pipe, bare or insulated, and the inside of a pipe sleeve or construction surface penetration with an elastomer caulk to a depth of 1/2 inch. Ensure all caulked surfaces are oil- and grease-free.

Ensure through-penetration fire stop materials and methods are in accordance with ASTM E814 and UL 1479.

Caulk exterior wall sleeves watertight with lead and oakum or mechanically expandable chloroprene inserts with mastic-sealed metal components.

Ensure sleeve height above roof surface is a minimum of 12 and a maximum of 18-inches.

### 3.6 ESCUTCHEONS

Install escutcheons at all penetrations of piping into finished areas. Where finished areas are separated by partitions through which piping passes, install escutcheons on both sides of the partition. Where suspended ceilings are installed, install plates at the underside only of such ceilings. For insulated pipes, select plates large enough to fit around the insulation. Use chrome-plated escutcheons in all occupied spaces and of size sufficient to effectively conceal openings in building construction. Firmly attach escutcheons with setscrews.

### 3.7 FLASHINGS

Install flashings at penetrations of building boundaries by mechanical systems and related work.

### 3.8 OPERATION AND MAINTENANCE

Provide Operation and Maintenance Manuals consistent with manufacturer's standard brochures, schematics, printed instructions, general operating procedures and safety precautions. Submit test data that is clear and readily legible.

### 3.9 PAINTING OF NEW EQUIPMENT

Factory or shop apply new equipment painting, as specified herein, and provided under each individual section.

#### 3.9.1 Factory Painting Systems

Manufacturer's standard factory painting systems may be provided subject to certification that the factory painting system applied withstands 125 hours in a salt-spray fog test, except that equipment located outdoors withstand 500 hours in a salt-spray fog test. Conduct salt-spray fog test is in accordance with ASTM B117, and for that test the acceptance criteria is as follows: immediately after completion of the test, the inspected paint shows no signs of blistering, wrinkling, or cracking, and no loss of adhesion; and the specimen shows no signs of rust creepage beyond 0.125 inch on either side of the scratch mark.

Ensure the film thickness of the factory painting system applied on the equipment is not less than the film thickness used on the test specimen. If manufacturer's standard factory painting system is being proposed for use on surfaces subject to temperatures above 120 degrees F, design the factory painting system for the temperature service.

#### 3.9.2 Shop Painting Systems for Metal Surfaces

Clean, pretreat, prime and paint metal surfaces; except aluminum surfaces need not be painted. Apply coatings to clean dry surfaces. Clean the surfaces to remove dust, dirt, rust, oil and grease by wire brushing and solvent degreasing prior to application of paint, except clean to bare metal, surfaces subject to temperatures in excess of 120 degrees F.

Where more than one coat of paint is specified, apply the second coat after the preceding coat is thoroughly dry. Lightly sand damaged painting

and retouch before applying the succeeding coat. Selected color of finish coat is aluminum or light gray.

- a. Temperatures Less Than 120 Degrees F: Immediately after cleaning, the metal surfaces subject to temperatures less than 120 degrees F receives one coat of pretreatment primer applied to a minimum dry film thickness of 0.3 mil, one coat of primer applied to a minimum dry film thickness of one mil; and two coats of enamel applied to a minimum dry film thickness of one mil per coat.
- b. Temperatures Between 120 and 400 Degrees F: Metal surfaces subject to temperatures between 120 and 400 degrees F Receives two coats of 400 degrees F heat-resisting enamel applied to a total minimum thickness of 2 mils.
- c. Temperatures Greater Than 400 Degrees F: Metal surfaces subject to temperatures greater than 400 degrees F receives two coats of 600 degrees F heat-resisting paint applied to a total minimum dry film thickness of 2 mils.

## 1.2 SYSTEM DESCRIPTION

### 1.2.1 General Requirements

Apply the requirements for seismic protection measures described in this section and on the drawings to the mechanical equipment and mechanical systems both inside and outside of the building along with exterior utilities and systems listed below. Where there is a conflict between the specifications and the drawings, the specifications will take precedence. Accomplish resistance to lateral forces induced by earthquakes without consideration of friction resulting from gravity loads.

### 1.2.2 Mechanical Equipment

Mechanical equipment to be seismically protected must include the following items to the extent required on the drawings or in other sections of these specifications:

Equipment/Components with  $I_p = 1.0$

|                    |                                      |
|--------------------|--------------------------------------|
|                    |                                      |
|                    |                                      |
|                    | Valves and Fittings for Piping       |
|                    |                                      |
|                    |                                      |
|                    |                                      |

### 1.2.3 Mechanical Systems

Mechanical systems to be seismically protected must include the following items to the extent required on the drawings or in this or other sections of these specifications:

Mechanical systems with  $I_p = 1.0$

- a. All Piping and Ducts Inside the Building Except as Specifically Stated Below Under "Items Not Covered By This Section".
- d. All Water Supply Systems Outside of Buildings.
- f. All Process Piping Outside of Buildings.

h. Condenser Water and Refrigerant Piping Outside the Building.

m. Ductwork Outside of Buildings.

#### 1.2.4 Contractor Designed Bracing

Submit copies of the design calculations with the drawings. Calculations must be approved, certified, stamped and signed by a registered Professional Structural Engineer. Calculations must verify the capability of structural members to which bracing is attached for carrying the load from the brace. Design the bracing in accordance with UFC 3-301-01, UFC 3-301-02, UFC 4-010-01 and additional data furnished by the Contracting Officer. Resistance to lateral forces induced by earthquakes must be accomplished without consideration of friction resulting from gravity loads. UFC 3-301-01 uses parameters for the building, not for the equipment in the building; therefore, corresponding adjustments to the formulas must be required. Loadings determined using UFC 3-301-01 are based on strength design; therefore, AISC 325 Specifications must be used for the design. The bracing for the mechanical equipment designated in paragraph 1.2.2 and systems designated in paragraph 1.2.3 must be developed by the Contractor.

Provide documentation of an independent design review for mission critical (MC) equipment bracing design. Documentation must be signed by the independent reviewer who must also be a registered structural engineer.

#### 1.2.5 Items Not Covered By This Section

##### 1.2.5.1 Items Requiring No Seismic Restraints

Seismic restraints are not required for the following items:

- a. Gas piping less than 1 inch nominal pipe size.
- b. Piping in boiler and mechanical equipment rooms less than 1-1/4 inches nominal pipe size.
- c. All other piping equal to or less than 3 inches nominal pipe size.
- d. Rectangular air handling ducts less than 6 square feet in cross sectional area.
- e. Round air handling ducts less than 28 inches in diameter.
- f. Piping suspended by individual hangers 12 inches or less in length from the top of pipe to the bottom of the supporting structural member where the hanger is attached, except as noted below.
- g. Ducts suspended by hangers 12 inches or less in length from the top of the duct to the bottom of the supporting structural member, except as

noted below.

In exemptions f. and g. all hangers must meet the length requirements. If the length requirement is exceeded by one hanger in the run, brace the entire run. Seismically protect interior piping and ducts not listed above in accordance with the provisions of this specification.

Non-critical items may require seismic restraints if adjacent to critical equipment or systems that must remain operational after an earthquake and could be compromised by impact with non-critical adjacent components.

### 1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

#### SD-02 Shop Drawings

- Coupling and Bracing
- Flexible Couplings or Joints
- Equipment Restraint
- Contractor Designed Bracing; G

#### SD-03 Product Data

- Coupling and Bracing; G
- Flexible Couplings Or Joints; G
- Equipment Restraint; G
- Contractor Designed Bracing; G
- Snubbers
- Anchor Bolts
- Vibration Isolators

#### SD-05 Design Data

- Design Calculations

#### SD-06 Test Reports

- Anchor Bolts; G

## PART 2 PRODUCTS

### 2.1 GENERAL DESIGN REQUIREMENTS

Submit detailed seismic restraint drawings for mechanical equipment, duct systems, piping systems and any other mechanical systems along with

calculations, catalog cuts, templates, and erection and installation details, as appropriate, for the items listed below. Indicate thickness, type, grade, class of metal, and dimensions; and show construction details, reinforcement, anchorage, and installation with relation to the building construction. Calculations must be stamped, by a registered structural engineer, and verify the capability of structural members to which bracing is attached for carrying the load from the brace. Include drawing for Mission Critical Equipment indicating the equipment location in the facility sufficient to be used for the installation. Design must be based on actual equipment and system layout. Design must include calculated dead loads, static seismic loads and capacity of materials utilized for the connection of the equipment or system to the structure. Analysis must detail anchoring methods.

## 2.2 EQUIPMENT RESTRAINT

Equipment must be rigidly or flexibly mounted as indicated in the specifications and/or drawings depending on vibration isolation requirements as follows below.

Roof mounted equipment such as cooling towers and condensers, both vibration isolated and nonisolated, must have support members designed and anchored to building structural steel or concrete as required for seismic restraint and wind loads.

### 2.2.1 Rigidly (Base and Suspended) Mounted Equipment

HVAC equipment furnished under this contract must be rigidly mounted that are qualified for earthquake loading in accordance with ACI 355.2 and ACI 355.4. Anchor bolts must conform to ASTM F1554. For any rigid equipment which is rigidly anchored, provide flexible joints for piping, ductwork, electrical conduit, etc., that are capable of accommodating displacements equal to the full width of the joint in both orthogonal directions. Suspended equipment bracing attachments should be located just above the center of gravity to minimize swinging. Use the ratio of the overturning moment from seismic forces to the resisting moment due to gravity loads to determine if overturning forces need to be considered in the sizing of anchor bolts. Provide calculations to verify the adequacy of the anchor bolts for combined shear and overturning.

Roof mounted HVAC equipment roof curbs, framing and attachment to equipment and structure must be designed and braced to withstand seismic loads. Designated Seismic Systems (DSS) assigned to Seismic Design Category (SDC) C, D, E, or F and Risk Category IV components needed for continued operation after an earthquake must have two nuts provided on each anchor bolt.

### 2.2.2 Nonrigid or Flexibly-Mounted Equipment

Select vibration isolation devices so that the maximum movement of equipment from the static deflection point is 1/4 inch. Equipment flexibly mounted on vibration isolators must have a bumper restraint or snubber in each horizontal direction and vertical restraints must be provided where required to resist overturning. Isolator housing and restraints must be constructed of ductile materials. A viscoelastic pad or similar material of appropriate thickness must be used between the bumper and components to limit the impact load. Restraints must be designed to resist the calculated horizontal lateral and vertical forces.

Spring vibration isolators must be seismically rated, restrained isolators for equipment subject to load variations and large external forces. The seismically rated housing must be sized to meet or exceed the force requirements applicable to the project and meet the required isolation criteria. Spring vibration isolator manufacturer's will be a member of VISCMA. Design force,  $F_p$ , must be doubled for vibration isolators with an air gap greater than 0.25 inches as specified in ASCE 7-16, Chapter 13. Housed springs must not be used for seismic restraint applications because they cannot resist uplift.

## 2.3 BOLTS AND NUTS

Hex head bolts, and heavy hexagon nuts must be ASTM A325 or ASTM A490 bolts and ASTM A563 nuts. Provide bolts and nuts galvanized in accordance with ASTM A153/A153M when used underground or exposed to weather.

## 2.4 FLEXIBLE JOINTS

Flexible joints must have same pressure and temperature ratings as adjoining pipe. Braided hoses must not be used where there is torsional or axial movement unless manufacturer allows it.

### 2.4.1 Braided Hose Expansion Joint

Braided hose expansion joint(s) must be installed in the locations indicated on the drawings and as required to accommodate any thermal expansion, contraction or seismic movement of the piping system. Joints must consist of two parallel sections of corrugated metal hose, compatible braid, and 180 degree return bend with inlet and outlet connections. Field fabricated loops are not acceptable. Braided hose expansion joint(s) must be installed in the locations indicated on the drawings and as required to accommodate any thermal expansion, contraction or seismic movement of the piping system. Joints must consist of two parallel sections of corrugated metal hose, compatible braid, and 180 degree return bend with inlet and outlet connections. Field fabricated loops must not be acceptable. Braided hose in a 60 degree flexible V loop arrangement must be used for small diameter pipe connections to coils in variable-air-volume (VAV) terminal units and fan coil units installed in suspended ductwork whether braced or unbraced.

All braided hose expansion joints must be manufactured in accordance with the documented manufacturers weld procedure specifications. The procedure qualification record must be used to document the execution of this procedure and must follow the general "guidelines" of ASME Section IX. Each individual welder must conform to the in-house procedure qualification record and be qualified prior to each production lot. The testing of each individual welder must be documented in a welding procedure qualification record.

#### 2.4.1.1 Corrugated Hose

Corrugated hose must be Type 304 stainless steel. Braid must be Type 304 stainless steel for any series 300 stainless steel hose. Fittings materials of construction and end fitting type must be consistent with pipe material and equipment/ pipe connection fittings. Copper fittings must not be attached to stainless steel hose.

#### 2.4.1.2 Flexible Hose Expansion Loops

Flexible hose expansion loops must have a factory supplied, hanger / support lug located at the bottom of the 180deg return. Flexible hose expansion loop(s) must be furnished with a plugged FPT to be used for a drain or air release vent. Flexible hose expansion loop(s) must be rated with an operating pressure which is the same as the adjoining pipe. The operating pressure must be based on burst pressure with a 4 to 1 safety factor.

#### 2.4.2 Double Ball Flexible Expansion Joint

Install flexible expansion joints manufactured of ductile iron conforming to the material requirements of ASTM A536 and AWWA C153/A21.53 in the locations indicated on the drawings. Provide foundry certification of material upon request. Each flexible expansion joint must be pressure tested prior to shipment against its own restraint to a minimum of 350 psi (250 psi for flexible expansion joints 2 inch and 30 inches diameter and larger.) A minimum 2:1 safety factor, determined from the published pressure rating, must apply. Factory Mutual Approval for the 3 inch through 12 inch sizes is required. Each flexible expansion joint must consist of an expansion joint designed and cast as an integral part of a ball and socket type flexible joint, having a minimum per ball deflection of: 20°, 2" - 12"; 15°, 14" - 36"; 12°, 42"-48" and 4-inches minimum expansion. Additional expansion sleeves must be available and easily added or removed at the factory or in the field. Both standardized mechanical joint and flange end connections must be available.

##### 2.4.2.1 Internal Surfaces

Line all internal surfaces (wetted parts) with a minimum of 15 mils of fusion bonded epoxy conforming to the applicable requirements of AWWA C213. Sealing gaskets must be constructed of EPDM. The coating must meet NSF/ANSI/CAN 61.

##### 2.4.2.2 Exterior Surfaces

Coat exterior surfaces with a minimum of 6 mils of fusion bonded epoxy conforming to the applicable requirements of AWWA C116/A21.16. Include appropriately sized polyethylene sleeves, meeting AWWA C105/A21.5, for direct buried applications.

#### 2.4.3 Double Ball Flexible Expansion Joint Gravity Drain (Non-Pressurized)

Flexible expansion joints gravity drain must be installed in the locations indicated on the drawings and must be manufactured of pvc. All connections whether solvent weld or mechanical must be restrained to allow movement to be transferred to expansion joint. Each ball must allow up to 15 degrees deflection.

End connection outside diameters must be compatible with ASTM D1785, ASTM D2665 and ASTM F891 PVC pipe and are to be solvent welded.

#### 2.5 SWAY BRACING MATERIALS

Material used for members listed in this section and on the drawings, must be structural steel conforming with the following:

- a. Plates, rods, and rolled shapes, ASTM A36/A36M.

- b. Wire rope, ASTM A603 pre-stretched. Class C galv coating Ferrule clamps must be qualified by testing for use in seismic applications per VISCMA 412. A minimum of two clamps are required on each end of wire rope.
- c. Tubes, ASTM A500/A500M, Grade B.
- d. Pipes, ASTM A53/A53M, Grade B.
- e. Angles, ASTM A36/A36M.
- f. Channels (Struts) with in-turned lips and associated hardware for fastening to channels at random points conforming to MFMA-4

## 2.6 MULTIDIRECTIONAL SEISMIC SNUBBERS

Install multidirectional seismic snubbers employing elastomeric pads on floor- or slab-mounted equipment and large piping as detailed on drawings. These snubbers must provide 1/4 inch free vertical and horizontal movement from the static deflection point. Snubber medium must consist of multiple pads of cotton duct and neoprene or other suitable materials arranged around a flanged steel trunnion so both horizontal and vertical forces are resisted by the snubber medium.

## PART 3 EXECUTION

### 3.1 COUPLING AND BRACING

- a. Submit detail drawings, as specified here and throughout this specification, along with catalog cuts, templates, and erection and installation details, as appropriate, for the items listed. Submittals must be complete in detail; must indicate thickness, type, grade, class of metal, and dimensions; and must show construction details, reinforcement, anchorage, and installation with relation to the building construction.
- b. Provide coupling installation conforming to the details shown on the drawings. Provisions of this paragraph apply to all piping within a 5 foot line around outside of building unless buried in the ground. Piping grouped for support on trapeze-type hangers must be braced at the most frequent interval as determined by applying the requirements of this specification to each piping run on the common support.
- c. Size bracing components as required for the total load carried by the common supports. Bracing rigidly attached to pipe flanges, or similar, must not be used where it would interfere with thermal expansion of piping.
- d. Adjust isolators and restraints after piping systems has been filled and equipment is at its operating weight, following the manufacturer's written instructions.
- e. Install cables at a 45-degree slope. Where interference is present, the slope may be minimum of 30 degrees or a maximum of 60 degrees per VISCMA 412.

### 3.2 BUILDING DRIFT

Provide joints capable of accommodating seismic displacements for vertical piping between floors of the building, where pipes pass through a building seismic or expansion joint, or where rigidly supported pipes connect to equipment with vibration isolators. Provide horizontal piping across expansion joints to accommodate the resultant of the drifts of each building unit in each orthogonal direction. For threaded piping, provide swing joints made of the same piping material. For piping with manufactured ball joints the seismic drift must be 0.015 feet per foot of height above the base where the seismic separation occurs; this drift value must be used in place of the expansion given in the manufacturer's selection table.

### 3.3 FLEXIBLE COUPLINGS OR JOINTS

#### 3.3.1 Building Piping

Provide flexible couplings or joints in building piping at bottom of all pipe risers for pipe larger than 3-1/2 inches in diameter. Laterally brace flexible couplings or joints without interfering with the action of the flexible coupling or joint. Cast iron waste and vent piping need only comply with these provisions when caulked joints are used. Flexible bell and spigot pipe joints using rubber gaskets may be used at each branch adjacent to tees and elbows for underground waste piping inside of building to satisfy these requirements.

### 3.4 PIPE SLEEVES

Size pipe sleeves in interior non-fire rated walls as indicated on the drawings to provide clearances that will permit differential movement of piping without the piping striking the pipe sleeve. Pipe sleeves in fire rated walls must conform to the requirements in Section 07 84 00 FIRESTOPPING.

### 3.5 SPREADERS

Provide spreaders between adjacent piping runs to prevent contact during seismic activity whenever pipe or insulated pipe surfaces are less than 4 inches apart. Apply spreaders at same interval as sway braces at an equal distance between the sway braces. If rack type hangers are used where the pipes are restrained from contact by mounting to the rack, spreaders are not required for pipes mounted in the rack. Apply spreaders to surface of bare pipe and over insulation on insulated pipes utilizing high-density inserts and pipe protection shields in accordance with the requirements of Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

### 3.6 SWAY BRACES FOR PIPING

Provide sway braces to prevent movement of the pipes under seismic loading. Provide braces in both the longitudinal and transverse directions, relative to the axis of the pipe. Provide sufficient braces for equipment to resist a horizontal force as specified in UFC 3-301-01, and UFC 3-301-02 without exceeding safe working stress of bracing components. Provide bracing that does not interfere with thermal expansion requirements for the pipes as described in other sections of these specifications. For seismic analysis of horizontal pipes, the equivalent static force should be considered to act concurrently with the full dead load of the pipe, including contents.

### 3.6.1 Transverse Sway Bracing

Provide transverse sway bracing for steel and copper pipe at intervals not to exceed those shown on the drawings. All runs (length of pipe between end joints) must have a minimum of transverse bracing at each end.

### 3.6.2 Longitudinal Sway Bracing

Provide longitudinal sway bracing at 40 foot intervals unless otherwise indicated. All runs (length of pipe between end joints) must have one longitudinal brace minimum. Construct sway braces in accordance with the drawings. Do not use branch lines, walls, or floors as sway braces.

### 3.6.3 Vertical Runs

Run is defined as length of pipe between end joints. Do not brace vertical runs of piping no more than 10 foot vertical intervals. Braces for vertical runs must be above the center of gravity of the segment being braced. Flexible couplings should be provided at the bottoms of risers for pipes larger than 3.5 in. (89 mm) in diameter. Flexible couplings and expansion joints should be braced laterally and longitudinally unless such bracing would interfere with the action of the couplings or joints. When pipes enter buildings, flexible couplings should be provided to allow for relative movement between the soil and building. Construct all sway braces in accordance with the drawings. Attach sway braces to the structural system. Do not connect to branch lines, walls, or floors.

### 3.6.4 Clamps and Hangers

Apply clamps or hangers on uninsulated pipes directly to pipe. Insulated piping must have clamps or hangers applied over insulation in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

Hanger rod stiffener angle or strut bracing must be securely attached by a series of attachment clamps manufactured from a one piece metal stamping and must include all require attachment hardware and locking nuts. Attachment clamps made from aluminum or cast iron must not be used in seismic applications. Do not weld vertical braces to hanger rods.

## 3.7 SWAY BRACES FOR DUCTS

### 3.7.1 Braced Ducts

Provide bracing details and spacing for rectangular and round ducts in accordance with SMACNA 1981. However, the design seismic loadings for these items must not be less than loadings obtained using the procedures in UFC 3-301-01, and UFC 3-301-02. Bracing must not attach to duct joints. Use shortest screws possible when penetrating ductwork to minimize airflow noise inside duct.

### 3.7.2 Unbraced Ducts

Attach hangers for unbraced ducts to the duct within 2 inches of the top of the duct with a minimum of two #10 sheet metal screws in accordance with FEMA P-414. Use shortest screws possible when penetrating ductwork to minimize airflow noise inside duct. Install unbraced ducts with a 6 inch minimum clearance to vertical ceiling hanger wires.

### 3.8 EQUIPMENT

#### 3.8.1 General

Ensure housekeeping pads have adequate space to mount equipment and seismic restraint devices allowing adequate edge distance and embedment depth for restraint anchor bolts. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength. Install neoprene grommet washers or fill the gap with epoxy on equipment anchor bolts where clearance between anchor and equipment support hole exceeds 0.125 inches.

#### 3.8.2 Controls

Ensure that controls for critical equipment that must remain operational after an earthquake are certified per paragraph 3.11 SPECIAL TESTING FOR SEISMIC-RESISTING EQUIPMENT and are served by emergency power as required.

### 3.9 ANCHOR BOLTS

#### 3.9.1 Cast-in-Place Anchor Bolts

Use templates to locate cast-in-place bolts accurately and securely in formwork. Anchor bolts must have an embedded straight length equal to at least 12 times nominal diameter of the bolt. Anchor bolts that exceed the normal depth of equipment foundation piers or pads must either extend into concrete floor or the foundation or be increased in depth to accommodate bolt lengths.

#### 3.9.2 Drilled-In Anchor Bolts

Drill holes with rotary impact hammer drills. Drill bits must be of diameters as specified by the anchor manufacturer. Unless otherwise shown on the Drawings, all holes must be drilled perpendicular to the concrete surface. Where anchors are permitted to be installed in cored holes, use core bits with matched tolerances as specified by the manufacturer. Properly clean cored hole per manufacturer's instructions. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Exercise care in coring or drilling to avoid damaging existing reinforcing or embedded items. Notify the COR if reinforcing steel or other embedded items are encountered during drilling. Take precautions as necessary to avoid damaging prestressing tendons, electrical and telecommunications conduit, and gas lines. Unless otherwise specified, do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength. Perform anchor installation in accordance with manufacturer instructions.

##### 3.9.2.1 Wedge Anchors, Heavy-Duty Sleeve Anchors, and Undercut Anchors

Protect threads from damage during anchor installation. Heavy-duty sleeve anchors must be installed with sleeve fully engaged in part to be fastened. Set anchors to manufacturer's recommended torque, using a torque wrench. Following attainment of 10% of the specified torque, 100% of the specified torque must be reached within 7 or fewer complete turns of the nut. If the specified torque is not achieved within the required number of turns, the anchor must be removed and replaced unless otherwise directed by the Engineer.

### 3.9.2.2 Cartridge Injection Adhesive Anchors

Where approved for seismic application, clean all holes per manufacturer instructions to remove loose material and drilling dust prior to installation of adhesive. Inject adhesive into holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive. Follow manufacturer recommendations to ensure proper mixing of adhesive components. Sufficient adhesive must be injected in the hole to ensure that the annular gap is filled to the surface. Remove excess adhesive from the surface. Shim anchors with suitable device to center the anchor in the hole. Do not disturb or load anchors before manufacturer specified cure time has elapsed.

### 3.9.2.3 Capsule Anchors

Where approved for seismic application, perform drilling and setting operations in accordance with manufacturer instructions. Clean all holes to remove loose material and drilling dust prior to installation of adhesive. Remove water from drilled holes in such a manner as to achieve a surface dry condition. Capsule anchors must be installed with equipment conforming to manufacturer recommendations. Do not disturb or load anchors before manufacturer specified cure time has elapsed.

Observe manufacturer recommendations with respect to installation temperatures for cartridge injection adhesive anchors and capsule anchors.

## 3.10 ANCHOR BOLT TESTING

Test in place expansion and chemically bonded anchors not more than 24 hours after installation of the anchor, conducted by an independent testing agency; testing must be performed on random anchor bolts as described below.

### 3.10.1 Torque Wrench Testing

Perform torque wrench testing on not less than 50 percent of the total installed applied torque expansion anchors and at least one anchor for every piece of equipment containing more than two anchors. The test torque must equal the minimum required installation torque as required by the bolt manufacturer. Calibrate torque wrenches at the beginning of each day the torque tests are performed. Recalibrate torque wrenches for each bolt diameter whenever tests are run on bolts of various diameters. Apply torque between 20 and 100 percent of wrench capacity. Reach the test torque within one half turn of the nut, except for 3/8 inch sleeve anchors which must reach their torque by one quarter turn of the nut. If any anchor fails the test, test similar anchors not previously tested until 20 consecutive anchors pass. Failed anchors must be retightened and retested to the specified torque; if the anchor still fails the test it must be replaced.

### 3.10.2 Pullout Testing

Test expansion and chemically bonded anchors by applying a pullout load using a hydraulic ram attached to the anchor bolt. Testing must be in accordance with ASTM E488/E488M or ICC ES AC193. At least 10 percent of each type and size of anchors, but not less than 3 per day must be tested. Apply the load to the anchor without removing the nut; when that is not possible, the nut must be removed and a threaded coupler must be

installed of the same tightness as the original nut. Check the test setup to verify that the anchor is not restrained from withdrawing by the baseplate, the test fixture, or any other fixtures. The support for the testing apparatus must be at least 1.5 times the embedment length away from the bolt being tested. Load each tested anchor to 1 times the design tension value for the anchor. The anchor must have no observable movement at the test load. If any anchor fails the test, similar type and size anchors not previously tested must be tested until 10 percent of those type consecutive anchors pass. Remove and replace failed anchors. Fill empty anchor holes and patch failed anchor locations with high-strength non-shrink, nonmetallic grout.

### 3.11 SPECIAL TESTING FOR SEISMIC-RESISTING EQUIPMENT

Equipment and components (including controls) designated as Designated Seismic Systems required to remain operational after an earthquake will be seismic qualified by shake table testing conforming to ICC ES AC156 procedures. The manufacturer is to provide a certification by a fully qualified testing agency for the specific equipment and/or components. Prequalified certifications are acceptable unless noted otherwise. Seismic component qualification documentation for each piece of equipment must contain the information required in UFC 3-301-02, Section 2-17.2.5 Component Qualification Documentation.

Mechanical components that are required to be certified must bear permanent marking or nameplates constructed of a durable heat and water resistant material. Nameplates must be mechanically attached to such nonstructural components and placed on each component for clear identification. The nameplate must not be less than 5 inches x 7 inches with red letters 1 inch in height on a white background stating "Certified Equipment." The following statement must be on the nameplate: "This equipment/component is certified. No modifications are allowed unless authorized in advance and documented in the Equipment Certification Documentation file." The nameplate must also contain the component identification number in accordance with the drawings/specifications and the O&M manuals.

### 3.12 SPECIAL INSPECTION FOR SEISMIC-RESISTING SYSTEMS AND EQUIPMENT

Perform special inspections for seismic-resisting mechanical systems, equipment and components designated mechanical seismic systems and equipment per ICC IBC 1705.12.4; and plumbing and mechanical components per ICC IBC 1705.12.6. Periodic special inspections will be conducted on mechanical equipment as required by Section 1705.12 of the International Building Code and paragraph 2-5.4 of UFC 3-301-01. Provide a Statement of Special Inspections and Final Report in accordance with paragraph 2-2.4.3 of UFC 3-301-01.

1.2 DEFINITIONS

- a. AABC: Associated Air Balance Council
- b. COTR: Contracting Officer's Technical Representative

- e. HVAC: Heating, ventilating, and air conditioning; or heating, ventilating, and cooling
- f. NEBB: National Environmental Balancing Bureau
- g. Out-of-tolerance data: Pertains only to field acceptance testing of Final TAB report. When applied to TAB work this phase means "a measurement taken during TAB field acceptance testing which does not fall within the range of plus 5 to minus 5 percent of the original measurement reported on the TAB Report for a specific parameter."
- h. Season of maximum heating load: The time of year when the outdoor temperature at the project site remains within plus or minus 30 degrees Fahrenheit of the project site's winter outdoor design temperature, throughout the period of TAB data recording.
- i. Season of maximum cooling load: The time of year when the outdoor temperature at the project site remains within plus or minus 5 degrees Fahrenheit of the project site's summer outdoor design temperature, throughout the period of TAB data recording.
- j. Season 1, Season 2: Depending upon when the project HVAC is completed and ready for TAB, Season 1 is defined, thereby defining Season 2. Season 1 could be the season of maximum heating load, or the season of maximum cooling load.
- k. Sound measurements terminology: Defined in AABC MN-1, NEBB MASV, or SMACNA 1858 (TABB).
- l. TAB: Testing, adjusting, and balancing (of HVAC systems)
- m. TAB'd: HVAC Testing/Adjusting/Balancing procedures performed
- n. TAB Agency: TAB Firm
- o. TAB team field leader: TAB team field leader
- p. TAB team supervisor: TAB team engineer
- q. TAB team technicians: TAB team assistants
- r. TABB: Testing Adjusting and Balancing Bureau

#### 1.2.1 Similar Terms

In some instances, terminology differs between the Contract and the TAB Standard primarily because the intent of this Section is to use the industry standards specified, along with additional requirements listed herein to produce optimal results.

The following table of similar terms is provided for clarification only. Contract requirements take precedent over the corresponding AABC, NEBB, or TABB requirements where differences exist.

| SIMILAR TERMS           |                                                                                                 |                                                                                    |                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Contract Term           | AABC Term                                                                                       | NEBB Term                                                                          | TABB Term                                                 |
| TAB Standard            | National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems | Procedural Standards for Testing, Adjusting and Balancing of Environmental Systems | International Standards for Environmental Systems Balance |
| TAB Specialist          | TAB Engineer                                                                                    | TAB Supervisor                                                                     | TAB Supervisor                                            |
| Systems Readiness Check | Construction Phase Inspection                                                                   | Field Readiness Check & Preliminary Field Procedures                               | Field Readiness Check & Prelim. Field Procedures          |

### 1.3 WORK DESCRIPTION

The work includes testing, adjusting, and balancing (TAB) of new heating, ventilating, and cooling (HVAC) air and water distribution systems including equipment and performance data, ducts, and piping which are located within, on, under, between, and adjacent to buildings

Perform TAB in accordance with the requirements of the TAB procedural standard recommended by the TAB trade association that approved the TAB Firm's qualifications. Comply with requirements of AABC MN-1, NEBB PROCEDURAL STANDARDS, or SMACNA 1780 (TABB) as supplemented and modified by this specification section. All recommendations and suggested practices contained in the TAB procedural standards are considered mandatory.

Conduct TAB of the indicated existing systems and equipment and submit the specified TAB reports for approval. Conduct TAB work in accordance with the requirements of this section.

#### 1.3.1 Air Distribution Systems

Test, adjust, and balance systems (TAB) in compliance with this section. Obtain Contracting Officer's written approval before applying insulation to exterior of air distribution systems as specified under Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

#### 1.3.2 Water Distribution Systems

TAB systems in compliance with this section. Obtain Contracting Officer's written approval before applying insulation to water distribution systems as specified under Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. At Contractor's option and with Contracting Officer's written approval, the piping systems may be insulated before systems are TAB'd.

Terminate piping insulation immediately adjacent to each flow control valve, automatic control valve, or device. Seal the ends of pipe insulation and the space between ends of pipe insulation and piping, with waterproof vapor barrier coating.

After completion of work under this section, insulate the flow control valves and devices as specified under Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

#### 1.3.3 TAB SCHEMATIC DRAWINGS

Show the following information on TAB Schematic Drawings:

1. A unique number or mark for each piece of equipment or terminal.
2. Air quantities at air terminals.
3. Air quantities and temperatures in air handling unit schedules.
4. Water quantities and temperatures in thermal energy transfer equipment schedules.
5. Water quantities and heads in pump schedules.
6. Water flow measurement fittings and balancing fittings.
7. Ductwork Construction and Leakage Testing Table that defines the DALT test requirements, including each applicable HVAC duct system ID or mark, duct pressure class, duct seal class, and duct leakage test pressure. This table is included in the file for Graphics for Unified Facilities Guide Specifications:  
<http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-gra>

The Testing, Adjusting, and Balancing (TAB) Specialist must review the Contract Plans and Specifications and advise the Contracting Officer of any deficiencies that would prevent the effective and accurate TAB of the system, including records of existing conditions, and systems readiness check. The TAB Specialist must provide a Design Review Report individually listing each deficiency and the corresponding proposed corrective action necessary for proper system operation.

Submit three copies of the TAB Schematic Drawings and Report Forms to the Contracting Officer, no later than 21 days prior to the start of TAB field measurements.

#### 1.3.4 Related Requirements

Requirements for construction scheduling related to HVAC TAB work are specified in Section 01 32 17.00 20 COST LOADED NETWORK ANALYSIS SCHEDULES (NAS).

#### 1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Records of Existing Conditions; G

Independent TAB Agency and Personnel Qualifications; G

TAB Design Review Report; G

SD-02 Shop Drawings

TAB Schematic Drawings and Report Forms; G

SD-03 Product Data

Equipment and Performance Data; G

TAB Related HVAC Submittals; G

A list of the TAB Related HVAC Submittals, no later than 7 days after the approval of the TAB team engineer .

SD-06 Test Reports

Prerequisite HVAC Work Checkout List For Proportional Balancing; G

Certified Final TAB Report for Proportional Balancing; G

Prerequisite HVAC Work Checkout List For Season 1; G

Certified Final TAB Report for Season 1; G

Prerequisite HVAC Work Checkout List For Season 2; G

Certified Final TAB Report for Season 2; G

SD-07 Certificates

Independent TAB Agency and Personnel Qualifications; G

TAB Submittal and Work Schedule; G

TAB Pre-Field Engineering Report; G

Instrument Calibration Certificates; G

TAB Procedures Summary; G

Advance Notice of TAB Field Work for Proportional Balancing; G

Advance Notice of TAB Field Work for Season 1; G

Advance Notice of TAB Field Work for Season 2 G

## 1.5 QUALITY ASSURANCE

### 1.5.1 Independent TAB Agency and Personnel Qualifications

To secure approval for the proposed agency, submit information certifying that the TAB agency is a first tier subcontractor who is not affiliated with any other company participating in work on this contract, including design, furnishing equipment, or construction. Further, submit the following, for the agency, to Contracting Officer for approval:

a. Independent AABC or NEBB or TABB TAB agency:

TAB agency: AABC registration number and expiration date of current certification; or NEBB certification number and expiration date of current certification; or TABB certification number and expiration date of current certification.

TAB team supervisor: Name and copy of AABC or NEBB or TABB TAB supervisor certificate and expiration date of current certification.

TAB team field leader: Name and documented evidence that the team field leader has satisfactorily performed full-time supervision of TAB work in the field for not less than 3 years immediately preceding this contract's bid opening date.

TAB team field technicians: Names and documented evidence that each field technician has satisfactorily assisted a TAB team field leader in performance of TAB work in the field for not less than one year immediately preceding this contract's bid opening date.

Current certificates: Registrations and certifications are current, and valid for the duration of this contract. Renew Certifications which expire prior to completion of the TAB work, in a timely manner so that there is no lapse in registration or certification. TAB agency or TAB team personnel without a current registration or current certification are not to perform TAB work on this contract.

b. TAB Team Members: TAB team approved to accomplish work on this contract are full-time employees of the TAB agency. No other personnel is allowed to do TAB work on this contract.

c. Replacement of TAB team members: Replacement of members may occur if each new member complies with the applicable personnel qualifications and each is approved by the Contracting Officer.

#### 1.5.1.1 TAB Standard

Perform TAB in accordance with the requirements of the standard under which the TAB Firm's qualifications are approved, i.e., AABC MN-1, NEBB PROCEDURAL STANDARDS, or SMACNA 1780 unless otherwise specified herein. All recommendations and suggested practices contained in the TAB Standard are considered mandatory. Use the provisions of the TAB Standard, including checklists, report forms, etc., as nearly as practical, to satisfy the Contract requirements. Use the TAB Standard for all aspects of TAB, including qualifications for the TAB Firm and Specialist and calibration of TAB instruments. Where the instrument manufacturer calibration recommendations are more stringent than those

listed in the TAB Standard, adhere to the manufacturer's recommendations.

All quality assurance provisions of the TAB Standard such as performance guarantees are part of this contract. For systems or system components not covered in the TAB Standard, TAB procedures must be developed by the TAB Specialist. Where new procedures, requirements, etc., applicable to the Contract requirements have been published or adopted by the body responsible for the TAB Standard used (AABC, NEBB, or TABB), the requirements and recommendations contained in these procedures and requirements are considered mandatory, including the latest requirements of ASHRAE 62.1.

#### 1.5.1.2 Qualifications

##### a. TAB Firm

The TAB Firm must be either a member of AABC or certified by the NEBB or the TABB and certified in all categories and functions where measurements or performance are specified on the plans and specifications, including TAB of environmental systems.

Certification must be maintained for the entire duration of duties specified herein. If, for any reason, the firm loses subject certification during this period, the Contractor must immediately notify the Contracting Officer and submit another TAB Firm for approval. Any firm that has been the subject of disciplinary action by either the AABC, the NEBB, or the TABB within the five years preceding Contract Award is not be eligible to perform any duties related to the HVAC systems, including TAB. All work specified in this Section and in other related Sections to be performed by the TAB Firm will be considered invalid if the TAB Firm loses its certification prior to Contract completion and must be performed by an approved successor.

These TAB services are to assist the prime Contractor in performing the quality oversight for which it is responsible. The TAB Firm must be a prime subcontractor of the Contractor and be financially and corporately independent of the mechanical subcontractor, reporting directly to and paid by the Contractor.

##### b. TAB Specialist

The TAB Specialist must be either a member of AABC, an experienced technician of the Firm certified by the NEBB, or a Supervisor certified by the TABB. The certification must be maintained for the entire duration of duties specified herein. If, for any reason, the Specialist loses subject certification during this period, immediately notify the Contracting Officer and submit another TAB Specialist for approval. Any individual that has been the subject of disciplinary action by either the AABC, the NEBB, or the TABB within the five years preceding Contract Award is not eligible to perform any duties related to the HVAC systems, including TAB. All work specified in this Section and in other related Sections performed by the TAB Specialist will be considered invalid if the TAB Specialist loses its certification prior to Contract completion and must be performed by the approved successor.

##### c. TAB Specialist Responsibilities

TAB Specialist responsibilities include all TAB work specified herein and in related sections under his direct guidance. The TAB specialist is required to be onsite on a daily basis to direct TAB efforts. The TAB Specialist must participate in the commissioning process.

#### 1.5.1.3 TAB Related HVAC Submittals

The TAB Specialist must prepare a list of the submittals from the Contract Submittal Register that relate to the successful accomplishment of all HVAC TAB. Accompany the submittals identified on this list with a letter of approval signed and dated by the TAB Specialist when submitted to the Government. Ensure that the location and details of ports, terminals, connections, etc., necessary to perform TAB are identified on the submittals.

#### 1.5.2 Responsibilities

The Contractor is responsible for ensuring compliance with the requirements of this section. The following delineation of specific work responsibilities is specified to facilitate TAB execution of the various work efforts by personnel from separate organizations. This breakdown of specific duties is specified to facilitate adherence to the schedule listed in the paragraph TAB SUBMITTAL AND WORK SCHEDULE.

##### 1.5.2.1 Contractor

- a. TAB personnel: Ensure that the DALT work and the TAB work is accomplished by a group meeting the requirements specified in the paragraph TAB PERSONNEL QUALIFICATION REQUIREMENTS.
- b. Pre-TAB meeting: Attend the meeting with the TAB Supervisor, and ensure that a representative is present for the sheetmetal contractor, mechanical contractor, electrical contractor, and automatic temperature controls contractor.
- c. HVAC documentation: Furnish one complete set of the following HVAC-related documentation to the TAB agency:
  - (1) Contract drawings and specifications
  - (2) Approved submittal data for equipment
  - (3) Construction work schedule
  - (4) Up-to-date revisions and change orders for the previously listed items
- d. Submittal and work schedules: Ensure that the schedule for submittals and work required by this section and specified in the paragraph TAB SUBMITTAL AND WORK SCHEDULE is met.
- e. Coordination of supporting personnel:

Provide the technical personnel, such as factory representatives or HVAC controls installer required by the TAB field team to support the DALT and the TAB field measurement work.

Provide equipment mechanics to operate HVAC equipment and ductwork mechanics to provide the field designated test ports to enable TAB

field team to accomplish the TAB field measurement work. Ensure these support personnel are present at the times required by the TAB team, and cause no delay in the TAB field work.

Conversely, ensure that the HVAC controls installer has required support from the TAB team field leader to complete the controls check out.

- f. Deficiencies: Ensure that the TAB Agency supervisor submits all Design/Construction deficiency notifications directly to the Contracting officer within 3 days after the deficiency is encountered. Further, ensure that all such notification submittals are complete with explanation, including documentation, detailing deficiencies.
- g. Prerequisite HVAC work: Complete check out and debugging of HVAC equipment, ducts, and controls prior to the TAB engineer arriving at the project site to begin the TAB work. Debugging includes searching for and eliminating malfunctioning elements in the HVAC system installations, and verifying all adjustable devices are functioning as designed. Include as prerequisite work items, the deficiencies pointed out by the TAB team supervisor in the design review report.
- h. Prior to the TAB field team's arrival, ensure completion of the applicable inspections and work items listed in the TAB team supervisor's pre-field engineering report. Do not allow the TAB team to commence TAB field work until all of the following are completed.
  - (1) HVAC system installations are fully complete.
  - (2) HVAC prerequisite checkout work lists specified in the paragraph PRE-FIELD TAB ENGINEERING REPORT are completed, submitted, and approved. Ensure that the TAB Agency gets a copy of the approved prerequisite HVAC work checklist.
  - (4) HVAC system filters are clean for both Season 1 and Season 2 TAB field work.
- i. Advance notice: Furnish to the Contracting Officer with advance written notice for the commencement of the TAB field work.
- j. Insulation work: Ensure that openings in duct and machinery insulation coverings for TAB test ports are marked, closed and sealed.

#### 1.5.2.2 TAB Agency

Provide the services of a TAB team which complies with the requirements of the paragraph INDEPENDENT TAB AGENCY PERSONNEL QUALIFICATIONS. The work to be performed by the TAB agency is limited to testing, adjusting, and balancing of HVAC air and water systems to satisfy the requirements of this specification section.

#### 1.5.2.3 TAB Team Supervisor

- a. Overall management: Supervise and manage the overall TAB team work effort, including preliminary and technical TAB procedures and TAB team field work.

- b. Pre-TAB meeting: Attend meeting with Contractor.
- c. Design review report: Review project specifications and accompanying drawings to verify that the air systems and water systems are designed in such a way that the TAB engineer can accomplish the work in compliance with the requirements of this section. Verify the presence and location of permanently installed test ports and other devices needed, including gauge cocks, thermometer wells, flow control devices, circuit setters, balancing valves, and manual volume dampers.
- d. Support required: Specify the technical support personnel required from the Contractor other than the TAB agency; such as factory representatives for temperature controls or for complex equipment. Inform the Contractor in writing of the support personnel needed and when they are needed. Furnish the notice as soon as the need is anticipated, either with the design review report, or the pre-field engineering report, the during the DALT or TAB field work.
- f. Pre-field engineering report: Utilizing the following HVAC-related documentation; contract drawings and specifications, approved submittal data for equipment, up-to-date revisions and change orders; prepare this report.
- g. Prerequisite HVAC work checklist: Ensure the Contractor gets a copy of this checklist at the same time as the pre-field engineering report is submitted.
- j. Technical Assistance for TAB Work: Provide immediate technical assistance to the TAB field team for the TAB work.
  - (1) TAB field visit: Near the end of the TAB field work effort, visit the contract site to inspect the HVAC installation and the progress of the TAB field work. Conduct site visit full-time for a minimum of one 8 hour workday duration. Review the TAB final report data and certify the TAB final report.
- k. Certified TAB report: Certify the TAB report. This certification includes the following work:
  - (1) Review: Review the TAB field data report. From this field report, prepare the certified TAB report.
  - (2) Verification: Verify adherence, by the TAB field team, to the TAB plan prescribed by the pre-field engineering report and verify adherence to the procedures specified in this section.
- l. Design/Construction deficiencies: Within 3 working days after the TAB Agency has encountered any design or construction deficiencies, the TAB Supervisor must submit written notification directly to the Contracting Officer, with a separate copy to the Contractor, of all such deficiencies. Provide in this submittal a complete explanation,

including supporting documentation, detailing deficiencies. Where deficiencies are encountered that are believed to adversely impact successful completion of TAB, the TAB Agency must issue notice and request direction in the notification submittal.

- m. TAB Field Check: The TAB team supervisor must attend and supervise Season 1 and Season 2 TAB field check.

#### 1.5.2.4 TAB Team Field Leader

- a. Field manager: Manage, in the field, the accomplishment of the work specified in Part 3, EXECUTION.
- b. Full time: Be present at the contract site when TAB field work is being performed by the TAB team; ensure day-to-day TAB team work accomplishments are in compliance with this section.
- c. Prerequisite HVAC work: Do not bring the TAB team to the contract site until a copy of the prerequisite HVAC Checklist, with all work items certified by the Contractor to be working as designed, reaches the office of the TAB Agency.

#### 1.5.3 Sequencing and Scheduling

##### 1.5.3.1 Projects with Phased Construction

This specification section is structured as though the HVAC construction, and thereby the TAB work, will be completed in a single phase. When the construction is completed in phases, the DALT work and TAB work must be planned, completed, and accepted for each construction phase.

##### a. Phasing of Work

This specification section is structured as though the HVAC construction, and thereby the TAB work, is going to be completed in a single phase in spite of the fact that there will be two seasons. All elements of the TAB work are addressed on this premise. When a contract is to be completed in construction phases, including the TAB work, and the DALT work, the TAB work and DALT work must be planned for, completed and approved by the Contracting Officer with each phase. An example of this case would be one contract that requires the rehabilitation of the HVAC in each of several separated buildings. At the completion of the final phase, compile all approved reports and submit as one document.

##### 1.5.3.2 TAB Submittal and Work Schedule

Comply with additional requirements specified in Appendix C: TAB SUBMITTAL AND WORK SCHEDULE included at the end of this section.

Submit this schedule, and TAB Schematic Drawings, adapted for this particular contract, to the Contracting Officer (CO) for review and approval. Include with the submittal the planned calendar dates for each submittal or work item. Resubmit an updated version for CO approval every 90 calendar days. Compliance with the following schedule is the Contractor's responsibility.

Qualify TAB Personnel: Within 45 calendar days after date of contract award, submit TAB agency and personnel qualifications.

Pre-TAB Meeting: Within 30 calendar days after the date of approval of the TAB agency and personnel, meet with the COTR.

Design Review Report: Within 60 calendar days after the date of the TAB agency personnel qualifications approval, submit design review report.

Pre-Field TAB Engineering Report: Within 15 calendar days after approval of the TAB agency Personnel Qualifications, submit the Pre-Field TAB Engineering Report.

Prerequisite HVAC Work Check Out List For Season 1 and Advanced Notice For Season 1 TAB Field Work: At a minimum of 115 calendar days prior to CCD, submit Season 1 prerequisite HVAC work check out list certified as complete, and submit advance notice of commencement of Season 1 TAB field work.

Season 1 TAB Field Work: At a minimum of 90 calendar days prior to CCD, and when the ambient temperature is within Season 1 limits, accomplish Season 1 TAB field work; submit Season 1 TAB report; and conduct Season 1 field check.

Complete Season 1 TAB Work: Prior to CCD, complete all TAB work except Season 2 TAB work.

Prerequisite HVAC Work Check Out List For Season 2 and Advanced Notice For Season 2 TAB Field Work: Within 150 calendar days after date of the commencement of the Season 1 TAB field work, submit the Season 2 prerequisite HVAC work check out list certified as complete and submit advance notice of commencement of Season 2 TAB field work.

Season 2 TAB Field Work: Within 180 calendar days after date of commencement of the Season 1 TAB field work and when the ambient temperature is within Season 2 limits, accomplish Season 2 TAB field work; submit Season 2 TAB report; and conduct Season 2 field check.

Complete Season 2 TAB Work: Within 15 calendar days after the completion of Season 2 field data check, complete TAB work.

a. TAB Design Review Report

Submit typed report describing omissions and deficiencies in the HVAC system's design that would preclude the TAB team from accomplishing the duct leakage testing work and the TAB work requirements of this

section. Provide a complete explanation including supporting documentation detailing the design deficiency. State that no deficiencies are evident if that is the case.

#### 1.5.3.3 TAB Pre-Field Engineering Report

Submit report containing the following information:

a. Step-by-step TAB procedure:

- (1) Strategy: Describe the method of approach to the TAB field work from start to finish. Include in this description a complete methodology for accomplishing each seasonal TAB field work session.
- (2) Air System Diagrams: Use the contract drawings and duct fabrication drawings if available to provide air system diagrams in the report showing the location of all terminal outlet supply, return, exhaust and transfer registers, grilles and diffusers. Use a key numbering system on the diagrams which identifies each outlet contained in the outlet airflow report sheets. Show intended locations of all traverses and static pressure readings.
- (3) Procedural steps: Delineate fully the intended procedural steps to be taken by the TAB field team to accomplish the required TAB work of each air distribution system and each water distribution system. Include intended procedural steps for TAB work for subsystems and system components.

b. Pre-field data: Submit AABC or NEBB or SMACNA 1780 data report forms with the following pre-field information filled in:

- (1) Design data obtained from system drawings, specifications, and approved submittals.
- (2) Notations detailing additional data to be obtained from the contract site by the TAB field team.
- (3) Designate the actual data to be measured in the TAB field work.
- (4) Provide a list of the types of instruments, and the measuring range of each, which are anticipated to be used for measuring in the TAB field work. By means of a keying scheme, specify on each TAB data report form submitted, which instruments will be used for measuring each item of TAB data. If the selection of which instrument to use, is to be made in the field, specify from which instruments the choice will be made. Place the instrument key number in the blank space where the measured data would be entered.

c. Prerequisite HVAC work checkout list: Provide a list of inspections and work items which are to be completed by the Contractor. This list must be acted upon and completed by the Contractor and then submitted and approved by the Contracting Officer prior to the TAB team coming to the contract site.

At a minimum, a list of the applicable inspections and work items

listed in the NEBB PROCEDURAL STANDARDS, Section III, "Preliminary TAB Procedures" under paragraphs titled, "Air Distribution System Inspection" and "Hydronic Distribution System Inspection" must be provided for each separate system to be TAB'd.

#### 1.5.4 Subcontractor Special Requirements

All contract requirements of this section must be accomplished directly by a first tier subcontractor. No work may be performed by a second tier subcontractor.

#### 1.5.5 Instrument Calibration Certificates

It is the responsibility of the TAB firm to provide instrumentation that meets the minimum requirements of the standard under which the TAB Firm's qualifications are approved for use on a project. Instrumentation must be in proper operating condition and must be applied in accordance with the instrumentation's manufacturer recommendations.

All instrumentation must bear a valid NIST traceable calibration certificate during field work and during government acceptance testing. All instrumentation must be calibrated within no later than one year of the date of TAB work or government acceptance testing field work.

### PART 2 PRODUCTS

Not used.

### PART 3 EXECUTION

#### 3.1 WORK DESCRIPTIONS OF PARTICIPANTS

Comply with requirements of this section as specified in Appendix A WORK DESCRIPTIONS OF PARTICIPANTS.

#### 3.2 PRE-TAB MEETING

Meet with the Contracting Officer's technical representative (COTR) to develop a mutual understanding relative to the details of the TAB work requirements. Ensure that the TAB supervisor is present at this meeting. Requirements to be discussed include required submittals, work schedule, and field quality control.

#### 3.3 TAB PROCEDURES

##### 3.3.1 TAB Field Work

Test, adjust, and balance the HVAC systems until measured flow rates (air and water flow) are within plus or minus 5 percent of the design flow rates as specified or indicated on the contract documents.

That is, comply with the the requirements of AABC MN-1 or SMACNA 1780 (TABB) and SMACNA 1858 (TABB), except as supplemented and modified by this section.

Provide instruments and consumables required to accomplish the TAB work. Calibrate and maintain instruments in accordance with manufacturer's written procedures.

Test, adjust, and balance the HVAC systems until measured flow rates (air and water flow) are within plus or minus 5 percent of the design flow rates as specified or indicated on the contract documents. Conduct TAB work, including measurement accuracy, and sound measurement work in conformance with the AABC MN-1 and AABC MN-4, or NEBB TABES and NEBB MASV, or SMACNA 1780 (used by TABB) and SMACNA 1858 sound measurement procedures, except as supplemented and modified by this section. The only water flow and air flow reporting which can be deferred until the Season 2 is that data which would be affected in terms of accuracy due to outside ambient conditions.

### 3.3.2 Preliminary Procedures

Use the approved pre-field engineering report as instructions and procedures for accomplishing TAB field work. TAB engineer is to locate, in the field, test ports required for testing. It is the responsibility of the sheet metal contractor to provide and install test ports as required by the TAB engineer.

### 3.3.3 TAB Air Distribution Systems

#### 3.3.3.1 Units With Coils

Report heating and cooling performance capacity tests for hot water, chilled water, DX and steam coils for the purpose of verifying that the coils meet the indicated design capacity. Submit the following data and calculations with the coil test reports:

- a. For air handlers with capacities greater than 7.5 tons (90,000 Btu) cooling, such as factory manufactured units, central built-up units and rooftop units, conduct capacity tests in accordance with AABC MN-4, procedure 3.5, "Coil Capacity Testing."

Do not determine entering and leaving wet and dry bulb temperatures by single point measurement, but by the average of multiple readings in compliance with paragraph 3.5-5, "Procedures", (in subparagraph d.) of AABC MN-4, Procedure 3.5, "Coil Capacity Testing."

Submit part-load coil performance data from the coil manufacturer converting test conditions to design conditions; use the data for the purpose of verifying that the coils meet the indicated design capacity in compliance with AABC MN-4, Procedure 3.5, "Coil Capacity Testing," paragraph 3.5.7, "Actual Capacity Vs. Design Capacity" (in subparagraph c.).

- b. For units with capacities of 7.5 tons (90,000 Btu) or less, such as fan coil units, duct mounted reheat coils associated with VAV terminal units, and unitary units, such as through-the-wall heat pumps:

Determine the apparent coil capacity by calculations using single point measurement of entering and leaving wet and dry bulb temperatures; submit the calculations with the coil reports.

#### 3.3.3.2 Exhaust Fans

Exhaust fan systems including fans, ducts, plenums, grilles, and hoods for exhaust air.

### 3.3.4 TAB Water Distribution Systems

#### 3.3.4.1 Condenser Water Make-up Water

Condenser water make-up water systems including cooling towers, pumps, system balance valves and flow measuring devices.

### 3.3.5 TAB Work on Performance Tests Without Seasonal Limitations

#### 3.3.5.1 Performance Tests

In addition to the TAB proportionate balancing work on the air distribution systems and the water distribution systems, accomplish TAB work on the HVAC systems which directly transfer thermal energy. TAB the operational performance of the heating systems and cooling systems.

#### 3.3.5.2 Ambient Temperatures

On each tab report form used for recording data, record the outdoor and indoor ambient dry bulb temperature range and the outdoor and indoor ambient wet bulb temperature range within which the report form's data was recorded. Record these temperatures at beginning and at the end of data taking.

### 3.3.6 TAB Work on Performance Tests With Seasonal Limitations

#### 3.3.6.1 Performance Tests

Accomplish proportional balancing TAB work on the air distribution systems and water distribution systems, in other words, accomplish adjusting and balancing of the air flows and water flows, any time during the duration of this contract, subject to the limitations specified elsewhere in this section. However, accomplish, within the following seasonal limitations, TAB work on HVAC systems which directly transfer thermal energy.

#### 3.3.6.2 Season Of Maximum Load

Visit the contract site for at least two TAB work sessions for Season 1 and Season 2 field measures. Visit the contract site during the season of maximum heating load and visit the contract site during the season of maximum cooling load, the goal being to TAB the operational performance of the heating systems and cooling systems under their respective maximum outdoor environment-caused loading. During the seasonal limitations, TAB the operational performance of the heating systems and cooling systems.

#### 3.3.6.3 Ambient Temperatures

On each tab report form used for recording data, record the outdoor and indoor ambient dry bulb temperature range and the outdoor and indoor ambient wet bulb temperature range within which the report form's data was recorded. Record these temperatures at beginning and at the end of data taking.

### 3.3.7 Workmanship

Conduct TAB work on the HVAC systems until measured flow rates are within plus or minus 5 percent of the design flow rates as specified or indicated

on the contract documents. This TAB work includes adjustment of balancing valves, balancing dampers, and sheaves. Further, this TAB work includes changing out fan sheaves and pump impellers if required to obtain air and water flow rates specified or indicated. If, with these adjustments and equipment changes, the specified or indicated design flow rates cannot be attained, contact the Contracting Officer for direction.

### 3.3.8 Deficiencies

Strive to meet the intent of this section to maximize the performance of the equipment as designed and installed. However, if deficiencies in equipment design or installation prevent TAB work from being accomplished within the range of design values specified in the paragraph WORKMANSHIP, provide written notice as soon as possible to the Contractor and the Contracting Officer describing the deficiency and recommended correction.

Responsibility for correction of installation deficiencies is the Contractor's. If a deficiency is in equipment design, call the TAB team supervisor for technical assistance. Responsibility for reporting design deficiencies to Contractor is the TAB team supervisor's.

### 3.3.9 TAB Reports

Additional requirements for TAB Reports are specified in Appendix B  
REPORTS - TAB

### 3.3.10 Quality Assurance - COTR TAB Field Acceptance Testing

#### 3.3.10.1 TAB Field Acceptance Testing

During the field acceptance testing, verify, in the presence of the COTR, random selections of data (water, air quantities, air motion, sound level readings) recorded in the TAB Report. Points and areas for field acceptance testing are to be selected by the COTR. Measurement and test procedures are the same as approved for TAB work for the TAB Report.

Field acceptance testing includes verification of TAB Report data recorded for the following equipment groups:

Group 4: 25 percent of the return grilles, return registers, exhaust grilles and exhaust registers.

Group 5: 25 percent of the supply fans, exhaust fans, and pumps.

Further, if any data on the TAB Report for Groups 2 through 5 is found not to fall within the range of plus 5 to minus 5 percent of the TAB Report data, additional group data verification is required in the presence of the COTR. Verify TAB Report data for one additional piece of equipment in that group. Continue this additional group data verification until out-of-tolerance data ceases to be found.

#### 3.3.10.2 Additional COTR TAB Field Acceptance Testing

If any of the acceptance testing measurements for a given equipment group is found not to fall within the range of plus 5 to minus 5 percent of the TAB Report data, terminate data verification for all affected data for that group. The affected data for the given group will be disapproved. Make the necessary corrections and prepare a revised TAB Report. Reschedule acceptance testing of the revised report data with the COTR.

#### 3.3.10.3 Prerequisite for Approval

Compliance with the field acceptance testing requirements of this section is a prerequisite for the final Contracting Officer approval of the TAB Report submitted.

### 3.4 MARKING OF SETTINGS

Upon the final TAB work approval, permanently mark the settings of HVAC adjustment devices including valves, gauges, splitters, and dampers so that adjustment can be restored if disturbed at any time. Provide permanent markings clearly indicating the settings on the adjustment devices which result in the data reported on the submitted TAB report.

### 3.5 MARKING OF TEST PORTS

The TAB team is to permanently and legibly mark and identify the location points of the duct test ports. If the ducts have exterior insulation, make these markings on the exterior side of the duct insulation. Show the location of test ports on the as-built mechanical drawings with dimensions given where the test port is covered by exterior insulation.

### 3.6 APPENDICES

Appendix A WORK DESCRIPTIONS OF PARTICIPANTS  
Appendix B REPORTS - TAB  
Appendix C TAB SUBMITTAL AND WORK SCHEDULE  
Appendix D REQUIREMENTS FOR DUCT AIR LEAK TESTING

## Appendix A

### WORK DESCRIPTIONS OF PARTICIPANTS

The Contractor is responsible for ensuring compliance with all requirements of this specification section. However, the following delineation of specific work items is provided to facilitate and co-ordinate execution of the various work efforts by personnel from separate organizations.

#### 1. Contractor

- a. HVAC documentation: Provide pertinent contract documentation to the TAB Firm, to include the following: the contract drawings and specifications; copies of the approved submittal data for all HVAC equipment, air distribution devices, and air/water measuring/balancing devices; the construction work schedule; and other applicable documents requested by the TAB Firm. Provide the TAB Firm copies of contract revisions and modifications as they occur.
- b. Schedules: Ensure the requirements specified under the paragraph "TAB Schedule" are met.
- c. Pre-TAB meeting: Arrange and conduct the TAB meeting. Ensure that a representative is present for the sheet metal contractor, the mechanical contractor, the electrical contractor, and the automatic temperature controls contractor.
- d. Coordinate Support: Provide and coordinate support personnel required by the TAB Firm in order to accomplish the TAB field work. Support personnel may include factory representatives, HVAC controls installers, HVAC equipment mechanics, sheet metal workers, pipe fitters, and insulators. Ensure support personnel are present at the work site at the times required.
- e. Correct Deficiencies: Ensure the notifications of Construction Deficiencies are provided as specified herein. Refer to the paragraph CONSTRUCTION DEFICIENCIES. Correct each deficiency as soon as practical with the Contracting Officer, and submit revised schedules and other required documentation.
- f. Pre-TAB Work Checklists: Complete check out and debugging of HVAC equipment, ducts, and controls prior to the TAB engineer arriving at the project site to begin the TAB work. Debugging includes searching for and eliminating malfunctioning elements in the HVAC system installations, and verifying all adjustable devices are functioning as designed. Include as pre-TAB work checklist items, the deficiencies pointed out by the TAB team supervisor in the design review report.

Prior to the TAB field team's arrival, ensure completion of the applicable inspections and work items listed in the TAB team supervisor's TAB Work Procedures Summary. Do not allow the TAB team to commence TAB field work until all of the following are completed.

- g. Give Notice of Testing: Submit advance notice of proportional balancing, Season 1, and Season 2 TAB field work accompanied by completed prerequisite HVAC Work List

- h. Insulation work: Ensure that no insulation is shall not be installed on ducts until work on the subject ducts is complete.

Ensure the duct and piping systems are properly insulated and vapor sealed upon the successful completion and acceptance of the TAB work.

2. TAB Team Supervisor

- a. Overall management: Supervise and manage the overall TAB team work effort, including preliminary and technical TAB procedures and TAB team field work.
- b. Schedule: Ensure the requirements specified under the paragraph "TAB Schedule" are met.
- c. Submittals: Provide the submittals specified herein.
- d. Pre-DALT/TAB meeting: Attend meeting with Contractor. Ensure TAB personnel that will be involved in the TAB work under this contract attend the meeting.
- e. Design Review Report: Submit typed report describing omissions and deficiencies in the HVAC system's design that would preclude the TAB team from accomplishing the duct leakage testing work and the TAB work requirements of this section. Provide a complete explanation including supporting documentation detailing the design deficiency. State that no deficiencies are evident if that is the case.
- f. Support required: Specify the technical support personnel required from the Contractor other than the TAB agency; such as factory representatives for temperature controls or for complex equipment. Inform the Contractor in writing of the support personnel needed and when they are needed. Furnish the notice as soon as the need is anticipated, either with the design review report, or the TAB Procedures Summary, the during the TAB field work.

Ensure the Contractor is properly notified and aware of all support personnel needed to perform the TAB work. Maintain communication with the Contractor regarding support personnel throughout the duration of the TAB field work, including the TAB field acceptance testing checking.

Ensure all inspections and verifications for the Pre-Final DALT and Pre-TAB Checklists are completely and successfully conducted before DALT and TAB field work is performed.

- g. Advance Notice: Monitor the completion of the duct system installations and provide the Advance Notice for field work as specified herein.
- h. Technical Assistance: Provide technical assistance to the TAB field work.
- i. Deficiencies Notification: Ensure the notifications of Construction Deficiencies are provided as specified herein. Comply with requirements of the paragraph CONSTRUCTION DEFICIENCIES. Resolve each deficiency as soon as practical and submit revised schedules and other required documentation.

- j. Procedures: Develop the required TAB procedures for systems or system components not covered in the TAB Standard.
3. TAB Team Field Leader
- a. Field manager: Manage, in the field, the accomplishment of the work specified in Part 3, EXECUTION.
  - b. Full time: Be present at the contract site when TAB field work is being performed by the TAB team; ensure day-to-day TAB team work accomplishments are in compliance with this section.
  - c. Prerequisite HVAC work: Do not bring the TAB team to the contract site until a copy of the prerequisite HVAC work list, with all work items certified by the Contractor to be working as designed, reaches the office of the TAB Agency.

## Appendix B

### REPORTS - TAB

All submitted documentation must be typed, neat, and organized. All reports must have a waterproof front and back cover, a title page, a certification page, sequentially numbered pages throughout, and a table of contents. Tables, lists, and diagrams must be titled. Generate and submit for approval the following documentation:

#### 1. TAB Work Execution Schedule

Submit a detailed schedule indicating the anticipated calendar date for each submittal and each portion of work required under this section. For each work entry, indicate the support personnel (such as controls provider, HVAC mechanic, etc.) that are needed to accomplish the work. Arrange schedule entries chronologically.

#### 2. TAB Procedures Summary

Submit a detailed narrative describing all aspects of the TAB field work to be performed. Include the following:

- a. A list of the intended procedural steps for the TAB field work from start to finish. Indicate how each type of data measurement will be obtained. Include what Contractor support personnel are required for each step, and the tasks they need to perform.
- b. A list of the project's submittals that are needed by the TAB Firm in order to meet this Contract's requirements.
- c. The schematic drawings to be used in the required reports, which may include building floor plans, mechanical room plans, duct system plans, and equipment elevations. Indicate intended TAB measurement locations, including where test ports need to be provided by the Contractor.
- d. The data presentation forms to be used in the report, with the preliminary information and initial design values filled in.
- e. A list of TAB instruments to be used, edited for this project, to include the instrument name and description, manufacturer, model number, scale range, published accuracy, most recent calibration date, and what the instrument will be used for on this project.
- f. A thorough checklist of the work items and inspections that need to be accomplished before field work can be performed. The Contractor must complete, submit, and receive approval of the Completed Pre-Final Work Checklist before field work can be accomplished.
- g. A thorough checklist of the work items and inspections that need to be accomplished before the Season 1 TAB field work can be performed. The Contractor must complete, submit, and receive approval of the Completed Season 1 Pre-TAB Work Checklist before the Season 1 TAB field work can be accomplished.
- h. A thorough checklist of the work items and inspections that need to be accomplished before the Season 2 TAB field work can be performed. The

Contractor must complete, submit, and receive approval of the Completed Season 2 Pre-TAB Work Checklist before the Season 2 TAB field work can be accomplished.

- i. The checklists specified above shall be individually developed and tailored specifically for the work under this contract. Refer to NEBB PROCEDURAL STANDARDS, Section III, "Preliminary TAB Procedures" under the paragraphs titled, "Air Distribution System Inspection" and "Hydronic Distribution System Inspection" for examples of items to include in the checklists.

### 3. Design Review Report

Submit report containing the following information:

- a. Review the contract specifications and drawings to verify that the TAB work can be successfully accomplished in compliance with the requirements of this section. Verify the presence and location of permanently installed test ports and other devices needed, including gauge cocks, thermometer wells, flow control devices, circuit setters, balancing valves, and manual volume dampers.
- b. Submit a typed report describing omissions and deficiencies in the HVAC system's design that would preclude the TAB team from accomplishing the TAB work requirements of this section. Provide a complete explanation including supporting documentation detailing the design deficiency. If no deficiencies are evident, state so in the report.

### 4. TAB Reports: Submit TAB Report for Proportional Balancing, Season 1, and Season 2 in the following manner:

- a. Procedure Summary: Submit a copy of the approved TAB Procedures Summary. When applicable, provide notations describing how actual field procedures differed from the procedures listed.
- b. Report format: Submit the completed data forms approved in the pre-field TAB Engineering Report completed by TAB field team, reviewed, approved and signed by the TAB supervisor. Bind the report with a waterproof front and back cover. Include a table of contents identifying by page number the location of each report. Report forms and report data shall be typewritten. Handwritten report forms or report data are not acceptable.
- c. Temperatures: On each TAB report form reporting TAB work accomplished on HVAC thermal energy transfer equipment, include the indoor and outdoor dry bulb temperature range and indoor and outdoor wet bulb temperature range within which the TAB data was recorded. Include in the TAB report continuous time versus temperature recording data of wet and dry bulb temperatures for the rooms, or zones, as designated in the following list:

Chemical Room, Pump Room and Maintenance Room

- (1) Data shall be measured and compiled on a continuous basis for the period in which TAB work affecting those rooms is being done.

- (2) Data shall be measured/recorded only after the HVAC systems installations are complete, the systems fully balanced and the HVAC systems controls operating in fully automatic mode. Provide a detailed explanation wherever a final measurement did not achieve the required value.
  - (3) Data may be compiled using direct digital controls trend logging where available. Otherwise, the Contractor shall temporarily install calibrated time versus temperature/humidity recorders for this purpose. The HVAC systems and controls shall have been fully operational a minimum of 24 hours in advance of commencing data compilation. The specified data shall be included in the Season I and Season 2 TAB Report.
- d. Air System Diagrams: Provided updated diagrams with final installed locations of all terminals and devices, any numbering changes, and actual test locations.
- e. Air Static Pressure Profiles: Report static pressure profiles for air duct systems including: EF-1, EF-2, EF-3 and SF-1. Report static pressure data for all supply, return, relief, exhaust and outside air ducts for the systems listed. The static pressure report data shall include, in addition to AABC or NEBB or TABB required data, the following:
- (1) Report supply fan, return fan, relief fan, and exhaust fan inlet and discharge static pressures.
  - (2) Report static pressure drop across chilled water coils, DX coils, hot water coils, steam coils, electric resistance heating coils and heat reclaim devices installed in unit cabinetry or the system ductwork.
  - (3) Report static pressure drop across outside air, return air, and supply air automatic control dampers, both proportional and two-position, installed in unit cabinetry.
  - (4) Report static pressure drop across air filters, acoustic silencers, moisture eliminators, air flow straighteners, air flow measuring stations or other pressure drop producing specialty items installed in unit cabinetry, or in the system ductwork. Examples of these specialty items are smoke detectors, white sound generators, RF shielding, wave guides, security bars, blast valves, small pipes passing through ductwork, and duct mounted humidifiers.  
  
Do not report static pressure drop across duct fittings provided for the sole purpose of conveying air, such as elbows, transitions, offsets, plenums, manual dampers, and branch takes-offs.
  - (5) Report static pressure drop across outside air and relief/exhaust air louvers.
  - (6) Report static pressure readings of supply air, return air, exhaust/relief air, and outside air in duct at the point where these ducts connect to each air moving unit.
- f. Duct Transverses: Report duct traverses for main supply, return,

exhaust, relief and outside air ducts. The TAB Agency shall evaluate and report findings on the duct traverses taken. Evaluate the suitability of the duct traverse measurement based on satisfying the qualifications for a pitot traverse plane as defined by AMCA 203, "Field Measurements", Section 8, paragraph 8.3, "Location of Traverse Plane".

- g. Instruments: List the types of instruments actually used to measure the tab data. Include in the listing each instrument's unique identification number, calibration date, and calibration expiration date.

Instrumentation, used for taking wet bulb temperature readings shall provide accuracy of plus or minus 5 percent at the measured face velocities. Submit instrument manufacturer's literature to document instrument accuracy performance is in compliance with that specified.

- h. Performance Curves: The TAB Supervisor shall include, in the TAB Reports, factory pump curves and fan curves for pumps and fans TAB'd on the job.
- i. Calibration Curves: The TAB Supervisor shall include, in the TAB Reports, a factory calibration curve for installed flow control balancing valves, flow venturis and flow orifices TAB'd on the job.
- j. Data From TAB Field Work: After completion of the TAB field work, prepare the TAB field data for TAB supervisor's review and approval signature, using the reporting forms approved in the pre-field engineering report. Data required by those approved data report forms shall be furnished by the TAB team. Except as approved otherwise in writing by the Contracting Officer, the TAB work and thereby the TAB report shall be considered incomplete until the TAB work is accomplished to within the accuracy range specified in the paragraph WORKMANSHIP.

## Appendix C

### TAB SUBMITTAL AND WORK SCHEDULE

Perform the following items of work in the order listed adhering to the dates schedule specified below. Include the major items listed in this schedule in the project network analysis schedule required by Section 01 32 17.00 20 COST-LOADED NETWORK ANALYSIS SCHEDULES (NAS).

Submit TAB Agency and TAB Personnel Qualifications: Within 42 calendar days after date of contract award.

Submit the TAB Work Execution Schedule: within 14 days after receipt of the TAB agency and TAB personnel qualifications approval. Revise and re-submit this schedule 28 days prior to the commencement of TAB Season 1 work and TAB Season 2 work.

Submit the TAB Work Procedures Summary: within 14 days after receipt of the initial approved TAB Work Execution Schedule.

Meet with the COTR at the Pre-TAB Meeting: Within 28 calendar days after receipt of the approved initial TAB Execution Schedule.

Submit Design Review Report: Within 56 calendar days after the receipt of the approved initial TAB Work Execution Schedule.

Advance Notice of Season 1 TAB Field Work: At a minimum of 14calendar days prior to Season 1 TAB Field Work, submit advance notice of TAB field work accompanied by completed Season 1 Pre-TAB Work Checklist.

Season 1 TAB Field Work: At a minimum of 84 calendar days prior to CCD, and when the ambient temperature is within Season 1 limits, accomplish Season 1 TAB field work.

Submit Season 1 TAB Report: Within 14 calendar days after completion of Season 1 TAB field work, submit initial Season 1 TAB report.

Season 1 Quality Assurance - COTR TAB Field Check: 30 calendar days after initial Season 1 TAB report is approved by the Contracting Officer, conduct Season 1 field check.

Complete Season 1 TAB Work: Prior to CCD, complete all TAB work except Season 2 TAB work and submit final.

Receive the approved TAB report: Within 21 calendar days, receive the report from Contracting Officer approved TAB report.

Advance Notice of Season 2 TAB Field Work: At a minimum of 126 calendar days after CCD, submit advance notice of Season 2 TAB field work accompanied by completed Season 2 Pre-TAB Work Checklist.

Season 2 TAB Field Work: Within 14 calendar days after date of advance notice of Season 2 TAB field work and when the ambient temperature is within Season 2 limits, accomplish Season 2 TAB field work.

Submit Season 2 TAB Report: Within 14 calendar days after completion of Season 2 TAB field work, submit Season 2 TAB report.

Season 2 Quality Assurance - COTR TAB Field Checks: 28 calendar days after the Season 2 TAB report is approved by the Contracting Officer, conduct Season 2 field check.

Complete Season 2 TAB Work: Within 14 calendar days after the completion of Season 2 TAB field data check, complete all TAB work.

Receive the approved TAB report: Within calendar 21 days, receive the report from Contracting Officer.

| Appendix D                                                    |                 |         |   |   |   |

1.2 SYSTEM DESCRIPTION

1.2.1 General

Provide field-applied insulation and accessories on mechanical systems as specified herein; factory-applied insulation is specified under the piping, duct or equipment to be insulated. Provide field applied insulation materials required for use on Government-furnished items as listed in the SPECIAL CONTRACT REQUIREMENTS.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Submit the three SD types, SD-02 Shop Drawings, SD-03 Product Data, and

SD-08 Manufacturer's Instructions at the same time for each system.

SD-02 Shop Drawings

MICA Plates; G, AE

Pipe Insulation Systems and Associated Accessories; G, AE

Duct Insulation Systems and Associated Accessories; G, AE

Equipment Insulation Systems and Associated Accessories; G, AE

Recycled content for insulation materials; G, AE

SD-03 Product Data

Duct Insulation Systems; G, AE

Equipment Insulation Systems; G, AE

SD-04 Samples

Thermal Insulation; G, AE

Display Samples; G, AE

SD-07 Certificates

Indoor air quality for adhesives; G, AE

SD-08 Manufacturer's Instructions

Pipe Insulation Systems; G, AE

Duct Insulation Systems; G, AE

Equipment Insulation Systems; G, AE

## 1.4 CERTIFICATIONS

### 1.4.1 Adhesives and Sealants

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification or validation by other third-party programs that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

## 1.5 QUALITY ASSURANCE

### 1.5.1 Installer Qualification

Qualified installers must have successfully completed three or more similar type jobs within the last 5 years.

## 1.6 DELIVERY, STORAGE, AND HANDLING

Deliver materials in the manufacturer's unopened containers. Protect materials delivered and placed in storage from weather, humidity, dirt, dust and other contaminants. The Contracting Officer may reject insulation material and supplies that become dirty, dusty, wet, or contaminated by some other means. Attach manufacturer's stamp or label giving the name of the manufacturer and brand, and a description of the material, date codes, and approximate shelf life (if applicable) to packages or standard containers of insulation, jacket material, cements, adhesives, and coatings delivered for use, and samples required for approval. Insulation packages and containers must be asbestos free.

## PART 2 PRODUCTS

### 2.1 STANDARD PRODUCTS

Provide materials which are the standard products of manufacturers regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening and is an acceptable product per this specification. Submit a complete list of materials, including manufacturer's descriptive technical literature, performance data, catalog cuts, and installation instructions. Include the product number, k-value, thickness and furnished accessories including adhesives, sealants and jackets for each mechanical system requiring insulation. The product data must be copyrighted, have an identifying or publication number, and have been published prior to the issuance date of this solicitation. Submit materials furnished under this section together in a booklet.

#### 2.1.1 Insulation System

Provide insulation systems in accordance with the approved MICA National Insulation Standards plates as supplemented by this specification. Provide field-applied insulation for heating, ventilating, and cooling (HVAC) air distribution systems and piping systems that are located within, on, under, and adjacent to buildings; and for plumbing systems. Provide CFC and HCFC free insulation.

#### 2.1.2 Surface Burning Characteristics

Unless otherwise specified, insulation must have a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84. Determine flame spread, and smoke developed indexes, by ASTM E84 or UL 723. Test insulation in the same density and installed thickness as the material to be used in the actual construction. Prepare and mount test specimens according to ASTM E2231.

### 2.2 MATERIALS

Provide insulation that meets or exceeds the requirements of ASHRAE 90.1 - IP. Ensure insulation exterior is cleanable, grease resistant, non-flaking and non-peeling. Provide compatible materials that do not contribute to corrosion, soften, or otherwise attack surfaces to which applied in either wet or dry state. Use materials on stainless steel surfaces meeting ASTM C795 requirements. Do not use calcium silicate on chilled or cold water systems. Use asbestos free materials. Provide product recognized under UL 94 (if containing plastic) and listed

in FM APP GUIDE.

#### 2.2.1 Adhesives

Provide non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) that meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168 (HVAC duct sealants must meet limit requirements of "Other" category within SCAQMD Rule 1168 sealants table). Provide aerosol adhesives used on the interior of the building that meet either emissions requirements of CDPH SECTION 01350 (use the office or classroom requirements, regardless of space type) or VOC content requirements of GS-36. Provide certification or validation of indoor air quality for adhesives.

##### 2.2.1.1 Acoustical Lining Insulation Adhesive

Provide a nonflammable, fire-resistant adhesive conforming to ASTM C916, Type I.

##### 2.2.1.2 Mineral Fiber Insulation Cement

Provide cement in accordance with ASTM C195.

##### 2.2.1.3 Lagging Adhesive

Lagging is the material used for thermal insulation, especially around a cylindrical object. This may include the insulation as well as the cloth/material covering the insulation. To resist mold/mildew, use lagging adhesive meeting ASTM D5590 with 0 growth rating. Provide nonflammable and fire-resistant lagging adhesives that have a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84. Ensure adhesive is MIL-A-3316, Class 1, pigmented white and suitable, as listed by the manufacturer, for bonding fibrous glass cloth to faced and unfaced fibrous glass insulation board; for bonding cotton brattice cloth to faced and unfaced fibrous glass insulation board; for sealing edges of and bonding glass tape to joints of fibrous glass board; for bonding lagging cloth to thermal insulation; or Class 2 for attaching fibrous glass insulation to metal surfaces. Apply lagging adhesives in strict accordance with the manufacturer's recommendations for pipe and duct insulation.

##### 2.2.1.4 Contact Adhesive

Adhesives may be any of, but not limited to, the neoprene based, rubber based, or elastomeric type that have a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84. Ensure adhesive does not adversely affect, initially or in service, the insulation to which it is applied, nor cause any corrosive effect on metal to which it is applied. Ensure that any solvent dispersing medium or volatile component of the adhesive has no objectionable odor and does not contain any benzene or carbon tetrachloride. Ensure dried adhesive does not emit nauseous, irritating, or toxic volatile matters or aerosols when the adhesive is heated to any temperature up to 212 degrees F. The dried adhesive must be nonflammable and fire resistant. Flexible Elastomeric Adhesive: Comply with MIL-A-24179, Type II, Class I. Provide product listed in FM APP GUIDE.

#### 2.2.2 Caulking

ASTM C920, Type S, Grade NS, Class 25, Use A.

#### 2.2.3 Corner Angles

Nominal 0.016 inch aluminum 1 by 1 inch with factory applied kraft backing. Aluminum must be ASTM B209, Alloy 3003, 3105, or 5005.

#### 2.2.4 Fittings

Fabricated Fittings are the prefabricated fittings for flexible elastomeric pipe insulation systems in accordance with ASTM C1710. Together with the flexible elastomeric tubes, they provide complete system integrity for retarding heat gain and controlling condensation drip from chilled-water and refrigeration systems. Flexible elastomeric, fabricated fittings provide thermal protection (0.25 k) and condensation resistance (0.05 Water Vapor Transmission factor). For satisfactory performance, use properly installed protective vapor retarder/barriers and vapor stops on high relative humidity and below ambient temperature applications to reduce movement of moisture through or around the insulation to the colder interior surface.

#### 2.2.5 Finishing Cement

ASTM C450: Mineral fiber hydraulic-setting thermal insulating and finishing cement. All cements that may come in contact with Austenitic stainless steel must comply with ASTM C795.

#### 2.2.6 Fibrous Glass Cloth and Glass Tape

Provide fibrous glass cloth, with 20X20 maximum mesh size, and glass tape with maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84. Provide tape consisting of 4 inch wide rolls. Provide Class 3 tape that is 4.5 ounces/square yard. Elastomeric Foam Tape: Black vapor-retarder foam tape with acrylic adhesive containing an anti-microbial additive.

#### 2.2.7 Staples

Outward clinching type monel.

#### 2.2.8 Jackets

##### 2.2.8.1 Aluminum Jackets

Provide aluminum jackets consisting of corrugated, embossed or smooth sheet, 0.016 inch nominal thickness; ASTM B209, Temper H14, Temper H16, Alloy 3003, 5005, or 3105. Do not use corrugated aluminum jacket outdoors. Aluminum jacket securing bands must be Type 304 stainless steel, 0.015 inch thick, 1/2 inch wide for pipe under 12 inch diameter and 3/4 inch wide for pipe over 12 inch and larger diameter. Aluminum jacket circumferential seam bands must be 2 by 0.016 inch aluminum matching jacket material. Ensure bands for insulation below ground are 3/4 by 0.020 inch thick stainless steel, or fiberglass reinforced tape. The jacket may, at the option of the Contractor, be provided with a factory fabricated Pittsburgh or "Z" type longitudinal joint. When the "Z" joint is used, use bands at the circumferential joints that are designed by the manufacturer to seal the joints and hold the jacket in

place.

#### 2.2.8.2 Polyvinyl Chloride (PVC) Jackets

Polyvinyl chloride (PVC) jacket and fitting covers must have high impact strength, ultraviolet (UV) resistant rating or treatment and moderate chemical resistance. The minimum thickness for a Standard jacket is 0.020 inch and where high abuse resistance is required use Heavy Duty PVC jacket 0.030 inch. Standard PVC fittings will have an initial core thickness (before thermoforming) of 0.025 inch and heavy duty fittings will have an initial core thickness of 0.030 inch.

#### 2.2.8.3 Vapor Barrier/Vapor Retarder

Apply the following criteria to determine which system is required.

- a. On ducts, equip piping and equipment operating below 90 degrees F or located outside with a vapor barrier.
- b. Install ducts, pipes and equipment that are located inside and that always operate above 90 degrees F with a vapor retarder where required as stated in paragraph VAPOR RETARDER REQUIRED.

#### 2.2.9 Vapor Retarder Required

ASTM C921, Type I, minimum puncture resistance 50 Beach units on all surfaces except concealed ductwork, where a minimum puncture resistance of 25 Beach units is acceptable. Minimum tensile strength, 35 pounds/inch width. ASTM C921, Type II, minimum puncture resistance 25 Beach units, tensile strength minimum 20 pounds/inch width. Use jackets on insulation exposed in finished areas that have white finish suitable for painting without sizing. Based on the application, insulation materials that require manufacturer or fabricator applied pipe insulation jackets are cellular glass, when all joints are sealed with a vapor barrier mastic, and mineral fiber. Ensure all non-metallic jackets have a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84. Flexible elastomerics require (in addition to vapor barrier skin) vapor retarder jacketing for high relative humidity and below ambient temperature applications.

##### 2.2.9.1 White Vapor Retarder All Service Jacket (ASJ)

ASJ is for use on hot/cold pipes, ducts, or equipment indoors or outdoors if covered by a suitable protective jacket. Provide product which meets all physical property and performance requirements of ASTM C1136, Type I, except a minimum burst strength of 85 psi. ASTM D2863 Limited Oxygen Index (LOI) is a minimum of 31.

In addition, do not use paper or other moisture-sensitive material for the outer exposed surface or the inner-most surface contacting the insulation. Ensure the outer exposed surface is white and has an emittance no less than 0.80.

##### 2.2.9.2 Vapor Retarder/Vapor Barrier Mastic Coatings

###### 2.2.9.2.1 Vapor Barrier

The vapor barrier must be self adhesive (minimum 2 mils adhesive, 3 mils embossed) greater than 3 plies standard grade, silver, white, black and

embossed white jacket for use on hot/cold pipes. Ensure permeability is less than 0.02 when tested in accordance with ASTM E96/E96M. Provide products meeting UL 723 or ASTM E84 flame and smoke requirements and that are UV resistant.

#### 2.2.9.2.2 Vapor Retarder

Provide fire and water resistant vapor retarder coating appropriately selected for either outdoor or indoor service. Color must be white. Ensure the water vapor permeance of the compound is in accordance with ASTM C755. Provide nonflammable, fire resistant coating. To resist mold/mildew, provide coating meeting ASTM D5590 with 0 growth rating. Ensure coating meets MIL-PRF-19565 Type II (if selected for indoor service) and is Qualified Products Database listed. Determine all other application and service properties pursuant to ASTM C647.

#### 2.2.9.3 Laminated Film Vapor Retarder

ASTM C1136, Type I, maximum moisture vapor transmission 0.02 perms, minimum puncture resistance 50 Beach units on all surfaces except concealed ductwork; where Type II, maximum moisture vapor transmission 0.02 perms, a minimum puncture resistance of 25 Beach units is acceptable. Provide vapor retarder with a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84. Flexible Elastomeric exterior foam with factory applied UV Jacket. Construction of laminate designed to provide UV resistance, high puncture, tear resistance and an excellent WVT rate.

#### 2.2.9.4 Polyvinylidene Chloride (PVDC) Film Vapor Retarder

Provide PVDC film vapor retarder with a maximum moisture vapor transmission of 0.02 perms, minimum puncture resistance of 150 Beach units, a minimum tensile strength in any direction of 30 lb/inch when tested in accordance with ASTM D882, and a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84.

#### 2.2.9.5 Polyvinylidene Chloride Vapor Retarder Adhesive Tape

Requirements must meet the same as specified for Laminated Film Vapor Retarder above.

#### 2.2.9.6 Vapor Barrier/Weather Barrier

Ensure the vapor barrier is greater than 3 ply self adhesive laminate -white vapor barrier jacket- superior performance (permeability less than 0.02 when tested in accordance with ASTM E96/E96M). Provide vapor barrier meeting UL 723 or ASTM E84 25 flame and 50 smoke requirements; and UV resistant. Minimum burst strength 185 psi in accordance with TAPPI T403 OM. Tensile strength 68 lb/inch width (PSTC-1000). Provide tape as specified for laminated film vapor barrier above.

#### 2.2.10 Vapor Retarder Not Required

ASTM C921, Type II, Class D, minimum puncture resistance 50 Beach units on all surfaces except ductwork, where Type IV, maximum moisture vapor transmission 0.10, a minimum puncture resistance of 25 Beach units is acceptable. Provide jacket with a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84.

#### 2.2.11 Wire

Soft annealed ASTM A580/A580M Type 302, 304 or 316 stainless steel, 16 or 18 gauge.

#### 2.2.12 Insulation Bands

Provide 1/2 inch wide; 26 gauge stainless steel insulation bands.

#### 2.2.13 Sealants

Choose sealants from the butyl polymer type, the styrene-butadiene rubber type, or the butyl type of sealants. Provide sealants with a maximum permeance of 0.02 perms based on Procedure B for ASTM E96/E96M, and a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84.

### 2.3 PIPE INSULATION SYSTEMS

Conform insulation materials to Table 1 and minimum insulation thickness as listed in Table 2 and meet or exceed the requirements of ASHRAE 90.1 - SIASHRAE 90.1 - IP. Limit pipe insulation materials to those listed herein and meeting the following requirements:

#### 2.3.1 Recycled Materials

Provide insulation materials containing the following minimum percentage of recycled material content by weight:

- Rock Wool: 75 percent slag of weight
- Fiberglass: 20 percent glass cullet
- Rigid Foam: 9 percent recovered material
- Phenolic Rigid Foam: 9 percent recovered material

Provide data identifying percentage of recycled content for insulation materials.

#### 2.3.2 Aboveground Cold Pipeline ( -30 to 60 deg. F)

Provide insulation for outdoor, indoor, exposed or concealed applications, as follows:

##### 2.3.2.1 Cellular Glass

ASTM C552, Type II, and Type III. Supply the insulation from the fabricator with (paragraph WHITE VAPOR RETARDER ALL SERVICE JACKET (ASJ)) ASJ vapor retarder and installed with all longitudinal overlaps sealed and all circumferential joints ASJ taped or supply the insulation unfaced from the fabricator and install with all longitudinal and circumferential joints sealed with vapor barrier mastic.

##### 2.3.2.2 Flexible Elastomeric Cellular Insulation

Closed-cell, foam- or expanded-rubber materials containing anti-microbial additive, complying with ASTM C534/C534M, Grade 1, Type I or II. Type I, Grade 1 for tubular materials. Type II, Grade 1, for sheet materials. Ensure Type I and II have vapor retarder/vapor barrier skin on one or both sides of the insulation, and require an additional exterior vapor retarder

covering for high relative humidity and below ambient temperature applications.

#### 2.3.2.3 Mineral Fiber Insulation with Integral Wicking Material (MFIWM)

ASTM C547. Install in accordance with manufacturer's instructions. Do not use in applications exposed to outdoor ambient conditions in climatic zones 1 through 4.

#### 2.3.2.4 Polyisocyanurate Insulation

ASTM C591, Type I. Polyisocyanurate insulation may only be used on systems operating at temperatures not to exceed 140 degrees F. Supply the insulation with a factory applied vapor retarder/barrier that complies with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. The insulation and all covering must pass the flame spread index of 25 and the smoke developed index of 50 when tested in accordance with ASTM E84.

#### 2.3.3 Aboveground Hot Pipeline (Above 60 deg. F)

Provide insulation for outdoor, indoor, exposed or concealed applications meeting the following requirements. Supply the insulation with manufacturer's recommended factory-applied jacket/vapor barrier.

##### 2.3.3.1 Mineral Fiber

ASTM C547, Types I, II or III, supply the insulation with manufacturer's recommended factory-applied jacket.

##### 2.3.3.2 Calcium Silicate

ASTM C533, Type I indoor only, or outdoors above 250 degrees F pipe temperature. Supply insulation with the manufacturer's recommended factory-applied jacket/vapor barrier.

##### 2.3.3.3 Cellular Glass

ASTM C552, Type II and Type III. Supply the insulation with manufacturer's recommended factory-applied jacket.

##### 2.3.3.4 Flexible Elastomeric Cellular Insulation

Closed-cell, foam- or expanded-rubber materials containing anti-microbial additive, complying with ASTM C534/C534M, Grade 1, Type I or II to 220 degrees F service. Type I for tubular materials. Type II for sheet materials.

##### 2.3.3.5 Phenolic Insulation

ASTM C1126 Type III to 250 degrees F service must comply with ASTM C795. Supply the insulation with manufacturer's recommended factory-applied jacket/vapor barrier.

##### 2.3.3.6 Perlite Insulation

ASTM C610

#### 2.3.3.7 Polyisocyanurate Insulation

ASTM C591, Type I. Supply the insulation with a factory applied vapor retarder/barrier that complies with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. The insulation and all covering must pass the flame spread index of 25 and the smoke developed index of 50 when tested in accordance with ASTM E84.

### 2.4 DUCT INSULATION SYSTEMS

#### 2.4.1 Factory Applied Insulation

Provide factory-applied ASTM C552, cellular glass thermal or ASTM C534/C534M Grade 1, Type II, flexible elastomeric closed cell insulation according to manufacturer's recommendations for insulation with insulation manufacturer's standard reinforced fire-retardant vapor barrier, with identification of installed thermal resistance (R) value and out-of-package R value.

#### 2.4.2 Field Applied Insulation

##### 2.4.2.1 General

Calculate the minimum thickness in accordance with ASHRAE 90.1 - IP.

#### 2.4.3 Rigid Insulation

Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C612, Type IA or Type IB; 3.0 pcf. Provide insulation with factory applied ASJ and factory-applied FSK jacket. Minimum thickness in accordance with ASHRAE 90.1 - IP Tables 3 and 4

#### 2.4.4 Blanket Insulation

Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C553, Type II and ASTM C1290, Type III with factory-applied FSK jacket; 3/4 pcf. Minimum thickness in accordance with ASHRAE 90.1 - IP Tables 3 and 4.

#### 2.4.5 Acoustical Duct Lining

##### 2.4.5.1 General

For ductwork indicated or specified in Section 23 30 00 HVAC AIR DISTRIBUTION to be acoustically lined, provide external insulation in accordance with this specification section and in addition to the acoustical duct lining if R-value would not be met as required in Table 3 and 4. The installation of internal acoustical duct insulation is prohibited.

##### 2.4.5.2 Duct Liner

Flexible Elastomeric Acoustical and Conformable Duct Liner Materials: Flexible Elastomeric Thermal, Acoustical and Conformable Insulation Compliance with ASTM C534/C534M Grade 1, Type II; and NFPA 90A or NFPA 90B as applicable.

## 2.4.6 Duct Insulation Jackets

### 2.4.6.1 All-Purpose Jacket

Provide insulation with insulation manufacturer's standard reinforced fire-retardant jacket with or without integral vapor barrier as required by the service. In exposed locations, provide jacket with a white surface.

### 2.4.6.2 Metal Jackets

#### 2.4.6.2.1 Aluminum Jackets

ASTM B209, Temper H14, minimum thickness of 27 gauge ( 0.016 inch), with factory-applied polyethylene and kraft paper moisture barrier on inside surface. Provide smooth surface jackets for jacket outside dimension 8 inches and larger. Provide corrugated surface jackets for jacket outside dimension 8 inches and larger. Provide stainless steel bands, minimum width of 1/2 inch.

#### 2.4.6.2.2 Stainless Steel Jackets

ASTM A240/A240M; Type 304, minimum thickness of 33 gauge ( 0.010 inch), smooth surface with factory-applied polyethylene and kraft paper moisture barrier on inside surface. Provide stainless steel bands, minimum width of 1/2 inch.

### 2.4.6.3 Vapor Barrier/Weatherproofing Jacket

Provide vapor barrier/weatherproofing jacket that is laminated self-adhesive (minimum 2 mils adhesive, 3 mils embossed) less than 0.02 permeability, (greater than 3 ply, standard grade, silver, white, black and embossed or greater than 8 ply (minimum 2.9 mils adhesive), heavy duty white or natural).

## 2.4.7 Weatherproof Duct Insulation

Provide ASTM C552, cellular glass thermal insulation or ASTM C534/C534M Grade 1, Type II, flexible elastomeric cellular insulation, and weatherproofing as specified in manufacturer's instruction. Multi-ply, Polymeric Blend Laminate Jacketing: Construction of laminate designed to provide UV resistance, high puncture, tear resistance and an excellent WVT rate.

## 2.5 EQUIPMENT INSULATION SYSTEMS

Insulate equipment and accessories as specified in Tables 5 and 6. In outside locations, provide insulation 1/2 inch thicker than specified. Increase the specified insulation thickness for equipment where necessary to equal the thickness of angles or other structural members to make a smooth, exterior surface. Submit a booklet containing manufacturer's published installation instructions for the insulation systems. The instructions must be copyrighted, have an identifying or publication number, and have been published prior to the issuance date of this solicitation. A booklet is also required by paragraphs titled: Pipe Insulation Systems and Duct Insulation Systems.

## PART 3 EXECUTION

### 3.1 APPLICATION - GENERAL

Apply insulation to unheated and uncooled piping and equipment. Do not compress flexible elastomeric cellular insulation at joists, studs, columns, ducts, and hangers. The insulation must not pull apart after a one hour period; replace any insulation found to pull apart after one hour.

#### 3.1.1 Display Samples

Submit and display, after approval of materials, actual sections of installed systems, properly insulated in accordance with the specification requirements. Such actual sections must remain accessible to inspection throughout the job and will be reviewed from time to time for controlling the quality of the work throughout the construction site. Identify each material used by indicating on an attached sheet the specification requirement for the material and the material by each manufacturer intended to meet the requirement. The Contracting Officer will inspect display sample sections at the jobsite. Keep approved display sample sections on display at the jobsite during the construction period. Upon completion of construction, the display sample sections will be closed and sealed.

##### 3.1.1.1 Pipe Insulation Display Sections

Include as a minimum an elbow or tee, a valve, dielectric waterways and flanges, a hanger with protection shield and insulation insert, or dowel as required, at support point, method of fastening and sealing insulation at longitudinal lap, circumferential lap, butt joints at fittings and on pipe runs, and terminating points for each type of pipe insulation used on the job, and for hot pipelines and cold pipelines, both interior and exterior, even when the same type of insulation is used for these services.

##### 3.1.1.2 Duct Insulation Display Sections

Display sample sections for rigid and flexible duct insulation used on the job. Use a temporary covering to enclose and protect display sections for duct insulation exposed to weather

#### 3.1.2 Installation

Except as otherwise specified, install material in accordance with the manufacturer's written instructions. Do not apply insulation materials until tests and heat tracing specified in other sections of this specification are completed. Remove material such as rust, scale, dirt and moisture from surfaces to receive insulation. Keep insulation clean and dry. Do not remove insulation from its shipping containers until the day it is ready to use and return to like containers or equally protect from dirt and moisture at the end of each workday. Thoroughly clean insulation that becomes dirty prior to use. If insulation becomes wet or if cleaning does not restore the surfaces to like new condition, reject the insulation, and immediately remove from the jobsite. Stagger joints on multi layer insulation. Mix mineral fiber thermal insulating cement with demineralized water when used on stainless steel surfaces. Install insulation, jacketing and accessories in accordance with MICA Insulation Stds plates except where modified herein or on the drawings.

### 3.1.3 Firestopping

Where pipes and ducts pass through fire walls, fire partitions, above grade floors, and fire rated chase walls, seal the penetration with fire stopping materials as specified in Section 07 84 00 FIRESTOPPING. The protection of ducts at point of passage through firewalls must be in accordance with NFPA 90A and NFPA 90B. All other penetrations, such as piping, conduit, and wiring, through firewalls must be protected with a material or system of the same hourly rating that is listed by UL, FM, or a NRTL.

### 3.1.4 Installation of Flexible Elastomeric Cellular Insulation

Install flexible elastomeric cellular insulation with seams and joints sealed with rubberized contact adhesive. Do not use flexible elastomeric cellular insulation on surfaces greater than 220 degrees F. Stagger seams when applying multiple layers of insulation. Protect insulation exposed to weather with metal jacketing as recommended by the manufacturer after the adhesive is dry and cured.

#### 3.1.4.1 Adhesive Application

Apply a brush coating of adhesive to both butt ends to be joined and to both slit surfaces to be sealed. Allow the adhesive to set until dry to touch but tacky under slight pressure before joining the surfaces. Ensure insulation seals at seams and joints are not capable of being pulled apart one hour after application. Replace insulation that can be pulled apart one hour after installation.

#### 3.1.4.2 Adhesive Safety Precautions

Use natural cross-ventilation, local (mechanical) pickup, or general area (mechanical) ventilation to prevent an accumulation of solvent vapors, keeping in mind the ventilation pattern must remove any heavier-than-air solvent vapors from lower levels of the workspaces. Gloves and spectacle-type safety glasses are recommended in accordance with safe installation practices.

### 3.1.5 Welding

Welding is not permitted on piping, duct or equipment without written approval of the Contracting Officer. The capacitor discharge welding process may be used for securing metal fasteners to duct.

### 3.1.6 Pipes/Ducts/Equipment That Require Insulation

Insulation is required on all pipes, ducts, or equipment, except for omitted items as specified.

## 3.2 PIPE INSULATION SYSTEMS INSTALLATION

### 3.2.1 Pipe Insulation

#### 3.2.1.1 General

Install pipe insulation on aboveground hot and cold pipeline systems as specified below to form a continuous thermal retarder/barrier, including straight runs, fittings and appurtenances unless specified otherwise.

Install full length units of insulation using a single cut piece to complete a run. Do not use cut pieces or scraps abutting each other. Omit pipe insulation on the following:

- a. Air chambers.
- b. Adjacent insulation.
- c. ASME stamps.
- d. Access plates of fan housings.

#### 3.2.1.2 Pipes Passing Through Walls, Roofs, and Floors

Provide continuous pipe insulation through the sleeve.

Provide an aluminum jacket or vapor barrier/weatherproofing self adhesive jacket (minimum 2 mils adhesive, 3 mils embossed) less than 0.0000 permeability, greater than 3 ply standard grade, silver, white, black and embossed with factory applied moisture retarder over the insulation wherever penetrations require sealing.

##### 3.2.1.2.1 Penetrate Interior Walls

Provide aluminum jacket or vapor barrier/weatherproofing - self adhesive jacket (minimum 2 mils adhesive, 3 mils embossed) less than 0.02 permeability, greater than 3 plies standard grade, silver, white, black and embossed which extends 2 inches beyond either side of the wall and secure on each end with a band.

##### 3.2.1.2.2 Penetrating Floors

Extend the aluminum jacket from a point below the backup material to a point 10 inches above the floor with one band at the floor and one not more than 1 inch from the end of the aluminum jacket.

##### 3.2.1.2.3 Penetrating Waterproofed Floors

Extend the aluminum jacket from below the backup material to a point 2 inches above the flashing with a band 1 inch from the end of the aluminum jacket.

##### 3.2.1.2.4 Penetrating Exterior Walls

Continue the aluminum jacket required for pipe exposed to weather through the sleeve to a point 2 inches beyond the interior surface of the wall.

##### 3.2.1.2.5 Penetrating Roofs

Insulate pipe as required for interior service to a point flush with the top of the flashing and sealed with flashing sealant. Tightly butt the insulation for exterior application to the top of flashing and interior insulation. Extend the exterior aluminum jacket 2 inches down beyond the end of the insulation to form a counter flashing. Seal the flashing and counter flashing underneath with metal jacketing/flashing sealant.

#### 3.2.1.3 Pipes Passing Through Hangers

Ensure insulation, whether hot or cold application, is continuous through

hangers. Support all horizontal pipes 2 inches and smaller on hangers with the addition of a Type 40 protection shield to protect the insulation in accordance with MSS SP-58. Whenever insulation shows signs of being compressed, or when the insulation or jacket shows visible signs of distortion at or near the support shield, install insulation inserts as specified below for piping larger than 2 inches, or factory insulated hangers (designed with a load bearing core) can be used.

#### 3.2.1.3.1 Horizontal Pipes Larger Than 2 Inches at 60 Degrees F and Above

Supported on hangers in accordance with MSS SP-58.

#### 3.2.1.3.2 Horizontal Pipes Larger Than 2 Inches and Below 60 Degrees F

Supported on hangers with the addition of a Type 40 protection shield in accordance with MSS SP-58. Install an insulation insert of cellular glass, prefabricated insulation pipe hangers, or perlite above 80 degrees F above each shield. Ensure insert covers no less than the bottom 180-degree arc of the pipe. Provide inserts that are the same thickness as the insulation, and extend 2 inches on each end beyond the protection shield. When insulation inserts are required in accordance with the above, and the insulation thickness is less than 1 inch, wooden or cork dowels or blocks may be installed between the pipe and the shield to prevent the weight of the pipe from crushing the insulation, as an option to installing insulation inserts. Ensure the insulation jacket is continuous over the wooden dowel, wooden block, or insulation insert.

#### 3.2.1.3.3 Vertical Pipes

Supported with either Type 8 or Type 42 riser clamps with the addition of two Type 40 protection shields in accordance with MSS SP-58 covering the 360-degree arc of the insulation. Install an insulation insert of cellular glass or calcium silicate between each shield and the pipe. Ensure the insert covers the 360-degree arc of the pipe. Provide inserts that are the same thickness as the insulation, and extend 2 inches on each end beyond the protection shield. When insulation inserts are required in accordance with the above, and the insulation thickness is less than 1 inch, wooden or cork dowels or blocks may be installed between the pipe and the shield to prevent the hanger from crushing the insulation, as an option instead of installing insulation inserts. Ensure the insulation jacket is continuous over the wooden dowel, wooden block, or insulation insert. Support the vertical weight of the pipe with hangers located in a horizontal section of the pipe. When the pipe riser is longer than 30 feet, support the weight of the pipe additionally with hangers in the vertical run of the pipe that are directly clamped to the pipe, penetrating the pipe insulation. Use insulated hangers and seal the insulation jacket as indicated herein for anchors in a similar service.

#### 3.2.1.3.4 Inserts

Covered with a jacket material of the same appearance and quality as the adjoining pipe insulation jacket, overlap the adjoining pipe jacket 1-1/2 inches, and seal as required for the pipe jacket. Use jacket material to cover inserts in flexible elastomeric cellular insulation conforming to ASTM C1136, Type 1, and is allowed to be of a different material than the adjoining insulation material.

#### 3.2.1.4 Flexible Elastomeric Cellular Pipe Insulation

Use tubular form flexible elastomeric cellular pipe insulation for pipe sizes 6 inches and less. Grade 1, Do not stretch Type II sheet insulation used on pipes larger than 6 inches around the pipe. On pipes larger than 12 inches, adhere the insulation directly to the pipe on the lower 1/3 of the pipe. Stagger seams when applying multiple layers of insulation. Insulate sweat fittings with miter-cut pieces the same size as on adjacent piping. Insulate screwed fittings with sleeved fitting covers fabricated from miter-cut pieces and overlap and seal to the adjacent pipe insulation. Type II requires an additional exterior vapor retarder/barrier covering for high relative humidity and below ambient temperature applications.

#### 3.2.1.5 Pipes in High Abuse Areas

In high abuse areas such as janitor closets and traffic areas in equipment rooms, kitchens, and mechanical rooms, utilize , aluminum or flexible laminate cladding (comprised of elastomeric, plastic or metal foil laminate) laminated self-adhesive (minimum 2 mils adhesive, 3 mils embossed) vapor barrier/weatherproofing jacket, - less than 0.02 permeability; (greater than 3 ply, standard grade, silver, white, black and embossed) aluminum jackets. Protect pipe insulation to the 6 foot level.

#### 3.2.1.6 Pipe Insulation Material and Thickness

Pipe insulation materials must be as listed in Table 1 and must meet or exceed the requirements of ASHRAE 90.1 - IP.

| TABLE 1                                                                |                                                                                                                                     |                 |      |       |             |
|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|-----------------|------|-------|-------------|
| Insulation Material for Piping                                         |                                                                                                                                     |                 |      |       |             |
| Service                                                                |                                                                                                                                     |                 |      |       |             |
|                                                                        | Material                                                                                                                            | Specification   | Type | Class | VR/VB Req'd |
| Chilled Water (Supply & Return, Dual Temperature Piping, 40 F nominal) |                                                                                                                                     |                 |      |       |             |

### 3.2.2 Aboveground Cold Pipelines

Insulate the following cold pipelines for minus 30 to plus 60 degrees F in accordance with Table 2 except those piping listed in subparagraph Pipe Insulation in PART 3 as to be omitted. This includes but is not limited to the following:

- a. Make-up water.
- b. Horizontal and vertical portions of interior roof drains.
- c. Refrigerant suction lines.
- d. Chilled water.
- e. Dual temperature water, i.e. HVAC hot/chilled water.
- f. Air conditioner condensate drains.
- g. Brine system cryogenics.
- h. Condenser water piping where pipe temperature may fall below ambient dew point.
- i. Exposed lavatory drains and domestic water lines serving plumbing fixtures for handicap persons.
- j. Domestic cold and chilled drinking water.

### 3.2.2.1 Insulation Material and Thickness

Determine insulation thickness for cold pipelines using Table 2.

### 3.2.2.2 Factory or Field applied Jacket

Cover insulation with a factory applied vapor retarder jacket/vapor barrier or field applied seal welded PVC jacket or greater than 3 ply laminated self-adhesive (minimum 2 mils adhesive, 3 mils embossed) vapor barrier/weatherproofing jacket - less than 0.02 permeability, standard grade, silver, white, black and embossed for use with Mineral Fiber, Cellular Glass, and Phenolic Foam Insulated Pipe. For insulation inside the building, to be protected with an aluminum jacket, PVC jacket or fittings (installed over a vapor retarder jacket), or greater than 3 ply vapor barrier/weatherproofing self-adhesive (minimum 2 mils adhesive, 3 mils embossed) product, less than 0.02 permeability, standard grade, Embossed Silver, White & Black, install the insulation and vapor retarder jacket as specified herein. Install the aluminum jacket, PVC jacket or fittings (installed over a vapor retarder jacket), or greater than 3 ply vapor barrier/weatherproofing self-adhesive (minimum 2 mils adhesive, 3 mils embossed) product, less than 0.02 permeability, standard grade, embossed silver, White & Black, as specified for piping exposed to weather, except sealing of the laps of the aluminum jacket is not required. In high abuse areas such as janitor closets and traffic areas in equipment rooms, kitchens, and mechanical rooms, provide aluminum jackets, PVC jacket or fittings (installed over a vapor retarder jacket), or greater than 3 ply vapor barrier/weatherproofing self-adhesive (minimum 2 mils adhesive, 3 mils embossed) product, less than 0.02 permeability, standard grade, embossed silver, white & black, for pipe insulation to the 6 ft level.

### 3.2.2.3 Installing Insulation for Straight Runs Hot and Cold Pipe

Apply insulation to the pipe with tight butt joints. Seal all butted joints and ends with joint sealant and seal with a vapor retarder coating, greater than 3 ply laminate jacket - less than 0.0000 perm adhesive tape or PVDC adhesive tape.

#### 3.2.2.3.1 Longitudinal Laps of the Jacket Material

Overlap not less than 1-1/2 inches. Provide butt strips 3 inches wide for circumferential joints.

#### 3.2.2.3.2 Laps and Butt Strips

Secure with adhesive and staple on 4 inch centers if not factory self-sealing. If staples are used, seal in accordance with paragraph STAPLES below. Note that staples are not required with cellular glass systems.

#### 3.2.2.3.3 Factory Self-Sealing Lap Systems

May be used when the ambient temperature is between 40 and 120 degrees F during installation. Install the lap system in accordance with manufacturer's recommendations. Use a stapler only if specifically recommended by the manufacturer. Where gaps occur, replace the section or repair the gap by applying adhesive under the lap and then stapling.

#### 3.2.2.3.4 Staples

Coat all staples, including those used to repair factory self-seal lap systems, with a vapor retarder coating or PVDC adhesive tape or greater than 3 ply laminate jacket - 0.0000 perm adhesive tape. Coat all seams, except those on factory self-seal systems, with vapor retarder coating or PVDC adhesive tape or greater than 3 ply laminate jacket - less than 0.0000 perm adhesive tape.

#### 3.2.2.3.5 Breaks and Punctures in the Jacket Material

Patch by wrapping a strip of jacket material around the pipe and secure it with adhesive, staple, and coat with vapor retarder coating or PVDC adhesive tape or greater than 3 ply laminate jacket - less than 0.0000 perm adhesive tape. Extend the patch not less than 1-1/2 inches past the break.

#### 3.2.2.3.6 Penetrations Such as Thermometers

Fill the voids in the insulation and seal with vapor retarder coating or PVDC adhesive tape or greater than 3 ply laminate jacket - less than 0.0000 perm adhesive tape.

#### 3.2.2.3.7 Flexible Elastomeric Cellular Pipe Insulation

Install by slitting the tubular sections and applying them onto the piping or tubing. Alternately, whenever possible slide un-slit sections over the open ends of piping or tubing. Secure all seams and butt joints and seal with adhesive. When using self seal products, secure only the butt joints with adhesive. Push insulation on the pipe, never pulled. Stretching of insulation may result in open seams and joints. Clean cut all edges. Rough or jagged edges of the insulation are not be permitted. Use proper tools such as sharp knives. Do not stretch Grade 1, Type II sheet insulation around the pipe when used on pipe larger than 6 inches. On pipes larger than 12 inches, adhere sheet insulation directly to the pipe on the lower 1/3 of the pipe.

#### 3.2.2.4 Insulation for Fittings and Accessories

- a. Butt pipe insulation tightly to the insulation of the fittings and accessories. Seal the butted joints and ends with joint sealant and seal with a vapor retarder coating or PVDC adhesive tape or greater than 3 ply laminate jacket - less than 0.0000 perm adhesive tape.
- b. Place precut or preformed insulation around all fittings and accessories and conform to MICA plates except as modified herein: 5 for anchors; 10, 11, and 13 for fittings; 14 for valves; and 17 for flanges and unions. Insulation must be the same insulation as the pipe insulation, including same density, thickness, and thermal conductivity. Where precut/preformed is unavailable, rigid preformed pipe insulation sections may be segmented into the shape required. Use insulation of the same thickness and conductivity as the adjoining pipe insulation. If nesting size insulation is used, overlap the insulation 2 inches or one pipe diameter. Elbows insulated using segments must conform to MICA Tables 12.20 "Mitered Insulation Elbow". Submit a booklet containing completed MICA Insulation Stds plates detailing each insulating system for each pipe, duct, or equipment insulating system, after approval of materials and prior to applying insulation.

- (1) Ensure MICA plates detail the materials to be installed and the specific insulation application. Submit all MICA plates required showing the entire insulating system, including plates required to show insulation penetrations, vessel bottom and top heads, legs, and skirt insulation as applicable. Present all variations of insulation systems including locations, materials, vaporproofing, jackets and insulation accessories.
  - (2) If the Contractor elects to submit detailed drawings instead of edited MICA Plates, ensure the detail drawings are technically equivalent to the edited MICA Plate submittal.
- c. Upon completion of insulation installation on flanges, unions, valves, anchors, fittings and accessories, terminations, seams, joints and insulation not protected by factory vapor retarder jackets or PVC fitting covers must be protected with PVDC or greater than 3 ply laminate jacket - less than 0.0000 perm adhesive tape or two coats of vapor retarder coating with a minimum total thickness of 1/16 inch, applied with glass tape embedded between coats. Overlap tap seams 1 inch. Extend the coating out onto the adjoining pipe insulation 2 inches. Protect fabricated insulation with a factory vapor retarder jacket with either greater than 3 ply laminate jacket - less than 0.0000 perm adhesive tape, standard grade, silver, white, black and embossed or PVDC adhesive tape or two coats of vapor retarder coating with a minimum thickness of 1/16 inch and with a 2 inch wide glass tape embedded between coats. Where fitting insulation butts to pipe insulation, seal the joints with a vapor retarder coating and a 4 inch wide ASJ tape which matches the jacket of the pipe insulation.
  - d. Insulate anchors attached directly to the pipe for a sufficient distance to prevent condensation but no less than 6 inches from the insulation surface.
  - e. Mark insulation to show the location of unions, strainers, and check valves.

#### 3.2.2.5 Optional PVC Fitting Covers

At the option of the Contractor, premolded, one or two piece PVC fitting covers may be used in lieu of the vapor retarder and embedded glass tape. Factory precut insulation inserts or premolded insulation segments must be used under the fitting covers for elbows, tees and other miscellaneous configurations. Insulation inserts must be the same installed insulation thickness. One insert must be installed for each inch of pipe insulation. The installed and compressed insert must have the same thermal performance as the pipe insulation. Premolded insulation segments must be the same insulation as the pipe insulation including same density, thickness, and thermal conductivity. PVC fitting covers must be secured by PVC vapor retarder tape, adhesive, seal welding or with tacks made for securing PVC covers. For above ambient pipe temperatures, secure PVC covers using tacks. As an option circumferential joints can be covered with PVC vapor retarder tape. For below ambient conditions seal system using PVC vapor retarder tape, and vapor retarder mastic with vapor dams. Longitudinal seams may be sealed with vapor retarder mastic, PVC vapor retarder tape or solvent weld adhesive to obtain a continuous vapor seal. For severe service conditions install PVC jackets over the existing ASJ jacket and seal using a solvent weld adhesive.

### 3.2.3 Aboveground Hot Pipelines

#### 3.2.3.1 General Requirements

Insulate all hot pipe lines above 60 degrees F, except those piping listed in subparagraph Pipe Insulation in PART 3 as to be omitted, in accordance with Table 2. This includes but is not limited to the following:

- a. Domestic hot water supply & re-circulating system.
- b. Steam.
- c. Condensate & compressed air discharge.
- d. Hot water heating.
- e. Heated oil.
- f. Water defrost lines in refrigerated rooms.

Cover insulation, in accordance with manufacturer's recommendations, with a factory applied Type I jacket or field applied aluminum where required or seal welded PVC.

#### 3.2.3.2 Insulation for Fittings and Accessories

Butt pipe insulation tightly to the insulation of the fittings and accessories. Seal butted joints and ends with joint sealant. Mark insulation to show the location of unions, strainers, check valves and other components that would otherwise be hidden from view by the insulation.

##### 3.2.3.2.1 Precut or Preformed

Place precut insulation inserts or preformed insulation inserts around all fittings and accessories. Insulation inserts must be the same installed insulation thickness as the pipe insulation. One insert must be installed for each inch of pipe insulation thickness. The installed and compressed insert must have the same thermal performance as the pipe insulation. Preformed insulation inserts must be the same insulation as the pipe insulation including same density, thickness, and thermal conductivity.

##### 3.2.3.2.2 Rigid Preformed

Where precut/preformed is unavailable, rigid preformed pipe insulation sections may be segmented into the shape required. Use insulation that is the same thickness and conductivity as the adjoining pipe insulation. If nesting size insulation is used, do not overlap insulation 2 inches or one pipe diameter. Elbows insulated using segments must conform to MICA Tables 12.20 "Mitered Insulation Elbow".

### 3.2.4 Piping Exposed to Weather

Insulate and jacket piping exposed to weather as specified for the applicable service inside the building. After this procedure, apply a laminated self-adhesive (minimum 2 mils adhesive, 3 mils embossed) vapor barrier/weatherproofing jacket - less than 0.02 permeability (greater than 3 ply, standard grade, silver, white, black and embossed aluminum jacket, stainless steel or PVC jacket).

PVC jacketing requires no factory-applied jacket beneath it, however apply an all service jacket if factory applied jacketing is not furnished.

#### 3.2.4.1 Aluminum Jacket

The jacket for hot piping may be factory applied. Overlap the jacket no less than 2 inches at longitudinal and circumferential joints and secure with bands at no more than 12 inch centers. Overlap longitudinal joints down to shed water and locate at 4 or 8 o'clock positions. Seal joints on piping 60 degrees F and below with metal jacketing/flashings sealant while overlapping to prevent moisture penetration. Where jacketing on piping 60 degrees F and below abuts an un-insulated surface, caulk joints to prevent moisture penetration. Seal joints on piping above 60 degrees F with a moisture retarder.

#### 3.2.4.2 Insulation for Fittings

Insulate and finish flanges, unions, valves, fittings, and accessories as specified for the applicable service. Apply two coats of breather emulsion type weatherproof mastic (impermeable to water, permeable to air) recommended by the insulation manufacturer with glass tape embedded between coats. Overlap tap no less than 1 inch and the adjoining aluminum jacket no less than 2 inches. Factory preformed aluminum jackets may be used in lieu of the above. Provide molded PVC fitting covers when PVC jackets are used for straight runs of pipe. PVC fitting covers must be sealed based upon the pipe temperature in combination with ambient conditions and if the pipe insulation will be exposed to severe service conditions. For below ambient conditions, the pipe insulation and insulation fittings must be covered and sealed with a vapor barrier or weatherproofing jacket with a minimum 0.02 permeability as defined per ASTM C1136 before installing the PVC jacket and fitting cover. When in doubt as to the pipe temperature or service conditions, secure the PVC jacket using a weld adhesive using the manufacturer's recommended adhesive.

#### 3.2.4.3 PVC Jacket

Provide ultraviolet resistant PVC jacket that is adhesive welded weather tight with manufacturer's recommended adhesive. Include provision for thermal expansion.

#### 3.2.4.4 Stainless Steel Jackets

ASTM A240/A240M; Type 304, minimum thickness of 33 gauge (0.010 inch), smooth surface with factory-applied polyethylene and kraft paper moisture barrier on inside surface. Provide stainless steel bands, minimum width of 1/2 inch.

### 3.3 DUCT INSULATION SYSTEMS INSTALLATION

Except for oven hood exhaust duct insulation, install corner angles on external corners of insulation on ductwork in exposed finished spaces before covering with jacket. Omit duct insulation on exposed supply and return ducts in air conditioned spaces unless otherwise shown. Air conditioned spaces are defined as those spaces directly supplied with cooled conditioned air (or provided with a cooling device such as a fan-coil unit) and heated conditioned air (or provided with a heating

device such as a unit heater, radiator or convector).

### 3.3.1 Duct Insulation Minimum Thickness

Duct insulation minimum thickness in accordance with Table 4.

| Table 4 - Minimum Duct Insulation (inches) |     |
|--------------------------------------------|-----|
| Cold Air Ducts                             | 2.0 |
| Relief Ducts                               | 1.5 |
| Fresh Air Intake Ducts                     | 1.5 |
|                                            |     |
| Warm Air Ducts                             | 2.0 |
| Relief Ducts                               | 1.5 |
| Fresh Air Intake Ducts                     | 1.5 |

### 3.3.2 Insulation and Vapor Retarder/Vapor Barrier for Cold Air Duct

Provide insulation and vapor retarder/vapor barrier for the following cold air ducts and associated equipment.

- a. Supply ducts.
- b. Return air ducts.
- c. Relief ducts.
- d. Flexible run-outs (field-insulated).
- e. Plenums.
- f. Duct-mounted coil casings.
- g. Coil headers and return bends.
- h. Coil casings.
- i. Fresh air intake ducts.
- j. Filter boxes.
- k. Mixing boxes (field-insulated).
- l. Supply fans (field-insulated).
- m. Site-erected air conditioner casings.
- n. Ducts exposed to weather.
- o. Combustion air intake ducts.
- p. Exhaust ducts passing through concealed spaces, unconditioned spaces, or semi-heated spaces exhausting conditioned air.

Use insulation for rectangular ducts that is flexible type where concealed, minimum density 3/4 pcf, and rigid type where exposed, minimum density 3 pcf. Provide insulation for both concealed or exposed round/oval ducts that is flexible type, minimum density 3/4 pcf or a semi rigid board, minimum density 3 pcf, formed or fabricated to a tight fit, edges beveled and joints tightly butted and staggered. Provide insulation for all exposed ducts with either a white, paint-able, factory-applied Type I jacket or a field applied vapor retarder/vapor barrier jacket coating finish as specified. Ensure the total field applied dry film thickness is approximately 1/16 inch. Provide insulation on all concealed duct with a factory-applied Type I or II vapor retarder/vapor barrier jacket. Continue duct insulation through sleeves and prepare openings except firewall penetrations. Duct insulation terminating at fire dampers, must be continuous over the damper collar and retaining angle of fire dampers, which are exposed to unconditioned air and which may be prone to condensate formation. Provide duct insulation and vapor retarder/vapor barrier to cover the collar, neck, and un-insulated surfaces of diffusers, registers and grills. Apply vapor retarder/vapor barrier materials to form a complete unbroken vapor seal over the insulation. Seal sheet metal duct in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION.

#### 3.3.2.1 Installation on Concealed Duct

- a. For rectangular, oval or round ducts, attach flexible insulation by applying adhesive around the entire perimeter of the duct in 6 inch wide strips on 12 inch centers.
- b. For rectangular and oval ducts, 24 inches and larger, additionally secure insulation to bottom of ducts using mechanical fasteners. Space fasteners on 16 inch centers and no more than 16 inches from duct corners.
- c. For rectangular, oval and round ducts, provide mechanical fasteners on sides of duct risers for all duct sizes. Space fasteners on 16 inch centers and no more than 16 inches from duct corners.
- d. Impale insulation on the mechanical fasteners (self stick pins) where used and press thoroughly into the adhesive. Take care to ensure vapor retarder/vapor barrier jacket joints overlap 2 inches. Do not compress insulation to a thickness less than that specified. Carry insulation over standing seams and trapeze-type duct hangers.
- e. Where mechanical fasteners are used, install self-locking washers and trim and bend the pin over.
- f. Secure jacket overlaps with staples and tape as necessary to ensure a secure seal. Coat staples, tape and seams with a brush coat of vapor retarder coating or PVDC adhesive tape or greater than 3 ply laminate (minimum 2 mils adhesive, 3 mils embossed) - less than 0.0000 perm adhesive tape.
- g. Cover breaks in the jacket material with patches of the same material as the vapor retarder jacket. Do not extend patches less than 2 inches beyond the break or penetration in all directions and secure with tape and staples. Seal staples and tape joints with a brush coat of vapor retarder coating or PVDC adhesive tape or greater than 3 ply laminate (minimum 2 mils adhesive, 3 mils embossed) - less than 0.0000 perm adhesive tape.

- h. At jacket penetrations such as hangers, thermometers, and damper operating rods, fill voids in the insulation and seal the penetration with a brush coat of vapor retarder coating or PVDC adhesive tape greater than 3 ply laminate (minimum 2 mils adhesive, 3 mils embossed) - less than 0.0000 perm adhesive tape.
- i. Seal insulation terminations and pin punctures and flash with a reinforced vapor retarder coating finish or tape with a brush coat of vapor retarder coating.. Ensure the coating overlaps the adjoining insulation and un-insulated surface 2 inches. Extend pin puncture coatings 2 inches from the puncture in all directions.
- j. Where insulation standoff brackets occur, extend insulation under the bracket and terminate the jacket at the bracket.

#### 3.3.2.2 Installation on Exposed Duct Work

- a. For rectangular ducts, secure rigid insulation to the duct by mechanical fasteners on all four sides of the duct, space no more than 12 inches apart and no more than 3 inches from the edges of the insulation joints. Provide a minimum of two rows of fasteners for each side of duct 12 inches and larger. Provide one row for each side of duct less than 12 inches. Provide mechanical fasteners that are corrosion resistant as G60 coated galvanized steel, and indefinitely sustain a 50 lb tensile dead load test perpendicular to the duct wall.
- b. Form duct insulation with minimum jacket seams. Fasten each piece of rigid insulation to the duct using mechanical fasteners. When the height of projections is less than the insulation thickness, bring insulation up to standing seams, reinforcing, and other vertical projections and do not carry over. Continue vapor retarder/barrier jacket across seams, reinforcing, and projections. When height of projections is greater than the insulation thickness, carry over insulation and jacket . Apply insulation with joints tightly butted. Neatly bevel insulation around name plates and access plates and doors.
- c. Impale insulation on the fasteners; install self-locking washers and trim and bend the pin over.
- d. Seal joints in the insulation jacket with a 4 inch wide strip of tape. Seal taped seams with a brush coat of vapor retarder coating.
- e. Cover breaks and ribs or standing seam penetrations in the jacket material with a patch of the same material as the jacket. Do not extend patches less than 2 inches beyond the break or penetration and secure with tape and staple. Seal staples and joints with a brush coat of vapor retarder coating.
- f. At jacket penetrations such as hangers, thermometers, and damper operating rods, fill the voids in the insulation and seal the penetrations with a flashing sealant.
- g. Seal and flash insulation terminations and pin punctures with a reinforced vapor retarder coating finish. Ensure coating overlaps the adjoining insulation and un-insulated surface 2 inches. Extend pin puncture coatings 2 inches from the puncture in all directions.
- h. Insulation for both concealed or exposed round or oval ducts must be

flexible type, minimum density 3/4 pcf or a semi rigid board, minimum density 3 pcf, formed or fabricated to a tight fit, edges beveled and joints tightly butted and staggered. Insulation for all exposed ducts must be provided with either a white, factory-applied Type I jacket or a field applied vapor retarder or vapor barrier jacket coating finish as specified, the total field applied dry film thickness must be approximately 1/16 inch.

- i. Insulate oval and round ducts, flexible type, with factory Type I jacket insulation with minimum density of 3/4 pcf, attach in accordance with MICA standards.

### 3.3.3 Insulation for Warm Air Duct

Provide insulation and vapor barrier for the following warm air ducts and associated equipment:.

- a. Supply ducts.
- b. Return air ducts.
- c. Relief air ducts
- d. Flexible run-outs (field insulated).
- e. Plenums.
- f. Duct-mounted coil casings.
- g. Coil-headers and return bends.
- h. Coil casings.
- i. Fresh air intake ducts.
- j. Filter boxes.
- k. Mixing boxes.
- l. Supply fans.
- m. Site-erected air conditioner casings.
- n. Ducts exposed to weather.
- o. Exhaust ducts passing through concealed spaces, unconditioned spaces, or semi-heated spaces exhausting conditioned air.

Provide insulation for rectangular ducts that is flexible type where concealed, and rigid type where exposed. Provide insulation on exposed ducts with a white, paint-able, factory-applied Type II jacket, or finish with adhesive finish. Use flexible type insulation for round ducts, with a factory-applied Type II jacket. Provide insulation on concealed duct with a factory-applied Type II jacket. Accomplish adhesive finish where indicated to be used by applying two coats of adhesive with a layer of glass cloth embedded between the coats. Ensure total dry film thickness is approximately 1/16 inch. Continue duct insulation through sleeves and prepare openings. Terminate duct insulation at fire dampers and flexible connections.

#### 3.3.3.1 Installation on Concealed Duct

- a. For rectangular, oval and round ducts, attach insulation by applying adhesive around the entire perimeter of the duct in 6 inch wide strips on 12 inch centers.
- b. For rectangular and oval ducts 24 inches and larger, secure insulation to the bottom of ducts using mechanical fasteners. Space fasteners on 18 inch centers and no more than 18 inches from duct corner.
- c. For rectangular, oval and round ducts, provide mechanical fasteners on sides of duct risers for all duct sizes. Space fasteners on 18 inch centers and no more than 18 inches from duct corners.
- d. Impale insulation on the mechanical fasteners where used. Do not compress insulation to a thickness less than that specified. Carry insulation over standing seams and trapeze-type hangers.
- e. Install self-locking washers where mechanical fasteners are used and trim and bend the pin over.
- f. Do not overlap insulation jacket less than 2 inches at joints and secure the lap and staple on 4 inch centers.

#### 3.3.3.2 Installation on Exposed Duct

- a. For rectangular ducts, secure the rigid insulation to the duct using mechanical fasteners on all four sides of the duct, space no more than 16 inches apart and no more than 6 inches from the edges of the insulation joints. Provide a minimum of two rows of fasteners for each side of duct 12 inches and larger and a minimum of one row for each side of duct less than 12 inches.
- b. Form duct insulation with factory-applied jacket with minimum jacket seams, and fasten each piece of rigid insulation to the duct using mechanical fasteners. When the height of projection is less than the insulation thickness, bring insulation up to standing seams, reinforcing, and other vertical projections and do not carry over the projection. Continue jacket across seams, reinforcing, and projections. Where the height of projections is greater than the insulation thickness, carry insulation and jacket over the projection.
- c. Impale insulation on the fasteners; install self-locking washers and trim and bend the pin over.
- d. Seal joints on jacketed insulation with a 4 inch wide strip of tape and brush with vapor retarder coating.
- e. Cover breaks and penetrations in the jacket material with a patch of the same material as the jacket. Extend patches no less than 2 inches beyond the break or penetration and secure with adhesive and staple.
- f. Seal insulation terminations and pin punctures with tape and brush with vapor retarder coating.
- g. Insulate oval and round ducts, flexible type, with factory Type I jacket insulation, minimum density of 3/4 pcf attach by staples spaced no more than 16 inches and no more than 6 inches from the degrees of

joints. Seal joints in accordance with item "d." above.

#### 3.3.4 Duct Test Holes

After duct systems have been tested, adjusted, and balanced, repair breaks in the insulation and jacket in accordance with the applicable section of this specification for the type of duct insulation to be repaired. After the insulation is repaired, identify on the outside of the insulation with marker, sticker, or other means "TAB test ports."

#### 3.3.5 Duct Exposed to Weather

##### 3.3.5.1 Installation

Insulate and finish ducts exposed to weather as specified for the applicable service for exposed duct inside the building. After the above is accomplished, further finish the insulation as detailed in the following subparagraphs.

##### 3.3.5.2 Round Duct

Laminated self-adhesive (minimum 2 mils adhesive, 3 mils embossed) vapor barrier/weatherproofing jacket - Less than 0.02 permeability, (greater than 3 ply, standard grade, silver, white, black and embossed or greater than 8 ply, heavy duty, white and natural) membrane must be applied overlapping material by 3 inches no bands or caulking needed - see manufacturer's recommended installation instructions. Aluminum jacket with factory applied moisture retarder must be applied with the joints lapped no less than 3 inches and secured with bands located at circumferential laps and at no more than 12 inch intervals throughout. Lap horizontal joints down to shed water and located at 4 or 8 o'clock position. Seal joints with metal jacketing sealant to prevent moisture penetration. Where jacketing abuts an un-insulated surface, seal joints with metal jacketing sealant.

##### 3.3.5.3 Fittings

Finish fittings and other irregular shapes as specified for rectangular ducts.

##### 3.3.5.4 Rectangular Ducts

Apply two coats of weather barrier mastic reinforced with fabric or mesh for outdoor application to the entire surface. Ensure each coat of weatherproof mastic has a minimum thickness of 1/16 inch. Ensure exterior is a metal jacketing applied for mechanical abuse and weather protection, and secure with screws or vapor barrier/weatherproofing jacket less than 0.02 permeability greater than 3 ply, standard grade, silver, white, black, and embossed or greater than 8 ply, heavy duty white and natural. Apply membrane overlapping material by 3 inches. No bands or caulking needed-see manufacturing recommend installation instructions.

#### 3.4 EQUIPMENT INSULATION SYSTEMS INSTALLATION

##### 3.4.1 General

Provide removable insulation sections to cover parts of equipment that must be opened periodically for maintenance including vessel covers, fasteners, flanges and accessories. Omit equipment insulation on the

following:

- a. Hand-holes.
- b. Boiler manholes.
- c. Cleanouts.
- d. ASME stamps.
- e. Manufacturer's nameplates.
- f. Duct Test/Balance Test Holes.

#### 3.4.2 Insulation for Cold Equipment

Cold equipment below 60 degrees F: Furnish insulation on equipment handling media below 60 degrees F including the following:

- a. Pumps.
- b. Refrigeration equipment parts that are not factory insulated.
- c. Drip pans under chilled equipment.
- d. Cold water storage tanks.
- e. Water softeners.
- f. Duct mounted coils.
- g. Cold and chilled water pumps.
- h. Pneumatic water tanks.
- i. Roof drain bodies.
- j. Air handling equipment parts that are not factory insulated.
- k. Expansion and air separation tanks.

##### 3.4.2.1 Insulation Type

Provide insulation suitable for the temperature encountered. Provide material and thicknesses as shown in Table 5:

| TABLE 5                                           |          |                    |
|---------------------------------------------------|----------|--------------------|
| Insulation Thickness for Cold Equipment (inches)  |          |                    |
| Equipment handling media at indicated temperature |          |                    |
|                                                   | Material | Thickness (inches) |
| 35 to 60 degrees F                                |          |                    |

| TABLE 5                                           |                               |                    |
|---------------------------------------------------|-------------------------------|--------------------|
| Insulation Thickness for Cold Equipment (inches)  |                               |                    |
| Equipment handling media at indicated temperature |                               |                    |
|                                                   | Material                      | Thickness (inches) |
|                                                   | Cellular Glass                | 1.5                |
|                                                   | Flexible Elastomeric Cellular | 1                  |
| 1 to 34 degrees F                                 |                               |                    |
|                                                   | Cellular Glass                | 3                  |
|                                                   | Flexible Elastomeric Cellular | 1.5                |
| Minus 30 to 0 degrees F                           |                               |                    |
|                                                   | Cellular Glass                | 3.5                |
|                                                   | Flexible Elastomeric Cellular | 1.75               |

#### 3.4.2.2 Pump Insulation

- a. Insulate pumps by forming a box around the pump housing. Construct the box by forming the bottom and sides using joints that do not leave raw ends of insulation exposed. Join joints between sides and between sides and bottom by adhesive with lap strips for rigid mineral fiber and contact adhesive for flexible elastomeric cellular insulation. Ensure box conforms to the requirements of MICA Insulation Stds plate No. 49 when using flexible elastomeric cellular insulation. Ensure joints between top cover and sides fit tightly forming a female shiplap joint on the side pieces and a male joint on the top cover, thus making the top cover removable.
- b. Protect exposed insulation corners with corner angles.
- c. Upon completion of installation of the insulation, including removable sections, apply two coats of vapor retarder coating with a layer of glass cloth embedded between the coats. The total dry thickness of the finish must be 1/16 inch. Provide a parting line between the box and the removable sections allowing the removable sections to be removed without disturbing the insulation coating. Apply flashing sealant to parting line, between equipment and removable section insulation, and at all penetrations.

#### 3.4.2.3 Other Equipment

- a. Form or fabricate insulation to fit the equipment. To ensure a tight fit on round equipment, bevel edges and tightly butt and stagger joints.
- b. Secure insulation in place with bands or wires at intervals as recommended by the manufacturer but no more than 12 inch centers except adhere flexible elastomeric cellular with contact adhesive.

Protect insulation corners under wires and bands with suitable corner angles.

- c. Install cellular glass in accordance with manufacturer's instructions. Seal joints and ends with joint sealant, and seal with a vapor retarder coating.
- d. Use removable insulation on heads of heat exchangers. Fabricate removable section joints using a male-female shiplap type joint. Finish the entire surface of the removable section by applying two coats of vapor retarder coating with a layer of glass cloth embedded between the coats. The total dry thickness of the finish must be 1/16 inch.
- e. Protect exposed insulation corners with corner angles.
- f. Apply insulation on equipment with ribs over 6 by 6 inches by 12 gauge welded wire fabric which has been cinched in place, or if approved by the Contracting Officer, spot weld to the equipment over the ribs. Secure insulation to the fabric with J-hooks and 2 by 2 inches washers or securely band or wire in place on 12 inch centers.

#### 3.4.2.4 Vapor Retarder/Vapor Barrier

Upon completion of installation of insulation, caulk penetrations. Apply two coats of vapor retarder coating or vapor barrier jacket over insulation, including removable sections, with a layer of open mesh synthetic fabric embedded between the coats. Ensure the total dry thickness of the finish is 1/16 inch. Apply flasing sealant or vapor barrier tape to parting line between equipment and removable section insulation.

#### 3.4.3 Insulation for Hot Equipment

Furnish insulation on equipment handling media above 60 degrees F including the following:

- a. Converters.
- b. Heat exchangers.
- c. Hot water generators.
- d. Water heaters.
- e. Pumps handling media above 130 degrees F.
- f. Fuel oil heaters.
- g. Hot water storage tanks.
- h. Air separation tanks.
- i. Surge tanks.
- j. Flash tanks.
- k. Feed-water heaters.

- l. Unjacketed boilers or parts of boilers.
- m. Boiler flue gas connection from boiler to stack (if inside).
- n. Induced draft fans.
- o. Fly ash and soot collectors.
- p. Condensate receivers.

#### 3.4.3.1 Insulation

Provide insulation suitable for the temperature encountered. Insulate shell and tube-type heat exchangers for the temperature of the shell medium.

Determine insulation thickness for hot equipment using Table 6:

| TABLE 6                                                                      |                                        |                    |
|------------------------------------------------------------------------------|----------------------------------------|--------------------|
| Insulation Thickness for Hot Equipment (inches)                              |                                        |                    |
| Equipment handling steam or media at indicated pressure or temperature limit |                                        |                    |
|                                                                              | Material                               | Thickness (inches) |
| 15 psig or 250 degrees F                                                     |                                        |                    |
|                                                                              | Rigid Mineral Fiber                    | 2                  |
|                                                                              | Flexible Mineral Fiber                 | 2                  |
|                                                                              | Calcium Silicate/Perlite               | 4                  |
|                                                                              | Cellular Glass                         | 3                  |
|                                                                              | Faced Phenolic Foam                    | 1.5                |
|                                                                              | Flexible Elastomeric Cellular (<200 F) | 1                  |
| 200psig or 400 degrees F                                                     |                                        |                    |
|                                                                              | Rigid Mineral Fiber                    | 3                  |
|                                                                              | Flexible Mineral Fiber                 | 3                  |
|                                                                              | Calcium Silicate/Perlite               | 4                  |
|                                                                              | Cellular Glass                         | 4                  |
| 600 degrees F                                                                |                                        |                    |
|                                                                              | Rigid Mineral Fiber                    | 5                  |
|                                                                              | Flexible Mineral Fiber                 | 6                  |
|                                                                              | Calcium Silicate/Perlite               | 6                  |

| TABLE 6                                                                                                                                                                                |                |                    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|--------------------|
| Insulation Thickness for Hot Equipment (inches)                                                                                                                                        |                |                    |
| Equipment handling steam or media at indicated pressure or temperature limit                                                                                                           |                |                    |
|                                                                                                                                                                                        | Material       | Thickness (inches) |
|                                                                                                                                                                                        | Cellular Glass | 6                  |
| 600 degrees F: Thickness necessary to limit the external temperature of the insulation to 120 F. Submit heat transfer calculations to substantiate insulation and thickness selection. |                |                    |

#### 3.4.3.2 Insulation of Pumps

Insulate pumps by forming a box around the pump housing. Construct the box by forming the bottom and sides using joints that do not leave raw ends of insulation exposed. Band bottom and sides to form a rigid housing that does not rest on the pump. Ensure joints between top cover and sides fit tightly. The top cover must have a joint forming a female shiplap joint on the side pieces and a male joint on the top cover, making the top cover removable. Apply two coats of Class I adhesive over insulation, including removable sections, with a layer of glass cloth embedded between the coats. Provide a parting line between the box and the removable sections allowing the removable sections to be removed without disturbing the insulation coating. The total dry thickness of the finish must be 1/16 inch. Apply caulking to parting line of the removable sections and penetrations.

#### 3.4.3.3 Other Equipment

- Form or fabricate insulation to fit the equipment. To ensure a tight fit on round equipment, bevel edges and tightly butt and stagger joints.
- Secure insulation in place with bands or wires at intervals as recommended by the manufacturer but no greater than 12 inch centers except adhere flexible elastomeric cellular. Protect insulation corners under wires and bands with suitable corner angles.
- On high vibration equipment, set cellular glass insulation in a coating of bedding compound as recommended by the manufacturer, and seal joints with bedding compound. Fill mineral fiber joints with finishing cement.
- Provide removable insulation on heads of heat exchangers. Fabricate the removable section joint using a male-female shiplap type joint. Finish the entire surface of the removable section as specified.
- Protect exposed insulation corners with corner angles.
- On equipment with ribs, such as boiler flue gas connection, draft fans, and fly ash or soot collectors, apply insulation over 6 by 6 inch by 12 gauge welded wire fabric which has been cinched in place, or if

approved by the Contracting Officer, spot weld to the equipment over the ribs. Secure insulation to the fabric with J-hooks and 2 by 2 inch washers or securely band or wire in place on 12 inch (maximum) centers.

- g. On equipment handling media above 600 degrees F, apply insulation in two or more layers with staggered joints.
- h. Upon completion of installation of insulation, caulk penetrations. Apply two coats of adhesive over insulation, including removable sections, with a layer of glass cloth embedded between the coats. The total dry thickness of the finish must be 1/16 inch. Apply caulking to parting line between equipment and removable section insulation.

#### 3.4.4 Equipment Exposed to Weather

##### 3.4.4.1 Installation

Insulate equipment exposed to weather and finish in accordance with the requirements for ducts exposed to weather in paragraph DUCT INSULATION INSTALLATION.

##### 3.4.4.2 Optional Panels

At the option of the Contractor, prefabricated metal insulation panels may be used in lieu of the insulation and finish previously specified. Thermal performance must be equal to or better than that specified for field applied insulation. Provide panels that are the standard catalog product of a manufacturer of metal insulation panels. Provide fastenings, flashing, and support system conforming to published recommendations of the manufacturer for weatherproof installation and that prevent moisture from entering the insulation. Design panels to accommodate thermal expansion and to support a 250 pound walking load without permanent deformation or permanent damage to the insulation. Exterior metal cover sheet must be aluminum and exposed fastenings must be stainless steel or aluminum.

-- End of Section --

SECTION 23 08 00

COMMISSIONING OF MECHANICAL SYSTEMS

05/23, CHG 1: 08/24

PART 1 GENERAL

Building Commissioning is a systematic, quality-focused process for enhancing the delivery of a project that focuses on verifying and documenting that all of the commissioned systems and assemblies are planned, designed, installed, tested, operated, and maintained to meet the project requirements. The purpose is to reduce the cost and performance risks associated with delivering facilities projects, and to increase value to owners, occupants, and users. Comply with specification Section 01 91 00.15 BUILDING COMMISSIONING.

1.1 SEQUENCING AND SCHEDULING

Complete functional performance testing prior to performance verification testing required by Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. Complete the following prior to starting Functional Performance Tests of mechanical systems:

- a. All equipment and systems completed, cleaned, flushed, disinfected, calibrated, tested, and operate in accordance with contract documents and construction plans and specifications
- b. Final DALT Report submitted and approved in accordance with Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC
- c. Pre-final Testing, Adjusting, and Balancing Report submitted in accordance with Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC
- e. The Certificate of Readiness submitted and approved in accordance with Section 01 91 00.15 BUILDING COMMISSIONING

1.2 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Test Equipment; G

SD-06 Test Reports

Pipe Flushing, Testing, And Water Treatment Reports; G

Completed Pre-Functional Checklists; G

Seasonal Test Report; G

Full-Load Test Report; G

Post-Construction Trend Log Report; G

SD-07 Certificates

Certificate Of Readiness; G

1.3 ACCESSIBILITY REQUIREMENTS

Equipment, systems, and devices for commissioned systems must be accessible. Make necessary modifications if systems and devices are not accessible for inspections and testing.

Assist commissioning team in testing by removing equipment covers, opening access panels, and other required activities that assist with visual oversight. Furnish ladders, flashlights, meters, gauges, or other inspection equipment as necessary.

1.4 COORDINATION

Refer to Section 01 91 00.15 BUILDING COMMISSIONING for requirements pertaining to coordination during the commissioning process. Coordinate with the Commissioning Provider in accordance with Section 01 91 00.15 and in accordance with the Commissioning Plan to schedule inspections as required to support the commissioning process. Furnish additional information requested by the Commissioning Provider. Coordinate scheduling of Functional Performance Testing with the commissioning team. Provide plans, reports, notes, and other documentation to the Commissioning Provider as specified in the commissioning plan, as it is completed.

1.5 PIPE FLUSHING, TESTING, AND WATER TREATMENT REPORTS

Test requirements are specified in Division 22 and 23 piping Sections. Prepare a pipe system cleaning, flushing, and hydrostatic testing log. Provide cleaning, flushing, testing, and water treatment log and final reports.

Include the following in the pipe system cleaning, flushing, and hydrostatic testing log:

- a. Minimum flushing water velocity.
- b. Water treatment reports.
- c. Tracking checklist for managing and ensuring that all pipe sections have been cleaned, flushed, hydrostatically tested, and chemically treated.

1.6 CERTIFICATE OF READINESS

Submit Certificate of Readiness documentation in accordance with Section 01 91 00.15 BUILDING COMMISSIONING for all equipment and systems including start-up reports; completed Pre-Functional Checklists; Testing, Adjusting, and Balancing (TAB) Report; Issues Log; HVAC Controls Start-Up Reports. Do not schedule Functional Performance Tests for the system until the Certificate of Readiness for that system receives approval by the Government. The CxC, Quality Control Manager, and the Mechanical, Electrical, Controls, and TAB subcontractor representatives must sign and date the Certificate of Readiness.

## PART 2 PRODUCTS

### 2.1 TEST EQUIPMENT

Provide all testing equipment required to perform testing for the systems to be commissioned, except for equipment specific to and used by TAB as required by Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC. Provide a sufficient quantity of two-way radios for each subcontractor. Submit list of Test Equipment and instrumentation to be used for testing including equipment/instrument identification number, equipment application or planned use, manufacturer, make, model, and serial number, and calibration history with certificates. Also list special equipment and proprietary tools specific to a piece of equipment required for testing.

#### 2.1.1 Proprietary Equipment

Provide manufacturer's proprietary test equipment and software required by any equipment manufacturer for programming and start-up, whether specified or not. Provide manufacturer test equipment, demonstrate its use, and assist in the commissioning process as needed. Provide data logging equipment and software required to test equipment.

#### 2.1.2 Calibration and Accuracy

Comply with equipment manufacturer's test equipment calibration procedures and intervals. Recalibrate test instruments immediately after instruments have been repaired resulting from being dropped or damaged. Affix calibration tags to test instruments. Furnish calibration records to Contracting Officer upon request.

Provide all testing equipment of sufficient quality and accuracy to test and measure system performance with the tolerances specified. Unless otherwise noted, the following minimum requirements apply: Provide temperature sensors and digital thermometers with a certified calibration within the past year to an accuracy of 0.5 degrees F and a resolution of plus or minus 0.1 degrees F. Provide pressure sensors with an accuracy of plus or minus 2.0 percent of the value range being measured (not full range of meter) and calibrated within the last year.

## PART 3 EXECUTION

### 3.1 MEETINGS

Attend all meetings in accordance with Section 01 91 00.15 BUILDING COMMISSIONING.

Provide timely updates on construction schedule changes to allow the Commissioning Provider to execute commissioning process efficiently. Notify Contracting Officer of anticipated construction delays to commissioning activities not yet performed or not yet scheduled.

### 3.2 COMMISSIONING CONSTRUCTION OBSERVATION CHECKLISTS

Commissioning construction observation checklists include Pre-Functional Checklists and Functional Performance Test Checklists. Provide commissioning construction observation checklists for the Interim and Final Construction Phase Commissioning Plan in accordance with Section

01 91 00.15 BUILDING COMMISSIONING.

### 3.2.1 Pre-Functional Checklists

The Pre-Functional Checklists must include items for physical inspection or testing that demonstrate that installation and start-up of equipment and systems is complete. Refer to paragraph PRE-FUNCTIONAL CHECKS. Pre-functional checklists must be tailored to verify the specific installation requirements and details of the construction documents and manufacturer's instructions.

Use the Pre-Functional Checklists prepared by the CxC for physical inspection or testing to demonstrate that installation and start-up of equipment and systems is complete. Refer to paragraph PRE-FUNCTIONAL CHECKS.

### 3.2.2 Functional Performance Test Checklists

Functional Performance Test Checklists must include procedures that explain, step-by-step, the actions and expected results that will demonstrate that the system performs in accordance with the contract. Refer to paragraph FUNCTIONAL PERFORMANCE TESTING. Include the following sections and details appropriate to the systems being tested in the Functional Performance Test Checklists:

- a. Notable system features including information about controls to facilitate understanding of system operation and maintenance
- b. Conclusions and recommendations. Conclusions must clearly indicate if system does or does not perform in accordance with contract requirements and specifications. Recommendation must clearly indicate that the system should or should not be approved by the Government.
- c. Test conditions including date, beginning and ending time, and beginning and ending outdoor air conditions
- d. Attendees
- e. Identification of the equipment involved in the test
- f. **System feature identification**
- g. Point-to-point observations including demonstrating system flow meters and sensors have been calibrated and are correctly displayed on the Operator work station
- h. Actuator operation observations demonstrating actuator responses to commands from the control system
- i. As-found condition of the system operation
- j. List of test items with step numbers along with the corresponding feature or control operation, intended test procedure, expected system response, and pass/fail indication.
- k. Space for comments for each test item.

Use the Functional Performance Test Checklists prepared by the CxC that list, step-by-step, the actions and expected results that will demonstrate that the system performs in accordance with the contract. Refer to paragraph FUNCTIONAL PERFORMANCE TESTING.

### 3.3 PRE-FUNCTIONAL CHECKS

Pre-Functional Checks are a type of Commissioning Inspection in accordance with Section 01 91 00.15 BUILDING COMMISSIONING. Complete one Pre-Functional Checklist for each individual item of equipment or system for each system required to be commissioned including, but not limited to, ductwork, piping, equipment, fixtures, and controls. Include manufacturer start-up checklists associated with equipment with the submission of the Pre-Functional Checklists. Provide manufacturer's installation manual for each type of unit. Indicate commissioning team member inspection and validation of each Pre-Functional Checklist item by initials. Validation of each Pre-Functional Checklist item by each team member indicates that item conforms to the contract documents and validated design in their area of responsibility. Commissioning Specialist validation of each Pre-Functional Checklist item indicates that each item has been installed correctly and in accordance with contract documents. Required commissioning team members for Pre-Functional Checks includes the CxC, Mechanical Commissioning Specialist, Quality Control Manager, sub-contractor representative for each trade responsible for construction/installation of the checklist item, and the TAB representative (for items impacting TAB). Submit the initialed and Completed Pre-Functional Checklists no later than 7 calendar days after completion of inspection of all checklist items for each system.

### 3.4 STARTUP AND INITIAL CHECKOUT

Document start-up and initial testing procedures, and include in the Completed Pre-Functional Checklists submittal, including:

- a. Startup tests and factory testing reports.
- b. Manufacturer's representative start-up, operating, troubleshooting and maintenance procedures.
- d. Perform and clearly document system operational checks and quality control checks as they are completed, and providing a copy to the commissioning team.
- e. Correct deficiencies and sign the Certificate of Readiness for each system before functional performance testing

### 3.5 TESTING, ADJUSTING, AND BALANCING REPORT REVIEW AND VERIFICATION

#### 3.5.1 Testing, Adjusting, and Balancing (TAB) Report Review

The Commissioning Specialist is responsible for reviewing the pre-final TAB Report required by Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC and identifying any deficiencies to the Contracting Officer's Representative and the Contractor's Quality Control Personnel. All deficiencies must be resolved prior to TAB Report approval.

#### 3.5.2 Testing, Adjusting, and Balancing (TAB) Report Verification

The Commissioning Specialist is responsible for witnessing the TAB Field

Acceptance Testing specified by Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC and identifying any deficiencies to the Contracting Officer's Representative and the Contractor's Quality Control Personnel. All deficiencies must be resolved prior to TAB Report approval.

### 3.6 HVAC CONTROLS START-UP AND PERFORMANCE VERIFICATION TEST REVIEW

The Commissioning Specialist is responsible for reviewing the Start-Up Testing Report, PVT Procedures and PVT Reports including endurance testing trend data required by Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC and identifying any deficiencies to the Contracting Officer's Representative and the Contractor's Quality Control Personnel. All deficiencies must be resolved prior to final acceptance.

### 3.7 FUNCTIONAL PERFORMANCE TESTING

Functional Performance Testing are a type of Commissioning Testing in accordance with Section 01 91 00.15 BUILDING COMMISSIONING. Conduct Functional Performance Testing in accordance with Section 01 91 00.15 BUILDING COMMISSIONING and requirements in this Section. Prior to Functional Performance Testing, complete all prerequisites in accordance with paragraph SEQUENCING AND SCHEDULING. Demonstrate that all system components have been installed, that each control device and item of equipment operates, and that the systems operate and perform, including interactive operation between systems, in accordance with contract documents.

#### 3.7.1 Test Scheduling and Coordination

Schedule and conduct Initial Functional Performance Tests as soon as all contract work is completed, regardless of the season. Develop and implement means of artificial loading to demonstrate, to a reasonable level of confidence, the ability of the HVAC systems to handle peak seasonal loads. Schedule Functional Performance Tests for each system only after the Certificate of Readiness has been approved by the Government for the system. Correct all deficiencies identified through any prior review, inspection, or test activity before the start of Functional Performance Tests.

Functional Performance Tests must be performed with the CxC present. Government reserves the right to witness all tests. Coordinate test schedule with Government representatives.

#### 3.7.2 Preparation

Put equipment and systems into operation and continue operation during each working day of functional performance testing, as required. Verify temperature and pressure taps in accordance with Contract Documents. Provide a pressure/temperature plug at each water sensor which is an input point to control system.

Perform minor adjustments to equipment and systems during Functional Performance Tests as deemed necessary by the commissioning team. Where calibrated DDC sensors cannot be used to record test data, provide measuring instruments, logging devices, and data acquisition equipment to record data for the complete range of test data for the required test period.

### 3.7.3 Testing Procedures

Provide all necessary materials and system modifications to produce the necessary flows, pressures, temperatures, and other conditions necessary to execute the test according to the specified conditions. At completion of the test, return the affected building equipment and systems to their pre-test condition.

Follow the Functional Performance Test from the approved Final Construction Phase Commissioning Plan. Perform Functional Performance Tests for each item of equipment and each system required to be commissioned. Verify all sensor calibrations, control responses, safeties, interlocks, operating modes, sequences of operation, capacities, and all other performance requirements comply with contract, regardless of the specific items listed within the checklists provided. In general, testing must progress from equipment or components to subsystems to systems to interlocks and connections between systems. Commissioning Specialists are responsible for determining the order of components and systems to be tested.

Indicate validation of each item of equipment and systems tested by signature of each commissioning team member for each test. The Quality Control Representative, Commissioning Specialists, and Contracting Officer's Representative, if present, must indicate validation after the equipment and systems are free of deficiencies.

### 3.7.4 Simulating Conditions

Functional performance testing is conducted by simulating conditions at control devices to initiate a control system response. Before testing, calibrate all sensors, transducers and devices. Over-writing control input values through the control system is not acceptable unless approved by the Contracting Officer. Perform each test under conditions that simulate actual conditions as close as is practically possible. Specific examples of simulating conditions are provided below. Do not simulate conditions when damage to the system or building may result.

- a. When varying static pressures inside ductwork cannot be simulated within the duct, and where a sensor signals the controls system to initiate sequences at various duct static pressures, it is acceptable to simulate the various pressures with a Pneumatic Squeeze-Bulb Type Signaling Device with gauge temporarily attached to the sensing tube leading to the transmitter. It is not acceptable to reset the various set-points, nor to simulate an electric analog signal (unless approved as noted above).
- b. Dirty filter pressure drops can be simulated by partially blocking filter face.
- c. Freeze-stat safeties can be simulated by packing portion of sensor with ice.
- d. High outside air temperatures can be simulated with a hair blower.
- e. Raising entering cooling coil temperatures by activating a heating/preheat coil can be used to simulate entering cooling coil conditions.
- f. Do not use signal generators to simulate sensor signals unless

approved by the Contracting Officer, as noted above, for special cases.

- g. Control set points can be altered. For example, to see the air conditioning compressor lockout work at an outside air temperature below 55 degrees F, when the outside air temperature is above 55 degrees F, temporarily change the lockout set point to be 0 degrees F above the current outside air temperature. Caution: Set points are not to be raised or lowered to a point to cause damage to the components, systems, or the building structure and contents.
- h. Test duct mounted smoke detectors in accordance with the manufacturer's recommendations. Perform the tests with air system at minimum airflow condition.
- i. Test current sensing relays used for fan and pump status signals to control system to indicate unit failure and run status by resetting the set point on the relay to simulate a lost belt or unit failure while the unit is running. Confirm that the failure alarm was generated and received at the control system. After the test is conducted, return the set point to its original set-point or a set-point as indicated by the Contracting Officer.

#### 3.7.5 Manufacturer's Representative

Provide a factory trained representative authorized by the equipment manufacturer to perform Functional Performance Testing for the following equipment:

Air Conditioners

Booster Pumps

Ensure the test representative reviews, approves, and signs the completed field test report. Include person's name with signatures.

#### 3.7.6 Sample Strategy

Perform Functional Performance Tests using the sample strategy identified herein. Test all central plant equipment, primary air handling units, and process cooling or heating equipment. Test all system-level equipment serving multiple zones. Twenty-five percent sample testing is allowed for large groups of identical equipment with identical controllers serving single zones such as air terminal units, fan coil units, unitary equipment, and plumbing fixtures. Sample size may be no less than three units. Complete a Functional Performance Test Checklist for each item of equipment or system to be tested.

##### 3.7.6.1 100 Percent Sample Procedures

Systems or equipment for which 100 percent sample size are tested fail if one or more of the test procedures results in discovery of a deficiency and the deficiency cannot be resolved within 5 minutes during the test.

Re-test to the extent necessary to confirm that the deficiencies have been corrected without negatively impacting the performance of the rest of the system.

#### 3.7.6.2 Less than 100 Percent Sample Procedures

Randomly test each sample group of identical equipment. If 10 percent of the units in the first sample fail the functional performance tests, test a second sample group, the same size as the first sample group. The second sample must not include any units from the first sample group.

If 10 percent of the units in the second sample fail, test all remaining units. If at any point frequent failures occur the CxC may stop the testing and require the contractor to perform and document a checkout of the remaining units prior to continuing functional testing.

#### 3.8 RETESTING REQUIREMENTS

Abort tests if any deficiency prevents successful completion of the test or if any required commissioning team member is not present for the test. Re-test only after all deficiencies identified during the original tests have been corrected.

Contracting Officer may withhold payment equivalent to lost time, re-testing, and aborted tests. These costs may include salary, travel costs, and per diem for Government team members. Correct deficiencies as identified by the commissioning team and retest the systems to be commissioned.

#### 3.9 SYSTEM ACCEPTANCE

Systems may be partially accepted prior to seasonal testing if they comply with all construction contract and accepted design requirements that can be tested during initial Functional Performance Tests. All test procedures must be successful completed prior to full systems acceptance.

#### 3.10 SEASONAL TESTS

Perform Initial Functional Performance Tests as soon as all contract work is completed, but prior to facility turnover, regardless of the season.

In addition to the Initial Functional Performance Tests, perform Functional Performance Tests of HVAC systems during peak heating and cooling seasons during outdoor air condition design extremes. Schedule Seasonal Functional Performance Tests in coordination with the Contracting Officer. Submit Seasonal Test Report within 14 days of test completion. Include seasonal test report in the Updated Final Commissioning Report as specified in Section 01 91 00.15 BUILDING COMMISSIONING

Execute seasonal functional performance testing, witnessed by the Contracting Officer. Correct deficiencies and make adjustments to O&M manuals and as-built drawings for applicable issues identified in any seasonal testing.

#### 3.11 FULL-LOAD TESTS

Perform Initial Functional Performance Tests as soon as all contract work is completed, but prior to facility turnover. In addition to the Initial Functional Performance Tests, perform Functional Performance Tests of HVAC systems under full-load conditions. Develop and implement means of artificial loading to demonstrate the ability of the process cooling systems to handle peak process loads. Schedule Full-Load Functional Performance Tests in coordination with the Contracting Officer. Submit

Full-Load Test Report within 14 days of test completion.

Execute full-load functional performance testing, witnessed by the Contracting Officer. Correct deficiencies and make adjustments to O&M manuals and as-built drawings for applicable issues identified in any full load testing.

### 3.12 TRAINING

Coordinate, schedule, and document all required training. At a minimum, include the following items in the training report for commissioned systems:

- a. Complete commissioning documentation
- b. Complete O&M data
- c. Complete Training
- d. Purpose of equipment.
- e. Principle of how the equipment works.
- f. Important parts and assemblies.
- g. How the equipment achieves its purpose and necessary operating conditions.
- h. Most likely failure modes, causes and corrections.
- i. On site demonstration.
- j. Provide updates to O&M manuals based on field modifications.
- k. Provide training of the post-occupancy operations and maintenance staff.

### 3.13 COMMISSIONING REPORT

Include all completed Pre-Functional Checklists and Functional Performance Checklists in the Commissioning Report as specified in Section 01 91 00.15 BUILDING COMMISSIONING. Include the approved TAB Report.

### 3.14 POST-CONSTRUCTION ENDURANCE TEST

Perform an Endurance Test in accordance with the paragraph ENDURANCE TESTING in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC once during the peak heating season and once during the peak cooling season during outdoor air condition extremes with the exception that network bandwidth usage measurement and recording is not required. Use the Temporary Trending Hardware, if necessary, in accordance with Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

The Mechanical System Commissioning Specialists must review the trend logs from the Endurance Tests to ensure that the systems have stable operation

and operate as required by the construction contract. The Commissioning Specialists must provide a Post-Construction Trend Log Report that identifies any deficiencies noted in operation, recommendations for correction, and includes a graphical representation of the trends. Provide one Trend Log Report for the peak cooling season and one Trend Log Report for the peak heating season. Submit the Post-Construction Trend Log Reports no later than 14 calendar days following receipt of the trend log data by the Commissioning Specialist. Provide a Post-Construction Trend Log Report meeting the same requirements as the Endurance Testing Results Format in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. Provide one Trend Log Report for the peak cooling season and one Trend Log Report for the peak heating season. Submit the Post-Construction Trend Log Reports no later than 14 calendar days following download of the trended data. Include the Post-Construction Trend Log Reports in the Updated Final Commissioning Report as specified in Section 01 91 00.15 BUILDING COMMISSIONING

-- End of Section --

SECTION 23 09 00

INSTRUMENTATION AND CONTROL FOR HVAC  
**08/24**

PART 1 GENERAL

1.1 SUMMARY

Provide a complete Direct Digital Control (DDC) system, suitable for the control of the heating, ventilating and air conditioning (HVAC) and other building-level systems as indicated on contract drawings.

1.1.1 System Requirements

Provide systems meeting the requirements this Section and other Sections referenced by this Section, and which have the following characteristics:

- a. The system implements the control sequences of operation shown in the Contract Drawings using DDC hardware to control mechanical and electrical equipment
- b. The system meet the requirements of this specification as a stand-alone system and does not require connection to any other system.
- c. Control sequences reside in DDC hardware in the building. The building control network is not dependent upon connection to a Utility Monitoring and Control System (UMCS) Front End or to any other system for performance of control sequences. To the greatest extent practical, the hardware performs control sequences without reliance on the building network.
- d. The hardware is installed such that individual control equipment can be replaced by similar control equipment from other equipment manufacturers with no loss of system functionality.
- e. All necessary documentation, configuration information, programming tools, programs, drivers, and other software are licensed to and otherwise remain with the Government such that the Government or their agents are able to perform repair, replacement, upgrades, and expansions of the system without subsequent or future dependence on the Contractor, Vendor or Manufacturer.
- f. Sufficient documentation and data, including rights to documentation and data, are provided such that the Government or their agents can execute work to perform repair, replacement, upgrades, and expansions of the system without subsequent or future dependence on the Contractor, Vendor or Manufacturer.
- g. Hardware is installed and configured such that the Government or their agents are able to perform repair, replacement, and upgrades of individual hardware without further interaction with the Contractor, Vendor or Manufacturer.

#### 1.1.2 End to End Accuracy

Select products, install and configure the system such that the maximum error of a measured value as read from the DDC Hardware over the network is less than the maximum allowable error specified for the sensor or instrumentation.

#### 1.1.3 Verification of Dimensions

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing any work.

#### 1.1.4 Drawings

The Government will not indicate all offsets, fittings, and accessories that may be required on the drawings. Carefully investigate the mechanical, electrical, and finish conditions that could affect the work to be performed, arrange such work accordingly, and provide all work necessary to meet such conditions.

#### 1.4 DEFINITIONS

The following list of definitions includes terms used in Sections referenced by this Section and are included here for completeness. The definitions contained in this Section may disagree with how terms are defined or used in other documents, including documents referenced by this Section. The definitions included here are the authoritative definitions for this Section and all Sections referenced by this Section.

After each term the protocol related to that term is included in parenthesis.

##### 1.4.1 Alarm Generation (All protocols)

Alarm Generation is the monitoring of a value, comparison of the value to alarm conditions and the creation of an alarm when the conditions set for the alarm are met. Note that this does NOT include delivery of the alarm to the final destination (such as a user interface).

##### 1.4.2 Building Automation and Control Network (BACnet) (BACnet)

The term BACnet is used in two ways. First meaning the BACnet Protocol Standard - the communication requirements as defined by ASHRAE 135 including all annexes and addenda. The second to refer to the overall technology related to the ASHRAE 135 protocol.

##### 1.4.3 BACnet Advanced Application Controller (B-AAC) (BACnet)

A hardware device BTL Listed as a B-AAC, which is required to support BACnet Interoperability Building Blocks (BIBBs) for scheduling and alarming, but is not required to support as many BIBBs as a B-BC.

##### 1.4.4 BACnet Application Specific Controller (B-ASC) (BACnet)

A hardware device BTL Listed as a B-ASC, with fewer BIBB requirements than a B-AAC. It is intended for use in a specific application.

##### 1.4.5 BACnet Building Controller (B-BC) (BACnet)

A hardware device BTL Listed as a B-BC. A general-purpose,

field-programmable device capable of carrying out a variety of building automation and control tasks including control and monitoring via direct digital control (DDC) of specific systems and data storage for trend information, time schedules, and alarm data. Like the other BTL Listed controller types (B-AAC, B-ASC etc.) a B-BC device is required to support the server ("B") side of the ReadProperty and WriteProperty services, but unlike the other controller types it is also required to support the client ("A") side of these services. Communication between controllers requires that one of them support the client side and the other support the server side, so a B-BC is often used when communication between controllers is needed.

#### 1.4.6 BACnet Broadcast Management Device (BBMD) (BACnet)

A communications device, typically combined with a BACnet router. A BBMD forwards BACnet broadcast messages to BACnet/IP devices and other BBMDs connected to the same BACnet/IP network. Each IP subnet that is part of a BACnet/IP network must have at least one BBMD. Note there are additional restrictions when multiple BBMDs share an IP subnet.

#### 1.4.7 BACnet/IP (BACnet)

An extension of BACnet, Annex J, defines the use of a reserved UDP socket to transmit BACnet messages over IP networks. A BACnet/IP network is a collection of one or more IP subnets that share the same BACnet network number. See also paragraph BACNET BROADCAST MANAGEMENT DEVICE.

#### 1.4.8 BACnet Internetwork (BACnet)

Two or more BACnet networks, connected with BACnet routers. In a BACnet Internetwork, there exists only one message path between devices.

#### 1.4.9 BACnet Interoperability Building Blocks (BIBBs) (BACnet)

A BIBB is a collection of one or more ASHRAE 135 Services intended to define a higher level of interoperability. BIBBs are combined to build the BACnet functional requirements for a device in a specification. Some BIBBs define additional requirements (beyond requiring support for specific services) in order to achieve a level of interoperability. For example, the BIBB DS-V-A (Data Sharing-View-A), which would typically be used by a front-end, not only requires the client to support the ReadProperty Service, but also provides a list of data types (Object / Properties) which the client must be able to interpret and display for the user.

In the BIBB shorthand notation, -A is the client side and -B is the server side.

|                                                                            |                                                  |
|----------------------------------------------------------------------------|--------------------------------------------------|
| The following is a list of some BIBBs used by this or referenced Sections: |                                                  |
| DS-COV-A                                                                   | Data Sharing-Change of Value (A side)            |
| DS-COV-B                                                                   | Data Sharing-Change of Value (B side)            |
| NM-RC-B                                                                    | Network Management-Router Configuration (B side) |

|                                                                            |                                                         |
|----------------------------------------------------------------------------|---------------------------------------------------------|
| The following is a list of some BIBBs used by this or referenced Sections: |                                                         |
| DS-RP-A                                                                    | Data Sharing-Read Property (A side)                     |
| DS-RP-B                                                                    | Data Sharing-Read Property (B side)                     |
| DS-RPM-A                                                                   | Data Sharing-Read Property Multiple (A Side)            |
| DS-RPM-B                                                                   | Data Sharing-Read Property Multiple (B Side)            |
| DS-WP-A                                                                    | Data Sharing-Write Property (A Side)                    |
| DM-TS-B                                                                    | Device Management-Time Synchronization (B Side)         |
| DM-UTC-B                                                                   | Device Management-UTC Time Synchronization (B Side)     |
| DS-WP-B                                                                    | Data Sharing-Write Property (B side)                    |
| SCHED-E-B                                                                  | Scheduling-External (B side)                            |
| DM-OCD-B                                                                   | Device Management-Object Creation and Deletion (B side) |
| AE-N-I-B                                                                   | Alarm and Event-Notification Internal (B Side)          |
| AE-N-E-B                                                                   | Alarm and Event-Notification External (B Side)          |
| T-VMT-I-B                                                                  | Trending-Viewing and Modifying Trends Internal (B Side) |
| T-VMT-E-B                                                                  | Trending-Viewing and Modifying Trends External (B Side) |

#### 1.4.10 BACnet Network (BACnet)

In BACnet, a portion of the control Internetwork consisting of one or more segments connected by repeaters. Networks are separated by routers.

#### 1.4.11 BACnet Operator Display (B-OD) (BACnet)

A basic operator interface with limited capabilities relative to a B-OWS. It is not intended to perform direct digital control. A B-OD profile could be used for LCD devices, displays affixed to BACnet devices, handheld terminals or other very simple user interfaces.

#### 1.4.12 BACnet Segment (BACnet)

One or more physical segments interconnected by repeaters (ASHRAE 135).

#### 1.4.13 BACnet Smart Actuator (B-SA) (BACnet)

A simple actuator device with limited resources intended for specific applications.

#### 1.4.14 BACnet Smart Sensor (B-SS) (BACnet)

A simple sensing device with limited resources.

#### 1.4.15 BACnet Testing Laboratories (BTL) (BACnet)

Established by BACnet International to support compliance testing and interoperability testing activities and consists of BTL Manager and the BTL Working Group (BTL-WG). BTL also publishes Implementation Guidelines.

#### 1.4.16 BACnet Testing Laboratories (BTL) Listed (BACnet)

A device that has been listed by BACnet Testing Laboratory. Devices may be certified to a specific device profile, in which case the listing indicates that the device supports the required capabilities for that profile, or may be listed as "other".

#### 1.4.17 Binary (All protocols)

A two-state system where an "ON" condition is represented by a high signal level and an "OFF" condition is represented by a low signal level. 'Digital' is sometimes used interchangeably with 'binary'.

#### 1.4.18 Broadcast (BACnet)

Unlike most messages, which are intended for a specific recipient device, a broadcast message is intended for all devices on the network.

#### 1.4.19 Building Control Network (BCN) (All protocols)

The network connecting all DDC Hardware within a building (or specific group of buildings).

#### 1.4.20 Building Point of Connection (BPOC) (All protocols)

A FPOC for a Building Control System. (This term is being phased out of use in preference for FPOC but is still used in some specifications and criteria. When it was used, it typically referred to a piece of control hardware. The current FPOC definition typically refers instead to IT hardware.)

#### 1.4.21 Commandable (All protocols)

See Overridable.

#### 1.4.22 Commandable Objects (BACnet)

Commandable Objects have a Commandable Property, Priority\_Array, and Relinquish\_Default Property as defined in ASHRAE 135, Clause 19.2, Command Prioritization.

#### 1.4.23 Configurable (All protocols)

A property, setting, or value is configurable if it can be changed via hardware settings on the device, via the use of engineering software or over the control network from the front end, and is retained through (after) loss of power.

- a. In a BACnet system, a property, setting, or value is configurable if it can be changed via one or more of:
  - (1) via BACnet services (including proprietary BACnet services)
  - (2) via hardware settings on the device

Note this is more stringent than the ASHRAE 135 definition.

#### 1.4.24 Control Logic Diagram (All protocols)

A graphical representation of control logic for multiple processes that make up a system.

#### 1.4.25 Device (BACnet)

A Digital Controller that contains a BACnet Device Object and uses BACnet to communicate with other devices.

#### 1.4.26 Device Object (BACnet)

Every BACnet device requires one Device Object, whose properties represent the network visible properties of that device. Every Device Object requires a unique Object Identifier number on the BACnet Internetwork. This number is often referred to as the device instance or device ID.

#### 1.4.27 Device Profile (BACnet)

A collection of BIBBs determining minimum BACnet capabilities of a device, defined in ASHRAE 135. Standard device profiles include BACnet Advanced Workstations (B-AWS), BACnet Building Controllers (B-BC), BACnet Advanced Application Controllers (B-AAC), BACnet Application Specific Controllers (B-ASC), BACnet Smart Actuator (B-SA), and BACnet Smart Sensor (B-SS).

#### 1.4.28 Digital Controller (All protocols)

An electronic controller, usually with internal programming logic and digital and analog input/output capability, which performs control functions.

#### 1.4.29 Direct Digital Control (DDC) (All protocols)

Digital controllers performing control logic. Usually the controller directly senses physical values, makes control decisions with internal programs, and outputs control signals to directly operate switches, valves, dampers, and motor controllers.

#### 1.4.30 Field Point of Connection (FPOC) (All protocols)

The FPOC is the point of connection between the UMCS IP Network and the field control network (either an IP network, a non-IP network, or a combination of both). The hardware at this location which provides the connection is generally an IT device such as a switch, IP router, or firewall.

In general, the term "FPOC Location" means the place where this connection occurs, and "FPOC Hardware" means the device that provides the connection. Sometimes the term "FPOC" is used to mean either and its actual meaning (i.e. location or hardware) is determined by the context in which it is used.

#### 1.4.31 Gateway (All protocols)

A device that translates from one protocol application data format to another. Devices that change only the transport mechanism of the protocol - "translating" from TP/FT-10 to Ethernet/IP or from BACnet MS/TP to

BACnet over IP for example - are not gateways as the underlying data format does not change. Gateways are also called Communications Bridges or Protocol Translators.

#### 1.4.32 IEEE 802.3 Ethernet (All protocols)

A family of local-area-network technologies providing high-speed networking features over various media, typically Cat 5, 5e or Cat 6 twisted pair copper or fiber optic cable.

#### 1.4.33 Internet Protocol (IP, TCP/IP, UDP/IP) (All protocols)

A communication method, the most common use is the World Wide Web. At the lowest level, it is based on Internet Protocol (IP), a method for conveying and routing packets of information over various LAN media. Two common protocols using IP are User Datagram Protocol (UDP) and Transmission Control Protocol (TCP). UDP conveys information to well-known "sockets" without confirmation of receipt. TCP establishes connections, also known as "sessions", which have end-to-end confirmation and guaranteed sequence of delivery.

#### 1.4.34 Input/Output (I/O) (All protocols)

Physical inputs and outputs to and from a device, although the term sometimes describes network or "virtual" inputs or outputs. See also "Points".

#### 1.4.35 I/O Expansion Unit (All protocols)

An I/O expansion unit provides additional point capacity to a digital controller

#### 1.4.36 IP subnet (All protocols)

A group of devices which share a defined range IP addresses. Devices on a common IP subnet can share data (including broadcasts) directly without the need for the traffic to traverse an IP router.

#### 1.4.37 Local-Area Network (LAN) (All protocols)

A communication network that spans a limited geographic area and uses the same basic communication technology throughout.

#### 1.4.38 Local Display Panels (LDPs) (All protocols)

A DDC Hardware with a display and navigation buttons, and must provide display and adjustment of points as shown on the Points Schedule and as indicated.

#### 1.4.39 MAC Address (All protocols)

Media Access Control address. The physical device address that identifies a device on a Local Area Network.

#### 1.4.40 Master-Slave/Token-Passing (MS/TP) (BACnet)

Data link protocol as defined by the BACnet standard. Multiple speeds

(data rates) are permitted by the BACnet MS/TP standard.

#### 1.4.41 Monitoring and Control (M&C) Software (All protocols)

The UMCS 'front end' software which performs supervisory functions such as alarm handling, scheduling and data logging and provides a user interface for monitoring the system and configuring these functions.

#### 1.4.42 Network Number (BACnet)

A site-specific number assigned to each network. This network number must be unique throughout the BACnet Internetwork.

#### 1.4.43 Object (BACnet)

An ASHRAE 135 Object. The concept of organizing BACnet information into standard components with various associated Properties. Examples include Analog Input objects and Binary Output objects.

#### 1.4.44 Object Identifier (BACnet)

A grouping of two Object properties: Object Type (e.g. Analog Value, Schedule, etc.) and Object Instance (in this case, a number). Object Identifiers must be unique within a device.

#### 1.4.45 Object Instance (BACnet)

See paragraph OBJECT IDENTIFIER

#### 1.4.46 Object Properties (BACnet)

Attributes of an object. Examples include present value and high limit properties of an analog input object. Properties are defined in ASHRAE 135; some are optional and some are required. Objects are controlled by reading from and writing to object properties.

#### 1.4.47 Operator Configurable (All protocols)

Operator configurable values are values that can be changed from a single common front end user interface across multiple vendor systems.

For non Niagara-based BACnet systems, a property, setting, or value in a device is Operator Configurable when it is Configurable and is either:

- a. a Writable Property of a Standard BACnet Object; or
- b. a Property of a Standard BACnet Object that is Writable when Out\_Of\_Service is TRUE and Out\_Of\_Service is Writable.

#### 1.4.48 Override (All protocols)

Changing the value of a point outside of the normal sequence of operation where the change has priority over the sequence and where there is a mechanism for releasing the change such that the point returns to the normal value. Overrides persist until released or overridden at the same or higher priority but are not required to persist through a loss of power. Overrides are often used by operators to change values, and generally originate at a user interface (workstation or local display panel).

#### 1.4.49 Packaged Equipment (All protocols)

Packaged equipment is a single piece of equipment provided by a manufacturer in a substantially complete and operable condition, where the controls (DDC Hardware) are factory installed, and the equipment is sold and shipped from the manufacturer as a single entity. Disassembly and reassembly of a large piece of equipment for shipping does not prevent it from being packaged equipment. Package units may require field installation of remote sensors. Packaged equipment is also called a "packaged unit".

Note industry may use the term "Packaged System" to mean a collection of equipment that is designed to work together where each piece of equipment is packaged equipment and there is a network that connects the equipment together. A "packaged system" of this type is NOT packaged equipment; it is a collection of packaged equipment, and each piece of equipment must individually meet specification requirements.

#### 1.4.50 Packaged Unit (All protocols)

See packaged equipment.

#### 1.4.51 Performance Verification Test (PVT) (All protocols)

The procedure for determining if the installed BAS meets design criteria prior to final acceptance. The PVT is performed after installation, testing, and balancing of mechanical systems. Typically the PVT is performed by the Contractor in the presence of the Government.

#### 1.4.52 Physical Segment (BACnet)

A single contiguous medium to which BACnet devices are attached (ASHRAE 135).

#### 1.4.53 Polling (All protocols)

A device periodically requesting data from another device.

#### 1.4.54 Points (All protocols)

Physical and virtual inputs and outputs. See also paragraph INPUT/OUTPUT (I/O).

#### 1.4.55 Proportional, Integral, and Derivative (PID) Control Loop (All protocols)

Three parameters used to control modulating equipment to maintain a setpoint. Derivative control is often not required for HVAC systems (leaving "PI" control).

#### 1.4.56 Proprietary (BACnet)

Within the context of BACnet, any extension of or addition to object types, properties, PrivateTransfer services, or enumerations specified in ASHRAE 135. Objects with Object\_Type values of 128 and above are Proprietary Objects. Properties with Property\_Identifier of 512 and above are proprietary Properties.

#### 1.4.57 Protocol Implementation Conformance Statement (PICS) (BACnet)

A document, created by the manufacturer of a device, which describes which portions of the BACnet standard may be implemented by a given device. ASHRAE 135 requires that all ASHRAE 135 devices have a PICS, and also defines a minimum set of information that must be in it. A device as installed for a specific project may not implement everything in its PICS.

#### 1.4.58 Repeater (All protocols)

A device that connects two control network segments and retransmits all information received on one side onto the other.

#### 1.4.59 Router (All protocols)

A device that connects two ASHRAE 135 networks and controls traffic between the two by retransmitting signals received from one side onto the other based on the signal destination. Routers are used to subdivide a BACnet internetwork and to limit network traffic.

#### 1.4.60 Segment (All protocols)

A 'single' section of a control network that contains no repeaters or routers. There is generally a limit on the number of devices on a segment, and this limit is dependent on the topology/media and device type.

#### 1.4.61 Standard BACnet Objects (BACnet)

Objects with Object\_Type values below 128 and specifically enumerated in Clause 21 of ASHRAE 135. Objects which are not proprietary. See paragraph PROPRIETARY.

#### 1.4.62 Standard BACnet Properties (BACnet)

Properties with Property\_Identifier values below 512 and specifically enumerated in Clause 21 of ASHRAE 135. Properties which are not proprietary. See Proprietary.

#### 1.4.63 Standard BACnet Services (BACnet)

ASHRAE 135 services other than ConfirmedPrivateTransfer or UnconfirmedPrivateTransfer. See paragraph PROPRIETARY.

#### 1.4.64 UMCS (All protocols)

UMCS stands for Utility Monitoring and Control System. The term refers to all components by which a project site monitors, manages, and controls real-time operation of HVAC and other building systems. These components include the UMCS "front-end" and all field building control systems connected to the front-end. The front-end consists of Monitoring and Control Software (user interface software), browser-based user interfaces and network infrastructure.

The network infrastructure (the "UMCS Network"), is an IP network connecting multiple building or facility control networks to the Monitoring and Control Software.

#### 1.4.65 UMCS Network (All protocols)

The UMCS Network connects multiple building or facility control networks to the Monitoring and Control Software.

#### 1.4.66 Writable Property (BACnet)

A Property is Writable when it can be changed through the use of one or more of the WriteProperty services defined in ASHRAE 135, Clause 15 regardless of the value of any other Property. Note that in the ASHRAE 135 standard, some Properties may be writable when the Out of Service Property is TRUE; for purposes of this Section, Properties that are only writable when the Out of Service Property is TRUE are not considered to be Writable.

### 1.5 PROJECT SEQUENCING

TABLE II: PROJECT SEQUENCING lists the sequencing of submittals as specified in paragraph SUBMITTALS (denoted by an 'S' in the 'TYPE' column) and activities as specified in PART 3 EXECUTION (denoted by an 'E' in the 'TYPE' column). TABLE II does not specify overall project milestone and completion dates; these dates are specified in the contract documents.

- a. Sequencing for Submittals: The sequencing specified for submittals is the deadline by which the submittal must be initially submitted to the Government. Following submission there will be a Government review period as specified in Section 01 33 00 SUBMITTAL PROCEDURES. If the submittal is not accepted by the Government, revise the submittal and resubmit it to the Government within 14 days of notification that the submittal has been rejected. Upon resubmittal there will be an additional Government review period. If the submittal is not accepted the process repeats until the submittal is accepted by the Government.
- b. Sequencing for Activities: The sequencing specified for activities indicates the earliest the activity may begin.
- c. Abbreviations: In TABLE II the abbreviation AAO is used for 'after approval of' and 'ACO' is used for 'after completion of'.

| TABLE II. PROJECT SEQUENCING |      |                                 |                                               |

#### 1.6 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

##### SD-02 Shop Drawings

DDC Contractor Design Drawings; G

Draft As-Built Drawings; G

Final As-Built Drawings; G

##### SD-03 Product Data

Programming Software; G

Controller Application Programs; G

Configuration Software; G

Controller Configuration Settings; G

Manufacturer's Product Data; G

##### SD-06 Test Reports

Pre-Construction Quality Control (QC) Checklist; G

Post-Construction Quality Control (QC) Checklist; G

Start-Up Testing Report; G

Control Contractor's Performance Verification Testing Plan; G

Equipment Supplier's Performance Verification Testing Plan; G

Endurance Testing Results; G

Performance Verification Test Report; G

#### SD-10 Operation and Maintenance Data

Operation and Maintenance (O&M) Instructions; G

Training Documentation; G

#### SD-11 Closeout Submittals

Enclosure Keys; G

Closeout Quality Control (QC) Checklist; G

### 1.7 DATA PACKAGE AND SUBMITTAL REQUIREMENTS

Technical data packages consisting of technical data and computer software (meaning technical data which relates to computer software) which are specifically identified in this project and which may be defined/required in other specifications must be delivered strictly in accordance with the CONTRACT CLAUSES and in accordance with the Contract Data Requirements List, DD Form 1423. Data delivered must be identified by reference to the particular specification paragraph against which it is furnished. All submittals not specified as technical data packages are considered 'shop drawings' under the Federal Acquisition Regulation Supplement (FARS) and must contain no proprietary information and be delivered with unrestricted rights.

### 1.8 SOFTWARE FOR DDC HARDWARE AND GATEWAYS

Provide all software related to the programming and configuration of DDC Hardware and Gateways as indicated. License all Software to the project site. The term "controller" as used in these requirements means both DDC Hardware and Gateways.

#### 1.8.1 Configuration Software

For each type of controller, provide the configuration tool software. Submit hard copies of the software user manuals for each software with the software submittal.

Submit Configuration Software on CD-ROM as a Technical Data Package. Submit USB flash drive hard copies of the software user manual for each piece of software.

#### 1.8.2 Controller Configuration Settings

For each controller, provide copies of the installed configuration settings as source code compatible with the configuration tool software for that controller.

Submit Controller Configuration Settings on CD-ROM as a Technical Data Package. Include on the CD-ROM a list or table of contents clearly indicating which files are associated with each device. Submit 2 USB flash drive copies of the Controller Configuration Settings CD-ROM.

#### 1.8.3 Programming Software

For each type of programmable controller, provide the programming software. Submit hard copies of software user manuals for each software with the software submittal.

Submit Programming Software on CD-ROM as a Technical Data Package. Submit USB flash drive hard copies of the software user manual for each piece of software.

#### 1.8.4 Controller Application Programs

For each programmable controller, provide copies of the application program as source code compatible with the programming software for that controller.

Submit Controller Application Programs on CD-ROM as a Technical Data Package. Include on the CD-ROM a list or table of contents clearly indicating which application program is associated with each device. Submit 2 copies of the Controller Application Programs CD-ROM.

### 1.9 QUALITY CONTROL CHECKLISTS

The QC Checklist for BACnet Systems in APPENDIX A of this Section must be completed by the Contractor's Chief Quality Control (QC) Representative and submitted as indicated.

The QC Representative must verify each item indicated and initial in the space provided to indicate that the requirement has been met. The QC Representative must sign and date the Checklist prior to submission to the Government.

#### 1.9.1 Pre-Construction Quality Control (QC) Checklist

Complete items indicated as Pre-Construction QC Checklist items in the QC Checklist. Submit four copies of the Pre-Construction QC Checklist.

#### 1.9.2 Post-Construction Quality Control (QC) Checklist

Complete items indicated as Post-Construction QC Checklist items in the QC Checklist. Submit four copies of the Post-Construction QC Checklist.

#### 1.9.3 Closeout Quality Control (QC) Checklist

Complete items indicated as Closeout QC Checklist items in the QC Checklist. Submit four copies of the Closeout QC Checklist.

## PART 2 PRODUCTS

Provide products meeting the requirements of other referenced Sections, and this Section.

### 2.1 GENERAL PRODUCT REQUIREMENTS

Units of the same type of equipment must be products of a single manufacturer. Each major component of equipment must have the manufacturer's name and address, and the model and serial number in a conspicuous place. Materials and equipment must be standard products of a manufacturer regularly engaged in the manufacturing of these and similar products. The standard products must have been in a satisfactory commercial or industrial use for two years prior to use on this project. The two year use must include applications of equipment and materials under similar circumstances and of similar size. DDC Hardware not meeting the two-year field service requirement is acceptable provided it has been successfully used by the Contractor in a minimum of two previous projects. The equipment items must be supported by a service organization. Items of the same type and purpose must be identical, including equipment, assemblies, parts and components.

### 2.2 PRODUCT DATA

Provide manufacturer's product data sheets documenting compliance with product specifications for each product provided under this Section. Provide product data for all products in a single indexed compendium, organized by product type.

For all BACnet hardware: for each manufacturer, model and version (revision) of DDC Hardware provide the Protocol Implementation Conformance Statement (PICS).

Submit Manufacturer's Product Data on CD-ROM.

### 2.3 OPERATION ENVIRONMENT

Unless otherwise specified, provide products rated for continuous operation under the following conditions:

- a. Pressure: Pressure conditions normally encountered in the installed location.
- b. Vibration: Vibration conditions normally encountered in the installed location.
- c. Temperature:
  - (1) Products installed indoors: Ambient temperatures in the range of 32 to 112 degrees F and temperature conditions outside this range normally encountered at the installed location.
- d. Humidity: 10 to 95 percent relative humidity, noncondensing and humidity conditions outside this range normally encountered at the installed location.

## 2.4 WIRELESS CAPABILITY

Wireless capabilities must comply with Section 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS

## 2.5 ENCLOSURES

Enclosures supplied as an integral (pre-packaged) part of another product are acceptable. Provide two Enclosure Keys for each lockable enclosure on a single ring per enclosure with a tag identifying the enclosure the keys operate. Provide enclosures meeting the following minimum requirements:

### 2.5.1 Outdoors

For enclosures located outdoors, provide enclosures meeting NEMA 250 Type 3 Type 4 requirements.

### 2.5.2 Mechanical and Electrical Rooms

For enclosures located in mechanical or electrical rooms, provide enclosures meeting NEMA 250 Type 2Type 4 requirements.

### 2.5.3 Other Locations

For enclosures in other locations including but not limited to occupied spaces, above ceilings, and in plenum returns, provide enclosures meeting NEMA 250 Type 1 requirements.

## 2.6 WIRE AND CABLE

Provide wire and cable meeting the requirements of NFPA 70 and NFPA 90A in addition to the requirements of this specification and referenced specifications.

### 2.6.1 Terminal Blocks

For terminal blocks which are not integral to other equipment, provide terminal blocks which are insulated, modular, feed-through, clamp style with recessed captive screw-type clamping mechanism, suitable for DIN rail mounting, and which have enclosed sides or end plates and partition plates for separation.

### 2.6.2 Control Wiring for Binary Signals

For Control Wiring for Binary Signals, provide 18 AWG copper or thicker wire rated for 300-volt service.

### 2.6.3 Control Wiring for Analog Signals

For Control Wiring for Analog Signals, provide 18 AWG or thicker, copper, single- or multiple-twisted wire meeting the following requirements:

- a. minimum 2 inch lay of twist
- b. 100 percent shielded pairs
- c. at least 300-volt insulation
- d. each pair has a 20 AWG tinned-copper drain wire and individual overall

pair insulation

- e. cables have an overall aluminum-polyester or tinned-copper cable-shield tape, overall 20 AWG tinned-copper cable drain wire, and overall cable insulation.

#### 2.6.4 Power Wiring for Control Devices

For 24-volt circuits, provide insulated copper 18 AWG or thicker wire rated for 300 VAC service. For 120-volt circuits, provide 14 AWG or thicker stranded copper wire rated for 600-volt service.

#### 2.6.5 Transformers

Provide UL 5085-3 approved transformers. Select transformers sized so that the connected load is no greater than 80 percent of the transformer rated capacity.

### PART 3 EXECUTION

#### 3.1 INSTALLATION

Fully install and test the control system in accordance with this Section.

##### 3.1.1 Dielectric Isolation

Provide dielectric isolation where dissimilar metals are used for connection and support. Install control system in a manner that provides clearance for control system maintenance by maintaining access space required to calibrate, remove, repair, or replace control system devices. Install control system such that it does not interfere with the clearance requirements for mechanical and electrical system maintenance.

##### 3.1.2 Penetrations in Building Exterior

Make all penetrations through and mounting holes in the building exterior watertight.

##### 3.1.3 Device Mounting Criteria

Install devices in accordance with the manufacturer's recommendations and as indicated and shown. Provide a weathershield for all devices installed outdoors. Provide clearance for control system maintenance by maintaining access space required to calibrate, remove, repair, or replace control system devices. Provide clearance for mechanical and electrical system maintenance; do not not interfere with the clearance requirements for mechanical and electrical system maintenance.

##### 3.1.4 Labels and Tags

Key all labels and tags to the unique identifiers shown on the As-Built drawings. For labels exterior to protective enclosures provide engraved plastic labels mechanically attached to the enclosure or DDC Hardware. Labels inside protective enclosures may be attached using adhesive, but must not be hand written. For tags, provide plastic or metal tags mechanically attached directly to each device or attached by a metal chain or wire.

- a. Label all Enclosures and DDC Hardware.

- b. Tag Airflow measurement arrays (AFMA) with flow rate range for signal output range, duct size, and pitot tube AFMA flow coefficient.
- c. Tag duct static pressure taps at the location of the pressure tap

### 3.1.5 Surge Protection

#### 3.1.5.1 Power-Line Surge Protection

Protect equipment connected to AC circuits to withstand power-line surges in accordance with IEEE C62.41. Do not use fuses for surge protection.

#### 3.1.5.2 Surge Protection for Transmitter and Control Wiring

Protect DDC hardware against or provided DDC hardware capable of withstanding surges induced on control and transmitter wiring installed outdoors and as shown. Protect equipment against the following two waveforms:

- a. A waveform with a 10-microsecond rise time, a 1000-microsecond decay time and a peak current of 60 amps.
- b. A waveform with an 8-microsecond rise time, a 20-microsecond decay time and a peak current of 500 amperes.

### 3.2 DRAWINGS AND CALCULATIONS

Provide drawings in the form and arrangement indicated and shown. Use the same abbreviations, symbols, nomenclature and identifiers shown. Assign a unique identifier as shown to each control system element on a drawing. When packaging drawings, group schedules by system. When space allows, it is permissible to include multiple schedules for the same system on a single sheet. Except for drawings covering all systems, do not put information for different systems on the same sheet.

Submit hardcopy drawings on ISO A1 34 by 22 inches or A3 17 by 11 inches sheets, and electronic drawings in PDF and in AutoCAD Microstation Bentley BIM V8 Autodesk Revit 2013 format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule.

- a. Submit DDC Contractor Design Drawings consisting of each drawing indicated with pre-construction information depicting the intended control system design and plans. Submit DDC Contractor Design Drawings as a single complete package: 2 hard copies and 2 copies on CD-ROM.
- b. Submit Draft As-Built Drawings consisting of each drawing indicated updated with as-built data for the system prior to PVT. Submit Draft As-Built Drawings as a single complete package: 2 hard copies and 2 copies on CD-ROM.
- c. Submit Final As-Built Drawings consisting of each drawing indicated updated with all final as-built data. Final As-Built Drawings as a single complete package: 2 hard copies and 2 copies on CD-ROM.

### 3.2.1 Sample Drawings

Sample drawings in electronic format are available at the Whole Building Design Guide page for this section:

<http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-23-09-00>

These drawings may prove useful in demonstrating expected drawing formatting and example content and are provided for illustrative purposes only. Note that these drawings do not meet the content requirements of this Section and must be completed to meet project requirements.

### 3.2.2 Drawing Index and Legend

Provide an HVAC Control System Drawing Index showing the name and number of the building, military site, State or other similar designation, and Country. In the Drawing Index, list all Contractor Design Drawings, including the drawing number, sheet number, drawing title, and computer filename when used. In the Design Drawing Legend, show and describe all symbols, abbreviations and acronyms used on the Design Drawings. Provide a single Index and Legend for the entire drawing package.

### 3.2.3 Thermostat and Occupancy Sensor Schedule

Provide a thermostat and occupancy sensor schedule containing each thermostat's unique identifier, room identifier and control features and functions as shown. Provide a single thermostat and occupancy sensor schedule for the entire project.

### 3.2.4 Valve Schedule

Provide a valve schedule containing each valve's unique identifier, size, flow coefficient Kv (Cv), pressure drop at specified flow rate, spring range, positive positioner range, actuator size, close-off pressure to torque data, dimensions, and access and clearance requirements data. In the valve schedule include actuator selection data supported by calculations of the force required to move and seal the valve, access and clearance requirements. Provide a single valve schedule for the entire project.

### 3.2.5 Damper Schedule

Provide a damper schedule containing each damper's unique identifier, type (opposed or parallel blade), nominal and actual sizes, orientation of axis and frame, direction of blade rotation, actuator size and spring ranges, operation rate, positive positioner range, location of actuators and damper end switches, arrangement of sections in multi-section dampers, and methods of connecting dampers, actuators, and linkages. Include the AMCA 511 maximum leakage rate at the operating static-pressure differential for each damper in the Damper Schedule. Provide a single damper schedule for the entire project.

### 3.2.6 Project Summary Equipment Schedule

Provide a project summary equipment schedule containing the manufacturer, model number, part number and descriptive name for each control device, hardware and component provided under this specification. Provide a single project equipment schedule for the entire project.

### 3.2.7 Equipment Schedule

Provide system equipment schedules containing the unique identifier, manufacturer, model number, part number and descriptive name for each control device, hardware and component provided under this specification. Provide a separate equipment schedule for each HVAC system.

### 3.2.8 Occupancy Schedule

Provide an occupancy schedule drawing containing the same fields as the occupancy schedule Contract Drawing with Contractor updated information. Provide a single occupancy schedule for the entire project.

### 3.2.9 DDC Hardware Schedule

Provide a single DDC Hardware Schedule for the entire project and including following information for each device.

#### 3.2.9.1 DDC Hardware Identifier

The Unique DDC Hardware Identifier for the device.

#### 3.2.9.2 HVAC System

The system "name" used to identify a specific system (the name used on the system schematic drawing for that system).

#### 3.2.9.3 BACnet Device Information

##### 3.2.9.3.1 Device Object Identifier

The Device Object Identifier: The Object\_Identifier of the Device Object

##### 3.2.9.3.2 Network Number

The Network Number for the device.

##### 3.2.9.3.3 MAC Address

The MAC Address for the device

##### 3.2.9.3.4 BTL Listing

The BTL Listing of the device. If the device is listed under multiple BTL Profiles, indicate the profile that matches the use and configuration of the device as installed.

##### 3.2.9.3.5 Proprietary Services Information

If the device uses non-standard ASHRAE 135 services, indicate that the device uses non-standard services and include a description of all non-standard services used. Describe usage and content such that a device from another vendor can interoperate with the device using the non-standard service. Provide descriptions with sufficient detail to allow a device from a different manufacturer to be programmed to both read and write the non-standard service request:

- a. read: interpret the data contained in the non-standard service and;

- b. write: given similar data, generate the appropriate non-standard service request.

#### 3.2.9.3.6 Alarming Information

Indicate whether the device is used for alarm generation, and which types of alarm generation the device implements: intrinsic, local algorithmic, remote algorithmic.

#### 3.2.9.3.7 Scheduling Information

Indicate whether the device is used for scheduling.

#### 3.2.9.3.8 Trending Information

Indicate whether the device is used for trending, and indicate if the device is used to trend local values, remote values, or both.

#### 3.2.10 Points Schedule

Provide a Points Schedule in tabular form for each HVAC system, with the indicated columns and with each row representing a hardware point, network point or configuration point in the system.

- a. When a Points Schedule was included in the Contract Drawing package, use the same fields as the Contract Drawing with updated information in addition to the indicated fields.
- b. When Point Schedules are included in the contract package, items requiring contractor verification or input have been shown in angle brackets ("<" and ">"), such as <\_\_\_> for a required entry or <value> for a value requiring confirmation. Complete all items in brackets as well as any blank cells. Do not modify values which are not in brackets without approval.

Points Schedule Columns must include:

##### 3.2.10.1 Point Name

The abbreviated name for the point using the indicated naming convention.

##### 3.2.10.2 Description

A brief functional description of the point such as "Supply Air Temperature".

##### 3.2.10.3 DDC Hardware Identifier

The Unique DDC Hardware Identifier shown on the DDC Hardware Schedule and used across all drawings for the DDC Hardware containing the point.

##### 3.2.10.4 Settings

The value and units of any setpoints, configured setpoints, configuration parameters, and settings related to each point.

#### 3.2.10.5 Range

The range of values, including units, associated with the point, including but not limited to a zone temperature setpoint adjustment range, a sensor measurement range, occupancy values for an occupancy input, or the status of a safety.

#### 3.2.10.6 Input or Output (I/O) Type

The type of input or output signal associated with the point. Use the following abbreviations for entries in this column:

- a. AI: The value comes from a hardware (physical) Analog Input
- b. AO: The value is output as a hardware (physical) Analog Output
- c. BI: The value comes from a hardware (physical) Binary Input
- d. BO: The value is output as a hardware (physical) Binary Output
- e. PULSE: The value comes from a hardware (physical) Pulse Accumulator Input
- f. NET-IN: The value is provided from the network (generally from another device). Use this entry only when the value is received from another device as part of scheduling or as part of a sequence of operation, not when the value is received on the network for supervisory functions such as trending, alarming, override or display at a user interface.
- g. NET-OUT: The value is provided to another controller over the network. Use this entry only when the value is transmitted to another device as part of scheduling or as part of a sequence of operation, not when the value is transmitted on the network for supervisory functions such as trending, alarming, override or display at a user interface.

#### 3.2.10.7 Object and Property Information

The Object Type and Instance Number for the Object associated with the point. If the value of the point is not in the Present\_Value Property, then also provide the Property ID for the Property containing the value of the point. Any point that is displayed at the front end or on an LDP, is trended, is used by another device on the network, or has an alarm condition must be documented here.

#### 3.2.10.8 Network Data Exchange Information (Gets Data From, Sends Data To)

Provide the DDC Hardware Identifier of other DDC Hardware the point is shared with.

#### 3.2.10.9 Override Information (Object Type and Instance Number)

For each point requiring an Override, indicate if the Object for the point is Commandable or, if the use of a separate Object was specifically approved by the Contracting Officer, provide the Object Type and Instance Number of the Object to be used in overriding the point.

#### 3.2.10.10 Trend Object Information

For each point requiring a trend, indicate if the trend is Local or Remote, the trend Object type and the trend Object instance number. For remote trends provide the DDC Hardware Identifier for the device containing the trend Object in the Points Schedule notes.

#### 3.2.10.11 Alarm Information

Indicate the Alarm Generation Type, Event Enrollment Object Instance Number, and Notification Class Object Instance Number for each point requiring an alarm. (Note that not all alarms will have Event Enrollment Objects.)

#### 3.2.10.12 Configuration Information

Indicate the means of configuration associated with each point.

- a. For Operator Configurable Points indicate BACnet Object and Property information (Name, Type, Identifiers) containing the configurable value. Indicate whether the property is writable always, or only when Out\_Of\_Service is TRUE.
- b. For Configurable Points indicate the BACnet Object and Property information as for Operator Configurable points, or identification of the configurable settings from within the engineering software for the device or identification of the hardware settings on the device.

#### 3.2.11 Riser Diagram

The Riser Diagram of the Building Control Network may be in tabular form, and must show all DDC Hardware and all Network Hardware, including network terminators. For each item, provide the unique identifier, common descriptive name, physical sequential order (previous and next device on the network), room identifier and location within room. A single riser diagram must be submitted for the entire system.

#### 3.2.12 Control System Schematics

Provide control system schematics in the same form as the control system schematic Contract Drawing with Contractor updated information. Provide a control system schematic for each HVAC system.

#### 3.2.13 Sequences of Operation Including Control Logic Diagrams

Provide HVAC control system sequence of operation and control logic diagrams in the same format as the Contract Drawings. Within these drawings, refer to devices by their unique identifiers. Submit sequences of operation and control logic diagrams for each HVAC system

#### 3.2.14 Controller, Motor Starter and Relay Wiring Diagram

Provide controller wiring diagrams as functional wiring diagrams which show the interconnection of conductors and cables to each controller and to the identified terminals of input and output devices, starters and package equipment. Show necessary jumpers and ground connections and the

labels of all conductors. Identify sources of power required for control systems and for packaged equipment control systems back to the panel board circuit breaker number, controller enclosures, magnetic starter, or packaged equipment control circuit. Show each power supply and transformer not integral to a controller, starter, or packaged equipment. Show the connected volt-ampere load and the power supply volt-ampere rating. Provide wiring diagrams for each HVAC system.

### 3.3 CONTROLLER TUNING

Tune each controller in a manner consistent with that described in the ASHRAE FUN IP and in the manufacturer's instruction manual. Tuning must consist of adjustment of the proportional, integral, and where applicable, the derivative (PID) settings to provide stable closed-loop control. Each loop must be tuned while the system or plant is operating at a high gain (worst case) condition, where high gain can generally be defined as a low-flow or low-load condition. Upon final adjustment of the PID settings, in response to a change in controller setpoint, the controlled variable must settle out at the new setpoint with no more than two (2) oscillations above and below setpoint. Upon settling out at the new setpoint the controller output must be steady. With the exception of naturally slow processes such as zone temperature control, the controller must settle out at the new setpoint within five (5) minutes. Set the controller to its correct setpoint and record and submit the final PID configuration settings with the O&M Instructions and on the associated Points Schedule.

### 3.4 START-UP

#### 3.4.1 Start-Up Test

Perform the following startup tests for each control system to ensure that the described control system components are installed and functioning per this specification.

Adjust, calibrate, measure, program, configure, set the time schedules, and otherwise perform all necessary actions to ensure that the systems function as indicated and shown in the sequence of operation and other contract documents.

##### 3.4.1.1 Systems Check

An item-by-item check must be performed for each HVAC system

##### 3.4.1.1.1 Step 1 - System Inspection

With the system in unoccupied mode and with fan hand-off-auto switches in the OFF position, verify that power and main air are available where required and that all output devices are in their failsafe and normal positions. Inspect each local display panel and each M&C Client to verify that all displays indicate shutdown conditions.

##### 3.4.1.1.2 Step 2 - Calibration Accuracy Check

Perform a two-point accuracy check of the calibration of each HVAC control system sensing element and transmitter by comparing the value from the test instrument to the network value provided by the DDC Hardware. Use digital indicating test instruments, such as digital thermometers, motor-driven psychrometers, and tachometers. Use test instruments with

accuracy at least twice as accurate as the specified sensor accuracy and with calibration traceable to National Institute of Standards and Technology standards. Check one the first check point in the bottom one-third of the sensor range, and the second in the top one-third of the sensor range. Verify that the sensing element-to-DDC readout accuracies at two points are within the specified product accuracy tolerances, and if not recalibrate or replace the device and repeat the calibration check.

#### 3.4.1.1.3 Step 3 - Actuator Range Check

With the system running, apply a signal to each actuator through the DDC Hardware controller. Verify proper operation of the actuators and positioners for all actuated devices and record the signal levels for the extreme positions of each device. Vary the signal over its full range, and verify that the actuators travel from zero stroke to full stroke within the signal range. Where applicable, verify that all sequenced actuators move from zero stroke to full stroke in the proper direction, and move the connected device in the proper direction from one extreme position to the other. For valve actuators and damper actuators, perform the actuator range check under normal system pressures.

#### 3.4.1.2 Weather Dependent Test

Perform weather dependent test procedures in the appropriate climatic season.

#### 3.4.2 Start-Up Testing Report

Submit 4 copies of the Start-Up Testing Report. The report may be submitted as a Technical Data Package documenting the results of the tests performed and certifying that the system is installed and functioning per this specification, and is ready for the Performance Verification Test (PVT).

### 3.5 PERFORMANCE VERIFICATION TESTING

#### 3.5.1 General

PVT testing must demonstrate compliance of controls work with contract document requirements and must be performed by the Controls Contractor and Equipment Suppliers. No less than 14 calendar days prior to start of controls system installation, meet with the Contracting Office's technical representative (COTR) and the designing engineer of the HVAC systems, the Contractor's QA representative, the Contractor's Controls Contractor representative, and the control system Owner to develop a mutual understanding relate to the details of the PVT work requirements, including required submittals, work schedule, and field quality control.

#### 3.5.2 Performance Verification Testing and Commissioning

PVT testing is a Government quality assurance function that includes systems trending and field tests. Commissioning is a quality control function that is the Commissioning Team's responsibility to the extent required by this contract.

#### 3.5.3 Performance Verification Testing of Equipment with Packaged Controls

Controls Contractor and Equipment Supplier(s) must share and coordinate PVT testing responsibilities for equipment provided with on-board factory

packaged controls such as boiler controllers, dedicated outside air systems (DOAS's), and packaged pumping systems.

#### 3.5.3.1 Controls Contractor Responsibilities

The Controls Contractor must provide a PVT Plan separate from Equipment Supplier's performance verification testing plan, perform endurance testing, and perform PVT testing concurrent with Equipment Suppliers' testing for equipment provided with on-board factory packaged controls to demonstrate the following:

- a. Equipment enabling and disabling.
- b. Equipment standard and optional control points necessary to accomplish functionality regardless if specified in contract documents or not.
- c. Equipment standard and optional alarms critical to safe operation regardless if specified in contract documents or not.
- d. All control points added by Controls Contractor in addition to onboard factory packaged controls regardless if specified in contract documents or not.

Refer to paragraphs titled "Performance Verification Test Plan" and "Endurance Testing" for additional information.

#### 3.5.3.2 Equipment Supplier Responsibilities

Each Equipment Supplier must provide PVT Plans separate from Controls Contractor's plans and perform PVT testing concurrent with Controls Contractor's testing for their equipment provided with on-board factory packaged controls to demonstrate the following:

- a. Equipment standard and optional control features necessary to accomplish functionality regardless if specified in contract documents or not.
- b. Equipment standard and optional operation modes necessary to accomplish functionality regardless if specified in contract documents or not.
- c. Equipment standard and optional alarm conditions for safe operation regardless if specified in contract documents or not.

Refer to all paragraphs under paragraph titled "Performance Verification Testing" except for section titled "Endurance Testing" for additional information.

#### 3.5.4 Sequencing of Performance Verification Testing Activities

PVT activities must be sequenced with major activities listed below for Test and Balance (TAB) Contractor, Equipment Suppliers, Commissioning Specialists, and others to demonstrate fully functioning systems. Refer to Section 01 32 17.00 20 COST-LOADED NETWORK ANALYSIS SCHEDULES (NAS). Complete the items in TABLE III: SEQUENCING OF PVT TESTING ACTIVITIES as schedule activities or milestones.

| TABLE III: SEQUENCING OF PVT TESTING ACTIVITIES |                                                                                                                  |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| SEQUENCE                                        | ITEM                                                                                                             |
| 1                                               | Submission, review, and approval of Control Contractors PVT Plans.                                               |
| 2                                               | Submission, review, and approval of Equipment Suppliers PVT Plans.                                               |
| 3                                               | Submission, review, and approval of certified final Test and Balance Report.                                     |
| 4                                               | Conduct commissioning functional performance tests.                                                              |
| 5                                               | Submission, review, and approval of all of the Commissioning Specialists completed functional performance tests. |
| 6                                               | Request Contracting Officer to allow beginning of Government-witnessed PVT testing.                              |
| 7                                               | Contracting Officers approval to begin PVT testing.                                                              |
| 8                                               | Conduct PVT field work.                                                                                          |
| 9                                               | Governments verbal approval of PVT field work for all systems.                                                   |
| 10                                              | Conduct Test and Balance verification field work.                                                                |
| 11                                              | Governments written approval of Test and Balance verification field work.                                        |
| 12                                              | Submission, review, and approval of endurance testing.                                                           |
| 13                                              | Governments written approval of PVT field work for all systems.                                                  |
| 14                                              | Facility acceptance recommendation.                                                                              |
| 15                                              | Submission, review, and approval of Control Contractors PVT Report.                                              |
| 16                                              | Submission, review, and approval of Equipment Suppliers PVT Report.                                              |
| 17                                              | Conduct applicable re-testing and seasonal testing within 10 months of beneficial occupancy.                     |

#### 3.5.4.1 PVT Testing for Multi-Phase Construction

For air moving systems except outside air systems serving multiple phases, all major activities listed in TABLE III through Government's verbal approval of Test and Balance verification field work can be completed by phase if all ductwork construction is completed for that phase.

For primary systems such as chilled water systems, HVAC heating hot water systems, and outside air systems serving multiple phases, all major activities listed listed in TABLE III through Government's verbal approval of Test and Balance verification field work for all air moving systems served by that primary system for that phase must be completed prior to conducting PVT field work for that primary system.

### 3.5.5 Control Contractor's Performance Verification Testing Plan

Submit a detailed PVT Plan of the proposed control systems testing in this contract for approval prior to its use. Develop and use a single PVT Plan for each system with a unique control sequence. Systems sharing an identical control sequence can be tested using copies of the PVT Plan intended for these systems.

PVT Plans must include system-based, step-by-step test methods demonstrating system performs in accordance with contract document requirements. The Government may provide sample PVT Plans upon request. PVT Plans must include the following:

- a. Control sequences from contract documents segmented such that each control algorithm, operation mode, and alarm condition is immediately followed by numbered test methods required to initiate a response, expected response, space for comments, and "pass" or "fail" indication for each expected response.
- b. PVT Plans with control sequences from contract documents that are not segmented into parts will not be accepted.
- c. Indication where assisting personnel are required such as Mechanical Contractor.
- d. Signature and date lines for the Contractor's PVT administrator, Contractor's quality assurance representative, and Contracting Officer's representative acknowledging completion of testing.

### 3.5.6 Performance Verification Testing Sample Size

PVT testing sample sizes will be as follows:

- a. 100-Percent of the following systems:
  - (1) primary systems including, but not limited to, chilled water and HVAC heating hot water systems
  - (2) air handling unit systems including all associated fans except for remote exhaust air fans
  - (3) DOAS's including all associated fans except for remote exhaust air fans
- b. 20-Percent of each set of systems with a shared identical control sequence for systems such as:
  - (1) air terminal units
  - (2) exhaust air fans
  - (3) terminal equipment such as fan coil units and unit heaters

#### 3.5.6.1 Selection of Systems to Test

For sample sets less than 100-percent, the Government will choose which systems will be tested. The Government may require additional testing if previous testing results are inconsistent or demonstrate improper system control as follows:

- a. An additional 25-percent after five-percent failure rate of first sample set.
- b. 100-percent after any failures occurring in additional sample set.

### 3.5.7 Conducting Performance Verification Testing

At least 15 days prior to preferred test date, request the Contracting Officer to allow the beginning of Government-witnessed PVT testing. Provide an estimated time table required to perform testing of each system. Furnish personnel, equipment, instrumentation, and supplies necessary to perform all aspects of testing. Testing personnel must be regularly employed in the testing and calibration of control systems. After receipt of Contracting Officer's approval to begin testing, perform PVT testing using project's as-built (shop) control system drawings, project's design drawings, and approved PVT Plans.

During testing, identify deficiencies that do not meet contract document requirements. Deficiencies must be investigated, corrected with corrections documented, and re-tested at a later date following procedures for the initial PVT testing. The Government may require re-testing of any control system components affected by the original failed test.

### 3.5.8 Endurance Testing

#### 3.5.8.1 General

Conduct endurance testing in conjunction with the PVT to demonstrate control loop stability and accuracy. For all control loops tested, record trend data of the control variables over time, demonstrating that the control loop responds to a sudden change of the control variable set point without excessive overshoot or undershoot. Conduct endurance testing for each system subject to PVT testing. Systems must be operating as normally anticipated during occupancy throughout endurance testing.

Endurance testing results must clearly demonstrate control loop stability and accuracy. Controlled loop outputs must be stable and accurately maintain each setpoint.

#### 3.5.8.2 Hardware

Use hardware provided in this contract for testing. Use Government furnished hardware for testing if available when endurance testing begins. If unavailable, the Contractor must provide suitable hardware for required testing.

If insufficient buffer capacity exists to trend the entire endurance test, upload trend data during the course of endurance testing to ensure all trend data is retained. Lost trend data will require retesting of all control points for affected system(s).

#### 3.5.8.3 Endurance Testing Results Format

Submit endurance testing results for each tested system in a graphical format complete with clear indication of value(s) for y-axis, value for x-axis, and legend identifying each trended control point. The number of control points contained on a single graph must be such that all control

points can be clearly visible. Control points must be logically grouped such that related points appear on a single graph. In addition, submit a separate comma separated value (CSV) file of raw trend data for each trended system. Each trended control point in CSV file must be clearly identified.

For control points recorded based on change of value, change of value for recording data must be clearly identified for each control point.

#### 3.5.8.4 Endurance Testing Start, Duration, and Frequency

Trending of all control points for a given system must start at an identical date and time regardless of the basis of data collection. Duration of all endurance tests must be at least one-week.

Unless specified otherwise for control points recorded based on time, frequency of data collection must be 15-minutes. Frequency of data collection for specific types of control points is as follows:

##### 3.5.8.4.1 Points Trended at One Minute Intervals

- a. Temperature for supply air, return air, mixed air, supply water, and return water
- c. Flow for supply air, return air, outside air, chilled water, and HVAC heating hot water
- g. Command and status for control dampers and control valves
- h. Speed for fans and pumps
- i. Pressure for fans and pumps

##### 3.5.8.4.2 Points Trended at 15 Minute Intervals

- a. Temperature for zones
- b. Temperature for outside air not associated with energy recovery
- c. Command and status for equipment
- d. Pressure relative to the outside for facility

#### 3.5.9 Performance Verification Test Report

Submit a PVT Report after receiving Government's written approval of PVT field work that is intended to document test results and final control system sequences and settings prior to turnover. The PVT Report must contain the following:

- a. Executive summary that briefly discusses results of each system's endurance testing and PVT testing and conclusions for each system.
- b. Endurance testing for each system.

- c. Completed PVT Plan for each system used during testing that includes hand written field notes and participant signatures.
- d. Blank PVT Plan for each system approved prior to testing that is edited to reflect changes occurring during testing. Edits must be typed and must reflect changes to control sequences from contract documents, must reflect changes to numbered test methods required to initiate a response, and must reflect changes to expected response. Only one blank PVT Plan is required for each set of systems sharing an identical control sequence, such as air terminal units, exhaust air fans, fan coil units and unit heaters.
- e. Written certification that the installation and testing of all systems are complete and meet all contract document requirements.

### 3.6 OPERATION AND MAINTENANCE (O&M) INSTRUCTIONS

Provide HVAC control System Operation and Maintenance Instructions which include:

- a. "Data Package 3" as indicated in Section 01 78 23 OPERATION AND MAINTENANCE DATA for each piece of control equipment.
- b. "Data Package 4" as described in Section 01 78 23 OPERATION AND MAINTENANCE DATA for all air compressors.
- c. HVAC control system sequences of operation formatted as indicated.
- d. Procedures for the HVAC system start-up, operation and shut-down including the manufacturer's supplied procedures for each piece of equipment, and procedures for the overall HVAC system.
- e. As-built HVAC control system detail drawings formatted as indicated.
- f. Routine maintenance checklist. Provide the routine maintenance checklist arranged in a columnar format, where the first column lists all installed devices, the second column states the maintenance activity or that no maintenance required, the third column states the frequency of the maintenance activity, and the fourth column is used for additional comments or reference.
- g. Qualified service organization list, including at a minimum company name, contact name and phone number.
- h. Start-Up Testing Report.
- i. Performance Verification Test (PVT) Procedures and Report.

Submit 2 copies of the Operation and Maintenance Instructions, indexed and in booklet form. The Operation and Maintenance Instructions may be submitted as a Technical Data Package.

### L3.7 MAINTENANCE AND SERVICE

Provide services, materials and equipment as necessary to maintain the entire system in an operational state as indicated for a period of one year from the date of final acceptance of the project. Minimize impacts on

facility operations.

- a. The integration of the system specified in this section into a Utility Monitoring and Control System must not, of itself, void the warranty or otherwise alter the requirement for the one year maintenance and service period. Integration into a UMCS includes but is not limited to establishing communication between devices in the control system and the front end or devices in another system.
- b. The changing of configuration properties must not, of itself, void the warranty or otherwise alter the requirement for the one year maintenance and service period.

#### 3.7.1 Description of Work

Provide adjustment and repair of the system including the manufacturer's required sensor and actuator (including transducer) calibration, span and range adjustment.

#### 3.7.2 Personnel

Use only service personnel qualified to accomplish work promptly and satisfactorily. Advise the Government in writing of the name of the designated service representative, and of any changes in personnel.

#### 3.7.3 Scheduled Inspections

Perform two inspections at six-month intervals and provide work required. Perform inspections in June and December. During each inspection perform the indicated tasks:

- a. Perform visual checks and operational tests of equipment.
- b. Clean control system equipment including interior and exterior surfaces.
- c. Check and calibrate each field device. Check and calibrate 50 percent of the total analog inputs and outputs during the first inspection. Check and calibrate the remaining 50 percent of the analog inputs and outputs during the second major inspection. Certify analog test instrumentation accuracy to be twice the specified accuracy of the device being calibrated. Randomly check at least 25 percent of all binary inputs and outputs for proper operation during the first inspection. Randomly check at least 25 percent of the remaining binary inputs and outputs during the second inspection. If more than 20 percent of checked inputs or outputs failed the calibration check during any inspection, check and recalibrate all inputs and outputs during that inspection.
- d. Run system software diagnostics and correct diagnosed problems.
- e. Resolve any previous outstanding problems.

#### 3.7.4 Scheduled Work

This work must be performed during regular working hours, Monday through Friday, excluding Federal holidays.

### 3.7.5 Emergency Service

The Government will initiate service calls when the system is not functioning properly. Qualified personnel must be available to provide service to the system. A telephone number where the service supervisor can be reached at all times must be provided. Service personnel must be at the site within 24 hours after receiving a request for service. The control system must be restored to proper operating condition.

### 3.7.6 Operation

After performing scheduled adjustments and repairs, verify control system operation as demonstrated by the applicable tests of the performance verification test.

### 3.7.7 Records and Logs

Keep dated records and logs of each task, with cumulative records for each major component, and for the complete system chronologically. Maintain a continuous log for all devices, including initial analog span and zero calibration values and digital points. Keep complete logs and provide logs for inspection onsite, demonstrating that planned and systematic adjustments and repairs have been accomplished for the control system.

### 3.7.8 Work Requests

Record each service call request as received and include its location, date and time the call was received, nature of trouble, names of the service personnel assigned to the task, instructions describing what has to be done, the amount and nature of the materials to be used, the time and date work started, and the time and date of completion. Submit a record of the work performed within 5 days after work is accomplished.

### 3.7.9 System Modifications

Submit recommendations for system modification in writing. Do not make system modifications, including operating parameters and control settings, without prior approval of the Government.

## 3.8 TRAINING

Conduct a training course for 10 operating staff members designated by the Government in the maintenance and operation of the system, including specified hardware and software. Conduct 16 hours of training at the project site within 30 days after successful completion of the performance verification test. The Government reserves the right to make audio and visual recordings (using Government supplied equipment) of the training sessions for later use. Provide audiovisual equipment and other training materials and supplies required to conduct training. A training day is defined as 8 hours of classroom instruction, including two 15 minute breaks and excluding lunchtime, Monday through Friday, during the daytime shift in effect at the training facility.

### 3.8.1 Training Documentation

Prepare training documentation consisting of:

- a. Course Attendee List: Develop the list of course attendees in coordination with and signed by the ControlsHVACElectrical shop

supervisor.

- b. Training Manuals: Provide training manuals which include an agenda, defined objectives for each lesson, and a detailed description of the subject matter for each lesson. When presenting portions of the course material by audiovisuals, deliver copies of those audiovisuals as a part of the printed training manuals.

### 3.8.2 Training Course Content

For guidance in planning the required instruction, assume that attendees will have a high school education, and are familiar with HVAC systems. During the training course, cover all of the material contained in the Operating and Maintenance Instructions, the layout and location of each controller enclosure, the layout of one of each type of equipment and the locations of each, the location of each control device external to the panels, the location of the compressed air station, preventive maintenance, troubleshooting, diagnostics, calibration, adjustment, commissioning, tuning, and repair procedures. Typical systems and similar systems may be treated as a group, with instruction on the physical layout of one such system. Present the results of the performance verification test and the Start-Up Testing Report as benchmarks of HVAC control system performance by which to measure operation and maintenance effectiveness.

### 3.8.3 Training Documentation Submittal Requirements

Submit hardcopy training manuals and all training materials on CD-ROM. Provide one hardcopy manual for each trainee on the Course Attendee List and 2 additional copies for archive at the project site. Provide 2 copies of the Course Attendee List with the archival copies. Training Documentation may be submitted as a Technical Data Package.

**APPENDIX A**

| <b><u>QC CHECKLIST FOR BACNET SYSTEMS</u></b>                                                                                                                                                                                                  |                                                                                                                   |      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|------|

SECTION 23 21 13

POLYPROPYLENE PRESSURE PIPING  
12/24

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NSF INTERNATIONAL (NSF)

NSF/ANSI 14 (2023) Plastics Piping System Components and Related Materials

ASTM INTERNATIONAL (ASTM)

ASTM F2389 (2024a) Standard Specification for Pressure-rated Polypropylene (PP) Piping Systems

PART 2 PRODUCTS

2.1 COMPONENTS

2.1.1 Pipe

Polypropylene pipe shall meet ASTM F2389 and NSF/ANSI 14.

- a. Polypropylene Pipe, fittings, and valves shall contain no rework or recycled materials except that generated in the manufacturer's own plant from resin of the same specification from the same raw material.
- b. Pipe shall be manufactured from polypropylene (PP-RCT) thermoplastic, multi-layer fiber-composite, with heat-fused connections, and crystallinity-resistant, temperature-resistant, and naturally corrosion-resistant properties. Pipe shall be high-performance pressure, suitable for aggressive medium applications. Provide fiber-composite technology to reduce linear expansion. Pipe shall be made in an extrusion process. Polypropylene pipe standard dimension ratio (wall thickness) shall be SDR 11.
- c. Pipe shall be labeled every three feet to identify the size and type of pipe and the test standards which they meet.
- d. Manufacturer shall warranty pipe and fittings for 10 years to be free of defects in materials or manufacturing. Pipe shall be Aquatherm Blue Pipe MF.
- e. Pipe shall be manufactured by Aquatherm pipe located at 825 West 600 North Lindon, Utah 84042, or equal.

2.1.2 UV Protection

- a. Avoid exposing PP-RCT pipe and fittings to UV radiation during

transport, storage and construction. Store pipe in UV-resistant bags or wrap.

- b. For outdoor above ground installation, provide PP-RCT pipe with factory applied UV resistant coating layer. UV protected pipe shall have outer layer of black polyethylene, factory extruded over the top of the pipe. To fuse UV protected pipe, remove portions of protective layer per pipe manufacturer's instructions. All above ground pipe, fittings and joints without factory UV resistant coating shall be field protected with black elastomeric paint.
- c. Polypropylene fittings shall conform to dimensional requirements of SDR 11.
- d. Polypropylene piping that will be exposed to UV light shall be provided with a Factory applied UV resistant coating.
- e. Provide PP-RCT fittings with stainless steel threaded inserts for transition to metal threaded components.

#### 2.1.3 Joints

- a. PP-RCT joints shall be socket or butt type, with heat-fusion connections in accordance with ASTM F2389. Heat fusion joints shall maintain the same properties as the pipe itself. Parts shall be installed by the manufacturer's approved installer.
- b. Provide transitions where required, to ANSI flanges, NPT threads, and stainless steel piping, using flanges, adapters, and stainless steel threads.
- c. Provide flange joints with full-face gaskets. Faces of flanges must be clean, free of paint, and other imperfections. PP-RCT flanges must be installed per manufacturer guidelines utilizing proper flange adaptors and coated steel flanged backing ring when required.

### PART 3 EXECUTION

#### 3.1 INSTALLATION

- a. Polypropylene pipe and fittings shall be joined by heat fusion methods or electrofusion by properly trained and qualified fusion equipment operators using well-maintained fusion equipment specifically designed for that purpose. The heat fusion procedure shall be conducted in accordance with ASTM F3722 and the pipe and/or fitting manufacturer's recommendations
- b. The installed pipe needs to be pressure tested at twice the working pressure or the pressure rating of the pipe, which ever is less. The pressure needs to remain the same for 2 hours without loss of pressure.
- c. Leaking fusion joints or mechanical connections shall be repaired in accordance with ASTM F3722 and the manufacturer's recommendation. Once the appropriate repairs are made, the system shall be re-tested for leaks using the same pressure testing procedure.

- d. Install hangers and supports at intervals specified in accordance with ANSI/MSS SP-58 or in the applicable code and as recommended by the manufacturer. Hangers and supports shall be located within one foot of any change in direction and within one foot of any fittings or valves.
- e. Contractor installers shall be trained by the manufacturer. When new contractor installers are implemented by the contractor due to staff change over, they shall be trained by the manufacturer prior to installation of pipe.

1.2 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

System Coordination; G

SD-03 Product Data

Instructions; G

Equipment Data; G

Training Period; G

SD-06 Test Reports

Factory Tests

Field Quality Control

SD-07 Certificates

Manufacturer's Representative

SD-10 Operation and Maintenance Data

Operation and Maintenance Manuals; G

Training; G

### 1.3 QUALITY ASSURANCE

#### 1.3.1 Manufacturer Services

Provide the services of a manufacturer's representative experienced in the installation, adjustment, and operation of the equipment specified. The representative must supervise the installation, adjustment, testing of the equipment, and conduct training.

Submit the names and qualifications of the manufacturer's representative and training engineers and written certification from the manufacturer that the representative and trainers are technically qualified.

#### 1.3.2 Standard Products

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate equipment that has been in satisfactory HVAC operation at least 2 years prior to issuance of this solicitation. Support equipment with a service organization that is reasonably convenient to the jobsite. Pumps and motors of the same types must each be the product of one manufacturer.

#### 1.3.3 Conformance with Agency Requirements

Where materials or equipment are specified to be an approved type, attach the seal or label of approval from a nationally recognized testing agency, adequately equipped and competent to perform such services. A written certificate from the testing agency must accompany the materials or equipment and be submitted stating that the items have been tested and that they conform to the applicable requirements of the specifications and to the standards listed herein. The certificate must indicate the methods of testing used by the testing agency. In lieu of a certificate from a testing agency, published catalog specification data, accompanied by the manufacturer's certified statement to the effect that the items are in accordance with the applicable requirements of the specifications and the referenced standards, will be considered and may be acceptable as evidence that the items conform with agency requirements.

### 1.4 DELIVERY, STORAGE, AND HANDLING

Protect equipment, delivered and designated for storage, from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

## PART 2 PRODUCTS

### 2.1 SYSTEM DESCRIPTION

Hydronic pumps used for heating and air conditioning applications are defined by the type of impeller, number of impellers, type of casing, method of connection to the driver, and mounting position. Provide centrifugal water pumps of the types indicated and specified. Use an electric motor driving unit for each pump as indicated and specified.

#### 2.1.1 Selection Criteria

Select pumps at a point within the maximum efficiency for a given impeller casing combination. Deviations within 3 percent of maximum efficiency are permissible, provided the lesser efficiency is not less than the scheduled

efficiency in the construction design documents. Pumps having impeller diameters larger or smaller than manufacturer's published maximum and minimum impeller diameters for a given impeller casing combination will be rejected. Pump performance data, as shown in performance curves, must be based on factory tests using precision instrumentation and exacting procedures as detailed in HI ANSI/HI 14.6.

#### 2.1.2 System Coordination

Submit drawings containing complete wiring and piping schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show the proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation. Provide a complete listing of equipment, materials and miscellaneous components including mechanical seals, bearings, and couplings.

#### 2.1.3 Safety Requirements

Fully enclose or guard couplings, projecting set-screws, keys, and other rotating parts, that pose an entangling hazards..

### 2.2 MATERIALS AND EQUIPMENT

#### 2.2.1 Nameplates

Securely affix a standard nameplate to pumps and motors in a conspicuous place showing the manufacturer's name, address, type or style, model, serial number, and catalog number. In addition, for each pump show the capacity in gpm at rated speed in rpm and total head in feet of water. For each electric motor show at least the minimum information required by NEMA MG 1. Show such other information as the manufacturer may consider necessary to complete identification on the nameplate. Pumps must be listed and labeled by UL, and comply with UL 778 for pumps not using universal motors rated more than 250 volts such as circulating pumps.

#### 2.2.2 Framed Instructions

Submit proposed diagrams, instructions, and other sheets, prior to posting. Post approved wiring and control diagrams showing the complete layout of the entire system, including equipment, piping valves, and control sequence, framed under glass or in approved laminated plastic, where directed. Provide condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation, and procedures for safely starting and stopping the system, framed as specified above for the wiring and control diagrams, and posted beside the diagrams. Post the framed instructions before acceptance testing of the systems.

#### 2.2.3 Pump Characteristic

Construct hydronic water pumps in accordance with HI 1.1-1.2 and HI ANSI/HI 2.1-2.2. The pumps must be capable of discharging quantities at total discharge heads measured at the discharge flange, between the following limits:

Operate pumps at optimum efficiencies to produce the most economical pumping system under the conditions encountered . Pumps must furnish not

less than 150 percent of rated capacity at a total discharge head of not less than 65 percent of total rated head. The shutoff total head must not be greater than 120 percent of total rated head. Operate pumps at specified system fluid temperatures without vapor binding and cavitation. Operate pumps to HI ANSI/HI 9.6.3 standard for Preferred Operating Region (POR).

#### 2.2.4 Pump Drivers

Provide electric motors as indicated for each pump and in compliance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

#### 2.2.5 Equipment Data

Submit manufacturer's descriptive data and technical literature, performance charts and curves for all impeller sizes for a given casing, catalog cuts, and installation instructions. Provide spare parts data for each different item of material and equipment specified, after approval of the detail drawings and not later than three months prior to the date of beneficial occupancy. Include a complete list of parts and supplies, with current unit prices and local source of supply with contact information.

Submit catalog information, certified pumps curves, rated capacities, final impeller dimensions, and accessories provided for the product indicated. Indicate operating point of each pump on curves. Furnish pump curves for each pump and combination of pumps designed to operate in parallel. The pump curve must show as a minimum; bhp, flow, total dynamic head, efficiency, NPSH, impeller diameter and system curve (individually and in combination for each pump operating in a parallel application). Select pumps operating in parallel operation to cross the system curve when operating individually.

### 2.3 HYDRONIC PUMPS

Provide centrifugal, single-stage type, or multi-stage type, designed for HVAC service in the following configurations:

| Configuration        | Pump No.        |
|----------------------|-----------------|
|                      |                 |
| Vertical, Multistage | P9-A/B, P10-A/B |
|                      |                 |

#### 2.3.1 Vertical, Multistage

Type: Vertical, multistage as defined in HI 1.1-1.2 and HI 1.3 for in-line, multistage, separately coupled, overhung impeller, centrifugal pump.

2.3.1.1 Casing

Cast-iron or steel base and stainless-steel chamber.

2.3.1.2 Impeller

Closed, stainless steel; statically and dynamically balanced and keyed to shaft.

2.3.1.3 Shaft

Stainless steel.

2.3.1.4 Seal

Mechanical.

2.3.1.5 Bearing

Water-lubricated sleeve type.

2.3.1.6 Motor

Provide electric motor conforming to NEMA MG 1 and of the horsepower, and voltage indicated. Motor enclosure must be open drip proof; with heavy duty grease lubricated ball bearings completely adequate for the maximum load for which the motor is designed. Motor must be non-overloading at any point on the pump curve and premium efficiency. Provide motor efficiencies as shown in the ICC IgCC standard. Totally enclosed fan cooled motor efficiencies must be as shown in NEMA MG 1.

2.3.1.7 Control Panel

Factory installed and connected as an integral part of the booster pump; automatic for multiple-pumps, constant-speed operation, with load control and protection functions. Hand-off-automatic selector switch for each pump in cover of control panel. Duplex, automatic, alternating starter; switches lead pump to lag main pump and to two-pump operation.

2.4 ELECTRICAL WORK

Provide electrical motor driven equipment specified herein complete with motors, motor starters, and controls. Provide electric equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Electrical characteristics must be as indicated. Provide motor starters complete with properly sized thermal overload protection in each phase and other appurtenances necessary for the motor control specified. Each motor must be of sufficient capacity to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor when operating at proper electrical system voltage and frequency. Manual or automatic control and protective or signal devices required for the operation herein specified and any control wiring required for controls and devices but not indicated must be provided under this section of the specifications.

2.5 ELECTRICAL EQUIPMENT

Provide electrical equipment in conformance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide electrical motor driven equipment herein

specified complete with motors, motor starters, and controls. Motor controls, equipment, and wiring must be in accordance with NFPA 70.

#### 2.5.1 Electric Motors

Drive each electric motor-driven pump by a continuous-duty electric motor with enclosure type for specific service as defined in paragraph HYDRONIC PUMPS. Motor must have a 1.5 service factor. Provide squirrel-cage induction motors having normal-starting-torque and low-starting-current characteristics, and of sufficient size so that the nameplate horsepower rating will not be exceeded throughout the entire published pump characteristic curve. Integral size motors must be the premium efficiency type in accordance with NEMA MG 1. Pump electric motor efficiencies must meet or exceed the requirements of the ICC IgCC standard. Motor bearings must provide smooth operations under the conditions encountered for the life of the motor. Provide adequate thrust bearing in the motor to carry the weight of all rotating parts plus the hydraulic thrust and be capable of withstanding upthrust imposed during pump starting and under variable pumping head conditions specified. Motors must be rated 460 volts, 3 phase, 60 Hz and such rating must be stamped on the nameplate. Provide motors in conformance with NEMA MG 1.

#### 2.5.2 Control Equipment

Manually controlled pumps must have START-STOP pushbutton in cover. Automatically controlled pumps must have three-position "MANUAL-OFF-AUTOMATIC" selector switch in cover. Provide additional controls or protective devices as indicated.

#### 2.5.3 Variable Speed Control

The variable speed motor controllers must meet the requirements of UFGS 26 29 23 ADJUSTABLE SPEED DRIVE SYSTEMS UNDER 600 VOLTS.

### 2.6 EQUIPMENT APPURTENANCES

#### 2.6.1 Attachments

Furnish all necessary bolts, nuts, washers, bolt sleeves, and other types of attachments with the equipment for the installation of the equipment. Bolts conform to the requirements of ASTM A307 and hexagonal nuts of the same quality as the bolts used. Threads must be clean-cut and conform to ASME B1.1. Bolts, nuts, and washers specified to be galvanized or not otherwise indicated or specified, must be zinc coated after being threaded, by the hot-dip process conforming to ASTM A123/A123M as appropriate. Bolts, nuts, and washers specified or indicated to be stainless steel must be Type 316.

#### 2.6.2 Equipment Guards

Provide equipment driven by open shafts, belts, chains, or gears with all-metal guards enclosing the drive mechanism. Secure guards in position with steel braces or straps that permit easy removal for servicing the equipment. Coupler guards must comply with current national safety standards including 29 CFR 1910.219 and NEMA Z535.4. Provide guards with gaps no greater than 0.250 inches, safety orange in color, and have an NEMA Z535.4 compliant warning label.

### 2.6.3 Tools

Furnish a complete set of all special tools which may be necessary for the adjustment, operation, maintenance, and disassembly of all equipment. Special tools are considered to be those tools which because of their limited use are not normally available, but which are necessary for the particular equipment. Special tools must be high-grade, smooth, forged, alloy, tool steel. Furnish one pressure grease gun for each type of grease required. Deliver all tools at the same time as the equipment to which they pertain. Properly store and safeguard such tools until completion of the work, at which time deliver them to the Contracting Officer.

### 2.7 FINISHES

All motors, pump casings, and similar parts of equipment must be thoroughly cleaned, primed, and given two finish coats of paint at the factory in accordance with the recommendations of the manufacturer. Give ferrous surfaces not to be painted a shop coat of grease or other suitable rust-resistant coating.

### 2.8 FACTORY TESTS

Pumps must be tested by the manufacturer or a nationally recognized testing agency in compliance with HI 1.3. Submit certified test results.

## PART 3 EXECUTION

### 3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.

### 3.2 INSTALLATION

Install each pump and motor in accordance with the written instructions of the manufacturer. Provide access space around the device for servicing no less than the minimum recommended by the manufacturer.

### 3.3 FIELD QUALITY CONTROL

After installation of the pumping units and appurtenances, including coupling guard, is complete, carry out operating tests to assure that the pumping installation operates properly. Make arrangements to have the manufacturer's representatives present when field equipment tests are made.

Give each pumping unit a running field test in the presence of the Contracting Officer for a minimum of 2 hours. Operate each pumping unit at its rated capacity or such other point on its head-capacity curve selected by the Contracting Officer. Provide an accurate and acceptable method of measuring the discharge flow. Tests must assure that the units and appurtenances have been installed correctly, that there is no objectionable heating, vibration, or noise from any parts, and that all manual and automatic controls function properly. If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests.

Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance

with the specified performance criteria, upon completion and testing of the installed system. Each test report must indicate the final position of controls.

### 3.4 FIELD PAINTING

Do not paint stainless steel, galvanized steel, and nonferrous surfaces.

#### 3.4.1 Touch-up painting

Factory painted items requiring touching up in the field must be thoroughly cleaned of all foreign material, and primed and topcoated with the manufacturer's standard factory finish.

#### 3.4.2 Exposed Ferrous Surfaces

Paint exposed ferrous surfaces with two coats of enamel paint conforming to SSPC Paint 21. Solvent clean factory primed surfaces before painting. Surfaces that have not been factory primed must be prepared and primed with one coat of SSPC Paint 25 or in accordance with the enamel paint manufacturer's recommendations.

### 3.5 CLOSEOUT ACTIVITIES

#### 3.5.1 Operation and Maintenance Manuals

Submit one complete set at the time the tests procedure is submitted; remaining sets before the contract is completed. Permanently bind each in a hard cover. Inscribe the following identification on the covers: the words "OPERATING AND MAINTENANCE INSTRUCTIONS," name and location of the building, name of the Contractor, and contract number. Place flysheets before instructions covering each subject. Use 8-1/2 by 11 inches paper for instruction sheets, with large sheets of drawings folded in.

Include, but do not limit to, the following in the Instructions:

- a. System layout showing piping, valves, and controls.
- b. Approved wiring and control diagrams including variable frequency drives.
- c. A control sequence describing startup, operation, and shutdown.
- d. Operating and maintenance instructions for each piece of equipment, including task list for routine maintenance, routine inspections, intermediate inspections, and annual inspections; lubrication instructions; and troubleshooting guide.
- e. Manufacturer's bulletins, cuts, and descriptive data; and parts list and recommended spare parts.

#### 3.5.2 Training

Upon completion of the work, and at a time designated by the Contracting Officer, provide the services of one or more competent engineers for a training period of not less than 8 hours to instruct a representative of the Government in the contents of the operation and maintenance manuals for the equipment furnished under these specifications. These field instructions must cover all the items contained in the bound

instructions. Submit the training course curriculum and training instructions 14 days prior to the start of training.

## 1.2 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Refrigerant Piping System; G, AE

SD-03 Product Data

Refrigerant Piping System

Qualifications

Refrigerant Piping Tests

Verification of Dimensions

SD-06 Test Reports

Refrigerant Piping Tests

SD-07 Certificates

Service Organization

SD-10 Operation and Maintenance Data

Maintenance; G, AE

Operation and Maintenance Manuals; G, AE

Demonstrations; G, AE

### 1.3 QUALITY ASSURANCE

#### 1.3.1 Qualifications

Submit six copies of qualified procedures, and list of names and identification symbols of qualified welders and welding operators, prior to non-factory welding operations. Weld piping in accordance with the qualified procedures using performance qualified welders and welding operators. Procedures and welders must be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests to be performed at the work site, if practical. The welder or welding operator must apply the personally assigned symbol near each weld made, as a permanent record. Weld structural members in accordance with Section 05 12 00 STRUCTURAL STEEL. Welding and nondestructive testing procedures are specified in Section 40 17 26.00 20 WELDING PRESSURE PIPING.

#### 1.3.2 Contract Drawings

Because of the small scale of the drawings, it is not possible to indicate all offsets, fittings, and accessories that may be required. Carefully investigate the plumbing, fire protection, electrical, structural and finish conditions that would affect the work to be performed and arrange such work accordingly, furnishing required offsets, fittings, and accessories to meet such conditions.

### 1.4 DELIVERY, STORAGE, AND HANDLING

Protect stored items from the weather, humidity and temperature variations, dirt and dust, or other contaminants. Proper protection and care of all material both before and during installation is the Contractor's responsibility. Replace any materials found to be damaged at

the Contractor's expense. During installation, cap piping and similar openings to keep out dirt and other foreign matter.

## 1.5 MAINTENANCE

### 1.5.1 General

Submit Data Package 2 plus operation and maintenance data complying with the requirements of Section 01 78 23 OPERATION AND MAINTENANCE DATA and as specified herein.

## PART 2 PRODUCTS

### 2.1 STANDARD COMMERCIAL PRODUCTS

- a. Provide materials and equipment which are standard products of a manufacturer regularly engaged in the manufacturing of such products, that are of a similar material, design and workmanship and that have been in satisfactory commercial or industrial use for 2 years prior to bid opening.
- b. The 2 year use must include applications of equipment and materials under similar circumstances and of similar size. The 2 years' experience must be satisfactorily completed by a product which has been sold or is offered for sale on the commercial market through advertisements, manufacturer's catalogs, or brochures. Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation, for not less than 6000 hours exclusive of the manufacturer's factory tests, can be shown.
- c. Products must be supported by a service organization. System components must be environmentally suitable for the indicated locations. Submit a certified list of qualified permanent service organizations for support of the equipment which includes their addresses and qualifications. The service organizations must be reasonably convenient to the equipment installation and be able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.
- d. Exposed equipment moving parts, parts that produce high operating temperature, parts which may be electrically energized, and parts that may be a hazard to operating personnel must be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Install safety devices so that proper operation of equipment is not impaired. Welding and cutting safety requirements must be in accordance with AWS Z49.1.
- e. Provide the manufacturer's standard catalog data, at least 5 weeks prior to the purchase or installation of a particular component. Highlight the data to show information such as, but not limited to, material, size, options, performance charts, and curves in adequate detail to demonstrate compliance with contract requirements. Include the manufacturer's recommended installation instructions and procedures in the data provided. Provide data for the following components as a minimum:
  - (1) Piping and Fittings
  - (2) Valves
  - (3) Piping Accessories

(4) Pipe Hangers, Inserts, and Supports

2.2 ELECTRICAL WORK

Manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices specified, but not shown, must be provided.

2.3 REFRIGERANT PIPING SYSTEM

Provide refrigerant piping, valves, fittings, and accessories in accordance with ASHRAE 15 & 34 and ASME B31.5, except as specified herein. Refrigerant piping, valves, fittings, and accessories must be compatible with the fluids used and capable of withstanding the pressures and temperatures of the service. Refrigerant piping, valves, and accessories used for refrigerant service must be cleaned, dehydrated, and sealed (capped or plugged) prior to shipment from the manufacturer's plant. Submit drawings, at least 5 weeks prior to beginning construction, provided in adequate detail to demonstrate compliance with contract requirements. Drawings must consist of:

- a. Piping layouts which identify all valves and fittings.
- b. Plans and elevations which identify clearances required for maintenance and operation.

2.4 PIPE, FITTINGS AND END CONNECTIONS (JOINTS)

2.4.1 Steel Pipe

Steel pipe for refrigerant service must conform to ASTM A53/A53M, Schedule 40, Type E or S, Grades A or B. Do not use Type F pipe.

2.4.1.1 Welded Fittings and Connections

Butt-welded fittings must conform to ASME B16.9. Socket-welded fittings must conform to ASME B16.11. Identify welded fittings with the appropriate grade and marking symbol. Welded valves and pipe connections (both butt-welds and socket-welds types) must conform to ASME B31.9.

2.4.1.2 Threaded Fittings and Connections

Threaded fitting must conform to ASME B16.3. Threaded valves and pipe connections must conform to ASME B1.20.1.

2.4.1.3 Flanged Fittings and Connections

Flanges must conform to ASME B16.5, Class 150. Gaskets must be non-asbestos compressed material in accordance with ASME B16.21, 1/16 inch thickness, full face or self-centering flat ring type. Gaskets must contain aramid fibers bonded with styrene butadiene rubber (SBR) or nitrile butadiene rubber (NBR). Bolts, nuts, and bolt patterns must conform to ASME B16.5. Bolts must be high or intermediate strength material conforming to ASTM A193/A193M.

2.4.2 Steel Tubing

Tubing must be cold-rolled, electric-forged, welded-steel in accordance with ASTM A334/A334M, Grade 1. Joints and fittings must be socket type

provided by the steel tubing manufacturer.

#### 2.4.3 Copper Tubing

Provide copper tubing conforming to ASTM B280 annealed or hard drawn as required. Copper tubing must bear the product identification markings in accordance with ASTM B280, "ACR" must be present on copper tubing. Copper tubing must be soft annealed where bending is required and hard drawn where no bending is required. Soft annealed copper tubing must not be used in sizes larger than 1-3/8 inches. Joints must be brazed except that joints on lines 7/8 inch and smaller may be flared. Cast copper alloy fittings for flared copper tube must conform to ASME B16.26 and ASTM B62. Wrought copper and bronze solder-joint pressure fittings must conform to ASME B16.22 and ASTM B75/B75M. Joints and fittings for brazed joint must be wrought-copper or forged-brass sweat fittings. Cast sweat-type joints and fittings are not allowed for brazed joints. Brass or bronze adapters for brazed tubing may be used for connecting tubing to flanges and to threaded ends of valves and equipment.

#### 2.4.4 Solder

Solder must conform to ASTM B32, grade Sb5, tin-antimony alloy for service pressures up to 150 psig. Solder flux must be liquid or paste form, non-corrosive and conform to ASTM B813.

#### 2.4.5 Brazing Filler Metal

Filler metal must conform to AWS A5.8/A5.8M, Type BAg-5 with AWS Type FB3-A or Type FB3-C flux, except Type BCuP-3, BCuP-4, or BCuP-5 may be used for brazing copper-to-copper joints. BAlSi-4 with AWS Type FB1-A flux may be used when joining copper piping to aluminum components.

#### 2.4.6 Brazing Flux

Brazing flux must conform to AWS A5.31/A5.31M, Type FB3-A or Type FB3-C when using Type BAg-5 filler metal. Type FB1-A is to be used with Type BAlSi-4 filler metal.

#### 2.4.7 Press Fittings

Press fittings are not acceptable for use in refrigerant piping systems.

### 2.5 VALVES

Valves must be designed, manufactured, and tested specifically for refrigerant service. The valve material and all internal components must be compatible with the specific refrigerant and lubricant used. Valve bodies must be of brass, bronze, steel, or ductile iron construction. Valves 1 inch and smaller must have brazed or socket welded connections. Valves larger than 1 inch must have butt welded end connections. Do not use threaded end connections, except in pilot pressure or gauge lines where maintenance disassembly is required and welded flanges cannot be used. Internal parts must be removable for inspection or replacement without applying heat or breaking pipe connections. Valve stems exposed to the atmosphere must be stainless steel or corrosion resistant metal plated carbon steel. Direction of flow must be legibly and permanently indicated on the valve body. Control valve inlets must be fitted with integral or adapted strainer or filter where recommended or required by the manufacturer. Purge, charge and receiver valves must be of

manufacturer's standard configuration.

#### 2.5.1 Refrigerant Stop Valves

Valve must be the globe or full-port ball type with a back-seating stem especially packed for refrigerant service. Valve packing must be replaceable under line pressure. Provide valve with a handwheel or wrench operator and a seal cap. Valve must be the straight or angle pattern design as indicated.

#### 2.5.2 Check Valves

Valve must be the swing or lift type as required to provide positive shutoff at the differential pressure indicated. Valve must be provided with resilient seat.

#### 2.5.3 Liquid Solenoid Valves

Provide valves that comply with AHRI 760 I-P and are suitable for continuous duty with applied voltages 15 percent under and 5 percent over nominal rated voltage at maximum and minimum encountered pressure and temperature service conditions. Valves must be direct-acting or pilot-operating type, packless, except that packed stem, seal capped, manual lifting provisions must be furnished. Provide solenoid coils that are moisture-proof, UL approved, totally encapsulated or encapsulated and metal jacketed as required. Valves must have safe working pressure of 610 psi and a maximum operating pressure differential of at least 200 psi at 85 percent rated voltage. Valves must have an operating pressure differential suitable for the refrigerant used.

#### 2.5.4 Expansion Valves

Provide valve conforming to AHRI 750 I-P and ASHRAE 17. Valve must be the diaphragm and spring-loaded type with internal or external equalizers, and bulb and capillary tubing. Provide valve with an external superheat adjustment along with a seal cap. Internal equalizers may be utilized where flowing refrigerant pressure drop between outlet of the valve and inlet to the evaporator coil is negligible and pressure drop across the evaporator is less than the pressure difference corresponding to 2 degrees F of saturated suction temperature at evaporator conditions. Bulb charge must be determined by the manufacturer for the application and such that liquid will remain in the bulb at all operating conditions. Do not use gas limited liquid charged valves and other valve devices for limiting evaporator pressure without a distributor or discharge tube or effective means to prevent loss of control when bulb becomes warmer than valve body. Pilot-operated valves must have a characterized plug to provide required modulating control. A de-energized solenoid valve may be used in the pilot line to close the main valve in lieu of a solenoid valve in the main liquid line. Provide an isolatable pressure gauge in the pilot line, at the main valve. Automatic pressure reducing or constant pressure regulating expansion valves may be used only where indicated or for constant evaporator loads.

#### 2.5.5 Electronic Expansion Valves

Valve must conform to AHRI 1370 I-P and ASHRAE 17. The valve must prevent the return of liquid to the compressor in the event of power loss or low superheat.

#### 2.5.6 Safety Relief Valves

Valve must be the two-way type, unless indicated otherwise. Valve must bear the ASME code symbol. Valve capacity must be certified by the National Board of Boiler and Pressure Vessel Inspectors. Valve must be of an automatically reseating design after activation.

#### 2.5.7 Evaporator Pressure Regulators, Direct-Acting

Valve must include a diaphragm/spring assembly, external pressure adjustment with seal cap, and pressure gauge port. Valve must maintain a constant inlet pressure by balancing inlet pressure on diaphragm against an adjustable spring load. Pressure drop at system design load must not exceed the pressure difference corresponding to a 2 degrees F change in saturated refrigerant temperature at evaporator operating suction temperature. Spring must be selected for indicated maximum allowable suction pressure range.

#### 2.5.8 Refrigerant Access Valves

Provide refrigerant access valves and hose connections in accordance with AHRI 720.

### 2.6 PIPING ACCESSORIES

#### 2.6.1 Filter Driers

Driers must conform to AHRI 710 I-P. Sizes 5/8 inch and larger must be the full flow, replaceable core type. Sizes 1/2 inch and smaller must be the sealed type. Cores must be of suitable desiccant that will not plug, cake, dust, channel, or break down, and must remove water, acid, and foreign material from the refrigerant. Construct filter driers so that none of the desiccant will pass into the refrigerant lines. Minimum bursting pressure must be 1,500 psi.

#### 2.6.2 Sight Glass and Liquid Level Indicator

##### 2.6.2.1 Assembly and Components

Assembly must be pressure- and temperature-rated and constructed of materials suitable for the service. Glass must be borosilicate type. Ferrous components subject to condensation must be electro-galvanized.

##### 2.6.2.2 Gauge Glass

Gauge glass must include top and bottom isolation valves fitted with automatic checks, and packing followers; red-line or green-line gauge glass; elastomer or polymer packing to suit the service; and gauge glass guard.

##### 2.6.2.3 Bull's-Eye and Inline Sight Glass Reflex Lens

Provide bull's-eye and inline sight glass reflex lens for dead-end liquid service. For pipe line mounting, provide two plain lenses in one body suitable for backlighted viewing.

##### 2.6.2.4 Moisture Indicator

Indicator must be a self-reversible action, moisture reactive, color

changing media. Indicator must be furnished with full-color-printing tag containing color, moisture, and temperature criteria. Unless otherwise indicated, the moisture indicator must be an integral part of each corresponding sight glass.

#### 2.6.3 Vibration Dampeners

Dampeners must be of the all-metallic bellows and woven-wire type.

#### 2.6.4 Flexible Pipe Connectors

Connector must be a composite of interior corrugated phosphor bronze or Type 300 Series stainless steel, as required for fluid service, with exterior reinforcement of bronze, stainless steel or monel wire braid. Assembly must be constructed with a safety factor of not less than 4 at 300 degrees F. Unless otherwise indicated, the length of a flexible connector must be as recommended by the manufacturer for the service intended.

#### 2.6.5 Strainers

Strainers used in refrigerant service must have brass or cast-iron body, Y-or angle-pattern, cleanable, not less than 60-mesh noncorroding screen of an area to provide net free area not less than ten times the pipe diameter with pressure rating compatible with the refrigerant service. Screens must be stainless steel or monel and reinforced spring-loaded where necessary for bypass-proof construction.

#### 2.6.6 Pressure and Vacuum Gauges

Provide gauges conforming to ASME B40.100 with throttling type needle valve or a pulsation dampener and shut-off valve. Gauge must be a minimum of 3-1/2 inches in diameter with a range from 0 psig to approximately 1.5 times the maximum system working pressure. Select each gauge range so that at normal operating pressure, the needle is within the middle-third of the range.

#### 2.6.7 Temperature Gauges

Provide industrial duty type temperature gauges for the required temperature range. Gauges must have Fahrenheit scale in 2 degrees graduations scale (black numbers) on a white face. The pointer must be adjustable. Provide rigid stem type temperature gauges in thermowells located within 5 feet of the finished floor. Provide universal adjustable angle type or remote element type temperature gauges in thermowells located 5 to 7 feet above the finished floor. Provide remote element type temperature gauges in thermowells located 7 feet above the finished floor.

##### 2.6.7.1 Stem Cased-Glass

Provide stem cased-glass case composed of polished stainless steel or cast aluminum, 9 inches long, with clear acrylic lens, and non-mercury filled glass tube with indicating-fluid column.

##### 2.6.7.2 Bimetallic Dial

Provide bimetallic dial type case that is greater than 3-1/2 inches, stainless steel, and hermetically sealed with clear acrylic lens. Bimetallic element must be silicone dampened and unit fitted with external calibrator adjustment. Accuracy must be one percent of dial range.

#### 2.6.7.3 Liquid-, Solid-, and Vapor-Filled Dial

Provide liquid-, solid-, and vapor-filled dial type cases that are greater than 3-1/2 inches, stainless steel or cast aluminum with clear acrylic lens. Fill must be nonmercury, suitable for encountered cross-ambients, and connecting capillary tubing must be double-braided bronze.

#### 2.6.7.4 Thermowell

Thermowell must be identical size, 1/2 or 3/4 inch NPT connection, brass or stainless steel. Where test wells are indicated, provide captive plug-fitted type 1/2 inch NPT connection suitable for use with either engraved stem or standard separable socket thermometer or thermostat. Mercury must not be used in thermometers. Extended neck thermowells must be of sufficient length to clear insulation thickness by 1 inch.

#### 2.6.8 Pipe Hangers, Inserts, and Supports

Provide pipe hangers, inserts, guides, and supports conforming to MSS SP-58.

#### 2.6.9 Escutcheons

Escutcheons must be chromium-plated iron or chromium-plated brass, either one piece or split pattern, held in place by internal spring tension or set screws.

### 2.7 FABRICATION

#### 2.7.1 Factory Coating

Unless otherwise specified, equipment and component items, when fabricated from ferrous metal, must be factory finished with the manufacturer's standard finish, except that items located outside of buildings must have weather resistant finishes that will withstand 500 hours exposure to the salt spray test specified in ASTM B117 using a 5 percent sodium chloride solution. Immediately after completion of the test, the specimen must show no signs of blistering, wrinkling, cracking, or loss of adhesion and no sign of rust creepage beyond 1/8 inch on either side of the scratch mark. Cut edges of galvanized surfaces where hot-dip galvanized sheet steel is used must be coated with a zinc-rich coating conforming to ASTM D520, Type I.

#### 2.7.2 Factory Applied Insulation

Factory installed insulation must be in accordance with ASHRAE 90.1 - IP. Refrigerant suction lines between the cooler and each compressor and cold gas inlet connections to gas cooled motors must be insulated with not less than 1/2 inch thick unicellular plastic foam. Factory insulated items installed outdoors are not required to be fire-rated. As a minimum, factory insulated items installed indoors must have a flame spread index no higher than 25 and a smoke developed index no higher than 50. Factory insulated items (no jacket) installed indoors and which are located in air plenums, in ceiling spaces, and in attic spaces must have a flame spread index no higher than 25 and a smoke developed index no higher than 50. Flame spread and smoke developed indexes must be determined by ASTM E84. Test insulation in the same density and installed thickness as the material to be used in the actual construction. Test material supplied by a manufacturer with a jacket as a composite material. Provide jackets,

facings, and adhesives that have a flame spread index less than 25 and a smoke developed index less than 50 when tested in accordance with ASTM E84.

## PART 3 EXECUTION

### 3.1 EXAMINATION

After becoming familiar with all details of the work, perform a verification of dimensions in the field. Submit a letter, at least 2 weeks prior to beginning construction, including the date the site was visited, conformation of existing conditions, and any discrepancies found before performing any work.

### 3.2 INSTALLATION

Pipe and fitting installation must conform to the requirements of ASME B31.1. Cut pipe accurately to measurements established at the jobsite, and work into place without springing or forcing, completely clearing all windows, doors, and other openings. Cutting or other weakening of the building structure to facilitate piping installation is not permitted without written approval. Cut pipe or tubing square, remove by reaming, and permit free expansion and contraction without causing damage to the building structure, pipe, joints, or hangers.

#### 3.2.1 Directional Changes

Make changes in direction with fittings, except that bending of pipe 4 inches and smaller is permitted, provided a pipe bender is used and wide weep bends are formed. Mitering or notching pipe or other similar construction to form elbows or tees is not permitted. The centerline radius of bends must not be less than 6 diameters of the pipe. Bent pipe showing kinks, wrinkles, flattening, or other malformations will not be accepted.

#### 3.2.2 Functional Requirements

Install piping 1/2 inch/10 feet of pipe in the direction of flow to ensure adequate oil drainage. Properly cap or plug open ends of refrigerant lines or equipment during installation to keep moisture, dirt, or other foreign material out of the system. Piping must remain capped until installation. Equipment piping must be in accordance with the equipment manufacturer's recommendations and the contract drawings. Equipment and piping arrangements must fit into space allotted and allow adequate acceptable clearances for installation, replacement, entry, servicing, and maintenance.

#### 3.2.3 Fittings and End Connections

##### 3.2.3.1 Threaded Connections

Make threaded connections with tapered threads and make tight with PTFE tape complying with ASTM D3308 or equivalent thread-joint compound applied to the male threads only. Do not show more than three threads after the joint is made.

##### 3.2.3.2 Brazed Connections

Perform brazing in accordance with AWS BRH, except as modified herein. During brazing, fill the pipe and fittings with a pressure regulated inert

gas, such as nitrogen, to prevent the formation of scale. Before brazing copper joints, clean both the outside of the tube and the inside of the fitting with a wire fitting brush until the entire joint surface is bright and clean. Do not use brazing flux on copper-to-copper connections. Remove surplus brazing material at all joints. Make steel tubing joints in accordance with the manufacturer's recommendations. Paint joints in steel tubing with the same material as the baked-on coating within 8 hours after joints are made. Protect tubing against oxidation during brazing by continuous purging of the inside of the piping using nitrogen. Support piping prior to brazing and do not spring or force.

#### 3.2.3.3 Welded Connections

Fusion-weld joints in steel refrigerant piping. Make branch connections with welding tees or forged welding branch outlets. Thoroughly clean pipe of all scale and foreign matter before the piping is assembled. During welding, fill the pipe and fittings with an inert gas, such as nitrogen, to prevent the formation of scale. Beveling, alignment, heat treatment, and inspection of weld must conform to ASME B31.1. Remove and reweld weld defects at no additional cost to the Government. Store and dry electrodes in accordance with AWS D1.1/D1.1M or as recommended by the manufacturer. Do not use electrodes that have been wetted or that have lost any of their coating

#### 3.2.3.4 Flared Connections

When flared connections are used, use a suitable lubricant between the back of the flare and the nut in order to avoid tearing the flare while tightening the nut.

#### 3.2.3.5 Flanged Connections

When steel refrigerant piping is used, provide union or flange joints in each line immediately preceding the connection to each piece of equipment requiring maintenance, such as compressors, coils, chillers, control valves, and other similar items. Flanged joints must be assembled square end tight with matched flanges, gaskets, and bolts. Provide gaskets that are suitable for use with the refrigerants to be handled.

#### 3.2.4 Valves

##### 3.2.4.1 General

Install refrigerant stop valves on each side of each piece of equipment such as compressors condensers, evaporators, receivers, and other similar items in multiple-unit installation, to provide partial system isolation as required for maintenance or repair. Install stop valves with stems horizontal unless otherwise indicated. Install ball valves must be installed with stems positioned to facilitate operation and maintenance. Isolating valves for pressure gauges and switches must be external to thermal insulation. Safety switches must not be fitted with isolation valves. Filter dryers having access ports may be considered a point of isolation. Purge valves must be provided at all points of systems where accumulated non-condensable gases would prevent proper system operation. Valves must be furnished to match line size, unless otherwise indicated or approved.

#### 3.2.4.2 Expansion Valves

Install expansion valves with the thermostatic expansion valve bulb located on top of the suction line when the suction line is less than 2-1/8 inches in diameter and at the 4 o'clock or 8 o'clock position on lines larger than 2-1/8 inches. Fasten the bulb securely with two clamps. Insulate the bulb. Install the bulb in a horizontal portion of the suction line, if possible, with the pigtail on the bottom. If the bulb must be installed in a vertical line, the bulb tubing must be facing up.

#### 3.2.4.3 Valve Identification

Tag each system valve, including those which are part of a factory assembly. Tags must be in alphanumeric sequence, progressing in direction of fluid flow. Tags must be embossed, engraved, or stamped plastic or nonferrous metal of various shapes, sized approximately 1-3/8 inch diameter, or equivalent dimension, substantially attached to a component or immediately adjacent thereto. Attach tags with nonferrous, heavy duty, bead or link chain, 14 gauge annealed wire, nylon cable bands or as approved. Reference tag numbers in Operation and Maintenance Manuals and system diagrams.

#### 3.2.5 Vibration Dampers

Provide vibration damper in the suction and discharge lines on spring mounted compressors. Install vibration dampers parallel with the shaft of the compressor and anchor firmly at the upstream end on the suction line and the downstream end in the discharge line.

#### 3.2.6 Strainers

Provide strainers immediately ahead of solenoid valves and expansion devices. Strainers may be an integral part of an expansion valve.

#### 3.2.7 Filter Dryer

Provide a liquid line filter dryer on each refrigerant circuit located such that all liquid refrigerant passes through a filter dryer. Size dryers in accordance with the manufacturer's recommendations for the system in which it is installed. Install dryers such that it can be isolated from the system, the isolated portion of the system evacuated, and the filter dryer replaced. Install dryers in the horizontal position except replaceable core filter dryers may be installed in the vertical position with the access flange on the bottom.

#### 3.2.8 Sight Glass

Install a moisture indicating sight glass in all refrigerant circuits downstream of all filter dryers and where indicated. Provide full line size sight glasses.

#### 3.2.9 Discharge Line Oil Separator

Provide discharge line oil separator in the discharge line from each compressor. Connect the oil return line to the compressor as recommended by the compressor manufacturer.

### 3.2.10 Accumulator

Provide accumulators in the suction line to each compressor.

### 3.2.11 Flexible Pipe Connectors

Install connectors perpendicular to line of motion being isolated. Fit piping for equipment with bidirectional motion with two flexible connectors, in perpendicular planes. Install reinforced elastomer flexible connectors in accordance with manufacturer's instructions. Provide piping guides and restraints related to flexible connectors as required.

### 3.2.12 Temperature Gauges

Locate temperature gauges specifically on, but not limited to the following: the sensing element of each automatic temperature control device where a thermometer is not an integral part thereof, the liquid line leaving a receiver and the suction line at each evaporator or liquid cooler. Thermowells for insertion thermometers and thermostats must extend beyond thermal insulation surface not less than 1 inch.

### 3.2.13 Pipe Hangers, Inserts, and Supports

Pipe hangers, inserts, and supports must conform to MSS SP-58, except as modified herein. Do not use pipe hanger types 5, 12, and 26. Fabricate hangers used to support piping 2 inches and larger to permit adequate adjustment after erection while still supporting the load. Support piping subjected to vertical movement, when operating temperatures exceed ambient temperatures, by variable spring hangers and supports or by constant support hangers.

#### 3.2.13.1 Hangers

Do not use Type 3 on insulated piping. Type 24 may be used only on trapeze hanger systems or on fabricated frames.

#### 3.2.13.2 Inserts

Secure Type 18 inserts to concrete forms before concrete is placed. Continuous inserts which allow more adjustments may be used if they otherwise meet the requirements for Type 18 inserts.

#### 3.2.13.3 C-Clamps

Torque Type 19 and 23 C-clamps in accordance with MSS SP-58 and have both locknuts and retaining devices, furnished by the manufacturer. Field-fabricated C-clamp bodies or retaining devices are not acceptable.

#### 3.2.13.4 Angle Attachments

Furnish Type 20 attachments used on angles and channels with an added malleable-iron heel plate or adapter.

#### 3.2.13.5 Saddles and Shields

Where Type 39 saddle or Type 40 shield are permitted for a particular pipe attachment application, the Type 39 saddle, connected to the pipe, must be used on all pipe 4 inches and larger when the temperature of the medium is

60 degrees F or higher. Use Type 40 shields on all piping less than 4 inches and all piping 4 inches and larger carrying medium less than 60 degrees F. Use a high-density insulation insert of cellular glass under the Type 40 shield for piping 2 inches and larger.

#### 3.2.13.6 Horizontal Pipe Supports

Space horizontal pipe supports as specified in MSS SP-58 and install a support no more than 1 foot from the pipe fitting joint at each change in direction of the piping. Space pipe supports no more than 5 feet apart at valves.

#### 3.2.13.7 Vertical Pipe Supports

Support vertical pipe at each floor, except at slab-on-grade, and at intervals of not more than 15 feet not more than 8 feet from end of risers, and at vent terminations.

#### 3.2.13.8 Pipe Guides

Provide Type 35 guides using, steel, reinforced polytetrafluoroethylene (PTFE) or graphite slides where required to allow longitudinal pipe movement. Provide lateral restraints as required. Provide slide materials that are suitable for the system operating temperatures, atmospheric conditions, and bearing loads encountered.

#### 3.2.13.9 Steel Slides

Where steel slides do not require provisions for restraint of lateral movement, an alternate guide method may be used. On piping 4 inches and larger, use a Type 39 saddle. On piping under 4 inches, a Type 40 protection shield may be attached to the pipe or insulation and freely rest on a steel slide plate.

#### 3.2.13.10 High Temperature Guides with Cradles

Where there are high system temperatures and welding to piping is not desirable, the Type 35 guide must include a pipe cradle, welded to the guide structure and strapped securely to the pipe. Separate the pipe from the slide material by at least 4 inches, or by an amount adequate for the insulation, whichever is greater.

#### 3.2.13.11 Multiple Pipe Runs

In the support of multiple pipe runs on a common base member, use a clip or clamp where each pipe crosses the base support member. Spacing of the base support members must not exceed the hanger and support spacing required for an individual pipe in the multiple pipe run.

#### 3.2.13.12 Seismic Requirements

Support and brace piping and attached valves to resist seismic loads as specified under UFC 3-301-01 and 23 05 48.19 SEISMIC BRACING FOR HVAC. Provide structural steel required for reinforcement to properly support piping, headers, and equipment but not shown under this section. Specify material used for support under Section 05 12 00 STRUCTURAL STEEL.

### 3.2.13.13 Structural Attachments

Attachment to building structure concrete and masonry must be by cast-in concrete inserts, built-in anchors, or masonry anchor devices. Inserts and anchors must be applied with a safety factor not less than 5. Do not attach supports to metal decking. Construct masonry anchors for overhead applications of ferrous materials only. Provide structural steel brackets required to support piping, headers, and equipment, but not shown, under this section. Specify material used for support under Section 05 12 00 STRUCTURAL STEEL.

### 3.2.14 Pipe Alignment Guides

Provide pipe alignment guides where indicated for expansion loops, offsets, and bends and as recommended by the manufacturer for expansion joints, not to exceed 5 feet on each side of each expansion joint, and in lines 4 inches or smaller not more than 2 feet on each side of the joint.

### 3.2.15 Pipe Anchors

Provide anchors wherever necessary or indicated to localize expansion or to prevent undue strain on piping. Provide anchors consisting of heavy steel collars with lugs and bolts for clamping and attaching anchor braces, unless otherwise indicated. Install anchor braces in the most effective manner to secure the desired results using turnbuckles where required. Do not attach supports, anchors, or stays where they will injure the structure or adjacent construction during installation or by the weight of expansion of the pipeline. Where pipe and conduit penetrations of vapor barrier sealed surfaces occur, immediately anchor these items adjacent to each penetrated surface, to provide essentially zero movement within penetration seal. Submit detailed drawings of pipe anchors for approval before installation.

### 3.2.16 Building Surface Penetrations

Do not install sleeves in structural members except where indicated or approved. Provide galvanized sheet metal sleeves in non-load bearing surfaces conforming to ASTM A653/A653M, Coating Class G-90, 20 gauge. Provide uncoated carbon steel pipe sleeves in load bearing surfaces conforming to ASTM A53/A53M, Schedule 30. Apply sealants to moisture and oil-free surfaces and elastomers to not less than 1/2 inch depth. Do not install sleeves in structural members.

#### 3.2.16.1 Refrigerated Space

Fit refrigerated space building surface penetrations with sleeves fabricated from hand-lay-up or helically wound, fibrous glass reinforced polyester or epoxy resin with a minimum thickness equal to equivalent size Schedule 40 steel pipe. Construct sleeves with integral collar or fit cold side with a bonded slip-on flange or extended collar. In the case of masonry penetrations where sleeve is not cast-in, fill voids with latex mixed mortar cast to shape of sleeve and assemble flange/external collar type sleeve with butyl elastomer vapor barrier sealant through penetration to cold side surface vapor barrier overlap and fastened to surface with masonry anchors. Flash integral cast-in collar type sleeve as indicated. Normally seal noninsulated penetrating round surfaces to sleeve bore with mechanically expandable seals in vapor tight manner and insulate remaining warm and cold side sleeve depth with not less than 4 inches of foamed-in-place rigid polyurethane or foamed-in-place silicone elastomer.

Apply vapor barrier sealant to finish warm side insulation surface. Insulate warm side of penetrating surface beyond vapor barrier sealed sleeve insulation for a distance which prevents condensation. Seal wires in refrigerated space surface penetrating conduit with vapor barrier plugs or compound to prevent moisture migration through conduit and condensation therein.

### 3.2.16.2 General Service Areas

Extend each sleeve through its respective wall, floor, or roof, and cut flush with each surface. Provide pipes passing through concrete or masonry wall or concrete floors or roofs with pipe sleeves fitted into place at the time of construction. Provide sleeves that allow a minimum of 1/4 inch all-around clearance between bare pipe and sleeves or between jacketed-insulation and sleeves. Except in pipe chases or interior walls, seal the annular space between pipe and sleeve or between jacket over-insulation and sleeve in accordance with Section 07 92 00 JOINT SEALANTS.

### 3.2.16.3 Waterproof Penetrations

Install pipes passing through roof or floor waterproofing membrane through a 17 ounce copper sleeve, or a 0.032 inch thick aluminum sleeve, each within an integral skirt or flange. Form flashing sleeve, and extend skirt or flange greater than 8 inches from the pipe and set over the roof or floor membrane in a troweled coating of bituminous cement. Extend the flashing sleeve up the pipe a minimum of 2 inches above the roof or floor penetration. Seal the annular space between the flashing sleeve and the bare pipe or between the flashing sleeve and the metal-jacket-covered insulation as indicated. Seal penetrations by either one of the following methods.

#### 3.2.16.3.1 Waterproofing Clamping Flange

Pipes up to and including 10 inches in diameter passing through roof or floor waterproofing membrane may be installed through a cast iron sleeve with caulking recess, anchor lugs, flashing clamp device, and pressure ring with brass bolts. Clamp waterproofing membrane into place and place sealant in the caulking recess.

#### 3.2.16.3.2 Modular Mechanical Type Sealing Assembly

In lieu of a waterproofing clamping flange and caulking and sealing of annular space between pipe and sleeve or conduit and sleeve, a modular mechanical type sealing assembly may be installed. Provide seals consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe/conduit and sleeve with corrosion protected carbon steel bolts, nuts, and pressure plates. Loosely assemble links with bolts to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and each nut. After the seal assembly is properly positioned in the sleeve, tighten the bolt to cause the rubber sealing elements to expand and provide a watertight seal between the pipe/conduit and the sleeve. Size each seal assembly as recommended by the manufacturer to fit the pipe/conduit and sleeve involved. The Contractor electing to use the modular mechanical type seals must provide sleeves of the proper diameters.

#### 3.2.16.4 Fire-Rated Penetrations

Seal penetration of fire-rated walls, partitions, and floors as specified in Section 07 84 00 FIRESTOPPING.

#### 3.2.16.5 Escutcheons

Provide escutcheons for finished surfaces where exposed piping, bare or insulated, pass through floors, walls, or ceilings, except in boiler, utility, or equipment rooms. Where sleeves project slightly from floors, use special deep-type escutcheons. Secure escutcheon to pipe or pipe covering.

#### 3.2.17 Field Applied Insulation

Field installed insulation is specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS, except as defined differently herein.

#### 3.2.18 Field Painting

Painting required for surfaces not otherwise specified, and finish painting of items only primed at the factory are specified in Section 09 90 00 PAINTS AND COATINGS.

##### 3.2.18.1 Color Coding

Color coding for piping identification is specified in Section 09 90 00 PAINTS AND COATINGS.

#### 3.2.19 Identification Tags

Provide identification tags made of brass, engraved laminated plastic or engraved anodized aluminum indicating service and item number on all valves and dampers. Tags must be 1-3/8 inch minimum diameter and marking must be stamped or engraved. Indentations must be black for reading clarity. Attach tags to valves with No. 12 AWG copper wire, chrome-plated beaded chain or plastic straps designed for that purpose.

#### 3.3 CLEANING AND ADJUSTING

Clean uncontaminated system(s) by evacuation and purging procedures currently recommended by refrigerant and refrigerant equipment manufacturers, and as specified herein, to remove small amounts of air and moisture. Systems containing moderate amounts of air, moisture, contaminated refrigerant, or any foreign matter are considered contaminated systems. Restore contaminated systems to clean condition including disassembly, component replacement, evacuation, flushing, purging, and re-charging, using currently approved refrigerant and refrigeration manufacturer's procedures. Restore contaminated systems at no additional cost to the Government as determined by the Contracting Officer. Do not use water in any procedure or test.

#### 3.4 TRAINING COURSE

- a. Submit a schedule, at least 2 weeks prior to the date of the proposed training course, which identifies the date, time, and location for the training. Conduct a training course for 20 members of the operating staff as designated by the Contracting Officer. The training period must consist of a total 8 hours of normal working time and start after

the system is functionally completed but prior to final acceptance tests.

- b. Cover all of the items contained in the approved operation and maintenance manuals as well as demonstrations of routine maintenance operations in the field posted instructions..
- c. Submit 6 complete copies of an operation manual in bound 8 1/2 by 11 inch booklets listing step-by-step procedures required for system startup, operation, abnormal shutdown, emergency shutdown, and normal shutdown at least 4 weeks prior to the first training course. Include the manufacturer's name, model number, and parts list in the booklets. Include the manufacturer's name, model number, service manual, and a brief description of all equipment and their basic operating features in the manuals.
- d. Submit 6 complete copies of maintenance manual in bound 8 1/2 x 11 inch booklets listing routine maintenance procedures, possible breakdowns and repairs, and a trouble shooting guide. Include piping layouts and simplified wiring and control diagrams of the system as installed in the manuals.

### 3.5 REFRIGERANT PIPING TESTS

After all components of the refrigerant system have been installed and connected, subject the entire refrigeration system to pneumatic, evacuation, and startup tests as described herein. Submit a schedule, at least 2 weeks prior to the start of related testing, for each test. Identify the proposed date, time, and location for each test. Conduct tests in the presence of the Contracting Officer. Water and electricity required for the tests will be furnished by the Government. Provide all material, equipment, instruments, and personnel required for the test. Provide the services of a qualified technician, as required, to perform all tests and procedures indicated herein. Coordinate field tests with Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS. Submit 6 copies of the tests report in bound 8 1/2 by 11 inch booklets documenting all phases of the tests performed. Include initial test summaries, all repairs/adjustments made, and the final test results in the report.

#### 3.5.1 Preliminary Procedures

Prior to pneumatic testing, isolate equipment which has been factory tested and refrigerant charged as well as equipment which could be damaged or cause personnel injury by imposed test pressure, positive or negative, from the test pressure, or remove from the system. Remove safety relief valves and rupture discs that are not part of factory sealed systems, and cap or plug openings.

#### 3.5.2 Pneumatic Test

Provide pressure control and excess pressure protection at the source of test pressure. Valves must be wide open, except those leading to the atmosphere. Test gas must be dry nitrogen, with minus 70 degree F dewpoint and less than 5 ppm oil. Apply test pressure in two stages before any refrigerant pipe is insulated or covered. In accordance with ASME B31.5, a preliminary test not to exceed 25 psi must be applied as a means of locating major leaks. Every joint being tested must be coated with a thick soap or color indicating solution. The second stage test

pressure must be at least 110 percent of the design pressure, but cannot exceed 130 percent of the design pressure of any component in the system. For large systems that are not completely visible, the pressure in the system must be gradually increased to one-half of the test pressure after which the pressure must be increased in steps of one-tenth of the test pressure, until the required test pressure has been reached. The test pressure must be continuously maintained for at least 24 hours, after which it can be reduced to the leak test pressure. A correction factor of 0.3 psi will be allowed for each degree F change between test space initial and final ambient temperature, plus for increase and minus for a decrease. The leak test pressure must be the design pressure, or a pressure specified in the engineering design. To repair leaks, the joint must be taken apart, thoroughly cleaned, and reconstructed as a new joint. Joints repaired by caulking, re-melting, or back-welding/brazing are not acceptable. Following repair, the entire system must be retested using the pneumatic tests described above. Reassemble the entire system once the pneumatic tests are satisfactorily completed.

### 3.5.3 Evacuation Test

Following satisfactory completion of the pneumatic tests, relieve the pressure and evacuate the entire system to an absolute pressure of 300 micrometers. During evacuation of the system, the ambient temperature must be higher than 35 degrees F. Do not evacuate no more than one system at one time by one vacuum pump. Once the desired vacuum has been reached, close the vacuum line and allow the system to stand for 1 hour. If the pressure rises over 500 micrometers after the 1 hour period, evacuate the system again down to 300 micrometers and let set for another 1 hour period. Do not charge the system until a vacuum of at least 500 micrometers is maintained for a period of 1 hour without the assistance of a vacuum line. If during the testing the pressure rises above 500 micrometers, continue to repeat the evacuation procedures until all residual moisture has been removed. During evacuation, record pressures by a thermocouple-type, electronic-type, or a calibrated-micrometer type gauge.

### 3.5.4 System Charging and Startup Test

Following satisfactory completion of the evacuation tests, charge the system with the required amount of refrigerant by raising pressure to normal operating pressure and in accordance with manufacturer's procedures. Following charging, the system must operate with high-side and low-side pressures and corresponding refrigerant temperatures, at design or improved values. Test the entire system tested for leaks. Test fluorocarbon systems with halide torch or electronic leak detectors.

### 3.5.5 Refrigerant Leakage

If a refrigerant leak is discovered after the system has been charged, the leaking portion of the system must be immediately isolated from the remainder of the system and the refrigerant pumped into the system receiver or other suitable container. The refrigerant must not be discharged into the atmosphere.

### 3.5.6 Contractor's Responsibility

At all times during the installation and testing of the refrigeration system, take steps to prevent the release of refrigerants into the atmosphere. The steps must include, but not be limited to, procedures

which will minimize the release of refrigerants to the atmosphere and the use of refrigerant recovery devices to remove refrigerant from the system and store the refrigerant for reuse or reclaim. At no time will the allowable leak rate exceed the leak rates allowed in Section 608 of the Clean Air Act: 30 percent of the full charge per year for industrial refrigeration, 20 percent of the full charge per year for commercial refrigeration, and 10 percent of the full charge per year for comfort cooling. Any system leaks within the first year must be repaired in accordance with the requirements herein at no cost to the Government including material, labor, and refrigerant if the leak is the result of defective equipment, material, or installation.

## 1.2 SYSTEM DESCRIPTION

Furnish ductwork, piping offsets, fittings, and accessories as required to provide a complete installation. Coordinate the work of the different trades to avoid interference between piping, equipment, structural, and electrical work. Provide complete, in place, all necessary offsets in piping and ductwork, and all fittings, and other components, required to install the work as indicated and specified.

### 1.2.1 Mechanical Equipment Identification

The number of charts and diagrams must be equal to or greater than the number of mechanical equipment rooms. Where more than one chart or diagram per space is required, mount these in edge pivoted, swinging leaf, extruded aluminum frame holders which open to 170 degrees.

#### 1.2.1.1 Charts

Provide chart listing of equipment by designation numbers and capacities such as flow rates, pressure and temperature differences, heating and cooling capacities, horsepower, pipe sizes, and voltage and current characteristics.

#### 1.2.1.2 Diagrams

Submit proposed diagrams, at least 2 weeks prior to start of related testing. provide neat mechanical drawings provided with extruded aluminum frame under 1/8-inch glass or laminated plastic, system diagrams that show the layout of equipment, piping, and ductwork, and typed condensed operation manuals explaining preventative maintenance procedures, methods of checking the system for normal, safe operation, and procedures for safely starting and stopping the system. After approval, post these items where directed.

### 1.2.2 Service Labeling

Label equipment, including fans, air handlers, terminal units, etc. with labels made of self-sticking, plastic film designed for permanent installation. Provide labels in accordance with the typical examples

below:

| SERVICE               | LABEL AND TAG DESIGNATION |
|-----------------------|---------------------------|
| Supply Fan Number     | SF-1                      |
|                       |                           |
| Exhaust Fan Number    | EF - 1, 2 and 3           |
| Duct Heater Number    | DH-1                      |
| Gravity Intake Number | GV-1 and 2                |
|                       |                           |
|                       |                           |

Identify similar services with different temperatures or pressures. Where pressures could exceed 125 pounds per square inch, gage, include the maximum system pressure in the label. Label and arrow piping in accordance with the following:

- a. Each point of entry and exit of pipe passing through walls.
- b. Each change in direction, i.e., elbows, tees.
- c. In congested or hidden areas and at all access panels at each point required to clarify service or indicated hazard.
- d. In long straight runs, locate labels at distances within eyesight of each other not to exceed 75 feet. All labels must be visible and legible from the primary service and operating area.

| For Bare or Insulated Pipes |            |
|-----------------------------|------------|
| for Outside Diameters of    | Lettering  |
| 1/2 thru 1-3/8 inch         | 1/2 inch   |
| 1-1/2 thru 2-3/8 inch       | 3/4 inch   |
| 2-1/2 inch and larger       | 1-1/4 inch |

### 1.2.3 Color Coding

Color coding of all piping systems must be in accordance with ASME A13.1.

### 1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance

with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detail Drawings; G

SD-03 Product Data

Metallic Flexible Duct

Insulated Nonmetallic Flexible Duct Runouts

Duct Connectors

Duct Access Doors; G

Fire Dampers

Manual Balancing Dampers; G

Diffusers

Centrifugal Type Power Roof Ventilators; G

Unit Ventilators; G

SD-11 Closeout Submittals

Indoor Air Quality During Construction; S

#### 1.4 QUALITY ASSURANCE

Except as otherwise specified, approval of materials and equipment is based on manufacturer's published data.

- a. Where materials and equipment are specified to conform to the standards of the Underwriters Laboratories, the label of or listing

with reexamination in UL Bld Mat Dir, and UL 6 is acceptable as sufficient evidence that the items conform to Underwriters Laboratories requirements. In lieu of such label or listing, submit a written certificate from any nationally recognized testing agency, adequately equipped and competent to perform such services, stating that the items have been tested and that the units conform to the specified requirements. Outline methods of testing used by the specified agencies.

- b. Where materials or equipment are specified to be constructed or tested, or both, in accordance with the standards of the ASTM International (ASTM), the ASME International (ASME), or other standards, a manufacturer's certificate of compliance of each item is acceptable as proof of compliance.
- c. Conformance to such agency requirements does not relieve the item from compliance with other requirements of these specifications.
- d. Where products are specified to meet or exceed the specified energy efficiency requirement of FEMP-designated or ENERGY STAR covered product categories, equipment selected must have as a minimum the efficiency rating identified under "Energy-Efficient Products" at <http://femp.energy.gov/procurement>.

#### 1.4.1 Prevention of Corrosion

Protect metallic materials against corrosion. Provide rust-inhibiting treatment and standard finish for the equipment enclosures. Do not use aluminum in contact with earth, and where connected to dissimilar metal. Protect aluminum by approved fittings, barrier material, or treatment. Provide hot-dip galvanized ferrous parts such as anchors, bolts, braces, boxes, bodies, clamps, fittings, guards, nuts, pins, rods, shims, thimbles, washers, and miscellaneous parts not of corrosion-resistant steel or nonferrous materials in accordance with ASTM A123/A123M for exterior locations and cadmium-plated in conformance with ASTM B766 for interior locations.

#### 1.4.2 Asbestos Prohibition

Do not use asbestos and asbestos-containing products.

#### 1.4.3 Ozone Depleting Substances Technician Certification

All technicians working on equipment that contain ozone depleting refrigerants must be certified as a Section 608 Technician to meet requirements in 40 CFR 82, Subpart F. Provide copies of technician certifications to the Contracting Officer at least 14 calendar days prior to work on any equipment containing these refrigerants.

#### 1.4.4 Detail Drawings

Submit detail drawings showing equipment layout, including assembly and installation details and electrical connection diagrams; ductwork layout showing the location of all supports and hangers, typical hanger details, gauge reinforcement, reinforcement spacing rigidity classification, and static pressure and seal classifications. Include any information required to demonstrate that the system has been coordinated and functions properly as a unit on the drawings and show equipment relationship to other parts of the work, including clearances required for operation and

maintenance. Submit drawings showing bolt-setting information, and foundation bolts prior to concrete foundation construction for all equipment indicated or required to have concrete foundations. Submit function designation of the equipment and any other requirements specified throughout this Section with the shop drawings.

#### 1.4.5 Test Procedures

Conduct performance tests as required in Section 23 05 93 Testing, Adjusting and Balancing for HVAC and Section 23 09 00 Instrumentation and Control for HVAC.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

Protect stored equipment at the jobsite from the weather, humidity and temperature variations, dirt and dust, or other contaminants. Additionally, cap or plug all pipes until installed.

### PART 2 PRODUCTS

#### 2.1 STANDARD PRODUCTS

Except for the fabricated duct, plenums and casings specified in paragraphs "Metal Ductwork" and "Plenums and Casings for Field-Fabricated Units", provide components and equipment that are standard products of manufacturers regularly engaged in the manufacturing of products that are of a similar material, design and workmanship. This requirement applies to all equipment, including diffusers, registers, fire dampers, and balancing dampers.

- a. Standard products are defined as components and equipment that have been in satisfactory commercial or industrial use in similar applications of similar size for at least two years before bid opening.
- b. Prior to this two year period, these standard products must have been sold on the commercial market using advertisements in manufacturers' catalogs or brochures. These manufacturers' catalogs, or brochures must have been copyrighted documents or have been identified with a manufacturer's document number.
- c. Provide equipment items that are supported by a service organization. In product categories covered by ENERGY STAR or the Federal Energy Management Program, provide equipment that is listed on the ENERGY STAR Qualified Products List or that meets or exceeds the FEMP-designated Efficiency Requirements.

#### 2.2 IDENTIFICATION PLATES

In addition to standard manufacturer's identification plates, provide engraved laminated phenolic identification plates for each piece of mechanical equipment. Identification plates are to designate the function of the equipment. Submit designation with the shop drawings. Provide identification plates that are layers, black-white-black, engraved to show white letters on black background. Letters must be upper case. Identification plates that are 1-1/2-inches high and smaller must be 1/16-inch thick, with engraved lettering 1/8-inch high; identification plates larger than 1-1/2-inches high must be 1/8-inch thick, with engraved lettering of suitable height. Identification plates 1-1/2-inches high and

larger must have beveled edges. Install identification plates using a compatible adhesive.

### 2.3 EQUIPMENT GUARDS AND ACCESS

Fully enclose or guard belts, pulleys, chains, gears, couplings, projecting setscrews, keys, and other rotating parts exposed to personnel contact according to OSHA requirements. Properly guard or cover with insulation of a type specified, high temperature equipment and piping exposed to contact by personnel or where it creates a potential fire hazard.

### 2.4 ELECTRICAL WORK

- a. Provide motors, controllers, integral disconnects, contactors, and controls with their respective pieces of equipment, except controllers indicated as part of motor control centers. Provide electrical equipment, including motors and wiring, as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide manual or automatic control and protective or signal devices required for the operation specified and control wiring required for controls and devices specified, but not shown. For packaged equipment, include manufacturer provided controllers with the required monitors and timed restart.
- b. For single-phase motors, provide high-efficiency type, fractional-horsepower alternating-current motors, including motors that are part of a system, in accordance with NEMA MG 11. Provide premium efficiency type integral size motors in accordance with NEMA MG 1.
- c. For polyphase motors, provide squirrel-cage medium induction motors, including motors that are part of a system, and that meet the efficiency ratings for premium efficiency motors in accordance with NEMA MG 1. Select premium efficiency polyphase motors in accordance with NEMA MG 10.
- d. Provide motors in accordance with NEMA MG 1 and of sufficient size to drive the load at the specified capacity without exceeding the nameplate rating of the motor. Provide motors rated for continuous duty with the enclosure specified. Provide motor duty that allows for maximum frequency start-stop operation and minimum encountered interval between start and stop. Provide motor torque capable of accelerating the connected load within 20 seconds with 80 percent of the rated voltage maintained at motor terminals during one starting period. Provide motor starters complete with thermal overload protection and other necessary appurtenances. Fit motor bearings with grease supply fittings and grease relief to outside of the enclosure.
- e. Where two-speed or variable-speed motors are indicated, solid-state variable-speed controllers are allowed to accomplish the same function. Use solid-state variable-speed controllers for motors rated 10 hp or less and adjustable frequency drives for larger motors. Provide variable frequency drives for motors as specified in Section 26 29 23 ADJUSTABLE SPEED DRIVE SYSTEMS UNDER 600 VOLTS.

### 2.5 ANCHOR BOLTS

Provide anchor bolts for equipment placed on concrete equipment pads or on

concrete slabs. Bolts to be of the size and number recommended by the equipment manufacturer and located by means of suitable templates. Installation of anchor bolts must not degrade the surrounding concrete.

## 2.6 SEISMIC ANCHORAGE

Anchor equipment in accordance with applicable seismic criteria for the area and as defined in SMACNA 1981

## 2.7 PAINTING

Paint equipment units in accordance with approved equipment manufacturer's standards unless specified otherwise. Field retouch only if approved. Otherwise, return equipment to the factory for refinishing.

## 2.8 INDOOR AIR QUALITY

Provide equipment and components that comply with the requirements of ASHRAE 62.1 unless more stringent requirements are specified herein.

## 2.9 DUCT SYSTEMS

### 2.9.1 Metal Ductwork

Provide metal ductwork construction, including all fittings and components, that complies with SMACNA 1966, as supplemented and modified by this specification .

- a. Construct ductwork meeting the requirements for the duct system static pressure specified in APPENDIX D of Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC.
- b. Provide radius type elbows with a centerline radius of 1.5 times the width or diameter of the duct where space permits. Otherwise, elbows having a minimum radius equal to the width or diameter of the duct or square elbows with factory fabricated turning vanes are allowed.
- d. Provide ductwork that meets the requirements of Seal Class A. Provide ductwork in VAV systems upstream of the VAV boxes that meets the requirements of Seal Class A.
- e. Provide sealants that conform to fire hazard classification specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS and are suitable for the range of air distribution and ambient temperatures to which it is exposed. Do not use pressure sensitive tape as a sealant. Provide duct sealant products that meet either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168 (HVAC duct sealants are classified as "Other" within the SCAQMD Rule 1168 sealants table). Provide validation of indoor air quality for duct sealants.
- f. Make spiral lock seam duct, and flat oval with duct sealant and lock with not less than 3 equally spaced drive screws or other approved methods indicated in SMACNA 1966. Apply the sealant to the exposed male part of the fitting collar so that the sealer is on the inside of the joint and fully protected by the metal of the duct fitting. Apply one brush coat of the sealant over the outside of the joint to at least

2 inch band width covering all screw heads and joint gap. Dents in the male portion of the slip fitting collar are not acceptable.

- g. Fabricate outdoor air intake ducts and plenums with watertight soldered or brazed joints and seams.

#### 2.9.1.1 Metallic Flexible Duct

- a. Provide duct that conforms to UL 181 and NFPA 90A with factory-applied insulation, vapor barrier, and end connections. Provide duct assembly that does not exceed 25 for flame spread and 50 for smoke developed. Provide ducts designed for working pressures of 2 inches water gauge positive and 1.5 inches water gauge negative. Provide flexible round duct length that does not exceed 5 feet. Secure connections by applying adhesive for 2 inches over rigid duct, apply flexible duct 2 inches over rigid duct, apply metal clamp, and provide minimum of three No. 8 sheet metal screws through clamp and rigid duct.
- b. Inner duct core: Provide interlocking spiral or helically corrugated flexible core constructed of zinc-coated steel, aluminum, or stainless steel; or constructed of inner liner of continuous galvanized spring steel wire helix fused to continuous, fire-retardant, flexible vapor barrier film, inner duct core.
- c. Insulation: Provide inner duct core that is insulated with mineral fiber blanket type flexible insulation, minimum of 1 inch thick. Provide insulation covered on exterior with manufacturer's standard fire retardant vapor barrier jacket for flexible round duct.

#### 2.9.1.2 Insulated Nonmetallic Flexible Duct Runouts

Use flexible duct runouts only where indicated. Runout length is indicated on the drawings, and is not to exceed 5 feet. Provide runouts that are preinsulated, factory fabricated, and that comply with NFPA 90A and UL 181. Provide either field or factory applied vapor barrier. Provide not less than 20 ounce glass fabric duct connectors coated on both sides with neoprene. Where coil induction or high velocity units are supplied with vertical air inlets, use a streamlined, vaned and mitered elbow transition piece for connection to the flexible duct or hose. Provide a die-stamped elbow and not a flexible connector as the last elbow to these units other than the vertical air inlet type. Insulated flexible connectors are allowed as runouts. Provide insulated material and vapor barrier that conform to the requirements of Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Do not expose the insulation material surface to the air stream.

#### 2.9.1.3 General Service Duct Connectors

Provide a flexible duct connector approximately 6 inches in width where sheet metal connections are made to fans or where ducts of dissimilar metals are connected. For round/oval ducts, secure the flexible material by stainless steel or zinc-coated, iron clinch-type draw bands. For rectangular ducts, install the flexible material locked to metal collars using normal duct construction methods. Provide a composite connector system that complies with NFPA 701 and is classified as "flame-retardant fabrics" in UL Bld Mat Dir.

#### 2.9.1.4 High Temperature Service Duct Connections

Provide material that is approximately 3/32 inch thick, 35 to 40-ounce per square yard weight, plain weave fibrous glass cloth with, nickel/chrome wire reinforcement for service in excess of 1200 degrees F.

#### 2.9.1.5 Aluminum Ducts

ASTM B209, alloy 3003-H14 for aluminum sheet and alloy 6061-T6 or equivalent strength for aluminum connectors and bar stock.

#### 2.9.1.6 Copper Sheets

ASTM B152/B152M, light cold rolled temper.

#### 2.9.1.7 Corrosion Resisting (Stainless) Steel Sheets

ASTM A167

#### 2.9.2 Duct Access Doors

Provide hinged access doors conforming to SMACNA 1966 in ductwork and plenums where indicated and at all air flow measuring primaries, automatic dampers, fire dampers, coils, thermostats, and other apparatus requiring service and inspection in the duct system. Provide access doors upstream and downstream of air flow measuring primaries and heating and cooling coils. Provide doors that are a minimum 15 by 18 inches, unless otherwise shown. Where duct size does not accommodate this size door, make the doors as large as practicable. Equip doors 24 by 24 inches or larger with fasteners operable from inside and outside the duct. Use insulated type doors in insulated ducts.

#### 2.9.3 Fire Dampers

Use 1.5 hour rated fire dampers unless otherwise indicated. Provide fire dampers that conform to the requirements of NFPA 90A and UL 555. Perform the fire damper test as outlined in NFPA 90A. If the ductwork connected to the fire damper is to be insulated then provide a factory installed pressure relief damper. Provide automatic operating fire dampers with a dynamic rating suitable for the maximum air velocity and pressure differential to which it is subjected. Provide fire dampers approved for the specific application, and install according to their listing. Equip fire dampers with a steel sleeve or adequately sized frame installed in such a manner that disruption of the attached ductwork, if any, does not impair the operation of the damper. Equip sleeves or frames with perimeter mounting angles attached on both sides of the wall or floor opening. Construct ductwork in fire-rated floor-ceiling or roof-ceiling assembly systems with air ducts that pierce the ceiling of the assemblies in conformance with UL Fire Resistance. Provide single blade type or multi-blade type fire dampers. Install dampers that do not reduce the duct or the air transfer opening cross-sectional area. Install dampers so that the centerline of the damper depth or thickness is located in the centerline of the wall, partition or floor slab depth or thickness. Unless otherwise indicated, comply with the installation details given in SMACNA 1819 and in manufacturer's instructions for fire dampers. Perform acceptance testing of fire dampers according to paragraph DAMPER ACCEPTANCE TEST and NFPA 90A.

#### 2.9.4 Manual Balancing Dampers

- a. Furnish manual balancing dampers with accessible operating mechanisms. Use chromium plated operators (with all exposed edges rounded) in finished portions of the building. Provide manual volume control dampers that are operated by locking-type quadrant operators.
- b. Unless otherwise indicated, provide opposed blade type multileaf dampers with maximum blade width of 12 inches. Provide access doors or panels for all concealed damper operators and locking setscrews. Provide access doors or panels in hard ceilings, partitions and walls for access to all concealed damper operators and damper locking setscrews. Coordinate location of doors or panels with other affected contractors.
- c. Provide stand-off mounting brackets, bases, or adapters not less than the thickness of the insulation when the locking-type quadrant operators for dampers are installed on ducts to be thermally insulated, to provide clearance between the duct surface and the operator. Provide stand-off mounting items that are integral with the operator or standard accessory of the damper manufacturer.

##### 2.9.4.1 Square or Rectangular Dampers

###### 2.9.4.1.1 Duct Height 12 inches and Less

###### 2.9.4.1.1.1 Frames

| Width               | Height            | Galvanized Steel Thickness | Length           |
|---------------------|-------------------|----------------------------|------------------|
| Maximum 19 inches   | Maximum 12 inches | Minimum 20 gauge           | Minimum 3 inches |
| More than 19 inches | Maximum 12 inches | Minimum 16 gauge           | Minimum 3 inches |

###### 2.9.4.1.1.2 Single Leaf Blades

| Width               | Height            | Galvanized Steel Thickness | Length           |
|---------------------|-------------------|----------------------------|------------------|
| Maximum 19 inches   | Maximum 12 inches | Minimum 20 gauge           | Minimum 3 inches |
| More than 19 inches | Maximum 12 inches | Minimum 16 gauge           | Minimum 3 inches |

###### 2.9.4.1.1.3 Blade Axles

To support the blades of round dampers, provide galvanized steel shafts supporting the blade the entire duct diameter frame-to-frame. Provide axle shafts that extend through standoff bracket and hand quadrant.

| Width               | Height            | Material         | Square Shaft     |
|---------------------|-------------------|------------------|------------------|
| Maximum 19 inches   | Maximum 12 inches | Galvanized Steel | Minimum 3/8 inch |
| More than 19 inches | Maximum 12 inches | Galvanized Steel | Minimum 1/2 inch |

#### 2.9.4.1.1.4 Axle Bearings

Support the shaft on each end at the frames with shaft bearings. Press fit shaft bearings configuration to provide a tight joint between blade shaft and damper frame.

| Width               | Height            | Material                                                            |
|---------------------|-------------------|---------------------------------------------------------------------|
| Maximum 19 inches   | Maximum 12 inches | solid nylon, or equivalent solid plastic, or oil-impregnated bronze |
| More than 19 inches | Maximum 12 inches | oil-impregnated bronze                                              |

#### 2.9.4.1.1.5 Control Shaft/Hand Quadrant

Provide dampers with accessible locking-type control shaft/hand quadrant operators.

Provide stand-off mounting brackets, bases, or adapters for the locking-type quadrant operators on dampers installed on ducts to be thermally insulated. Provide a minimum stand-off distance of 2 inches off the metal duct surface. Provide stand-off mounting items that are integral with the operator or standard accessory of the damper manufacturer.

#### 2.9.4.1.1.6 Finish

Mill Galvanized

#### 2.9.4.1.2 Duct Height Greater than 12 inches

##### 2.9.4.1.2.1 Dampers

Provide dampers with multi-leaf opposed-type blades.

##### 2.9.4.1.2.2 Frames

Maximum 48 inches in height; maximum 48 inches in width; minimum of 16 gauge galvanized steel, minimum of 5 inches long.

##### 2.9.4.1.2.3 Blades

Minimum of 16 gauge galvanized steel; 6 inch nominal width.

#### 2.9.4.1.2.4 Blade Axles

To support the blades of round dampers, provide galvanized square steel shafts supporting the blade the entire duct diameter frame-to-frame. Provide axle shafts that extend through standoff bracket and hand quadrant.

#### 2.9.4.1.2.5 Axle Bearings

Support the shaft on each end at the frames with shaft bearings constructed of oil-impregnated bronze, or solid nylon, or a solid plastic equivalent to nylon. Press fit shaft bearings configuration to provide a tight joint between blade shaft and damper frame.

#### 2.9.4.1.2.6 Blade Actuator

Minimum 1/2 inch diameter galvanized steel.

#### 2.9.4.1.2.7 Blade Actuator Linkage

Mill Galvanized steel bar and crank plate with stainless steel pivots.

#### 2.9.4.1.2.8 Control Shaft/Hand Quadrant

Provide dampers with accessible locking-type control shaft/hand quadrant operators.

Provide stand-off mounting brackets, bases, or adapters for the locking-type quadrant operators on dampers installed on ducts to be thermally insulated. Provide a minimum stand-off distance of 2 inches off the metal duct surface. Provide stand-off mounting items that are integral with the operator or standard accessory of the damper manufacturer.

#### 2.9.4.1.2.9 Finish

Mill Galvanized

### 2.9.4.2 Round Dampers

#### 2.9.4.2.1 Frames

| Size            | Galvanized Steel Thickness | Length           |
|-----------------|----------------------------|------------------|
| 4 to 20 inches  | Minimum 20 gauge           | Minimum 6 inches |
| 22 to 30 inches | Minimum 20 gauge           | Minimum 6 inches |
| 32 to 40 inches | Minimum 16 gauge           | Minimum 6 inches |

#### 2.9.4.2.2 Blades

| Size            | Galvanized Steel Thickness |
|-----------------|----------------------------|
| 4 to 20 inches  | Minimum 20 gauge           |
| 22 to 30 inches | Minimum 16 gauge           |
| 32 to 40 inches | Minimum 10 gauge           |

#### 2.9.4.2.3 Blade Axles

To support the blades of round dampers, provide galvanized steel shafts supporting the blade the entire duct diameter frame-to-frame. Provide axle shafts that extend through standoff bracket and hand quadrant.

| Size            | Shaft Size and Shape    |
|-----------------|-------------------------|
| 4 to 20 inches  | Minimum 3/8 inch square |
| 22 to 30 inches | Minimum 1/2 inch square |
| 32 to 40 inches | Minimum 3/4 inch square |

#### 2.9.4.2.4 Axle Bearings

Support the shaft on each end at the frames with shaft bearings constructed of oil-impregnated bronze, nylon, or a solid plastic equivalent to nylon. Axle bearings intended for low leakage at the damper frame must be neoprene, nitrile, or equivalent of 60 or greater durometer to reduce damper blade vibration. Press fit shaft bearings configuration to provide a tight joint between blade shaft and damper frame.

| Size            | Material                                                            |
|-----------------|---------------------------------------------------------------------|
| 4 to 20 inches  | solid nylon, or equivalent solid plastic, or oil-impregnated bronze |
| 22 to 30 inches | solid nylon, or equivalent solid plastic, or oil-impregnated bronze |
| 32 to 40 inches | oil-impregnated bronze, or stainless steel sleeve bearing           |

#### 2.9.4.2.5 Control Shaft/Hand Quadrant

Provide dampers with accessible locking-type control shaft/hand quadrant operators.

Provide stand-off mounting brackets, bases, or adapters for the locking-type quadrant operators on dampers installed on ducts to be

thermally insulated. Provide a minimum stand-off distance of 2 inches off the metal duct surface. Provide stand-off mounting items that are integral with the operator or standard accessory of the damper manufacturer.

#### 2.9.4.2.6 Finish

Mill Galvanized

### 2.9.5 Automatic Balancing Dampers

Provide dampers as specified in paragraph SUPPLEMENTAL COMPONENTS/SERVICES, subparagraph CONTROLS.

### 2.9.6 Diffusers, Registers, and Grilles

Provide factory-fabricated units of corrosion-resistant steel or aluminum that distribute the specified quantity of air evenly over space intended without causing noticeable drafts, air movement faster than 50 fpm in occupied zone, or dead spots anywhere in the conditioned area. Provide outlets for diffusion, spread, throw, and noise level as required for specified performance. Certify performance according to ASHRAE 70. Provide sound rated and certified inlets and outlets according to ASHRAE 70. Provide sound power level as indicated. Provide diffusers and registers with volume damper with accessible operator, unless otherwise indicated; or if standard with the manufacturer, an automatically controlled device is acceptable. Provide opposed blade type volume dampers for all diffusers and registers, except linear slot diffusers. Provide linear slot diffusers with round or elliptical balancing dampers. Where the inlet and outlet openings are located less than 7 feet above the floor, protect them by a grille or screen according to NFPA 90A.

#### 2.9.6.1 Diffusers

Provide diffuser types indicated. Furnish ceiling mounted units with anti-smudge devices, unless the diffuser unit minimizes ceiling smudging through design features. Provide diffusers with air deflectors of the type indicated. Provide air handling troffers or combination light and ceiling diffusers conforming to the requirements of UL Electrical Construction for the interchangeable use as cooled or heated air supply diffusers or return air units. Install ceiling mounted units with rims tight against ceiling. Provide sponge rubber gaskets between ceiling and surface mounted diffusers for air leakage control. Provide suitable trim for flush mounted diffusers. For connecting the duct to diffuser, provide duct collar that is airtight and does not interfere with volume controller. Provide return or exhaust units that are similar to supply diffusers.

#### 2.9.6.2 Registers

Double-deflection supply registers. Provide manufacturer-furnished volume dampers. Provide volume dampers of the group-operated, opposed-blade type and key adjustable by inserting key through face of register. Operating mechanism must not project through any part of the register face. Automatic volume control devices are acceptable. Provide exhaust and return registers as specified for supply registers, except provide exhaust and return registers that have a single set of nondirectional face bars or vanes having the same appearance as the supply registers. Set face bars or vanes at 90 degrees.

### 2.9.7 Louvers

Provide louvers for installation in exterior walls that are associated with the air supply and distribution system as specified in Section 07 60 00 FLASHING AND SHEET METAL and 08 91 00 METAL WALL AND DOOR LOUVERS.

### 2.9.8 Air Vents, Penthouses, and Goosenecks

Fabricate air vents, penthouses, and goosenecks from galvanized steel or aluminum sheets with galvanized or aluminum structural shapes. Provide sheet metal thickness, reinforcement, and fabrication that conform to SMACNA 1966. Accurately fit and secure louver blades to frames. Fold or bead edges of louver blades for rigidity and baffle these edges to exclude driving rain. Provide air vents, penthouses, and goosenecks with bird screen.

### 2.9.9 Bird Screens and Frames

Provide bird screens that conform to ASTM E2016, No. 2 mesh, aluminum or stainless steel. Provide "medium-light" rated aluminum screens. Provide "light" rated stainless steel screens. Provide removable type frames fabricated from either stainless steel or extruded aluminum.

## 2.10 AIR SYSTEMS EQUIPMENT

### 2.10.1 Fans

Test and rate fans according to AMCA 210. Calculate system effect on air moving devices in accordance with AMCA 201 where installed ductwork differs from that indicated on drawings. Install air moving devices to minimize fan system effect. Where system effect is unavoidable, determine the most effective way to accommodate the inefficiencies caused by system effect on the installed air moving device. The sound power level of the fans must not exceed 85 dBA when tested according to AMCA 300 and rated in accordance with AMCA 301. Provide all fans with an AMCA seal. Connect fans to the motors either directly or indirectly with V-belt drive. Use V-belt drives designed for not less than 150 percent of the connected driving capacity. Provide variable pitch motor sheaves for 15 hp and below, and fixed pitch as defined by AHRI Guideline D (A fixed-pitch sheave is provided on both the fan shaft and the motor shaft. This is a non-adjustable speed drive.). Select variable pitch sheaves to drive the fan at a speed which can produce the specified capacity when set at the approximate midpoint of the sheave adjustment. When fixed pitch sheaves are furnished, provide a replaceable sheave when needed to achieve system air balance. Provide motors for V-belt drives with adjustable rails or bases. Provide removable metal guards for all exposed V-belt drives, and provide speed-test openings at the center of all rotating shafts. Provide fans with personnel screens or guards on both suction and supply ends, except that the screens need not be provided, unless otherwise indicated, where ducts are connected to the fan. Provide fan and motor assemblies with vibration-isolation supports or mountings as indicated. Use vibration-isolation units that are standard products with published loading ratings. Select each fan to produce the capacity required at the fan static pressure indicated. Provide sound power level as indicated. Obtain the sound power level values according to AMCA 300. Provide standard AMCA arrangement, rotation, and discharge as indicated. Provide power ventilators that conform to UL 705 and have a UL label.

#### 2.10.1.1 In-Line Centrifugal Fans

Provide in-line fans with centrifugal backward inclined blades, stationary discharge conversion vanes, internal and external belt guards, and adjustable motor mounts. Mount fans in a welded tubular casing. Provide a fan that axially flows the air in and out. Streamline inlets with conversion vanes to eliminate turbulence and provide smooth discharge air flow. Enclose and isolate fan bearings and drive shafts from the air stream. Provide precision, self aligning ball or roller type fan bearings that are sealed against dust and dirt and are permanently lubricated. Provide L50 rated bearing life at not less than 200,000 hours as defined by ABMA 9 and ABMA 11. Provide motors with open drip proof enclosure. Provide magnetic motor starters across-the-line with general-purpose enclosures. Provide remote manual switch with pilot indicating light where indicated.

#### 2.10.1.2 Axial Flow Fans

Provide axial flow fans complete with drive components and belt guard, with steel housing, cast fan wheel, cast or welded steel diffusers, fan shaft, bearings, and mounting frame as a factory-assembled unit. Provide fan wheels that are dynamically balanced and keyed to the fan shaft, with radially projecting blades of airfoil cross-section. Enclose and isolate fan bearings and drive shafts from the air stream. Permanently lubricate fan bearings or provide them with accessible grease fittings. Provide precision self-aligning ball or roller type fan bearings that are sealed against dust and dirt. Provide fan bearings that have a L50 rated bearing life at not less than 200,000 hours of operation as defined by ABMA 9 and ABMA 11. Provide fan inlets with an aerodynamically shaped bell and an inlet cone. Install diffuser or straightening vanes at the fan discharge to minimize turbulence and provide smooth discharge air flow. Furnish fan unit with inlet and outlet flanges, inlet screen, duct equalizer section, and manual operation adjustable inlet vanes. Unless otherwise indicated, provide motors that do not exceed 1800 rpm and have open drip proof enclosure. Provide magnetic motor starters across-the-line with general-purpose enclosure. Provide remote manual switch with pilot indicating light where indicated.

#### 2.10.1.3 Centrifugal Type Power Roof Ventilators

Provide direct or V-belt driven centrifugal type fans with backward inclined, non-overloading wheel. Provide hinged or removable and weatherproof motor compartment housing, constructed of heavy gauge aluminum. Provide fans with birdscreen, disconnect switch, gravity dampers, roof curb, and extended base. Provide drip proof type motor enclosure. Use only lubricated bearings. If there is a conflict between NFPA 96 and UL 705 the most stringent wording must be adhered to.

#### 2.10.2 Coils

Provide fin-and-tube type coils constructed of seamless copper tubes and aluminum or copper fins mechanically bonded or soldered to the tubes. Provide copper tube wall thickness that is a minimum of 0.016 inches. Provide aluminum fins that are 0.0055 inch minimum thickness. Provide copper fins that are 0.0045 inch minimum thickness. Provide casing and tube support sheets that are not lighter than 16 gauge galvanized steel, formed to provide structural strength. When required, provide multiple tube supports to prevent tube sag. Mount coils for counterflow service. Rate and certify coils to meet the requirements of AHRI 410. Provide

factory applied phenolic, vinyl or epoxy/electrodeposition coating.

2.10.2.1 Electric Heating Coil

Provide an electric duct heater coil in accordance with UL 1995 and NFPA 70. Provide duct- or unit-mounted coil. Provide nickel chromium resistor, single stage, strip or stainless steel, fin tubular type coil. Provide coil with a built-in or surface-mounted high-limit thermostat interlocked electrically so that the coil cannot be energized unless the fan is energized. Provide galvanized steel or aluminum coil casing and support brackets. Mount coil to eliminate noise from expansion and contraction and for complete accessibility for service.

### 2.10.3 Air Filters

List air filters according to requirements of UL 900, except list high efficiency particulate air filters of 99.97 percent efficiency by the DOP Test method under the Label Service to meet the requirements of UL 586.

#### 2.10.3.1 Extended Surface Pleated Panel Filters

Provide 2 inch depth, sectional, disposable type filters of the size indicated with a MERV of 8 when tested according to ASHRAE 52.2. Provide initial resistance at 500 fpm that does not exceed 0.36 inches water gauge. Provide UL Class 2 filters, and nonwoven cotton and synthetic fiber mat media. Attach a wire support grid bonded to the media to a moisture resistant fiberboard frame. Bond all four edges of the filter media to the inside of the frame to prevent air bypass and increase rigidity.

#### 2.10.3.2 Holding Frames

Fabricate frames from not lighter than 16 gauge sheet steel with rust-inhibitor coating. Equip each holding frame with suitable filter holding devices. Provide gasketed holding frame seats. Make all joints airtight.

#### 2.10.3.3 Filter Gauges

Provide dial type filter gauges, diaphragm actuated draft for all filter stations, including those filters which are furnished as integral parts of factory fabricated air handling units. Provide gauges that are at least 3-7/8 inches in diameter, with white dials with black figures, and graduations with a minimum range of 1 inch of water beyond the specified final resistance for the filter bank on which each gauge is applied. Provide each gauge with a screw operated zero adjustment and two static pressure taps with integral compression fittings, two molded plastic vent valves, two 5 foot minimum lengths of 1/4 inch diameter aluminum tubing, and all hardware and accessories for gauge mounting.

## 2.11 TERMINAL UNITS

### 2.11.1 Unit Ventilators

Provide unit ventilators that include an enclosure, galvanized casing, coil assembly, resistance heating coil assembly, fan assembly, fan drive, motor, motor controller, dampers, damper operators, and sound power level as indicated. Obtain sound power level data or values for these units according to test procedures based on AHRI 350. Sound power values apply to units provided with factory fabricated cabinet enclosures and standard grilles, when handling standard flow for which the unit air capacity is

rated. Secure each unit to the building structure. Provide the unit ventilators with capacity indicated.

#### 2.11.1.1 Enclosures

Fabricate enclosures from not lighter than 16 gauge galvanized steel, reinforced and braced, or all welded framework with panels to provide equivalent strength. Provide casing that is acoustically and thermally insulated internally with not less than 1/2 inch thick dual density fibrous glass insulation. Make the exposed side a high density, erosion-proof material suitable for use in air streams with velocities up to 4500 fpm. Fasten the insulation with waterproof, fire-resistant adhesive. Design front panel for easy removal by one person. Provide discharge grilles that have adjustable grilles or grilles with adjustable vanes and properly distribute air throughout the conditioned space. Provide return grilles that are removable where front panel does not provide access to interior components. Plastic discharge or return grilles are not acceptable. Furnish removable panels or access doors for all piping and control compartments. Provide fan switch that is key operated or accessible through a locked access panel. Install gaskets at the back and bottom of the unit for effective air seal, as required.

#### 2.11.1.2 Electric Resistance Heating Elements

Provide electric resistance heating elements that are of the sheathed, finned, tubular type, or of the open resistance type designed for direct exposure to the air stream. Provide heating element electrical characteristics as indicated. Where fan motor or control voltage is lower than required for the electric-resistance heating element, install a fused factory mounted and wired transformer.

#### 2.11.1.3 Fans

Provide fans that meet the requirements as specified in paragraph AIR SYSTEMS EQUIPMENT. Provide galvanized steel or aluminum, multiblade, centrifugal type fans, dynamically and statically balanced. Equip fan housings with resilient mounted, self-aligning permanently lubricated ball bearings, sleeve bearings, or combination ball and sleeve bearings, capable of not less than 2000 hours of operation on one oiling. Provide direct-connected fans.

#### 2.11.1.4 Dampers

Provide an outside air proportioning damper on each unit. In addition, provide a vane to prevent excessive outside air from entering unit and to prevent blow-through of outside air through the return air grille under high wind pressures. Where outside air and recirculated air proportioning dampers are provided on the unit, an additional vane is not required. Provide face and bypass dampers for each unit to ensure constant air volume at all positions of the dampers. Furnish each unit with a factory installed control cam assembly, pneumatic motor, or electric motor to operate the face and bypass dampers and outside air damper or outside air and recirculated air dampers in the sequence as specified in paragraph SUPPLEMENTAL COMPONENTS/SERVICES, subparagraph CONTROLS.

#### 2.11.1.5 Motors

Provide permanent split-capacitor type motors with built-in thermal overload protection and automatic reset. Mount motor on a resilient

mounting, isolated from the casing and suitable for operation on electric service available. Provide a manually operated motor switch that provides for 2 or 3 speeds and off, mounted on an identified plate inside the unit below or behind an access door or adjacent to the room thermostats indicated. In lieu of speed control, provide a solid state variable speed controller having minimum speed reduction of 50 percent.

#### 2.11.1.6 Outside Air Intakes

Provide the manufacturer's standard design outside air intakes furnished with 1/2 inch mesh bird screen or louvers on 1/2 inch centers.

### 2.12 FACTORY PAINTING

Factory paint new equipment, which are not of galvanized construction. Paint with a corrosion resisting paint finish according to ASTM A123/A123M or ASTM A924/A924M. Clean, phosphatize and coat internal and external ferrous metal surfaces with a paint finish which has been tested according to ASTM B117, ASTM D1654, and ASTM D3359. Submit evidence of satisfactory paint performance for a minimum of 125 hours for units to be installed indoors and 500 hours for units to be installed outdoors. Provide rating of failure at the scribe mark that is not less than 6, average creepage not greater than 1/8 inch. Provide rating of the inscribed area that is not less than 10, no failure. On units constructed of galvanized steel that have been welded, provide a final shop docket of zinc-rich protective paint on exterior surfaces of welds or welds that have burned through from the interior according to ASTM D520 Type I.

Field paint factory painting that has been damaged prior to acceptance by the Contracting Officer in compliance with the requirements of paragraph FIELD PAINTING OF MECHANICAL EQUIPMENT.

### 2.13 SUPPLEMENTAL COMPONENTS/SERVICES

#### 2.13.1 Condensate Drain Lines

Provide and install condensate drainage for each item of equipment that generates condensate.

#### 2.13.2 Insulation

The requirements for shop and field applied insulation are specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

#### 2.13.3 Controls

The requirements for controls are specified in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS and Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

## PART 3 EXECUTION

### 3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

### 3.2 INSTALLATION

- a. Install materials and equipment in accordance with the requirements of the contract drawings and approved manufacturer's installation instructions. Accomplish installation by workers skilled in this type of work. Perform installation so that there is no degradation of the designed fire ratings of walls, partitions, ceilings, and floors.
- b. No installation is permitted to block or otherwise impede access to any existing machine or system. Install all hinged doors to swing open a minimum of 120 degrees. Provide an area in front of all access doors that clears a minimum of 3 feet. In front of all access doors to electrical circuits, clear the area the minimum distance to energized circuits as specified in OSHA Standards, part 1910.333 (Electrical-Safety Related work practices) and an additional 3 feet.
- c. Except as otherwise indicated, install emergency switches and alarms in conspicuous locations. Mount all indicators, to include gauges, meters, and alarms in order to be easily visible by people in the area.

#### 3.2.1 Condensate Drain Lines

Provide water seals in the condensate drain from all units. Provide a depth of each seal of 2 inches plus the number of inches, measured in water gauge, of the total static pressure rating of the unit to which the drain is connected. Provide water seals that are constructed of 2 tees and an appropriate U-bend with the open end of each tee plugged. Provide pipe cap or plug cleanouts where indicated. Connect drains indicated to connect to the sanitary waste system using an indirect waste fitting. Insulate air conditioner drain lines as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

#### 3.2.2 Equipment and Installation

Provide frames and supports for tanks, compressors, pumps, valves, air handling units, fans, coils, dampers, and other similar items requiring supports. Floor mount or ceiling hang air handling units as indicated. Anchor and fasten as detailed. Set floor-mounted equipment on not less than 6 inch concrete pads or curbs doweled in place unless otherwise indicated. Make concrete foundations heavy enough to minimize the intensity of the vibrations transmitted to the piping, duct work and the surrounding structure, as recommended in writing by the equipment manufacturer. In lieu of a concrete pad foundation, build a concrete pedestal block with isolators placed between the pedestal block and the floor. Make the concrete foundation or concrete pedestal block a mass not less than three times the weight of the components to be supported. Provide the lines connected to the pump mounted on pedestal blocks with flexible connectors. Submit foundation drawings as specified in paragraph DETAIL DRAWINGS. Provide concrete for foundations as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

#### 3.2.3 Access Panels

Install access panels for concealed valves, vents, controls, dampers, and items requiring inspection or maintenance of sufficient size, and locate them so that the concealed items are easily serviced and maintained or completely removed and replaced.

#### 3.2.4 Flexible Duct

Install pre-insulated flexible duct in accordance with the latest printed instructions of the manufacturer to ensure a vapor tight joint. Provide hangers, when required to suspend the duct, of the type recommended by the duct manufacturer and set at the intervals recommended.

#### 3.2.5 Metal Ductwork

Install according to SMACNA 1966 unless otherwise indicated. Install duct supports for sheet metal ductwork according to SMACNA 1966, unless otherwise specified. Do not use friction beam clamps indicated in SMACNA 1966. Anchor risers on high velocity ducts in the center of the vertical run to allow ends of riser to move due to thermal expansion. Erect supports on the risers that allow free vertical movement of the duct. Attach supports only to structural framing members and concrete slabs. Do not anchor supports to metal decking unless a means is provided and approved for preventing the anchor from puncturing the metal decking. Where supports are required between structural framing members, provide suitable intermediate metal framing. Where C-clamps are used, provide retainer clips.

#### 3.2.6 Dust Control

To prevent the accumulation of dust, debris and foreign material during construction, perform temporary dust control protection. Protect the distribution system (supply and return) with temporary seal-offs at all inlets and outlets at the end of each day's work. Keep temporary protection in place until system is ready for startup.

#### 3.2.7 Insulation

Provide thickness and application of insulation materials for ductwork, piping, and equipment according to Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS. Externally insulate outdoor air intake ducts and plenums up to the point where the outdoor air reaches the conditioning unit or up to the point where the outdoor air mixes with the return air stream.

#### 3.2.8 Duct Test Holes

Provide holes with closures or threaded holes with plugs in ducts and plenums as indicated or where necessary for the use of pitot tube in balancing the air system. Plug insulated duct at the duct surface, patched over with insulation and then marked to indicate location of test hole if needed for future use.

#### 3.2.9 Power Roof Ventilator Mounting

Provide foamed 1/2 inch thick, closed-cell, flexible elastomer insulation to cover width of roof curb mounting flange. Where wood nailers are used, predrill holes for fasteners.

#### 3.2.10 Power Transmission Components Adjustment

Test V-belts and sheaves for proper alignment and tension prior to operation and after 72 hours of operation at final speed. Uniformly load belts on drive side to prevent bouncing. Make alignment of direct driven couplings to within 50 percent of manufacturer's maximum allowable range of misalignment.

### 3.3 EQUIPMENT PADS

Provide equipment pads to the dimensions shown or, if not shown, to conform to the shape of each piece of equipment served with a minimum 3-inch margin around the equipment and supports. Allow equipment bases and foundations, when constructed of concrete or grout, to cure a minimum of 28 calendar days before being loaded.

### 3.4 CUTTING AND PATCHING

Install work in such a manner and at such time that a minimum of cutting and patching of the building structure is required. Make holes in exposed locations, in or through existing floors, by drilling and smooth by sanding. Use of a jackhammer is permitted only where specifically approved. Make holes through masonry walls to accommodate sleeves with an iron pipe masonry core saw.

### 3.5 CLEANING

Thoroughly clean surfaces of piping and equipment that have become covered with dirt, plaster, or other material during handling and construction before such surfaces are prepared for final finish painting or are enclosed within the building structure. Before final acceptance, clean mechanical equipment, including piping, ducting, and fixtures, and free from dirt, grease, and finger marks. When the work area is in an occupied space such as office, laboratory or warehouse protect all furniture and equipment from dirt and debris. Incorporate housekeeping for field construction work which leaves all furniture and equipment in the affected area free of construction generated dust and debris; and, all floor surfaces vacuum-swept clean.

### 3.6 PENETRATIONS

Provide sleeves and prepared openings for duct mains, branches, and other penetrating items, and install during the construction of the surface to be penetrated. Cut sleeves flush with each surface. Place sleeves for round duct 15 inches and smaller. Build framed, prepared openings for round duct larger than 15 inches and square, rectangular or oval ducts. Sleeves and framed openings are also required where grilles, registers, and diffusers are installed at the openings. Provide one inch clearance between penetrating and penetrated surfaces except at grilles, registers, and diffusers. Pack spaces between sleeve or opening and duct or duct insulation with mineral fiber conforming with ASTM C553, Type 1, Class B-2.

#### 3.6.1 Sleeves

Fabricate sleeves, except as otherwise specified or indicated, from 20 gauge thick mill galvanized sheet metal. Where sleeves are installed in bearing walls or partitions, provide black steel pipe conforming with ASTM A53/A53M, Schedule 20.

#### 3.6.2 Framed Prepared Openings

Fabricate framed prepared openings from 20 gauge galvanized steel, unless otherwise indicated.

### 3.6.3 Insulation

Provide duct insulation in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS continuous through sleeves and prepared openings except firewall penetrations. Terminate duct insulation at fire dampers and flexible connections. For duct handling air at or below 60 degrees F, provide insulation continuous over the damper collar and retaining angle of fire dampers, which are exposed to unconditioned air.

### 3.6.4 Closure Collars

Provide closure collars of a minimum 4 inches wide, unless otherwise indicated, for exposed ducts and items on each side of penetrated surface, except where equipment is installed. Install collar tight against the surface and fit snugly around the duct or insulation. Grind sharp edges smooth to prevent damage to penetrating surface. Fabricate collars for round ducts 15 inches in diameter or less from 20 gauge galvanized steel. Fabricate collars for square and rectangular ducts, or round ducts with minimum dimension over 15 inches from 18 gauge galvanized steel. Fabricate collars for square and rectangular ducts with a maximum side of 15 inches or less from 20 gauge galvanized steel. Install collars with fasteners a maximum of 6 inches on center. Attach to collars a minimum of 4 fasteners where the opening is 12 inches in diameter or less, and a minimum of 8 fasteners where the opening is 20 inches in diameter or less.

### 3.6.5 Firestopping

Where ducts pass through fire-rated walls, fire partitions, and fire rated chase walls, seal the penetration with fire stopping materials as specified in Section 07 84 00 FIRESTOPPING.

## 3.7 FIELD PAINTING OF MECHANICAL EQUIPMENT

Clean, pretreat, prime and paint metal surfaces; except aluminum surfaces need not be painted. Apply coatings to clean dry surfaces. Clean the surfaces to remove dust, dirt, rust, oil and grease by wire brushing and solvent degreasing prior to application of paint, except clean to bare metal on metal surfaces subject to temperatures in excess of 120 degrees F. Where more than one coat of paint is specified, apply the second coat after the preceding coat is thoroughly dry. Lightly sand damaged painting and retouch before applying the succeeding coat. Provide aluminum or light gray finish coat.

### 3.7.1 Temperatures less than 120 degrees F

Immediately after cleaning, apply one coat of pretreatment primer applied to a minimum dry film thickness of 0.3 mil, one coat of primer applied to a minimum dry film thickness of one mil; and two coats of enamel applied to a minimum dry film thickness of one mil per coat to metal surfaces subject to temperatures less than 120 degrees F.

### 3.7.2 Temperatures between 120 and 400 degrees F

Apply two coats of 400 degrees F heat-resisting enamel applied to a total minimum thickness of two mils to metal surfaces subject to temperatures between 120 and 400 degrees F.

### 3.7.3 Temperatures greater than 400 degrees F

Apply two coats of 315 degrees C 600 degrees F heat-resisting paint applied to a total minimum dry film thickness of two mils to metal surfaces subject to temperatures greater than 400 degrees F.

### 3.8 IDENTIFICATION SYSTEMS

Provide identification tags made of brass, engraved laminated plastic, or engraved anodized aluminum, indicating service and item number on all valves and dampers. Provide tags that are 1-3/8 inch minimum diameter with stamped or engraved markings. Make indentations black for reading clarity. Attach tags to valves with No. 12 AWG 0.0808-inch diameter corrosion-resistant steel wire, copper wire, chrome-plated beaded chain or plastic straps designed for that purpose.

### 3.9 DUCTWORK LEAK TESTS

The requirements for ductwork leak tests are specified in Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC.

### 3.10 DAMPER ACCEPTANCE TEST

Submit the proposed schedule, at least 2 weeks prior to the start of test. Operate all fire dampers and smoke dampers under normal operating conditions, prior to the occupancy of a building to determine that they function properly. Test each fire damper equipped with fusible link by having the fusible link cut in place. Test dynamic fire dampers with the air handling and distribution system running. Reset all fire dampers with the fusible links replaced after acceptance testing. To ensure optimum operation and performance, install the damper so it is square and free from racking.

### 3.11 TESTING, ADJUSTING, AND BALANCING

The requirements for testing, adjusting, and balancing are specified in Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC. Begin testing, adjusting, and balancing only when the air supply and distribution, including controls, has been completed, with the exception of performance tests.

### 3.12 PERFORMANCE TESTS

Conduct performance tests as required in Section 23 05 93 Testing, Adjusting and Balancing for HVAC and Section 23 09 00 Instrumentation and Control for HVAC.

### 3.13 CLEANING AND ADJUSTING

Provide a temporary bypass for water coils to prevent flushing water from passing through coils. Inside of air terminal units, unit ventilators, thoroughly clean ducts, plenums, and casing of debris and blow free of small particles of rubbish and dust and then vacuum clean before installing outlet faces. Wipe equipment clean, with no traces of oil, dust, dirt, or paint spots. Provide temporary filters prior to startup of all fans that are operated during construction, and provide new filters after all construction dirt has been removed from the building, and the ducts, plenums, casings, and other items specified have been vacuum cleaned. Perform and document that proper "Indoor Air Quality During

Construction" procedures have been followed; provide documentation showing that after construction ends, and prior to occupancy, new filters were provided and installed. Maintain system in this clean condition until final acceptance. Properly lubricate bearings with oil or grease as recommended by the manufacturer. Tighten belts to proper tension. Adjust control valves and other miscellaneous equipment requiring adjustment to setting indicated or directed. Adjust fans to the speed indicated by the manufacturer to meet specified conditions. Maintain all equipment installed under the contract until close out documentation is received, the project is completed and the building has been documented as beneficially occupied.

### 3.14 OPERATION AND MAINTENANCE

#### 3.14.1 Operation and Maintenance Manuals

Submit six manuals at least 2 weeks prior to field training. Submit data complying with the requirements specified in Section 01 78 23 OPERATION AND MAINTENANCE DATA. Submit Data Package 3 for the items/units listed under SD-10 Operation and Maintenance Data

#### 3.14.2 Operation And Maintenance Training

Conduct a training course for the members of the operating staff as designated by the Contracting Officer. Make the training period consist of a total of 8 hours of normal working time and start it after all work specified herein is functionally completed and the Performance Tests have been approved. Conduct field instruction that covers all of the items contained in the Operation and Maintenance Manuals as well as demonstrations of routine maintenance operations. Submit the proposed On-site Training schedule concurrently with the Operation and Maintenance Manuals and at least 14 days prior to conducting the training course.

-- End of Section --

SECTION 23 64 26

DESALINATION INTAKE SCREEN SYSTEM

08/09, CHG 7: 02/24

PART 1 GENERAL

1.1 SUMMARY

This Section includes intake screens, airburst backwash system, intake valves and valve actuators.

1.2 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B31.9 (2020) Building Services Piping

ASME BPVC SEC IX (2017; Errata 2018) BPVC Section IX-Welding, Brazing and Fusing Qualifications

AMERICAN WELDING SOCIETY (AWS)

AWS Z49.1 (2021) Safety in Welding and Cutting and Allied Processes

1.3 SYSTEM DESCRIPTION

This specification includes desal intake system. Certain intake system components are a delegated design to be performed by the Contractor. Components and arrangements indicated are for reference only and are intended to show performance requirements. The intake screen, valves, valve extension and operators, airburst backwash system, controls, devices, and accessories must be designed by the system manufacturer. The intake design must include calculations showing pressure losses and flow velocities through the intake, screens, and the airburst system. Design must include calculations stamped and signed by a licensed Professional Engineer. The calculations must include a quantification of adequate volume and speed of the airburst system under the specified requirements. Commissioning program requirements to be set forth by delegated design.

1.4 BASIS OF DESIGN

The Basis of Design for the intake screens and airburst backwash system is Johnson Screens, New Brighton, MN, Hendrick Screen Design, Owensboro, KY, Elgin, Canal Winchester, OH, or approved equal. Products must meet requirements of the Buy American Act.

1.5 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval.. When used, a code following the "G"

classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

The intake screens and airburst backwash system are long-lead items and submittals are critical submittals.

SD-01 Preconstruction Submittals

Valves; G, AE

Intake screens and airburst back wash system; G, AE

Intake Screen Flow Distribution; G, AE

SD-02 Shop Drawings

Detail Drawings; G, AE

SD-03 Product Data

Piping; G, AE

Valves; G, AE

Intake screens and airburst back wash system; G, AE

SD-05 Design Data; G

INTAKE SCREENS AND AIRBURST BACK WASH SYSTEM; G, AE

SD-06 Test Reports

Piping Welds NDE Report; G, AE

Intake Screen Flow Distribution; G, AE

INTAKE SCREENS AND AIRBURST BACK WASH SYSTEM; G, AE

SD-07 Certificates

Employer's Record Documents (For Welding); G

Welding Procedures and Qualifications; G

Certificates shall be submitted showing conformance with the referenced standards contained in this section.

INTAKE SCREENS AND AIRBURST BACK WASH SYSTEM; G, AE

SD-08 Manufacturer's Instructions

Lesson plan for the Instruction Course; G, AE

SD-10 Operation and Maintenance Data

Requirements for data packages are specified Section 01 78 23 OPERATION AND MAINTENANCE DATA, except as supplemented and modified by this specification section. Refer to Section

01 78 24.00 20 FACILITY ELECTRONIC OPERATION AND MAINTENANCE  
SUPPORT INFORMATION (eOMSI) for additional requirements.

Submit spare parts data for each different item of equipment specified, with operation and maintenance data packages. Include a complete list of parts and supplies, with current unit prices and source of supply, a recommended spare parts list for one year of operation, and a list of the parts recommended by the manufacturer to be replaced on a routine basis.

Submit a list of qualified permanent service organizations with operation and maintenance data packages. Include service organization addresses and service area or expertise. The service organizations shall be reasonably convenient to the equipment installation and be able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

Valves; G, AE

INTAKE SCREENS AND AIRBURST BACK WASH SYSTEM; G, AE

#### 1.6 SAFETY REQUIREMENTS

Exposed moving parts, parts that produce high operating temperature, parts which may be electrically energized, and parts that may be a hazard to operating personnel shall be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Safety devices shall be installed so that proper operation of equipment is not impaired.

#### 1.7 QUALITY CONTROL

##### 1.7.1 Detail Drawings

Submit drawings of sufficient size to be easily read, within 90 days of notice of Award of Contract. Submit information in the English language. Provide with English (IP) dimensions. Drawings must consist of complete designs of the intake and airburst backwash systems and other equipment, installation instructions, performance charts, brochures, and other information required to illustrate that the entire system has been coordinated and will function as a unit.

- a. Outline drawings of the system showing pertinent dimensions and weight of each component of the system. Prepare drawings to scale.
- b. Drawing showing details and dimensions of mounting design or layout including any embedded items.
- c. Cross-sectional drawings of the system showing each component. Show major or complicated sections of the system in detail. Indicate on each drawing an itemized list of components showing type, grade, and class of material used and make and model number of standard component used.
- d. Detail and assembly drawings required for manufacturing showing dimensions, tolerances, and clearances.
- e. Drawings covering erection and installation that are intended to be furnished to the erecting engineer.

## 1.8 DELIVERY, STORAGE, AND HANDLING

Protect stored items from the weather, humidity and temperature variations, dirt and dust, or other contaminants. Proper protection and care of all material both before and during installation shall be the Contractor's responsibility. Any materials found to be damaged shall be replaced at the Contractor's expense. During installation, cap piping and similar openings to keep out dirt and other foreign matter. Any porous materials found to be contaminated with mold or mildew will be replaced at the Contractor's expense. Non-porous materials found to be contaminated with mold or mildew will be disinfected and cleaned prior to installation.

## 1.9 PROJECT/SITE CONDITIONS

### 1.9.1 Verification of Dimensions

The Contractor shall become familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy(ies) before performing any work.

### 1.9.2 Drawings

Because of the small scale of the drawings, it is not possible to indicate all offsets, fittings, and accessories that may be required. The Contractor shall carefully investigate the plumbing, fire protection, electrical, structural and finish conditions that would affect the work to be performed and shall arrange such work accordingly, furnishing required offsets, fittings, and accessories to meet such conditions.

### 1.9.3 Accessibility

Install all work so that parts requiring periodic inspection, operation, maintenance, and repair are readily accessible.

## PART 2 PRODUCTS

### 2.1 STANDARD COMMERCIAL PRODUCTS

Materials and equipment must be standard products of a manufacturer regularly engaged in the manufacturing of such products, which are of a similar material, design, and workmanship. The standard products must have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The two-year use must include applications of equipment and materials under similar circumstances and of similar size. The 2 years' experience must be satisfactorily completed by a product which has been sold or is offered for sale on the commercial market through advertisements, manufacturer's catalogs, or brochures.

The equipment items shall be supported by service organizations. These service organizations shall be reasonably convenient to the equipment installation and able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

### 2.2 PIPING

Copper Nickel Pipe: 70/30 copper nickel pipe ASTM B411 and ASME SB466, IPS Class 200 wall.

Copper Nickel Flanges: 70/30 copper nickel ASTM B466 and ASME SB466, Class 150, coordinate bolt pattern with wet well bulkhead, valves, and intake screen

## 2.3 VALVES

### 2.3.1 Intake Screen Isolation Butterfly Valve

Butterfly valves for intake screens must be double offset design with sealing elements to provide zero leakage through non-rubbing 90-degree rotation. The body style shall be lug type and body and disk shall be constructed from super duplex material (ASTM A995 Gr 5A). Pressure rating and bolt pattern shall be class 150. The valve shall be manufactured by DelVal Flow Control LCC, or equal.

Valve must be suitable for sea water applications, The valve shall have the following characteristics:

| Item No | Part Name            | Material Specification |
|---------|----------------------|------------------------|
| 1       | Body                 | ASTM A 995 Gr. 5A      |
| 2       | Disc                 | ASTM A 995 Gr. 5A      |
| 3       | Seat                 | RPTFE                  |
| 4       | Stem                 | ASTM A479              |
| 5       | Bearing              | IGLIDUR-X              |
| 6       | Seat Retainer Ring   | ASTM A240              |
| 7       | Retainer Screw       | ASTM A1082             |
| 8       | Disc Spacer          | ASTM A479              |
| 9       | Wedge Key            | ASTM A479              |
| 10      | Stem Packing Support | ASTM 479               |
| 11      | Stem Packing         | PTFE                   |
| 12      | Gland                | ASTM A 479             |
| 13      | Snap Ring            | ASTM A313              |
| 14      | Gland Flange         | ASTM A240              |
| 15      | Belleville Washer    | ASTM A666              |
| 16      | Hex Nut              | ASTM A1082             |
| 17      | Bottom Plate Gasket  | PTFE                   |
| 18      | Bottom Plate         | ASTM A240              |
| 19      | Spring Washer        | ASTM A580              |
| 20      | Hex Bolt             | ASTM A1082             |

| Item No | Part Name              | Material Specification |
|---------|------------------------|------------------------|
| 21      | Square Nut Size: 2 in. | ASTM A1082             |

## 2.4 INTAKE SCREENS AND AIRBURST BACK WASH SYSTEM

### 2.4.1 General

- a. Provide delegated designs of intake screens and airburst backwash systems. The pump intake system components and equipment must be furnished as a complete integrated system by one manufacturer to ensure a properly designed and integrated intake system.
- b. System must be designed for hydrostatic load depth 30 feet and collapse rating of 13 psi.
- c. Intake Screens assembly must be horizontal orientation, of all-welded continuous slot construction and must be designed for air flushing of screen surface for debris removal. Equipment manufacturer must maintain an ongoing quality assurance program, preferably ISO-9000 certification. All welders must maintain certification to ASME Section IX. Copies of certification must be provided upon request.
- d. The single manufacturer supplying this equipment must be able to furnish proof of at least 5 installations and 10 years of manufacturing equipment of similar technology.
- e. Manufacturer must submit a complete and detailed pre-submittal package, including delegated designs, containing the below information:
  - (1) Detailed layout drawings.
  - (2) Supporting Intake Screen Flow Distribution data via a CFD (Computational Fluid Dynamics) analysis.
  - (3) Weld certifications.
  - (4) Evidence of a recognized ongoing quality assurance program.
  - (5) Detailed component specifications and catalog cuts as required.
  - (6) Detailed list of all variations required from the original design if an alternate screen is used, referencing appropriate Sections of the specifications and locations on the drawings.

### 2.4.2 Capacity and Strength

- a. Intake assembly capacity must be 1550 GPM (2.23 MGD) at a maximum through-slot velocity, as a result of water withdrawal, of 0.35 feet per second when screens are clean and 0.45 feet per second when the

screens are 20 percent blocked. The corresponding average through-slot velocity must be 80-90 percent of the maximum velocity. The hydraulic design of this system is based on this maximum headloss of 8 inches through a 20 percent blocked screen assembly. Screens that exceed this headloss are not acceptable. The manufacturer's clean screen assembly headloss must be stated in the delegated design documents.

- b. Evidence of the intake assembly capacity and flow distribution must be proven by a Computational Fluid Dynamic (CFD) analysis, supplied by the manufacturer. The CFD Analysis Method must be verified by calculations supported by previously completed physical flow distribution tests.
- c. The intake assembly shall be designed to a maximum of 4.33 psi negative pump pressure or differential head loss.

#### 2.4.3 Construction and Slot Opening Size

- a. Intake screen surface wire, support beam and stiffener structure must be an all-welded matrix designed to provide the specific strength with minimal interference with the through screen flow pattern.
- b. End plates must be a minimum of 0.105 inches thick. All structural butt welds must be full penetration fillet welds and must be the thickness of the thinner component.
- c. Screen slot size must be 0.0315 inch (0.8 mm). Slot size must be controlled and continuously monitored during manufacture.
- d. The mean slot size must be within +/- 0.002-inch with a standard deviation no greater than 0.002-inch throughout the assembly.
- e. The screen shall be provided with an end support connection to allow the screen to be supported.
- f. The screen shall have a maximum outside diameter of 36 inches and a maximum overall length of 70 inches.

#### 2.4.4 Materials

- a. Main outlet flange must mate with a flange pattern to mount directly to the pipe as shown on the drawings.
- b. Air connection must be 2.0-inch pipe size flange.
- c. Intake screen assembly must be manufactured of Z-Alloy or 70/30 copper-nickel material.
- d. The end of the screen shall be extended to allow support by a stanchion or provided with legs welded to structural supports of the screen that would allow stanchion supports to be welded to the legs.

#### 2.4.5 Airburst Backwash System

Intake screen supplier must provide, as part of the overall intake screen system, an airburst backwash system designed to remove debris from the screen surface by delivering a suitable volume of compressed air to the inside of the screen body. The exiting air must scour the screen surface to maintain adequate design flow and through slot velocity characteristics.

- a. Airburst Backwash System
  - (1) The airburst backwash system must consist of an integrated system of compressor, receiver tank, valves, and control panel. All components must be skid mounted and arrive on site ready to operate. Systems requiring field assembly and not ready to operate is not acceptable.
- b. Compressed air lines after the air compressor serving the intake structure must be:
  - (1) 70-30 copper nickel Class 700 with socket weld joints once at the docking seawall and in the seawater.
  - (2) Compressed air lines from building, to the 90 degree bend may be 316 stainless steel, polyethylene coated and wrapped.
- c. The air compressor must be a reciprocating type or rotary screw, pressure lubricated, and must be sized to recover from each backwash in 15 minutes. The compressor system shall have the following characteristics:
  - (1) 3/60/460V, TEFC 5HP Electric Motor.
  - (2) IP 54 Electrical Enclosure.
  - (3) Belt drive with automatic tensioning.
  - (4) Provided with a sound Enclosure to provide 63 dBa. rating or less.
  - (5) Ambient Temp (max/min) rating: 115F / 40F.
  - (6) Factory filled with Food grade oil.
    - (a) Provided with Moisture separator & condensate management.
- d. The receiver must be a 200 gallon (min) horizontal or vertical receiver, ASME coded for 200 psig,. The tanks shall be sized for the system piping and to displace three (3) screen volumes of air at the screen in 3-5 seconds during a backwash to provide suitable debris removal and cleaning. Alternatively, the tanks can be size per manufacturer recommendations such that the performance would be equal or better than as described above. The receiver must be equipped with a 4-inch isolated pressure gauge, safety relief valve, check valve, and automatic drain valve. The pipe supplied shall be of a size and thickness to be self-supporting of any gauges or equipment mounted to it.
- e. The system must include two fast-acting pneumatic valves rated at 200 psi with standard ANSI class 125/150 flanges. There must be one valve per screen and must be sized to match the tank flange and the backwash piping as part of the delegated design.
- f. Automatic Operation
  - (1) The above fast-acting valves must be provided with a spring return pneumatic actuator, single solenoid control with

position indicator, and position switches.

- (2) A stainless steel NEMA 4X control panel must be included that will contain as a minimum, the motor starter for the compressor, control power transformer (if not wired directly to 120V) and a programmable logic controller (PLC) with Human Machine Interface (MHI) touchscreen to perform the specified control functions. The panel will have the following features:
  - (a) All indicators will be LED type
  - (b) Lockable Disconnect with Type J Fusing
  - (c) 7-Day Programmable Time
  - (d) System On-Off Selector Switch
  - (e) Cycle Start Push Button
  - (f) Event Mode Selector Switch
  - (g) Digital pressure controller with readout
  - (h) System Power On Pilot Light
  - (i) Low Air Pressure Alarm Pilot Light
  - (j) Adequate Air Pressure Pilot Light
  - (k) Cycle in progress Pilot Light
  - (l) Relays
  - (m) Auxiliary Contacts
  - (n) Compression Type Terminal Blocks capable of 1 #10 wire or 2, #12 wires
  - (o) Isolated SCADA / PLC Output Contacts
    - 1. Cycle Start - Option for remote signal to initiate an air burst cycle.
    - 2. Valve Open
    - 3. Valve Closed
    - 4. Adequate Air
    - 5. Low Air Pressure
- (3) Controls must allow timed automatic, low level in the wetwell automatic clean, or manual initiated air cleaning cycles. A cycle consists of cleaning both intake system screens. The control system included must allow a full week duration of programmed airburst cycles.
- (4) Contractor must provide interconnecting piping and control wiring between the intake screen assembly and the airburst backwash

system.

- g. Onsite Commissioning and Training: A manufacturer's technician must be on the site for system start up and commissioning, and conduct a training course for system operators. Cost shall include all travel costs as well.

## PART 3 EXECUTION

### 3.1 INSTALLATION

Cut pipe accurately to measurements established at the jobsite, and work into place without springing or forcing, completely clearing all windows, doors, and other openings. Cutting or other weakening of the building structure to facilitate piping installation is not permitted without written approval. Cut pipe or tubing square, remove burrs by reaming, and fashion to permit free expansion and contraction without causing damage to the building structure, pipe, joints, or hangers.

Notify the Contracting Officer in writing at least 15 calendar days prior to the date the connections are required. Obtain approval before interrupting service. Furnish materials required to make connections into existing systems and perform excavating, backfilling, compacting, and other incidental labor as required. Furnish labor and tools for making actual connections to existing systems.

#### 3.1.1 Welding

##### 3.1.1.1 Welding and Brazing:

Provide welding work specified in this Section for piping systems in conformance with ASME B31.9, as modified and supplemented by this specification Section and the accompanying drawings. The welding work includes: qualification of welding procedures, welders, welding operators, and nondestructive examination personnel; maintenance of welding records, and examination methods for welds.

##### 3.1.1.2 Employer's Record Documents (For Welding)

Submit for review and approval the following documentation. This documentation and the subject qualifications shall be in compliance with ASME B31.9.

- a. List of qualified welding procedures that is proposed to be used to provide the work specified in this specification section.
- b. List of qualified welders, brazers, welding operators, and brazing operators that are proposed to be used to provide the work specified in this specification section.
- c. List of qualified weld examination personnel that are proposed to be used to provide the work specified in this specification section.

##### 3.1.1.3 Welding Procedures and Qualifications

- a. Specifications and Test Results: Submit copies of the welding procedures specifications and procedure qualification test results for each type of welding required. Approval of any procedure does not relieve the Contractor of the responsibility for producing acceptable

welds. Submit this information on the forms printed in ASME BPVC SEC IX or their equivalent.

- b. Certification: Before assigning welders or welding operators to the work, submit a list of qualified welders, together with data and certification that each individual is performance qualified as specified. Do not start welding work prior to submitting welder, and welding operator qualifications. The certification shall state the type of welding and positions for which each is qualified, the code and procedure under which each is qualified, date qualified, and the firm and individual certifying the qualification tests.

#### 3.1.1.4 Examination of Piping Welds

Conduct non-destructive examinations (NDE) on piping welds and brazing and verify the work meets the acceptance criteria specified in ASME B31.9. NDE on piping welds covered by ASME B31.9 is visual inspection only. Submit a piping welds NDE report meeting the requirements specified in ASME B31.9.

#### 3.1.1.5 Welding Safety

Welding and cutting safety requirements shall be in accordance with AWS Z49.1.

#### 3.1.2 Fittings and End Connections

##### Welded Connections

- a. Branch connections must be made with welding tees or forged welding branch outlets. Pipe must be thoroughly cleaned of all scale and foreign matter before the piping is assembled. During welding, the pipe and fittings must be filled with an inert gas, such as nitrogen, to prevent the formation of scale. Beveling, alignment, heat treatment, and inspection of weld must conform to ASME B31.9. Weld defects must be removed and rewelded at no additional cost to the Government. Electrodes must be stored and dried in accordance with AWS D1.1/D1.1M or as recommended by the manufacturer.
- b. Electrodes that have been wetted or that have lost any of their coating must not be used.

#### 3.1.3 Flanges

Flanged joints must be provided in each line immediately preceding the connection to each piece of equipment or material requiring maintenance such as pumps, control valves, and other similar items. Flanged joints must be assembled square end tight with matched flanges, gaskets, and bolts. Gaskets must be suitable for the intended application.

#### 3.1.4 Pipe Hangers, Inserts, and Supports

Supports must be designed by and stamped by a Professional Engineer and submitted. This cost will be carried by the Contractor as part of their bid.

Material must be compatible with the environment the structural attachment it is placed in.

#### 3.1.4.1 Multiple Pipe Runs

In the support of multiple pipe runs on a common base member, a clip or clamp shall be used where each pipe crosses the base support member. Spacing of the base support members shall not exceed the hanger and support spacing required for an individual pipe in the multiple pipe run.

#### 3.1.4.2 Structural Attachments

Structural brackets required to support piping, headers, and equipment, but not shown, must be provided under this Section. Material must be compatible with the environment the structural attachment is placed in. Supports must be designed by and stamped by a Professional Engineer. This cost will be carried by the Contractor.

#### 3.1.5 Building Surface Penetrations

Cores or sleeves must not pass through structural members unless specifically detailed on the Drawings.

##### 3.1.5.1 Waterproof Penetrations

Penetrations must be sealed by either one of the following methods.

- a. Modular Mechanical Type Sealing Assembly: Modular mechanical type sealing assembly must be installed. Seals must consist of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe/conduit and sleeve with 316 stainless steel bolts, nuts, and pressure plates. Links must be loosely assembled with bolts to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and each nut.
- b. After the seal assembly is properly positioned in the sleeve, tightening of the bolt must cause the rubber sealing elements to expand and provide a watertight seal between the pipe/conduit and the sleeve. Each seal assembly must be sized as recommended by the manufacturer to fit the pipe/conduit and sleeve involved. The Contractor must provide sleeves of the proper diameters.
- c. Existing Construction: Pipe penetration of the existing concrete can be done without sleeve. Seal concrete core hole with a mechanical link seal. Fill interior with silicone sealant, and fill exterior with non-shrink grout. Sleeves must be provided in holes through existing concrete where holes would not allow tight seal.

#### 3.2 INSPECTING AND CLEANING

The pipes must be flushed with cold water after finishing the installation. Flush the system until the water runs clear of debris and dirt. Inspect and test piping systems following procedures of authorities having jurisdiction and as specified by the piping system manufacturer.

Clean water distribution piping following procedures of the manufacturer and/or the Authority Having Jurisdiction.

#### 3.3 ELECTRICAL INSTALLATION

Install electrical equipment in accordance with NFPA 70 and manufacturers

instructions. Wiring must be installed in conduit.

### 3.4 FIELD TESTS

Field tests shall be conducted in the presence of the QC Manager or his designated representative to verify systems compliance with specifications. Any material, equipment, instruments, and personnel required for the test shall be provided by the Contractor.

### 3.5 INSTRUCTION TO GOVERNMENT PERSONNEL

Furnish the services of competent instructors to give full instruction to the designated Government personnel in the adjustment, operation, and maintenance, including pertinent safety requirements, of the desalination intake structure. Instructors shall be thoroughly familiar with all parts of the installation and shall be instructed in operating theory as well as practical operation and maintenance work. Submit a lesson plan for the instruction course for approval. The lesson plan and instruction course shall be based on the approved operation and maintenance data and maintenance manuals.

Conduct a training course for the operating staff and maintenance staff selected by the Contracting Officer. Give the instruction during the first regular work week after the equipment or system has been accepted and turned over to the Government for regular operation. The number of man-days (8 hours per day) of instruction furnished shall be one man-day. Use approximately half of the time for classroom instruction and the other time for instruction at the location of equipment or system.

When significant changes or modifications in the equipment or system are made under the terms of the contract, provide additional instruction to acquaint the operating personnel with the changes or modifications.

Training Course Documentation: Training must be based on the operation and maintenance manuals and control system training manual. Deliver manuals for each trainee with two additional sets for archiving at the project site. Include an agenda, defined objectives, and a detailed description of subject matter for each lesson.

-- End of Section --

SECTION 23 81 00

DECENTRALIZED UNITARY HVAC EQUIPMENT  
05/24

PART 1 GENERAL

1.1 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS, applies to this section with the additions and modifications specified herein.

### 1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

#### SD-03 Product Data

Spare Parts

Posted Instructions

Coil Corrosion Protection

System Performance Tests

Training; G

Inventory

Supplied Products

Manufacturer's Standard Catalog Data

#### SD-06 Test Reports

System Performance Tests; G

#### SD-07 Certificates

Service Organizations

#### SD-10 Operation and Maintenance Data

Operation and Maintenance Manuals; G

#### SD-11 Closeout Submittals

Ozone Depleting Substances; S

### 1.4 QUALITY ASSURANCE

Carefully investigate the plumbing, fire protection, electrical, structural and finish conditions that would affect the work to be performed and arrange such work accordingly, furnishing required offsets, fittings, and accessories to meet such conditions. Submit drawings consisting of:

- a. Equipment layouts which identify assembly and installation details.
- b. Plans and elevations which identify clearances required for maintenance and operation.

- c. Wiring diagrams which identify each component individually and interconnected or interlocked relationships between components.
- d. Foundation drawings, bolt-setting information, and foundation bolts prior to concrete foundation construction for equipment indicated or required to have concrete foundations.
- e. Details, if piping and equipment are to be supported other than as indicated, which include loadings and type of frames, brackets, stanchions, or other supports.
- f. Automatic temperature control diagrams and control sequences.
- g. Installation details which includes the amount of factory set superheat and corresponding refrigerant pressure/temperature.
- h. Equipment schedules

#### 1.5 DELIVERY, STORAGE, AND HANDLING

Protect stored items from the weather, humidity and temperature variations, dirt and dust, or other contaminants. Properly protect and care for all material both before and during installation. Submit an inventory of all the stored items. Replace any materials found to be damaged, at no additional cost to the Government. During installation, cap piping and similar openings capped to keep out dirt and other foreign matter.

#### 1.6 ENVIRONMENTAL REQUIREMENTS

For proper Indoor Environmental Quality, maintain pressure within the building as indicated. Ventilation must meet or exceed ASHRAE 62.1 and all published addenda. Meet or exceed filter media efficiency as tested in accordance with ASHRAE 52.2. Thermal comfort must meet or exceed ASHRAE 55.

#### 1.7 WARRANTY

Provide equipment with the Manufacturer's Standard Warranty.

### PART 2 PRODUCTS

#### 2.1 ENERGY EFFICIENCY REQUIREMENTS

42 USC 8259b requires the procurement of energy efficient products in product categories covered by the Energy Star program or the Federal Energy Management Program for designated products. A list of covered product categories is available from the Federal Energy Management Web site at: <https://www.energy.gov/femp/search-energy-efficient-products>. A list of qualified light commercial products is available at: <http://www.energystar.gov/productfinder/product/certified-light-commercial-hvac/result>

Submit Material, Equipment, and Fixtures List of all supplied products within a covered product category, including manufacturer's catalog numbers, specification and drawing reference number, warranty information, fabrication site, and energy performance data. For product categories covered by the Energy Star program, submit documentation that the product is Energy Star-qualified. For product categories covered by the Federal

Energy Management Program, submit documentation that the product meets or exceeds FEMP-designated efficiency requirements.

#### 2.1.1 Room Air Conditioners

Selected room air conditioners are required to meet performance requirements specified by Energy Star. Information on the requirements can be found at:

[https://www.energystar.gov/products/room\\_air\\_conditioners/partners](https://www.energystar.gov/products/room_air_conditioners/partners).

### 2.2 MATERIALS

Provide Manufacturer's standard catalog data, at least 5 weeks prior to the purchase or installation of a particular component, highlighted to show material, size, options, performance charts and curves, etc. in adequate detail to demonstrate compliance with contract requirements. Data includes manufacturer's recommended installation instructions and procedures. If vibration isolation is specified for a unit, include vibration isolator literature containing catalog cuts and certification that the isolation characteristics of the isolators provided meet the manufacturer's recommendations. Submit data for each specified component. Minimum efficiency requirements must be in accordance with ASHRAE 90.1 - IP.

#### 2.2.1 Standard Products

Provide materials and equipment that are standard products of a manufacturer regularly engaged in the manufacturing of such products, which are of a similar material, design and workmanship. The standard products must have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2 year use includes applications of equipment and materials under similar circumstances and of similar size. The 2 years' experience must be satisfactorily completed by a product which has been sold or is offered for sale on the commercial market through advertisements, manufacturer's catalogs, or brochures. Products having less than a 2 year field service record will be acceptable if a certified record of satisfactory field operation, for not less than 6000 hours exclusive of the manufacturer's factory tests, can be shown. Products must be supported by a service organization. Ensure system components are environmentally suitable for the indicated geographic locations.

#### 2.2.2 Product Sustainability Criteria

##### 2.2.2.1 Energy Efficient Equipment

Provide equipment meeting the efficiency requirements as stated within this section.

##### 2.2.2.2 Electrical Equipment / Motors

Provide electrical equipment, motors, motor efficiencies, and wiring which are in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Electrical motor driven equipment specified must be provided complete with motors, motor starters, and controls. Electrical characteristics must be as shown, and unless otherwise indicated, all motors of 1 horsepower and above with open, dripproof, totally enclosed, or explosion proof fan cooled enclosures, must be the premium efficiency type in accordance with

NEMA MG 1. Field wiring must be in accordance with manufacturer's instructions. Each motor must conform to NEMA MG 1 and NEMA MG 2 and be of sufficient size to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor. Motors must be continuous duty with the enclosure specified. Motor starters must be provided complete with thermal overload protection and other appurtenances necessary for the motor control indicated. Motors must be furnished with a magnetic across-the-line or reduced voltage type starter as required by the manufacturer. Motor duty requirements must allow for maximum frequency start-stop operation and minimum encountered interval between start and stop. Motors must be sized for the applicable loads. Motor torque must be capable of accelerating the connected load within 20 seconds with 80 percent of the rated voltage maintained at motor terminals during one starting period. Motor bearings must be fitted with grease supply fittings and grease relief to outside of enclosure. Manual or automatic control and protective or signal devices required for the operation specified and any control wiring required for controls and devices specified, but not shown, must be provided.

#### 2.2.2.3 Ozone Depleting Substances

Unitary air conditioning equipment must not use CFC-based refrigerants. Refrigerant may be an approved alternative refrigerant in accordance with EPA's Significant New Alternative Policy (SNAP) listing..

#### 2.2.2.4 Local/Regional Materials

Use materials or products extracted, harvested, or recovered, as well as manufactured, within a 500 mile radius from the project site, if available from a minimum of three sources.

#### 2.2.3 Nameplates

Major equipment including compressors, condensers, receivers, heat exchanges, fans, and motors must have the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment. Plates must be durable and legible throughout equipment life and made of stainless steel. Fix plates in prominent locations with nonferrous screws or bolts.

#### 2.2.4 Safety Devices

Exposed moving parts, parts that produce high operating temperature, parts which may be electrically energized, and parts that may be a hazard to operating personnel must be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Safety devices must be installed so that proper operation of equipment is not impaired. Welding and cutting safety requirements must be in accordance with AWS Z49.1.

### 2.3 EQUIPMENT

#### 2.3.1 Room Air Conditioner

Provide a through-the-wall mounted, appliance grade, factory assembled air conditioner unit in accordance with AHAM RAC-1 and UL 484. Units must include a self-contained, precharged, slide-in and removable chassis-mounted, air-cooled refrigeration system. Provide units removable from inside the building for servicing without removing the outside cabinet. Mount compressors on vibration isolators. Minimum cooling

capacity must be not less than that indicated. Provide units listed in the AHAM RAC-1. Cooling section must be equipped with a filter-drier on the suction line. Fan and condenser motors must have totally enclosed enclosures. Room Air Conditioners must have a minimum energy efficiency ratio (EER) of 10, and a minimum COP of 2.

#### 2.3.1.1 Primary/Supplemental Heat

Provide heating unit with internal thermal insulation having a fire hazard rating not to exceed 25 for flame spread and 50 for smoke developed as determined by ASTM E84.

##### 2.3.1.1.1 Electric Heating

Provide electric duct heater in accordance with UL 1995 and NFPA 70. Coil must be completely assembled, unit-mounted, and integral to the unit. Provide coil with nickel chromium elements and a maximum density of 40 watts per square inch. provide coil with automatic reset high limit control operating through heater backup contactors. Provide coil casing and support brackets of galvanized steel or aluminum. Mount coil to eliminate noise from expansion and contraction and be completely accessible for service. Electric resistance heating elements with high temperature-limit safety device, factory-mounted, and wired to chassis.

#### 2.3.1.2 Filters

Provide air filters of the throw-away or permanent washable type removable without the use of tools and arranged to filter both room and ventilating air. Filters must have a minimum efficiency reporting value (MERV) of 13 when tested in accordance with ASHRAE 52.2.

#### 2.3.1.3 Fans

Provide direct driven, statically and dynamically, centrifugal or propeller type fans. Design outdoor fan so that condensate evaporates without drip, splash, or spray on building exterior. Remove condensate by means of a drain or by evaporation and diffusion.

#### 2.3.1.4 Casing

Provide exterior casings for the specified room HVAC Units constructed of factory phosphatized and painted galvanized steel or aluminum sheet metal and galvanized or aluminum structural members. Fit casing with lifting provisions, access panels or doors, fan vibration isolators, electrical control panel, corrosion-resistant components, structural support members, insulated condensate drip pan and drain, and internal insulation in the cold section of the casing. Incorporate provisions to permit replacement of major unit components. Seal penetrations of cabinet surfaces, including the floor. Unit base must be watertight. Fit unit with a drain pan which extends under all areas where water may accumulate. Fabricate drain pan from Type 30X stainless steel, galvanized steel with protective coating as required, or an approved plastic material. Pan insulation must be water impervious. Extent and effectiveness of the insulation of unit air containment surfaces must prevent, within limits of the specified insulation, heat transfer between the unit exterior and ambient air, heat transfer between the two conditioned air streams, and condensation on surfaces. Insulation must conform to ASTM C1071.

Construct outside cabinets, including metal grilles to protect condenser

coils, of zinc-coated steel or aluminum. Steel and zinc-coated surfaces must receive at least one coat of primer and manufacturer's standard factory-applied finish. Insulate cabinets to prevent condensation and run off of moisture. Provide mounting hardware made of corrosion-resistant material or protected by a corrosion-resistant finish. Provide with metal or plastic mounting flanges on each side, top, and bottom of unit. For through-the-wall installations provide aluminum or shop painted zinc-coated steel flanged telescopic wall sleeves. Design wall sleeves to restrict driving rain. For window mounted units provide shop-painted metal mounting brackets, braces, and sill plates.

#### 2.3.1.5 Energy Efficiency

Minimum energy efficiency ratio (EER) must be in accordance with the paragraph EQUIPMENT EFFICIENCY. Room air conditioners must include the Energy Star label affixed to the equipment.

#### 2.3.1.6 Units for Operation on 115 Volts

Provide 3-wire cords of manufacturer's standard length. If not existing, provide a receptacle within reach of the standard length cord. Cords must have a 15- or 20-amp, 3-pole, 125-volt ground type plug to match receptacle.

#### 2.3.1.7 Units for Operation on 208 or 230 Volts

Provide 3-wire cords of manufacturer's standard length. If not existing, provide a receptacle within reach of the standard length cord. Cords must have a 15-, 20-, or 30-amp, 3-pole, 250-volt ground type plug to match receptacle.

#### 2.3.1.8 Controls

Provide units internally prewired by manufacturer with a 24 volt control circuit powered by an internal transformer. Terminal blocks must be provided for power wiring and external control wiring. Unit must be internally protected by fuses or a circuit breaker in accordance with UL 1995. Unit must be provided with microprocessor controls to provide all 24V control functions.

Mount controls in cabinet. Manual controls must permit operation of either the fan or the fan and refrigerating equipment. Fan control must provide two fan speed settings. Automatic controls must include a thermostat for controlling air temperature. Thermostat must have an adjustable range, including 72 to 80 degrees F and must automatically turn the refrigeration system on or off to maintain the preselected temperature within plus or minus 4 degrees F.

### 2.4 COMPONENTS

#### 2.4.1 Refrigerant and Oil

Refrigerant must be one of the fluorocarbon gases. Refrigerants must have number designations and safety classifications in accordance with ASHRAE 15 & 34. Refrigerants must meet the requirements of AHRI 700 as a minimum. Provide a complete charge of refrigerant for the installed system as recommended by the manufacturer. Lubricating oil must be of a type and grade recommended by the manufacturer for each compressor. Where

color leak indicator dye is incorporated, charge must be in accordance with manufacturer's recommendation.

#### 2.4.2 Fans

Fan wheel shafts must be supported by either maintenance-accessible lubricated antifriction block-type bearings, or permanently lubricated ball bearings. Unit fans must be selected to produce the cfm required at the fan total pressure. Motor starters, if applicable, must be magnetic across-the-line type with a opendriprooof enclosure. Thermal overload protection must be of the manual or automatic-reset type. Fan wheels or propellers must be constructed of aluminum or galvanized steel. Centrifugal fan wheel housings must be of galvanized steel, and both centrifugal and propeller fan casings must be constructed of aluminum or galvanized steel. Steel elements of fans, except fan shafts, must be hot-dipped galvanized after fabrication or fabricated of mill galvanized steel. Mill-galvanized steel surfaces and edges damaged or cut during fabrication by forming, punching, drilling, welding, or cutting must be recoated with an approved zinc-rich compound. Fan wheels or propellers must be statically and dynamically balanced. Forward curved fan wheels must be limited to 24 inches. Direct-drive fan motors must be of the multiple-speed variety. Belt-driven fans must have adjustable sheaves to provide not less than 100 percent fan-speed adjustment. The sheave size must be selected so that the fan speed at the approximate midpoint of the sheave adjustment will produce the specified air quantity. Centrifugal scroll-type fans must be provided with streamlined orifice inlet and V-belt drive. Each drive will be independent of any other drive. Propeller fans must be direct-drive drive type with adjustable pitch blades. V-belt driven fans must be mounted on a corrosion protected drive shaft supported by either maintenance-accessible lubricated antifriction block-type bearings, or permanently lubricated ball bearings. Each drive will be independent of any other drive. Drive bearings must be protected with water slingers or shields. V-belt drives must be fitted with guards where exposed to contact by personnel and fixed pitch sheaves.

#### 2.4.3 Primary/Supplemental Heating

##### 2.4.3.1 Electric Heating Coil

Coil must be an electric duct heater in accordance with UL 1995 and NFPA 70. Coil must be duct- or unit-mounted. Coil must be of the nickel chromium resistor, single stage, strip or stainless steel, fin tubular type. Coil must be provided with a built-in or surface-mounted high-limit thermostat interlocked electrically so that the coil cannot be energized unless the fan is energized. Coil casing and support brackets must be of galvanized steel or aluminum. Coil must be mounted to eliminate noise from expansion and contraction and be completely accessible for service. Supplemental Electric Resistance Heating controls must be provided to prevent operation when the heating load can be met by the primary source.

#### 2.4.4 Air Filters

Provide filters to filter outside air and return air and locate as indicated inside air conditioners inside filter box. Provide replaceable (throw-away) type. Filters must conform to UL 900, Class 1 or Class 2. Polyurethane filters cannot be used on units with multiframe filters.

Air filters must be listed in accordance with requirements of UL 900, except high efficiency particulate air filters of 99.97 percent efficiency

by the DOP Test Method must be as listed under the label service and must meet the requirements of UL 586.

#### 2.4.4.1 Extended Surface Pleated Panel Filters

Filters must be 2 inch depth sectional type of the size indicated and must have an average efficiency of 25 to 30 percent when tested in accordance with ASHRAE 52.2. Initial resistance at 500 feet/minute must not exceed 0.36 inches water gauge. Filters must be UL Class 2. Media must be nonwoven cotton and synthetic fiber mat. A wire support grid bonded to the media must be attached to a moisture resistant fiberboard frame. Four edges of the filter media must be bonded to the inside of the frame to prevent air bypass and increase rigidity.

#### 2.4.4.2 Manometers

Provide inclined-type manometers for filter stations of 2,000 cfm capacity or larger including filters furnished as integral parts of air-handling units and filters installed separately. Provide sufficient length to read at least one inch of water column with 10 major graduations, and equipped with spirit level. Equip manometers with overpressure safety traps to prevent loss of fluid, and two three-way vent valves for checking zero setting.

#### 2.4.5 Internal Dampers

Dampers must be parallel blade type with renewable blade seals and be integral to the unitary unit. Damper provisions must be provided for each outside air intake, exhaust, economizer, and mixing boxes. Dampers must have minimum position stops automatic modulation and operate as specified.

#### 2.4.6 Mixing Boxes

Mixing boxes must match the base unit in physical size and must include equally-sized flanged openings, each capable of full air flow. Arrangement must be as indicated.

#### 2.4.7 Cabinet Construction

Casings for the specified unitary equipment must be constructed of galvanized steel or aluminum sheet metal and galvanized or aluminum structural members. Minimum thickness of single wall exterior surfaces must be 18 gauge galvanized steel or 0.071 inch thick aluminum on units with a capacity above 20 tons and 20 gauge galvanized steel or 0.064 inch thick aluminum on units with a capacity less than 20 tons. Casing must be fitted with lifting provisions, access panels or doors, fan vibration isolators, electrical control panel, corrosion-resistant components, structural support members, insulated condensate drip pan and drain, and internal insulation in the cold section of the casing. Where double-wall insulated construction is proposed, minimum exterior galvanized sheet metal thickness must be 20 gauge. Provisions to permit replacement of major unit components must be incorporated. Penetrations of cabinet surfaces, including the floor, must be sealed. Unit must be fitted with a drain pan which extends under all areas where water may accumulate. Drain pan must be fabricated from Type 300 stainless steel, galvanized steel with protective coating as required, or an approved plastic material. Pan insulation must be water impervious. Extent and effectiveness of the insulation of unit air containment surfaces must prevent, within limits of the specified insulation, heat transfer between the unit exterior and

ambient air, heat transfer between the two conditioned air streams, and condensation on surfaces. Insulation must conform to ASTM C1071. Paint and finishes must comply with the requirements specified in paragraph FACTORY COATING.

#### 2.4.7.1 Indoor Cabinet

Indoor cabinets must be suitable for the specified indoor service and enclose all unit components.

#### 2.4.7.2 Outdoor Cabinet

Outdoor cabinets must be suitable for outdoor service with a weathertight, insulated and corrosion-protected structure. Cabinets constructed exclusively for indoor service which have been modified for outdoor service are not acceptable.

#### 2.4.8 Condensate Drain Piping

provide condensate drain piping in accordance with Section 23 05 15 COMMON PIPING FOR HVAC.

#### 2.4.9 Ductwork

Provide ductwork in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION.

#### 2.4.10 Temperature Controls

Provide temperature controls fully coordinated with and integrated into the existing air-conditioning system.

### 2.5 UNITARY EQUIPMENT ACCESSORIES AND MISCELLANEOUS EQUIPMENT

#### 2.5.1 Air Economizer

Provide factory installed economizer with fully modulating 0-100 percent motor and dampers, barometric relief, minimum position setting and fixed dry bulb.

### 2.6 FINISHES

#### 2.6.1 Coil Corrosion Protection

Provide coil with a uniformly applied epoxy electrodeposition, phenolic, or vinyl type coating to all coil surface areas without material bridging between fins. Submit product data on the type coating selected, the coating thickness, the application process used, the estimated heat transfer loss of the coil, and verification of conformance with the salt spray test requirement. Coating must be applied at either the coil or coating manufacturer's factory. Coating process must ensure complete coil encapsulation. Coating must be capable of withstanding a minimum 1,000 hours exposure to the salt spray test specified in ASTM B117 using a 5 percent sodium chloride solution.

#### 2.6.2 Equipment and Components Factory Coating

Unless otherwise specified, equipment and component items, when fabricated from ferrous metal, must be factory finished with the manufacturer's standard finish, except that items located outside of buildings must have

weather resistant finishes that will withstand 500 hours exposure to the salt spray test specified in ASTM B117 using a 5 percent sodium chloride solution. Immediately after completion of the test, the specimen must show no signs of blistering, wrinkling, cracking, or loss of adhesion and no sign of rust creepage beyond 1/8 inch on either side of the scratch mark. Cut edges of galvanized surfaces where hot-dip galvanized sheet steel is used must be coated with a zinc-rich coating conforming to ASTM D520, Type I.

Where stipulated in equipment specifications of this section, coat finned tube coils of the affected equipment as specified below. Apply coating at the premises of a company specializing in such work. Degrease and prepare for coating in accordance with the coating applicator's procedures for the type of metals involved. Completed coating must show no evidence of softening, blistering, cracking, crazing, flaking, loss of adhesion, or "bridging" between the fins.

#### 2.6.2.1 Phenolic Coating

Provide a resin base thermosetting phenolic coating. Apply coating by immersion dipping of the entire coil. Provide a minimum of two coats. Bake or heat dry coils following immersions. After final immersion and prior to final baking, spray entire coil with particular emphasis given to building up coating on sheared edges. Total dry film thickness must be 2.5 to 3.0 mils.

#### 2.6.2.2 Chemical Conversion Coating with Polyelastomer Finish Coat

Dip coils in a chemical conversion solution to molecularly deposit a corrosion resistant coating by electrolysis action. Chemical conversion coatings must conform to MIL-DTL-5541, Class 1A. Cure conversion coating at a temperature of 110 to 140 degrees F for a minimum of 3 hours. Coat coil surfaces with a complex polymer primer with a dry film thickness of 1 mil. Cure primer coat for a minimum of 1 hour. Using dip tank method, provide three coats of a complex polyelastomer finish coat. After each of the first two finish coats, cure the coils for 1 hour. Following the third coat, spray a fog coat of an inert sealer on the coil surfaces. Total dry film thickness must be 2.5 to 3.0 mils. Cure finish coat for a minimum of 3 hours. Coating materials must have 300 percent flexibility, operate in temperatures of minus 50 to plus 220 degrees F, and protect against atmospheres of a pH range of 1 to 14.

#### 2.6.2.3 Vinyl Coating

Apply coating using an airless fog nozzle. For each coat, make at least two passes with the nozzle. Materials to be applied are as follows:

- a. Total dry film thickness, 6.5 mils maximum
- b. Vinyl Primer, 24 percent solids by volume: One coat 2 mils thick
- c. Vinyl Copolymer, 30 percent solids by volume: One coat 4.5 mils thick

#### 2.6.3 Factory Applied Insulation

Refrigeration equipment must be provided with factory installed insulation on surfaces subject to sweating including the suction line piping. Where motors are the gas-cooled type, factory installed insulation must be provided on the cold-gas inlet connection to the motor in accordance with

manufacturer's standard practice. Factory insulated items installed outdoors are not required to be fire-rated. As a minimum, factory insulated items installed indoors must have a flame spread index no higher than 75 and a smoke developed index no higher than 150. Factory insulated items (no jacket) installed indoors and which are located in air plenums, in ceiling spaces, and in attic spaces must have a flame spread index no higher than 25 and a smoke developed index no higher than 50. Flame spread and smoke developed indexes must be determined by ASTM E84. Insulation must be tested in the same density and installed thickness as the material to be used in the actual construction. Material supplied by a manufacturer with a jacket must be tested as a composite material. Jackets, facings, and adhesives must have a flame spread index no higher than 25 and a smoke developed index no higher than 50 when tested in accordance with ASTM E84.

## 2.7 TESTS, INSPECTIONS, AND VERIFICATIONS

All manufactured units must be inspected and tested, and documentation provided to demonstrate that each unit is in compliance with ANSI/AHRI and UL requirements and that the minimum efficiency requirements of ASHRAE 90.1 - IP have been met.

## PART 3 EXECUTION

### 3.1 EXAMINATION

After becoming familiar with all details of the work, perform Verification of Dimensions in the field, and advise the Contracting Officer of any discrepancy before performing any work.

### 3.2 INSTALLATION

Perform work in accordance with the manufacturer's published diagrams, recommendations, and equipment warranty requirements. Where equipment is specified to conform to the requirements of ASME BPVC SEC VIII D1 and ASME BPVC SEC IX, the design, fabrication, and installation of the system must conform to ASME BPVC SEC VIII D1 and ASME BPVC SEC IX.

#### 3.2.1 Equipment

Provide refrigeration equipment conforming to ASHRAE 15 & 34. Provide necessary supports for all equipment, appurtenances, and pipe as required, including frames or supports for compressors, pumps, cooling towers, condensers, and similar items. Isolate compressors from the building structure. If mechanical vibration isolators are not provided, provide vibration absorbing foundations. Each foundation must include isolation units consisting of machine and floor or foundation fastenings, together with intermediate isolation material. Other floor-mounted equipment must be set on not less than a 6 inch concrete pad doweled in place. Concrete foundations for floor mounted pumps must have a mass equivalent to three times the weight of the components, pump, base plate, and motor to be supported. In lieu of concrete pad foundation, concrete pedestal block with isolators placed between the pedestal block and the floor may be provided. Concrete pedestal block must be of mass not less than three times the combined pump, motor, and base weights. Isolators must be selected and sized based on load-bearing requirements and the lowest frequency of vibration to be isolated. Isolators must limit vibration to 20-40 percent at lowest equipment rpm. Provide lines connected to pumps mounted on pedestal blocks with flexible connectors. Provide foundation

drawings, bolt-setting information, and foundation bolts prior to concrete foundation construction for all equipment indicated or required to have concrete foundations. Concrete for foundations must be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE. Equipment must be properly leveled, aligned, and secured in place in accordance with manufacturer's instructions.

### 3.2.2 Mechanical Room Ventilation

Provide mechanical ventilation systems in accordance with Section 23 30 00 HVAC AIR DISTRIBUTION.

### 3.2.3 Field Applied Insulation

Apply field applied insulation as specified in Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS, except as defined differently herein.

### 3.2.4 Field Painting

Painting required for surfaces not otherwise specified, and finish painting of items only primed at the factory are specified in Section 09 90 00 PAINTS AND COATINGS.

## 3.3 CLEANING AND ADJUSTING

Equipment must be wiped clean, with all traces of oil, dust, dirt, or paint spots removed. Temporary filters must be provided for all fans that are operated during construction, and new filters must be installed after all construction dirt has been removed from the building. System must be maintained in this clean condition until final acceptance. Bearings must be properly lubricated with oil or grease as recommended by the manufacturer. Belts must be tightened to proper tension. Control valves and other miscellaneous equipment requiring adjustment must be adjusted to setting indicated or directed. Fans must be adjusted to the speed indicated by the manufacturer to meet specified conditions. Testing, adjusting, and balancing must be as specified in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS.

## 3.4 TRAINING

Conduct a training course for the operating staff as designated by the Contracting Officer. The training period must consist of a total 8 hours of normal working time and start after the system is functionally completed but prior to final acceptance tests.

- a. Submit a schedule, at least 2 weeks prior to the date of the proposed training course, which identifies the date, time, and location for the training.
- b. Submit the field posted instructions, at least 2 weeks prior to construction completion, including equipment layout, wiring and control diagrams, piping, valves and control sequences, and typed condensed operation instructions. The condensed operation instructions must include preventative maintenance procedures, methods of checking the system for normal and safe operation, and procedures for safely starting and stopping the system. The posted instructions must be framed under glass or laminated plastic and be posted where indicated by the Contracting Officer.

- c. The posted instructions must cover all of the items contained in the approved operation and maintenance manuals as well as demonstrations of routine maintenance operations. Submit 6 complete copies of an operation manual in bound 8-1/2 by 11 inch booklets listing step-by-step procedures required for system startup, operation, abnormal shutdown, emergency shutdown, and normal shutdown at least 4 weeks prior to the first training course. The booklets must include the manufacturer's name, model number, and parts list. The manuals must include the manufacturer's name, model number, service manual, and a brief description of all equipment and their basic operating features.
- d. Submit 6 complete copies of maintenance manual in bound 8-1/2 by 11 inch booklets listing routine maintenance procedures, possible breakdowns and repairs, and a trouble shooting guide. The manuals must include piping and equipment layouts and simplified wiring and control diagrams of the system as installed.

### 3.5 SYSTEM PERFORMANCE TESTS

Before each refrigeration system is accepted, conduct tests to demonstrate the general operating characteristics of all equipment by a registered professional engineer or an approved manufacturer's start-up representative experienced in system start-up and testing, at such times as directed. Six copies of the report provided in bound 8-1/2 by 11 inch booklets. The report must document compliance with the specified performance criteria upon completion and testing of the system. The report must indicate the number of days covered by the tests and any conclusions as to the adequacy of the system.

For equipment providing heating and cooling the system performance tests must be performed during the heating and cooling seasons.

- a. Submit a schedule, at least 2 weeks prior to the start of related testing, for the system performance tests. The schedules must identify the proposed date, time, and location for each test. Tests must cover a period of not less than 48 hours for each system and must demonstrate that the entire system is functioning in accordance with the drawings and specifications.
- b. Make corrections and adjustments, as necessary, tests must be re-conducted to demonstrate that the entire system is functioning as specified. Prior to acceptance, install and tighten service valve seal caps and blanks over gauge points. Replace any refrigerant lost during the system startup.
- c. If tests do not demonstrate satisfactory system performance, correct deficiencies and retest the system. Conduct tests in the presence of the Contracting Officer. Water and electricity required for the tests will be furnished by the Government. Provide all material, equipment, instruments, and personnel required for the test.
- d. Coordinate field tests with Section 23 05 93 TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS. Submit 6 copies of the report provided in bound 8-1/2 by 11 inch booklets. The report must document compliance with the specified performance criteria upon completion and testing of the system. The report must indicate the number of days covered by the tests and any conclusions as to the adequacy of the system. Submit the report including the following information (where values

are taken at least three different times at outside dry-bulb temperatures that are at least 5 degrees F apart):

- (1) Date and outside weather conditions.
- (2) The load on the system based on the following:
  - (a) The refrigerant used in the system.
  - (b) Condensing temperature and pressure.
  - (c) Suction temperature and pressure.
  - (d) Ambient, condensing and coolant temperatures.
  - (e) Running current, voltage and proper phase sequence for each phase of all motors.
- (3) The actual on-site setting of operating and safety controls.
- (4) Thermostatic expansion valve superheat - value as determined by field test.
- (5) Subcooling.
- (6) High and low refrigerant temperature switch set-points
- (7) Low oil pressure switch set-point.
- (8) Defrost system timer and thermostat set-points.
- (9) Moisture content.
- (10) Capacity control set-points.
- (11) Field data and adjustments which affect unit performance and energy consumption.
- (12) Field adjustments and settings which were not permanently marked as an integral part of a device.

### 3.6 MAINTENANCE

#### 3.6.1 EXTRA MATERIALS

Submit spare parts data for each different item of equipment specified, after approval of detail drawings and not later than 2 months prior to the date of beneficial occupancy. Include in the data a complete list of parts and supplies, with current unit prices and source of supply, a recommended spare parts list for 1 year of operation, and a list of the parts recommended by the manufacturer to be replaced on a routine basis.

#### 3.6.2 Maintenance Service

Submit a certified list of qualified permanent service organizations, which includes their addresses and qualifications, for support of the equipment. The service organizations must be reasonably convenient to the equipment installation and be able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

UL SOLUTIONS (UL)

UL 1025 (1980; R 1990, Bul. 1991) Electric Air  
Heaters

1.2 GENERAL REQUIREMENTS

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, applies to this section, with the additions and modifications specified herein.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Heater Installation Drawing

SD-03 Product Data

Electric Unit and Cabinet Heaters

Thermostat

SD-10 Operation and Maintenance Data

Electric Unit and Cabinet Heaters, Data Package 5

Submit in accordance with Section 01 78 23 OPERATION AND  
MAINTENANCE DATA.

## PART 2 PRODUCTS

### 2.1 ELECTRIC UNIT AND CABINET HEATERS

UL 1025; wattage, voltage, phase, number of steps, Btu/hr and CFM as indicated. Provide control-circuit terminals and single source of power supply. Heaters 5 Kw and larger shall be 3-phase, with load balanced on each of the three phases. Limit leaving air temperature to 140 degrees F with entering air of 60 degrees F.

#### 2.1.1 Enclosure

Minimum 20 gage steel.

#### 2.1.2 Heating Element

Nickel chromium heating wire element, free from expansion noise and 60 Hz hum. Embed element in magnesium-oxide insulating refractory. Seal element in high-mass steel or corrosion-resisting metallic sheath with fins. Enclose element ends in terminal box. Provide not more than six fins per inch. Limit fin surface temperature 550 degrees F at any point during normal operation.

#### 2.1.3 Controls

Include limit controls for overheat protection of heaters. For remote thermostatic operation, provide contactor rated for 100,000 duty cycles. Provide a control transformer to supply 120-volt thermostat control circuit for each heater.

#### 2.1.4 Wiring

Completely factory-prewired to terminal strips, ready to receive branch circuit and control connections for 140 degrees F copper wiring.

#### 2.1.5 Accessories

Provide fan switching devices to independently operate the fan motor for summer ventilation and winter heat recovery.

#### 2.1.6 Thermostat

Provide tamper resistant space thermostat, adjustable without requiring removal of heater components. Thermostat operating range shall be approximately 50 degrees F to a maximum of 85 degrees F with operating differential of 3 degrees F or less.

#### 2.1.7 Disconnect Means

Provide factory-installed safety disconnect switch in the housing or in an auxiliary matching control section with "off" position marking on the face plate.

#### 2.1.8 Outdoor Sensor

Provide outdoor sensor with sunlight-and-rain protection shield. The sensor shall provide a positive heater shut off when outdoor air temperature is 65 degrees F or higher.

#### 2.2 CONTACTORS

NEMA ICS 2, Enclosure Type 1.

#### 2.3 DISCONNECTS

Disconnect. UL listed. Enclosed fused switch, rated 480 volt, 3 phase, 4 wire, NEMA Type 1 enclosure. Disconnect shall be capable of being locked in the open position.

### PART 3 EXECUTION

#### 3.1 INSTALLATION

Install in conformance with the approved heater installation drawing, NFPA 70, UL listing, and manufacturer's instructions, with necessary clearances for air circulation, maintenance, inspection, service testing and repair. Connect to electrical supply in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

##### 3.1.1 Unit Heaters

Mount units plumb, square and level with ceiling and walls.

##### 3.1.2 Cabinet Heaters

Where recessed mounting is indicated, seal entire recessed opening from exterior wall cavities, and provide a minimum 1/2-inch thick rigid fire resistant insulation on the wall behind the cabinet. Verify manufacturer's clearance requirements from electrical cords, drapes, and other furnishings.

##### 3.1.3 Remote Thermostat

Mount remote room space thermostats 4 feet 6 inches above finished floor on wall or as indicated. Connect remote thermostats with conduit and wiring to heaters as indicated.

#### 3.2 FIELD QUALITY CONTROL

Provide necessary personnel, instruments, and equipment to perform tests. Notify the Contracting Officer 5 working days prior to scheduled testings and locations.

##### 3.2.1 Field Inspection

Prior to initial operation, inspect installed equipment for conformance with drawings and specifications.

##### 3.2.2 Insulation Resistance Tests

Test 600-volt wiring to verify that no short circuits or grounds exist. Tests shall be made using an instrument which applies a voltage of

approximately 500 volts and provides a direct reading of resistance in ohms.

### 3.2.3 Operational Tests

Test equipment circuits and devices to demonstrate proper operation. Test each item of control equipment not less than 5 times.

-- End of Section --

SECTION 25 05 11  
CYBERSECURITY FOR DESALINATION SCADA SYSTEM  
08/24

PART 1 GENERAL

Many subparts in this Section contain text in curly braces ("{" and "}") indicating which cybersecurity control and control correlation identifier (CCI) the requirements of the subpart relate to. The text inside these curly braces is for Government reference only and enables coordination of the requirements of this Section with the RMF process throughout the design and construction process. Text in curly braces are not contractor requirements.

This Section refers to Security Requirements Guide (SRGs) and Security Technical Implementation Guide (STIGs). STIGs and SRGs are available online at the Information Assurance Support Environment (IASE) website at <https://public.cyber.mil/stigs/downloads/> and an SRG/STIG Applicability Guide and Collection Tool is available at <https://public.cyber.mil/stigs/SCAP/>. Not all control system components have applicable STIGs or SRGs. The "Control Systems SRG" does not apply to work performed under this Section; all requirements within this section to apply applicable SRGs DO NOT include the "Control Systems SRG".

1.1 CONTROL SYSTEM APPLICABILITY

There are multiple versions of this Section associated with this project. Different versions have requirements applicable to different control systems. This specific Section applies only to the Desalination SCADA System.

1.2 RELATED REQUIREMENTS

This section does not contain sufficient requirements to procure a control system and must be used in conjunction with other Sections which specify control systems. This Section adds cybersecurity requirements to the control systems specified in other Sections, and as these requirements are conditioned on the control system being provided, there may be requirements in this Section that will not apply to this project. All Sections containing facility-related control systems or control system components are related to the requirements of this Section. Review all specification sections to determine related requirements.

In cases where a requirement is specified in both this Section and in another Section, the more stringent requirement must be met. In cases where a requirement in this Section conflicts with the requirements of another Section such that both requirements cannot be met at the same time, request direction from the Contracting Officer (KO) to determine which requirement applies to the project.

Incorporate each of the requirements contained in this specification for facility-related control systems and equipment specified in the following UFGS Section(s):

- a. 26 29 23 ADJUSTABLE SPEED DRIVE (ASD) SYSTEMS UNDER 600 VOLTS
- b. 40 60 00 PROCESS CONTROL

### 1.3 REFERENCES

Defense (DoD) Information Systems -  
Standard Consent Banner and User Agreement

### 1.4 DEFINITIONS

#### 1.4.1 Administrator Account

An administrator account is an account with full permissions to a device, application, or operating system, including the ability to create and modify other user accounts.

Note that the operating system Administrator Account may be different than Administrator Accounts for applications hosted on that operating system. Also, most controllers will not have any support for accounts and will therefore not have an 'Administrator Account'.

#### 1.4.2 Controller

A device other than a computer or Ethernet switch.

#### 1.4.3 Mission Space

A device or media is in mission space if physical access to the device or media is controlled by the organization served by the device. For example, a control panel in an electrical room is in mission space if the organization (mission) served by that control panel controls access to the electrical room.

#### 1.4.4 Network

A network is a group of two or more devices that can communicate using a

network protocol. Network protocols must provide a method for addressing devices on the network; a communication method that does not provide an addressing scheme is not a networked form of communication. Devices that communicate using a method of communication that does not support device addressing are not using a network. Addresses may be other than IP addresses, and addressing may be at either Open Systems Interconnection (OSI) layer 2 or layer 3.

#### 1.4.5 Network Connected

A component is network connected (or "connected to a network") only when the device has a network transceiver which is directly connected to the network and implements the network protocol. A device lacking a network transceiver (and accompanying protocol implementation) can never be considered network connected. Note that (unlike many IT definitions of "Network Connected") a device connected to a non-IP network is still considered network connected (an IP connection or IP address is not required for a device to be network connected).

##### 1.4.5.1 Wireless Network Connected

Any device that supports wireless network communication is network connected to a wireless network, regardless of whether the device is communicating using wireless. Unless physically disabled, devices with wireless transceivers support wireless, it is not sufficient to disable the wireless in software.

#### 1.4.6 Network Media

The thing that provides the communication channel between the devices on a network. Typically wire, but might include wireless, fiber optic, or even power line (some network protocols allow sending network signals over power wiring).

#### 1.4.7 User Account Support Levels

The support for user accounts is categorized in this Section as one of three levels:

##### 1.4.7.1 FULLY Supported

Device supports configurable individual accounts. Accounts can be created, deleted, modified, etc. Privileges can be assigned to accounts. These devices support user-based (as opposed to role-based) authentication.

##### 1.4.7.2 MINIMALLY Supported

Device supports a small, fixed number of accounts (perhaps only one). Accounts cannot be modified. A device with only a "User" and an "Administrator" account would fit this category. Similarly, a device with two PINs for logon - one for restricted and one for unrestricted rights would fit here (in other words, the accounts do not have to be the traditional "username and password" structure). These devices typically only support role-based authentication.

Examples of devices which MINIMALLY support accounts are a) a variable frequency drive with a single account which requires a PIN for access to configuration; and b) a room lighting control touchpad interface that has a single account.

#### 1.4.7.3 NOT Supported

Device does not support any Access Enforcement therefore the whole concept of "account" is meaningless.

#### 1.4.8 Manual Local Input

Manual Local Inputs are system analog or binary inputs that are adjustable by a person but are, by intrinsic hardware design, very limited in potential capabilities. Manual Local Inputs do not have touch screens or full keyboards, but may have a few buttons or dials to allow input. Manual Local Inputs do not have full graphic screens or dot-matrix displays, but may have simple lights (LEDs) or 7-segment displays. Manual Local Inputs do not have any sort of menu structure, each button has a single well-defined function.

Examples of Manual Local Inputs are H-O-A switches, simple thermostats, and disconnect switches.

#### 1.4.9 Card Reader

A card reader is an input/output device whose primary function is to assist in two-factor authentication. A card reader must have an interface to read data from a card and may be able to write data to a card. A card reader may have a means (such as buttons, keypad, touchscreen, etc.) for a user to input a PIN or password, as well as a limited display.

#### 1.4.10 User Interface

A User Interface (UI) is something other than a Manual Local Input or Card Reader that allows a person to interact with the system or device. Note that while a Card Reader is not by itself a User Interface, a User Interface may contain a Card Reader in order for it to authenticate its user. Within control systems, there are a wide range of User Interfaces.

Two important distinctions are 1) whether the user interface is Local or Remote, and 2) the effective capabilities of the User Interface to alter data, which is the "privilege" of the user interface (where effective privilege available to a specific user at a specific user interface is the combination of the greatest privilege offered by the user interface and the specific account the user is logged into).

##### 1.4.10.1 Local User Interface

A Local User Interface is a user interface where the physical hardware the user interacts with (keyboard, buttons, display, etc.) is physically part of the device being affected. All of the relevant characteristics of the user interface are embodied within a single device.

Note that a Local UI may be able to access data in a different device, Local versus Remote in this context refers to the user interface itself; the capability to access data in a different device is covered under "Full User Interface".

##### 1.4.10.2 Remote User Interface

A Remote User Interface implements a Client/Server model where the physical hardware the user interacts with (Client) is physically distinct

from the device being affected (Server). Most or all of the security and functionality characteristics of the user interface are defined by the Server, not the Client. The Client and Server communicate via a network connection. A common example of a remote user interface is a web-based interface where the browser (client) is generally on different hardware than the web server (server). A Remote UI remains a Remote UI even if the user happens to be at a Client on the same hardware as the Server. What is important is that a) the Client may be on different hardware than the Server and b) the majority of the security and functional characteristics of the interface are defined at the Server.

Note that this definition of "remote" is consistent with that generally used in the control industry but is not aligned with the NIST 800-53 definition of "Remote", which refers to "outside the system". The term "Remote" here better aligns with the NIST 800-53 definition of "Network" (remote from within the system) Access.

#### 1.4.10.3 Types of User Interface (by capability)

User interfaces are also categorized by their capabilities as being Read Only, Limited, or Full.

##### 1.4.10.3.1 Read-Only User Interface

A Read Only User Interface (also referred to as a View-Only User Interface) is a user interface that only allows for reading data, it does not allow (have the capability to) modify data. A Read Only User Interface may be either Local or Remote. A User Interface that is configured to be Read Only (by some other means than the interface itself, such as using configuration software on a laptop) is a Read-Only Interface. Note a Read Only User Interface may have buttons (or touch screen, etc.) allowing the user to navigate through the presentation of data.

Examples of a Read Only User Interfaces are a) a publicly viewable "energy dashboard" showing weather data and energy usage within a building and b) digital wayfinding signage.

##### 1.4.10.3.2 Limited User Interface

A Limited User Interface is a user interface that - by design - can only alter information local to the user interface. Note that the determination of "alter" includes only direct interactions, it explicitly excludes interactions that might occur as secondary effects. For example, an interface changing the flow setpoint in a pump controller is a direct interaction, the subsequent change in flow (as well as any subsequent downstream changes in valve position) are not direct interactions.

Two examples of LIMITED UIs are: a) a variable speed drive has a Limited Local User Interface which allows the user to change properties within the drive, but does not allow affecting things outside the drive; and b) a typical home WiFi Router has a Limited Remote User Interface which allows configuration of the Router, but does not allow direct interaction with other devices.

##### 1.4.10.3.3 Full User Interface

A Full User Interface can alter information in devices outside the device with the user interface. For example, a typical Local Display Panel is a

Full Local User Interface while a browser-based front end is a Full Remote User Interface.

#### 1.4.10.3.4 View-Only User Interface

See Read-Only User Interface

#### 1.4.10.4 Other User Interface Terminology

In addition to defining whether a user interface is a Hardware Limited, Read-Only, Limited or Full, and whether it is Local or Remote, user interfaces are classified by whether they are writable or privileged.

##### 1.4.10.4.1 Writable User Interface

Any User Interface that is not Read-Only is Writable. (Limited User Interfaces and Full User Interfaces are both writable user interfaces (as they are capable of changing a value)).

##### 1.4.10.4.2 Privileged User Interface

A Privileged UI is a UI that has sufficient capabilities or functionality that it requires specific cybersecurity measures to be put in place to limit its unauthorized use. Ultimately, whether a specific user interface is considered a Privileged User Interface must be determined by usage. Unless otherwise specified, user interfaces can be determined to be privileged or not using the following:

- a. Read-Only User Interfaces are not privileged user interfaces.
- b. Full User Interfaces are privileged user interfaces.
- c. User interfaces that allow for configuration of auditing or allows for modification or deletion of audit logs are privileged user interface.
- d. User interfaces that allow for reprogramming a network connected device is a privileged user interface.
- e. Except as specified above, a Limited User Interface must be determined to be privileged or not based on the specific capabilities and use case of the user interface. In general however, user interfaces that do not offer significant capabilities above and beyond those available at that location via other means (e.g. such as a disconnect switch, breaker, or hand-off-auto switch, or physical attack) are not privileged.

#### 1.4.11 Wireless Network

Any network that communicates without using wires or fiber optics as the communication media. Wireless networks include: WiFi, Bluetooth, ZigBee, cellular, satellite, long and short wave radio, 2.4 GHz, free space optical, point-to-point laser, microwave, and IR.

#### 1.4.12 Wired Broadcast Network

Wired Broadcast Networks are any network, such as powerline carrier networks and modem (wired telephony), that use wire-based technologies where there is not a clearly defined boundary for signal propagation.

#### 1.4.13 Facility-Related Control System (FRCS)

A control system (a system of digital controllers, communication architecture, and user interfaces that monitor, or monitor and control, infrastructure and equipment) which controls equipment and infrastructure that is part of the facility (building, structure, or linear structure).

#### 1.4.14 Field Control System

A Building Control System, Utility Control System, Electronic Security System, etc. within the Facility and "downstream" of the Field Point of Connection (FPOC).

#### 1.4.15 Field Point of Connection (FPOC)

The FPOC is the point of connection between the Level 4 control system IP network and the Level 2 field control IP network. Note the Level 2 IP network here may consist entirely of a single patch cable from the FPOC to a Level 1-to-Level 2 device. The hardware which provides the connection at this location is an IT device such as a switch, IP router, or firewall.

#### 1.4.16 SCADA System

A SCADA system, or Supervisory Control and Data Acquisition system, is a system that monitors and controls water and wastewater equipment in real-time. SCADA systems use sensors, controllers, and software to collect data from various sources, such as pumps, tanks, and valves.

### 1.5 ADMINISTRATIVE REQUIREMENTS

#### 1.5.1 Points of Contact

When coordination is required, coordinate with the Contracting Officer (K0).

#### 1.5.2 Coordination

Coordinate the execution of this Section with the execution of all other Sections related to control systems as indicated in the paragraph RELATED REQUIREMENTS. Items that must be considered when coordinating project efforts include but are not limited to:

- a. If requesting permission for wireless or wired broadcast communication, the Wireless and Wired Broadcast Communication Request submittal must be approved prior to control system device selection and installation.
- b. If requesting permission for alternate account lock permissions, the Device Account Lock Exception Request must be approved prior to control system device selection and installation.
- c. If requesting permission for the use of a device with multiple physical connections to IP networks, the Multiple IP Connection Device Request must be approved prior to control system device selection and installation.
- d. Wireless testing may be required as part of the control system testing. See requirements for the Wireless Communication Test Report submittal.

- e. If the Device Audit Record Upload Software is to be installed on a computer not being provided as part of the control system, coordination is required to identify the computer on which to install the software.
- f. The Cybersecurity Interconnection Schedule must be coordinated with other work that will be interconnected to, and interconnections must be approved by the Government before relying on them for system functionality.
- g. Cybersecurity testing support must be coordinated across control systems and with the Government cybersecurity testing schedule.
- h. Passwords must be coordinated with the indicated contact for the project site.
- i. If applicable, HTTPS web server certificates must be obtained from the Contracting Officer (KO).
- j. Contractor Computer Cybersecurity Compliance Statements must be provided for each contractor using contractor owned computers.

#### 1.6 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

##### SD-01 Preconstruction Submittals

Device Account Lock Exception Request; G  
Multiple Ethernet Connection Device Request; G  
Contractor Computer Cybersecurity Compliance Statements; G  
Contractor Temporary Network Cybersecurity Compliance Statements; G  
Cybersecurity Interconnection Schedule ; G  
Proposed STIG and SRG Applicability Report; G  
Pre-Construction Control System Inventory Report ; G

##### SD-02 Shop Drawings

Network Communication, Ports, Protocols and Services Report; G  
Cybersecurity Network (Riser) Diagram ; G

##### SD-03 Product Data

Control System Cybersecurity Documentation; G

##### SD-06 Test Reports

Control System Cybersecurity Testing Procedures; G  
Control System Cybersecurity Testing Report; G

SD-07 Certificates

Software Licenses; G

SD-11 Closeout Submittals

Confidential Password Report; G

Enclosure Keys; G

Software and Configuration Backups; G

Auditing Front End Software; G

Device Audit Record Upload Software; G

System Maintenance Tool Software; G

Control System Scanning Tools; G

STIG, SRG and Vendor Guide Compliance Result Report; G

Final Control System Inventory Report; G

1.7 CYBERSECURITY DOCUMENTATION

{For Government Reference Only: This subpart (and its subparts) relates to PL-7; CCI-003071}

1.7.1 Proposed STIG and SRG Applicability Report

For each model of network connected or network infrastructure device, use the DISA SRG/STIG Applicability Guide and Collection Tool (available at <https://public.cyber.mil/stigs/SCAP/>) to identify applicable STIGs or SRGs and provide a report indicating applicable STIGs and SRGs for each model. Provide the Proposed STIG and SRG Applicability Report concurrently with the Pre-Construction Control System Inventory Report.

1.7.2 Cybersecurity Interconnection Schedule

{For Government Reference Only: This subpart relates to CA-3(b), PL-8, SC-7(9), SC-7(11); CCI-000258, CCI-003072, CCI-003073, CCI-003075, CCI-002398, CCI-002399, CCI-002401, CCI-002402, CCI-002403.}

Provide a completed Cybersecurity Interconnection Schedule documenting network connections between the installed system and other systems. Provide the following information for each device directly communicating between systems: Device Identifier, Device Manufacturer, Device Description, Transport layer Protocol, Network Address, Port (if applicable), MAC (Layer 2) address (if applicable), Media, Application Protocol, Service (if applicable), Descriptive Purpose of communication. For communication with other authorized systems also provide the Foreign Destination and POC for Destination. If other control system Sections used on this project include submittals documenting this information, provide copies of those submittals to meet this requirement.

In addition to the requirements of Section 01 33 00 SUBMITTAL PROCEDURES, provide the Cybersecurity Interconnection Schedule as an editable

Microsoft Excel file (a template Cybersecurity Interconnection Schedule in Excel format is available at <https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-25-05-11>.)

#### 1.7.3 Network Communication, Ports, Protocols and Services Report

{For Government Reference Only: This subpart (and its subparts) relates to CA-9, PL-8; CCI-002102, CCI-002103, CCI-002104, CCI-002105, CCI-003072, CCI-003073, CCI-003075 and also the submittal requirements associated with CM-6, CM-7, including CM-7(3), CCI-000388.}

Provide a Network Communication, Ports, Protocols and Services Report. For each networked device, document device identifier and the communication characteristics of the device including communication protocols, services used, encryption employed, and a general description of what information is communicated over the network. For each device using IP communication, document all TCP and UDP ports used. For each device using non-IP communication, document communication protocol and media used. If other control system Sections used on this project include submittals documenting this information, provide copies of those submittals to meet this requirement.

In addition to the requirements of Section 01 33 00 SUBMITTAL PROCEDURES, provide the Network Communication, Ports, Protocols and Services Report as an editable Microsoft Excel file.

#### 1.7.4 Control System Inventory Reports

{For Government Reference Only: This subpart (and its subparts) relates to CM-8(a), SI-17, IA-3; CCI-000389, CCI-000392, CCI-000398, CCI-002773, CCI-002774, CCI-002775, CCI-000777, CCI-000778, CCI-001958}

Provide a Pre-Construction Control System Inventory Report report and a Final Control System Inventory Report, using the Inventory Spreadsheet listed under this Section at <https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-25-05-11>. In the Control System Inventory Reports, document all devices with networking capabilities (both IP and non-IP), including network infrastructure devices and devices once capable of wireless communication. For each device provide all applicable information for which there is a field on the spreadsheet in accordance with the instructions on the spreadsheet.

In addition to the requirements of Section 01 33 00 SUBMITTAL PROCEDURES, provide the Control System Inventory Reports as editable Microsoft Excel files. Provide the Pre-Construction Control System Inventory Report concurrently with the Proposed STIG and SRG Applicability Report

#### 1.7.5 Software and Configuration Backups

{For Government Reference Only: This subpart (and its subparts) relates to CP-10; CCI-000550, CCI-000551, CCI-000552}

For all controllers, provide a backup of the controller configuration and the source code for all loaded application programs (all software that is not common to every controller of the same manufacturer and model).

If any or all of these are provided under another Section, provide documentation indicating this and referencing those submittals.

#### 1.7.6 Cybersecurity Network (Riser) Diagram

{For Government Reference Only: This subpart (and its subparts) relates to PL-2(a), PL-8; CCI-003051, CCI-003053, CCI-003072, CCI-003073, CCI-003075}

Provide a cybersecurity network (riser) diagram of the complete control system including all network and device hardware. For each device, include the device identifier, device type, and manufacturer. If the control system specifications require a riser diagram submittal, provide a copy of that submittal as the cybersecurity riser diagram. Otherwise, provide a riser diagram in one-line format.

#### 1.7.7 STIG, SRG and Vendor Guide Compliance Result Report

For every component (device or software) with an applicable STIG or SRG in the Proposed STIG and SRG Applicability Report, document compliance with the STIG or SRG requirements.

- a. For components which are scannable by the SCAP (security content automation protocol) tool (available online at <https://public.cyber.mil/stigs/scap>), include the SCAP report and raw scan results in addition to the final, manually reviewed and revised, documentation of compliance with STIG and SRG requirements. Checklist files should not contain any findings with a Not Reviewed (NR) status after manual reviews.
- b. For components which do not support automated scanning, a manual review using the General Purpose STIG option should be done. A completed Checklist file should not contain any findings with a Not Reviewed (NR) status after manual reviews

For every component (device or software) with manufacturer provided cybersecurity documentation, procedure, or method for secure configuration or installation, provide a report documenting how the component was configured and any deviation from the manufacturer instructions.

#### 1.7.8 Control System Cybersecurity Documentation

{For Government Reference Only: This subpart (and its subparts) relates to SA-5(a), SA-5(b), SA-5(c), SA-22(b); CCIs: CCI-003124, CCI-003125, CCI-003126, CCI-003127, CCI-003128, CCI-003129, CCI-003130, CCI-003131, CCI-003374}

Provide a Control System Cybersecurity Documentation submittal containing the indicated information for each device and software application.

##### 1.7.8.1 Desalination SCADA System

For Desalination SCADA System Devices, use the Default Requirements for Control System Devices.

##### 1.7.8.2 Default Requirements for Control System Devices

For control system devices where Control System Cybersecurity Documentation requirements are not otherwise indicated in this Section,

provide:

- a. Documentation that describes secure configuration of the device {For Government Reference Only: relates to CCI-003124}
- b. Documentation that describes secure installation of the device {For Government Reference Only: relates to CCI-003125}
- c. Documentation that describes secure operation of the device {For Government Reference Only: relates to CCI-003126}
- d. Documentation that describes effective use and maintenance of security functions or mechanisms for the device {For Government Reference Only: relates to CCI-003127}
- e. Documentation that describes known vulnerabilities regarding configuration and use of administrative (i.e. privileged) functions for the device {For Government Reference Only: relates to CCI-003128}
- f. Documentation that describes user-accessible security functions or mechanisms in the device and how to effectively use those security functions or mechanisms {For Government Reference Only: relates to CCI-003129}
- g. Documentation that describes methods for user interaction which enables individuals to use the device in a more secure manner {For Government Reference Only: relates to CCI-003130}
- h. Documentation that describes user responsibilities in maintaining the security of the device {For Government Reference Only: relates to CCI-003131}
- i. Documentation of the published last date of support by the manufacturer or indication that a published date is not available. {For Government Reference Only: relates to CCI-003374}

#### 1.8 SOFTWARE LICENSING

{For Government Reference Only: This subpart (and its subparts) relates to SI-2(a), SI-2(c), SI-7(14); CCI-001227, CCI-002605, CCI-002737}

For all software provided that has not already been licensed to the government or project site, provide a license to the project site for a period of no less than 5 years, and the license must also include the following software updates:

- a. Security and bug-fix patches issued by the software manufacturer.
- b. Security patches to address any vulnerability identified in the National Vulnerability Database at <http://nvd.nist.gov> with a Common Vulnerability Scoring System (CVSS) severity rating of MEDIUM or higher.

Provide a single Software Licenses submittal with documentation of the software licenses for all software provided

#### 1.9 CYBERSECURITY DURING CONSTRUCTION

{For Government Reference Only: This subpart (and its subparts) relates

to AC-18, CA-3; CCI-000258}

In addition to the control system cybersecurity requirements indicated in this section, meet following requirement throughout the construction process.

#### 1.9.1 Contractor Computer Equipment

Contractor owned computers may be used for construction. Contractor computers connected to the control system, control system network, or a control system component at any point during construction must meet the following requirements:

##### 1.9.1.1 Operating System

The operating system must be an operating system currently supported by the manufacturer of the operating system. The operating system must be current on security patches and operating system manufacturer required updates.

##### 1.9.1.2 Anti-Malware Software

The computer must run anti-malware software from a reputable software manufacturer. Anti-malware software must be a version currently supported by the software manufacturer, must be current on all patches and updates, and must use the latest definitions file. Computers used on this project must perform a full antivirus scan at least once per day. Computers which have connected to any other network since the last full antivirus scan must perform a full antivirus scan prior to connection to the control system network or to the temporary contractor-installed IP network. Perform an antivirus scan on all removable media (e.g., external hard drives, CDs, DVDs, USB flash drives) prior to connecting to the control system environment.

##### 1.9.1.3 Passwords and Passphrases

The passwords and passphrases for computers, applications, and web-based applications supporting passwords must be changed from their default values. Passwords must be a minimum of eight characters with a minimum of one uppercase letter, one lowercase letter, one number and one special character.

##### 1.9.1.4 User-Based Authentication

Each user must have a unique account; sharing of a single account between multiple users is prohibited.

##### 1.9.1.5 Demonstration of Compliance

The Government has the right to require demonstration of computer compliance with these requirements at any time during the project.

##### 1.9.1.6 Contractor Computer Cybersecurity Compliance Statements

Provide a single submittal containing completed Contractor Computer Cybersecurity Compliance Statements for each company using contractor owned computers. Contractor Computer Cybersecurity Compliance Statements must use the template published at <https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-25-05-11>. Each Statement must

be signed by a cybersecurity representative for the relevant company.

#### 1.9.2 Temporary IP Networks

Temporary contractor-installed IP networks may be used during construction. When used, temporary contractor-installed IP networks connected to the control system, control system network, or a control system component at any point during construction must meet the following requirements:

##### 1.9.2.1 Network Boundaries and Connections

The network must not extend outside the project site and must not connect to any IP network other than those specifically provided or furnished for this project. Any and all access to the network from outside the project site is prohibited.

##### 1.9.3 Government Access to Network

Government personnel must be allowed to have complete and immediate access to the network at any time in order to verify compliance with this specification.

##### 1.9.4 Temporary Wireless IP Networks

In addition to the other requirements on temporary IP networks, temporary wireless IP (WiFi) networks, when permitted, must not interfere with existing wireless networks, must use WPA2 security and must not broadcast the network name (SSID). Network names (SSID) for wireless networks must be changed from their default values.

##### 1.9.5 Passwords and Passphrases

The passwords and passphrases for all network devices and network access must be changed from their default values. Passwords must be a minimum 8 characters with a minimum of one uppercase letter, one lowercase letter, one number and one special character.

##### 1.9.6 Contractor Temporary Network Cybersecurity Compliance Statements

Provide a single submittal containing completed Contractor Temporary Network Cybersecurity Compliance Statements for each company implementing a temporary IP network. Contractor Temporary Network Cybersecurity Compliance Statements must use the template published at <https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-25-05-11>. Each Statement must be signed by a cybersecurity representative for the relevant company. If no temporary IP networks will be used, provide a single copy of the Statement indicating this.

#### 1.10 CYBERSECURITY DURING WARRANTY PERIOD

All work performed on the control system after acceptance must be performed using Government Furnished Equipment or equipment specifically and individually approved by the Government.

## PART 2 PRODUCTS

All products used on this project must meet the indicated requirements, but not all products specified here will be required by every project.

## 2.1 ETHERNET SWITCH

Provide Open Systems Interconnection (OSI) Layer 2 Ethernet switches with the following capabilities, and with an interface to support switch configuration for these capabilities:

### 2.1.1 Required Functionality

Switches must:

- a. Copper Ethernet ports must auto negotiate for 10, 100 and 1000 megabits-per-second links.
- b. Be capable of implementing port level access control by MAC address and limit the number of MAC addresses to one MAC address per port.
- c. Be capable of implementing per-port access control lists (ACLs) where the list can be filtered by source and destination IP addresses, and by source and destination UDP or TCP ports.
- d. Support Remote Network Monitoring (RMON) Port Analysis in accordance with IETF RFC 2819
- e. Configure target port and analysis port such that switch clones all target port traffic to analysis port.
- f. Support authentication via RADIUS server (for management and 802.1x)
- g. Support IEEE 802.1x network login.

### 2.1.2 Configuration Requirements

Switches must:

- a. Support configuration save and restore.
- b. Support both manual IP address assignment and acquisition of a dynamic IP address via Dynamic Host Configuration Protocol (DHCP).
- c. Be capable of limiting access for configuration to one or more of: a web interface using HTTPS, a command line interface using SSH, or an SNMP connection using SNMP version 3 or later.
- d. Support the ability to lock configuration capability to a dedicated management port.

## 2.2 DAISY CHAIN IP CONTROLLERS

Controllers used as Daisy Chain IP Controllers must be IP controllers with exactly two Ethernet network connections and basic built-in switch capabilities to allow implementation of an Ethernet network in a daisy chain architecture. Switches incorporated by Daisy Chain IP Controllers are not required to meet the requirements for Ethernet Switches as defined in this Section.

## PART 3 EXECUTION

### 3.1 CYBERSECURITY HARDENING AND CONFIGURATION GUIDES

Install, configure, and harden all hardware and software furnished on this project in accordance with manufacturer provided documentation, procedures, or methods for secure configuration or installation. Do not implement specific hardening actions if that action would conflict with required functionality or another requirement of this Section.

### 3.2 NETWORK REQUIREMENTS

#### 3.2.1 Wireless and Wired Broadcast Communication

{For Government Reference Only: This subpart (and its subparts) relates to AC-18, AC-18(3); CCI-001438, CCI-001439, CCI-002323, CCI-001441, CCI-001449}

The use of wireless and wired broadcast communication for Desalination SCADA systems within a facility is prohibited. Wireless communication may be used to provide communication from the Desalination SCADA system at a facility to the central monitoring station. Communication between the Desalination SCADA system and the central monitoring station must be via FIPS 140-2 certified devices.

#### 3.2.2 Non-IP Control Networks

When control system specifications require particular communication protocols, use only those communication protocols and only as specified. Do not implement any other communication protocol.

When control system specifications do not indicate requirements for communication protocols, use only those protocols required for operation of the system as specified.

#### 3.2.3 IP Control Networks

{For Government Reference Only: This subpart relates to CM-6(a), CM-7(a), CM-7(b), CM-7(1)(b), SC-41; CCI-001588, CCI-000381, CCI-000380, CCI-000381, CCI-000382, CCI-001761, CCI-001762, CCI-002544, CCI-002545, CCI-002546.}

IP Networks must be Ethernet networks and must use switches which are Ethernet Switches or Daisy Chain IP Controllers as defined in this Section. Do not use nonsecure functions, ports, protocols and services as defined in DODI 8551.01 unless those ports, protocols and services are specifically required by the control system specifications or otherwise specifically authorized by the Government. Do not use ports, protocols and services that are not specified in the control system specifications or required for operation of the control system.

##### 3.2.3.1 IP Network Routers

Do not install any device that performs IP routing.

##### 3.2.3.2 IP Devices With Multiple Ethernet Connections

Except for Ethernet Switches and Daisy Chain IP Controllers, devices must not have more than one Ethernet connection to IP networks unless doing so

is required by the project specifications and the specific application is approved. If a device with Multiple Ethernet Connections to IP networks is required, provide a Multiple Ethernet Connection Device Request using the Multiple Ethernet Connection Device Request Template at <https://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/ufgs-25-05-11> to request approval for each device. If a device with Multiple Ethernet Connections to IP networks is not required, instead provide a document stating that no approval is being requested.

#### 3.2.4 Device Identification and Authentication

{For Government Reference Only: This subpart (and its subparts) relates to IA-3; CCI-000777, CCI-000778, CCI-001958.}

##### 3.2.4.1 Default Requirements for Control System Devices

For control system devices where Device Identification and Authentication requirements are not otherwise indicated in this Section: Devices using HTTP as a control protocol must use HTTPS instead.

#### 3.2.5 Cryptographic Module Authentication

{For Government Reference Only: This subpart (and its subparts) relates to IA-7; CCI-000803}

For devices (including but not limited to NIST FIPS 140-2 compliant radios) that have STIG/SRGs related to cryptographic module authentication (CCI-000803), comply with the requirements of those STIG/SRGs.

### 3.3 ACCESS CONTROL REQUIREMENTS

#### 3.3.1 User Accounts

{For Government Reference Only: This subpart (and its subparts) relate to AC-2(a), AC-3, AC-6(1), AC-6(10), AC-6(2), AC-6(9), CM-11(2), and IA-2; CCI-002110, CCI-000213, CCI-001558, CCI-002221, CCI-002222, CCI-002223, CCI-002235, CCI-000039, CCI-001419, CCI-002234, CCI-001812, and CCI-000764. }

Any user interface supporting user accounts (either FULLY or MINIMALLY) must limit access according to specified limitations for each account. Install and configure any device having a STIG or SRG in accordance with that STIG or SRG.

All user interfaces FULLY supporting accounts must implement user-based authentication where each account is uniquely assigned to a specific user. User interfaces FULLY supporting accounts must implement at least three (3) levels of user account privilege including: 1) an account with read-only permissions 2) an account with full permissions including account creation and modification and 3) an account with greater permissions than read-only but without account creation and modification. Disable any unnecessary or unused accounts. Disable any "guest-level" accounts that are created on the system by default.

##### 3.3.1.1 Controllers

For user interfaces provided by controllers, provide access control in accordance with the User Interface Requirements table for the applicable control system and user interface type.

- a. For table entries of "NA": NA means Not Applicable, there are no interfaces in this category.
- b. For table entries of "None Required": The user interface is not required to support user accounts.
- c. For table entries of "MINIMALLY": The user interface must at least MINIMALLY support user accounts.
- d. For table entries of "FULLY": The user interface must at FULLY support user accounts.
- e. For table entries of "KEY": The user interface must have physical security in the form of either a key lock on the interface itself or be furnished inside a lockable enclosure. Where this is required for a read only interface, the lockable enclosure must prevent viewing of data on the interface; for other interfaces, this lockable enclosure must prevent using the interface to alter data.
- f. For table entries of "Physical Security": For Local FULL interfaces, the interface must be located inside mission space. For Local Limited (not FULL) interfaces, the user interface must either a) be located within mission space or b) be protected by physical security at least as good as the control devices (and equipment controlled by the control devices) affected by the interface. For purposes of this requirement, 'affected' includes controllers with data that can be directly altered by the interface, as well as mechanical and/or electrical equipment directly controlled by those controllers, but does not include other interactions.
- g. Entries of the form "X and Y" must meet both the requirement indicated for X and the requirement indicated for Y. For example, an entry of "MINIMALLY and Physical Security" indicates the user interface must both MINIMALLY support accounts and have physical security.
- h. Entries of the form "X or Y" must meet either the requirement indicated for X or the requirement indicated for Y.

#### 3.3.1.1.1 Desalination SCADA System

For Desalination SCADA System Devices, use the Default Requirements for Control Systems.

#### 3.3.1.1.2 Default Requirements for Control Systems

For control system devices where User Interface Requirements are not otherwise indicated in this Section, use the Default User Interface Requirements tables.

| Default User Interface Requirements for Control Systems |                                   |
|---------------------------------------------------------|-----------------------------------|
| <u>User Interface Type</u>                              | <u>Access Control Requirement</u> |
| Local Read Only (see note 1)                            | None Required                     |

| Default User Interface Requirements for Control Systems                                                                      |                                   |
|------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|
| <u>User Interface Type</u>                                                                                                   | <u>Access Control Requirement</u> |
| Local Limited, Non-privileged                                                                                                | MINIMALLY                         |
| Local Limited, Privileged                                                                                                    | MINIMALLY                         |
| Local Full                                                                                                                   | MINIMALLY                         |
| Remote Read Only                                                                                                             | None Required                     |
| Remote Limited, Non-Privileged                                                                                               | MINIMALLY                         |
| Remote Limited, Privileged<br>AND<br>Remote Full (see note 2)                                                                | FULLY                             |
| Notes:<br>1)Local Read Only User Interfaces are always Non-Privileged<br>2)Remote Full User Interfaces are always Privileged |                                   |

### 3.3.2 Unsuccessful Logon Attempts

{For Government Reference Only: This subpart (and its subparts) relate to AC-7 (a), AC-7 (b); CCI-000043, CCI-000044, CCI-001423, CCI-002236, CCI-002237, CCI-002238}

Except for high availability user interfaces indicated as exempt, devices must meet the indicated requirements for handling unsuccessful logon attempts. If a device cannot meet these requirements, document device capabilities to protect from subsequent logon attempts and propose alternate protections in a Device Account Lock Exception Request submittal. Do not implement alternate protection measures in lieu of the indicated requirements without explicit permission from the Government. If no Device Account Lock Exceptions are requested, provide a document stating that no approval is being requested as the Device Account Lock Exception Request.

#### 3.3.2.1 Devices MINIMALLY Supporting Accounts

Devices which MINIMALLY (but not FULLY) support accounts are not required to lock based on unsuccessful logon attempts.

#### 3.3.2.2 Devices FULLY Supporting Accounts

Devices which FULLY support accounts must meet the following requirements.

- a. It must lock the user account when three unsuccessful logon attempts occur within a 15 minute interval.
- b. Once an account is locked, the account must stay locked until unlocked by an administrator. If the account being locked is the sole administrator account on the device, the account must stay locked for one hour and then automatically unlock.

- c. Once the indicated number of unsuccessful logon attempts occurs, delay further logon prompts by five seconds.

### 3.3.2.3 High Availability Interfaces Exempt from Unsuccessful Logon Attempts Requirements

There are no high availability interfaces which are exempt from unsuccessful logon attempts requirements.

### 3.3.3 System Use Notification

{For Government Reference Only: This subpart (and its subparts) relates to AC-8; CCI-000048, CCI-002247, CCI-002243, CCI-002244, CCI-002245, CCI-002246, CCI-000050, CCI-002248}

#### 3.3.3.1 System Use Notification for Local User Interfaces

Devices which are connected to a network and have a local user interface must display a warning banner meeting the requirements of DTM 08-060 on the user interface screen if capable of doing so and must have a permanently affixed label with an approved banner from DTM 08-060 if unable to display the warning banner on the screen. Where it is impractical (perhaps due to device size) to affix the label to the device, affix the label to the device enclosure.

Labels must be machine printed or engraved, plastic or metal, designed for permanent installation, must use a font no smaller than 14 point, and must provide a high contrast between font and background colors.

Digital banners must be acknowledged before allowing users to take further action.

#### 3.3.4 Permitted Actions Without Identification or Authentication

{For Government Reference Only: This subpart (and its subparts) relates to AC-14; CCI-000061, CCI-000232}

The control system must require identification and authentication before allowing any actions, except read-only actions, by a user acting from a user interface which MINIMALLY or FULLY supports accounts.

#### 3.3.5 Enclosures

Prior to final acceptance of the system, lock all lockable enclosures. Submit an Enclosure Keys submittal with all copies of keys for all enclosures and a key inventory list documenting all keys. Label each key with the matching enclosure identifier.

### 3.4 USER IDENTIFICATION AND AUTHENTICATION

{For Government Reference Only: This subpart (and its subparts) relates to IA-2, IA-2(1), IA-2(12), IA-5 IA-5(b), IA-5(c), IA-5(e), IA-5(g), IA-5(1), IA-5(11); CCI-000764, CCI-000765, CCI-001953, CCI-001954, CCI-001544, CCI-001989, CCI-000182, CCI-001610, CCI-000192, CCI-000193, CCI-000194, CCI-000205, CCI-001619, CCI-001611, CCI-001612, CCI-001613, CCI-001614, CCI-000195, CCI-001615, CCI-000196, CCI-000197, CCI-000199, CCI-000198, CCI-001616, CCI-001617, CCI-000200, CCI-001618, CCI-002041, CCI-002002, CCI-002003. }

This subpart indicates requirements for specific methods of identification and authentication for users and user accounts. Where these requirements conflict apply the following order of precedence: 1) If present, Device Specific Requirements take precedence over any other requirements; and then 2) multifactor authentication requirements take precedence over password requirements.

#### 3.4.1 User Identification and Authentication for All System Types

Unless otherwise indicated, all user interfaces supporting accounts (either FULLY or MINIMALLY) must implement Identification and Authorization via passwords.

#### 3.4.2 User Identification and Authentication for Specific System Types

System specific requirements are in addition to and supersede those indicated for all system types. When no additional requirements are indicated for a specific system type the requirements for all systems still apply to that system type.

#### 3.4.3 User Identification and Authentication for Specific Devices

There are no additional device specific user interface requirements

#### 3.4.4 Implementation of Identification and Authorization Requirements

Identification and Authorization must be met by direct implementation in the user interface.

#### 3.4.5 Password-Based Authentication Requirements

##### 3.4.5.1 Passwords for Controllers FULLY Supporting Accounts

All controllers FULLY supporting accounts and supporting password-based authentication must enforce the following requirements:

- a. Minimum password length of 12 characters.
- b. Password must contain at least one uppercase character.
- c. Password must contain at least one lowercase character.
- d. Password must contain at least one numeric character.
- e. Password must contain at least one special character. The list of supported special characters must include at least four separate characters.
- f. Password must have a maximum lifetime of 60 days. When passwords expire, prompt users to change passwords. Do not lock accounts due to expired passwords.
- g. Password must differ from previous five passwords, where differ is defined as changing at least 50 percent of the characters.
- h. Passwords must be cryptographically protected during storage and transmission.

#### 3.4.5.2 Passwords for Devices Minimally Supporting Accounts

Devices MINIMALLY supporting accounts must support passwords with a minimum length of four characters.

#### 3.4.5.3 Password Configuration and Reporting

For all devices with a password, change the password from the default password. Coordinate selection of passwords with the Password Point of Contact. Do not use the same password for more than one device unless specifically instructed to do so. Provide a Confidential Password Report documenting the password for each device and describing the procedure to change the password for each device.

Do not provide the Confidential Password Report in electronic format. Provide two hardcopies of the Confidential Password Report, each copy in its own sealed envelope.

#### 3.4.6 Authenticator Feedback

{For Government Reference Only: This subpart relates to IA-6; CCI-000206}

Devices must never show authentication information, including passwords, on a display. Devices that momentarily display a character as it is entered, and then obscure the character, are acceptable. For devices that have STIGs or SRGs related to obscuring of authenticator feedback (CCI-000206), comply with the requirements of those STIGS/SRGs.

### 3.5 CYBERSECURITY AUDITING

#### 3.5.1 Audit Events, Content of Audit Records, and Audit Generation

{For Government Reference Only: This subpart (and its subparts) relates to AU-2(a), AU-2(c), AU-2(d), AU-3, AU-10, AU-12, AU-14(b), AU-14(1), AU-14(2), AU-14(3), CM-5(1), SC-7 (9); CCI-000123, CCI-001571, CCI-000125, CCI-001485, CCI-000130, CCI-000131, CCI-000132, CCI-001230, CCI-000133, CCI-000134, CCI-001487, CCI-000166, CCI-001899, CCI-000169, CCI-001459, CCI-000171, CCI-000172, CCI-001910, CCI-001914, CCI-001919, CCI-001464, CCI-001462, CCI-001920, CCI-001814, CCI-002400.}

For devices that have STIG/SRGs related to audit events, content of audit records or audit generation, comply with the requirements of those STIG/SRGs.

If auditing requirements can be met using existing control system alarm or event capabilities, those existing capabilities may be used to meet these requirements.

##### 3.5.1.1 Desalination SCADA System

For Desalination SCADA System Controllers, use the Default Requirements for Control System Controllers.

##### 3.5.1.2 Default Requirements for Control System Controllers

For control system controllers where Audit Events, Content of Audit Records, and Audit Generation are not otherwise indicated in this Section:

#### 3.5.1.2.1 Controllers Which FULLY Support Accounts

For each controller which FULLY supports accounts, provide the capability to select audited events and the content of audit logs. Configure controllers to audit the indicated events, and to record the indicated information for each auditable event.

##### 3.5.1.2.1.1 Audited Events

Configure each controller to audit the following events (where capable to the device):

- a. Successful and unsuccessful attempts to access, modify, or delete privileges, security objects, security levels, or categories of information (e.g. classification levels)
- b. Successful and unsuccessful logon attempts
- c. Successful logouts
- d. Concurrent logons from different workstations
- e. All account creations, modifications, disabling, and terminations.
- f. All kernel module load, unload, and restart

##### 3.5.1.2.1.2 Audit Event Information To Record

Configure each controller to record, for each auditable event, the following information (where applicable to the event):

- a. what type of event occurred
- b. when the event occurred
- c. where the event occurred
- d. the source of the event
- e. the outcome of the event
- f. the identity of any individuals or subjects associated with the event

#### 3.5.1.2.2 Controllers Which Do Not FULLY Support Accounts

For each controller which does not FULLY support accounts configure the controller to audit all controller shutdown and startup events and to record for each event the type of event and when the event occurred.

#### 3.5.2 Audit Time Stamps

{For Government Reference Only: This subpart (and its subparts) relates to AU-8; CCI-000159, CCI-001889, CCI-001890.}

Any device (computer or controller) generating audit records must have an internal clock capable of providing time with a resolution of one second. Clocks must not drift more than 10 seconds per day. Configure the system so that each device (computer or controller) generating audit records maintains accurate time to within one second. Note that if the control

system specifications include requirement for clocks, the most stringent requirement applies.

### 3.5.3 Auditing Front End Software

The project site currently has the following software to support control system auditing: TBD. If there is no existing auditing front end software or the software is not compatible with the provided control systems, provide Auditing Front End Software with audit log import and upload, export, notification, and analysis functionality. The Auditing Front End Software may be provided as a component of the control system front end or as a separate software package, and a single package may serve multiple control systems provided under the same projects if they are sharing a cybersecurity authorization.

When the Auditing Front End Software is neither existing nor installed under the requirements of another Section, furnish the Auditing Front End Software media and license the control system front end computer in TBD. Submit copies of Auditing Front End Software if this function is not part of the software provided with the control system to meet requirements of other Sections.

#### 3.5.3.1 Import and Upload Requirements

Auditing Front End Software must be capable of importing audit logs from the Device Audit Record Upload Software and of uploading audit logs over the network from all control system devices supporting network upload of audit logs.

#### 3.5.3.2 Export Requirements

Auditing Front End Software must be capable of exporting to a file format supported by Microsoft Excel.

### 3.5.4 Audit Storage Capacity and Audit Upload

{For Government Reference Only: This subpart (and its subparts) relates to AU-4; CCI-001848, CCI-001849}

The creation of audit records must never interfere with normal device operation. Devices must cease collection of auditing information if required to maintain normal operation.

- a. For devices that have STIG/SRGs related to audit storage capacity (CCI-001848 or CCI-001849) comply with the requirements of those STIG/SRGs.
- b. For controllers capable of generating audit records, provide 60 days worth of secure local storage, assuming 10 auditable events per day.

#### 3.5.4.1 Device Audit Record Upload Software

For each device required to audit events and for which audit logs cannot be uploaded over the network by the Auditing Front End Software, provide and license to the Government software implementing a secure mechanism of uploading audit records from the device and exporting them to the Auditing Front End Software. Where different devices use different software, provide software of each type required to upload audit logs from all devices.

When Device Audit Record Upload Software is capable of uploading audit logs over the network, install Device Audit Record Upload Software on the same computer as the Auditing Front End Software. Submit copies of device audit record upload software if this function is not part of the software provided with the control system to meet requirements of other Sections. If there are no devices requiring this software, provide a document stating this in lieu of this submittal.

### 3.5.5 Response to Audit Processing Failures

{For Government Reference Only: This subpart (and its subparts) relates to AU-5; CCI-000139, CCI-000140, CCI-001490.}

In case of an audit failure, if possible, continue to collect audit records by overwriting existing audit records.

### 3.6 REQUIREMENTS FOR LEAST FUNCTIONALITY

{For Government Reference Only: This subpart (and its subparts), along with the Network Communication, Ports, Protocols and Services Report submittal specified elsewhere in this section, relates to CM-6(a), CM-6(c), CM-7, CM-7(1)(b), SC-41; CCI-000363, CCI-000364, CCI-000365, CCI-001588, CCI-001755, CCI-000381, CCI-000380, CCI-000382, CCI-001761, CCI-001762, CCI-002544, CCI-002545, CCI-002546. }

For devices that have a STIG or SRG related to Requirements for Least Functionality (such as configuration settings and port and device I/O access for least functionality), install and configure the device in accordance with that STIG or SRGs.

#### 3.6.1 Device Capabilities

Do not provide devices with remote user interfaces or with full user interfaces where one was not required. Do not use a networked sensor or actuator where a non-networked sensor or actuator would suffice.

#### 3.6.2 Software

For software that has a STIG or SRG related to Requirements for Least Functionality (such as configuration settings and port access for least functionality), install and configure the software in accordance with that STIG or SRG.

Do not install software that is not specifically required to meet a contract requirement. Remove any previously installed that is not specifically required to meet a contract requirement. Do not implement functionality within software that is not specifically required to meet contract requirements.

### 3.7 SYSTEM AND COMMUNICATION PROTECTION

#### 3.7.1 Collaborative Computing

{For Government Reference Only: This subpart relates to SC-15(a), SC-15(b); CCI-001150, CCI-001152.}

Without explicit approval from the project site, control systems must not use collaborative computing technologies.

### 3.7.2 Denial of Service Protection

{For Government Reference Only: This subpart relates to SC-5, SC-12, SC-7(a); CCI-001093, CCI-002385, CCI-002386, CCI-002430, CCI-001097. }

To the greatest extent practical, implement control logic without reliance on the network. Except when required to meet the requirements of the control system Section (where the requirement can only be met using computer hardware), do not implement control logic in computers.

### 3.8 SAFE MODE AND FAIL SAFE OPERATION

{For Government Reference Only: This subpart (and its subparts) relates to CP-12, SI-10(3), SI-17; CCI-002855, CCI-002856, CCI-002857, CCI-002754, CCI-002773, CCI-002774, CCI-002775}

For all control system components with an applicable STIG or SRG, configure the component in accordance with all applicable STIGs and SRGs.

### 3.9 SYSTEM MAINTENANCE TOOL SOFTWARE

{For Government Reference Only: This subpart (and its subparts) relates to MA-3; CCI-000865.}

Submit and license to the Government all software required to operate, maintain and modify the control system such the Government or their agents are able to perform repair, replacement, upgrades, and expansions of the system without subsequent or future dependence on the Contractor, Vendor or Manufacturer. Submit hard copies of user manuals for each software with the software submittal. Provide any hardware keys or dongles, software keys, license numbers, and other information required to enable the Government to access or change the system.

For software provided and licensed to the Government under the requirements of another Section, submit a statement indicating the Section and Submittal under which the software was provided. For software provided to meet the requirements of this Section and not provided and licensed under another Section, submit software and software user manuals on DVD or CD as a Technical Data Package and submit one hard copy of the software user manual for each piece of software.

### 3.10 VULNERABILITY SCANNING

{For Government Reference Only: This subpart (and its subparts) relates to RA-5 RA-5(a), RA-5(b), RA-5(c), RA-5(d); CCI-001054, CCI-001055, CCI-000156, CCI-001641, CCI-001643, CCI-001057, CCI-001058, CCI-001059. }

All IP devices must be scannable, such that the device can be scanned by industry standard IP network scanning utilities without harm to the device, application, or functionality.

#### 3.10.1 Computers and Software Running on Computers

Computers and applications running on computers must meet relevant vulnerability scanning STIGs/SRGs and respond to approved DoD vulnerability scanning tools.

### 3.10.2 Controllers

Provide controllers that are scannable by standard control system discovery tools or control system browsers and return meaningful status information including the network inputs and outputs for the controller. This information must contain sufficient detail to detect vulnerabilities or exploits of the controller.

Provide all software needed to scan the control system as the Control System Scanning Tools submittal. If the software required to scan the system is already installed at the project site or is provided under a separate section instead provide a statement indicating this.

### 3.11 CONTROL SYSTEM CYBERSECURITY TESTING

#### 3.11.1 Control System Cybersecurity Testing Procedures

Prepare and submit Control System Cybersecurity Testing Procedures explaining step-by-step, the actions and expected results that will demonstrate that the control system meets the requirements of this Section. The Control System Cybersecurity Testing Procedures may be submitted as a Technical Data Package.

#### 3.11.2 Control System Cybersecurity Testing Execution

Using the Control System Cybersecurity Testing Procedures verify that the control system meets the requirements of this Section. UNLESS GOVERNMENT WITNESSING OF A TEST IS SPECIFICALLY WAIVED BY THE GOVERNMENT, PERFORM ALL TESTS WITH A GOVERNMENT WITNESS. If testing reveals deficiencies in the system, correct the deficiency and retest until successful.

#### 3.11.3 Control System Cybersecurity Testing Report

Prepare and submit a Control System Cybersecurity Testing Report documenting all tests performed and their results. Include all tests in the Control System Cybersecurity Testing Procedures and any additional tests performed during testing. Document test failures and repairs conducted with the test results. The Control System Cybersecurity Testing Report may be submitted as a Technical Data Package

### 3.12 FIELD QUALITY CONTROL, CYBERSECURITY VALIDATION SUPPORT

In addition to testing and testing support required by other Sections, provide a minimum of 40 hours of technical support for cybersecurity testing of control systems to support the DoD Risk Management Framework process Cybersecurity assessment of the control system. This support is independent of (and in addition to) the Control System Cybersecurity Testing specified in this section.

### 3.13 CYBERSECURITY TRAINING

Provide eight hours of classroom and hands-on training for Government personnel on the cybersecurity operation and maintenance of the control system provided. This training is in addition to and must be coordinated with control system training specified in other Sections.

The Government will provide the training location. Training must cover, at a minimum: (a) applying software and firmware updates, (b) user account creation, modification and deletion, (c) audit log upload

procedures and (d) identification of privileged user interfaces and system impact of those interfaces. Training session must include a question and answer period during which government staff questions about cybersecurity aspects of the control system are answered.

-- End of Section --

SECTION 26 05 13.00 10

MEDIUM-VOLTAGE CABLES

**11/23**

PART 1 GENERAL

UNDERGROUND ELECTRICAL DISTRIBUTION applies to work specified in this section.

1.2 DEFINITIONS

Medium-voltage power cables include all cables rated above 600 volts up to 35,000 volts.

1.3 ADMINISTRATIVE REQUIREMENTS

1.3.1 Pre-Installation Meetings

No later than 30 days of Contract Award, coordinate with the Contracting Officer to schedule a pre-installation meeting. Submit the following for

review and approval prior to the meeting:

- a. Pulling Plan including calculations of pulling tension and side wall pressure anticipated, and the maximum allowable pulling tension for each pull. Do not perform any pull until Government reviews and approves the pulling plan.
- b. Splicer/Terminator Certifications
- c. List of Splices and Terminations to be Installed by Splicer/Terminator
- d. Manufacturer's catalog data for all cables, cable supports and fittings, cable tags, fireproof tape, splice kits, terminations, and any other product data required to complete the work.
- e. Certificates showing that the cable manufacturer has made factory-conducted tests on each shipping length (reel) of cable. Include certified copies of test data showing conformance with the referenced standards and approval prior to delivery of cable.

#### 1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

##### SD-01 Preconstruction Submittals

List of Splices and Terminations to be Installed by  
Splicer/Terminator; G

##### SD-02 Shop Drawings

Pulling Plan; G

##### SD-03 Product Data

Single-Conductor Shielded Cables; G

Cable Supports and Fittings; G

Polyethylene Cable Tags; G

Fireproof Tape; G

Splices; G

Terminations; G

Polyethylene Cable Tags; G

Field Testing; G

Qualification Test Reports; G

Radiographic Tests; G

SD-07 Certificates

Splicer/Terminator Certifications; G

Cable Installer Qualifications; G

SD-08 Manufacturer's Instructions

Medium-Voltage Power Cables; G

Terminations; G

Splices; G

1.5 QUALITY CONTROL

1.5.1 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Ensure equipment, materials, installation, and workmanship are in accordance with the mandatory and advisory provisions of NFPA 70, IEEE C2 unless more stringent requirements are specified or indicated.

1.5.2 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Provide products which have been in satisfactory commercial or industrial use for 2 years prior to bid opening. Ensure the 2-year period includes applications of equipment and materials under similar circumstances and of similar size. Ensure the product has been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer.

1.5.2.1 Cable Installer Qualifications

Provide at least one onsite person in a supervisory position with a documentable level of competency and experience to supervise all cable pulling operations. Provide a resume showing the cable installers' experience in the last three years, including a list of references complete with points of contact, addresses and telephone numbers. Cable installer must demonstrate experience with a minimum of three medium voltage cable installations. The Contracting Officer reserves the right to require additional proof of competency or to reject the individual and call for an alternate qualified cable installer.

## Qualifications`

Verify personnel performing Medium Voltage (MV) splicing or terminations have 15 years minimum experience in cable splicing and terminations of the type used in this project. Submit splicer/terminator certifications issued by the cable splice and termination manufacturer who has examined and tested a test splice or termination of each type required by this contract for each cable splicer. Ensure the certification identifies which splices and terminations it applies to. Require each individual, certified or not, with the required medium voltage splicing and terminating experience, who is to perform cable splicing or terminating, to perform a minimum of one splice or termination of each type in the presence of the manufacturer's and Government's representative. Splicer/terminator certifications are required to be submitted no less than 45 days before splices or terminations are to be made in medium voltage cables. Supply all materials and tools required for the demonstration splices and terminations.

Once a splice or termination has been started by a splicer, ensure the same splicer completes that particular splice, and that each termination and splice is started and completed in one continuous work period.

Maintain and submit a list of splices and terminations to be installed by splicer/terminator. Ensure the list includes the following for each splice or termination completed.

- a. Name of splicer/terminator.
- b. Date splice or termination was performed.
- c. Location of splice or termination. For terminations at equipment indicate equipment number as required to completely define the location.
- d. Feeder number.

## 1.6 DELIVERY, STORAGE, AND HANDLING

Ship cables on reels in a way that protects the cable from mechanical injury. Hermetically seal end of each cable length using heat-shrinkable molded cable end caps to exclude moisture and securely attached to the reel..

Make the minimum reel drum diameter 14 times the overall diameter of the cable. Ensure that each cable length is installed with a pulling eye installed by the manufacturer, for installation in ducts, manholes, and utility tunnels.

## PART 2 PRODUCTS

### 2.1 SYSTEM DESCRIPTION

Provide medium-voltage power cables including multiple- and single-conductor cables rated 15,000 volts, ungrounded neutral, on 13,200-volt three-phase, 60-hertz, phase-to-phase, for grounded and ungrounded neutral systems.

Provide conductor cable assemblies consisting of:

- a. Conductor core with an extruded semiconductor shield over the conductors
- b. Insulation
- c. A polyethylene (PE) jacket.
- d. An extruded semiconductor insulation shield, a concentric neutral

## 2.2 EQUIPMENT

Ensure that ethylene-propylene rubberinsulated conductors are lead-free.

### 2.2.1 Single-Conductor Shielded Cables

#### 2.2.1.1 Ethylene-Propylene-Rubber-Insulated with PVC Jacket

Provide single-conductor 15 kV rated cable assemblies that consist of the following: Class B stranded copper conductors, an extruded semiconducting shield over the conductors, 220 mils of ethylene propylene rubber insulation, an extruded or other approved semiconducting shield, a 5-mil minimum copper tape shield wrapped helically with a minimum 12.5 percent overlap and a PVC jacket.

Provide single-conductor, ethylene-propylene-insulated, PVC-jacketed, shielded cable that conforms to NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, NEMA WC 74/ICEA S-93-639 and AEIC CS8.

### 2.2.2 Insulated Medium Voltage Connectors

Provide connector with a steel reinforced hook-stick eye, grounding eye, test point, and arc-quenching contact material per IEEE 386. Ensure connections are compatible with equipment bushings. Provide connectors as follows:

- a. 600 Ampere deadbreak connector ratings: Voltage: 15kV, 95kV BIL. Short time rating: 27,000 ampere rms, symmetrical for a time duration of 4.0 seconds.
- b. Provide connectors with a steel reinforced hook-stick eye, grounding eye, test point, and arc-quenching contact material per IEEE 386. Provide hot line voltage indicators on all connectors.

Ensure connections are compatible with equipment bushings.

### 2.2.3 Splices

Provide heat shrink splice kits which are the product of a single manufacturer. Ensure the power cable splice meets the requirements of IEEE 404 for a 15 kV rating, and must be rated by the manufacturer for use on 15 kV class cable systems. Ensure splices are rated for continuous operation at 221 degrees F, with an emergency overload temperature rating of 284 degrees F. Ensure the kit is capable of splicing cables with copper conductors sized as indicated in the contract drawings or accommodate a conductor size transitionProvide splices specifically

designed for the cable and grounding provisions.

Provide heat shrink splices which include but are not limited to the following:

- a. Inner heat shrink stress control tube with external end sealant, additional heat shrink tube over inner tube and inner tube end sealant.
- b. Heat shrink outer wraparound sleeve with heat sensitive indications on both the tube and rail/channel area to indicate proper torch heating, stress relief material, mastic, sealant, shielding mesh, and silicone grease.

#### 2.2.4 Terminations

Provide Class 1 terminations per IEEE 48.

#### 2.2.5 Cable Supports and Fittings

Provide cable supports, related fittings, and accessories for use in corrosive underground locations, such as manholes and utility tunnels, with a factory-applied coating of PVC of at least 20 mils thick. Provide PVC coated items that have a uniform thickness and are free of blisters, breaks, and holidays. Provide PVC compound that conforms to ASTM D746.

Provide cable racks, cable tray supports and related fittings that are UL-listed heavy-duty nonmetallic glass-reinforced nylon.

#### 2.2.6 Polyethylene Cable Tags

Provide tags of polyethylene that have an average tensile strength of 4500 pounds per square inch, and are 0.035-inch thick, non-corrosive non-conductive. Ensure tags are resistive to acids, alkalis, organic solvents, salt water, and are distortion resistant to 300 degrees F. Provide a one-piece nylon, self-locking tie at each end of the cable tag. Ensure ties have a minimum loop tensile strength of 175 pounds. Provide cable tags with block letters, numbers, and symbols 1 inch high on a yellow background. Ensure letters, numbers, and symbols do not fall off or change positions regardless of the cable tags orientation.

#### 2.2.7 Fireproof Tape

Provide fireproof tape approximately 30 mils thick by 3 inches wide, consisting of a flexible, unsupported elastomer that expands in fire to provide a thick char buildup between the flame and the cable. Ensure the tape does not give off a smoke when subjected to flames or support combustion. Also, ensure tape does not deteriorate when subjected to oil, water, gases, salt water, sewage and fungus.

### 2.3 MATERIALS

#### 2.3.1 Conductors

Ensure that conductors conform to the applicable requirements of NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, or NEMA WC 74/ICEA S-93-639.

Ensure that conductors are annealed copper core conforming to ASTM B3 and ASTM B8 and that they are bare, or tin-alloy-coated, according to the type of insulation used. Do not intermix copper and aluminum conductors in the

same raceway.

Provide Class B stranded conductors.

### 2.3.2 Insulation

Ensure the provided cables are rated for minimum 194 degrees F continuous conductor temperature and 266 degrees F emergency overload.

Provide cables with 133 percent insulation. Ensure insulation thickness is in accordance with the following:

| Voltage Rating (kV) | Insulation Level (%) | Typical Insulation Thickness |      |
|---------------------|----------------------|------------------------------|------|
|                     |                      | mm                           | mils |
| 5                   | 100                  | 2.29                         | 90   |
|                     | 137                  | 2.92                         | 115  |
|                     | 173                  | 3.56                         | 140  |
| 8                   | 100                  | 2.92                         | 115  |
|                     | 133                  | 3.56                         | 140  |
|                     | 173                  | 4.45                         | 175  |
| 15                  | 100                  | 4.45                         | 175  |
|                     | 133                  | 5.59                         | 220  |
|                     | 173                  | 6.6                          | 260  |
| 25                  | 100                  | 6.6                          | 260  |
|                     | 133                  | 8.13                         | 320  |
|                     | 173                  | 10.67                        | 420  |
| 35                  | 100                  | 8.76                         | 345  |
|                     | 133                  | 10.67                        | 420  |
|                     | 173                  | 14.73                        | 580  |

### 2.3.3 Cable Identification

Provide cables with printing on the outer jacket showing the cable type, name of the manufacturer, the year in which the cable was manufactured, sequential cable reel length markings and a unique number for identification purposes. Closely group the information on the tape at 6 foot maximum intervals to permit complete identification.

#### 2.3.4 Non-metallic Insulation Shield

Provide extruded insulation shield made of an extruded thermoset material compatible with the insulation and jacket. Ensure insulation shield is applied directly over and bonded to the insulation, and complies with AEIC CS8.

#### 2.3.5 Cable Shielding & bending Requirements

All cables shall be copper-tape shielded and installed with a minimum bending radius of 12 time the overall cable diameter. Copper-wire shielded cables shall only be permitted in locations where existing manholes are utilized and the minimum bending radius requirements for copper-tape shielded cables cannot be met. Cable bending radii shall conform to the guidelines specified in NEMA WC 74/ICEA S-93-639

#### 2.3.6 Jacket

Provide polyethylene (PE) jacketed cable extruded over the cable to a minimum thickness of 80 mils.

#### 2.3.7 Interlock Armored Cable

Provide a nonmetallic, corrosion-resistant jacket over interlock-armored cable that is black polyethylene conforming to NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659 and NEMA WC 74/ICEA S-93-639.

### 2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

#### 2.4.1 FACTORY TESTING

Submit certified evidence that the cable manufacturer has made factory-conducted tests on each shipping length (reel) of cable. Submit certified copies of test data in accordance with applicable provisions of the referenced standard. Include in tests on each length of cable to include:

- (1) Conductor Resistance
- (2) Accelerated Water Absorption Test
- (3) Water Immersion Test
- (4) Ionization
- (5) High-Voltage
- (6) Partial Discharge Test

Contracting Officer or designee has the option of witnessing required factory testing at no additional cost. Provide a schedule of manufacturing and testing in advance to permit such witnessing, if requested.

Submit certified qualification test reports in accordance with AEIC CS8 made in accordance with the applicable referenced standards. Ensure certified copies of test data show conformance to the requirements of referenced standards and submit for approval prior to shipment of the cable.

Prior to manufacturing, provide data regarding degradation of proposed insulating material and cable performance due to water immersion test as specified in this specification to the Contracting Officer or designee. Indicate in information AC breakdown stress in kV/mm or V/mil versus immersion time. Ensure a complete description and condition under which cable was tested accompanies the test information. Submit an accelerated water absorption test.

For cables not to be enclosed in metallic conduit, test for flammability in accordance with FED-STD-228, Method 5221 vertical, spark IEEE 383 and IEEE 1202, 70,000 Btu per hour per hour vertical tray flame test.

### PART 3 EXECUTION

#### 3.1 DEMOLITION OR CABLE CUTTING

Notify the Contracting Officer 14 working days prior to an outage for demolition or cable cutting of medium voltage electrical system.

The Government has established a mandatory inspection point prior to Contractor performing any medium voltage cable cuts or demolition. Notify the Contracting Officer 48 hours in advance of this mandatory inspection point.

As part of the mandatory inspection point, positively identify and label the medium voltage cable to be worked utilizing an electronic cable identifier. Ensure the process of identifying and labeling the cable to be worked is witnessed by the Government. Cable cutting and demolition of any medium voltage cable can occur only after approval by the Contracting Officer.

Cut medium voltage cables and conductors by indirect means using cable cutters specifically designed to be operated remotely only. Cutting of medium voltage cables and conductors by direct means is not permitted.

#### 3.2 INSTALLATION

Install medium-voltage cables in accordance with NFPA 70, NFPA 70E; and IEEE C2.

Refer to contract provisions for safety submittals and requirements associated with working in the vicinity of energized cables and equipment. The use of arc-flash and shock prevention equipment and personal protective equipment is mandatory.

Notify the Contracting Officer 14 working days prior to an outage that requires testing for phasing and phase rotation of medium voltage electrical systems. The Government will identify and tag the phasing of equipment and provide to the Contractor, in writing, the results of phasing and phase rotation tests. The Contractor is responsible for maintaining the phasing and phase rotation tests, and is responsible for maintaining the phasing, and matching the existing phase rotation and phasing when installing conductors in existing electrical systems.

Install the cables in the following locations:

Exterior:

- a. In underground duct banks
- b. In conduit above and below grade
- c. In manholes
- d. And by direct burial

Inside Buildings:

- a. By open wire method
- b. On insulator hooks
- c. On racks
- d. In wall and ceiling mounted cable trays

Secure cables with heavy-duty cable ties in existing or new trays mounted horizontally, where the cable rests on the tray bottom. Install cable ties at a minimum of 10 foot intervals.

Secure cables with non-metallic cable clamps, straps, hangers, or other approved supporting devices to tunnel walls, ceilings, and in new or existing cable trays mounted vertically, where the tray bottom is in a vertical plane.

When field cuts or other damage occurs to the PVC coating, apply a liquid PVC patch to maintain the integrity of the coating. After the installation is complete, perform an inspection to ensure that the coating has no voids, pinholes, or cuts.

Before installing new armored cable, ensure that cable trays are properly secured and supported. Add new permanent or temporary tray support devices as required to preclude cable tray failure during cable pulling or after cable is installed.

Installed cable or conductors of a primary distribution system will be rejected by the Government when placed:

- a. Openly in cable trays or openly racked along interior walls
- b. In the same raceway or conduit with AC/DC control circuits or AC power circuits operating at less than 600 volts
- c. In a manner allowing the cable to support its own weight

### 3.2.1 Duct Cleaning

Thoroughly clean ducts before installation of power cables. Pull a standard flexible mandrel through each duct to loosen particles of earth, sand, or foreign material in the line. Use a mandrel that is not less than 12 inches long with a diameter 1/2 inch less than the inside diameter of the duct. Then pull a brush with stiff bristles through each duct to remove the loosened particles. Use a brush with a diameter that is the same as or slightly larger than the diameter of the duct.

### 3.2.2 Pulling Cables in Ducts, Manholes and Utility Tunnels

Submit a Pulling Plan including calculations of pulling tension and side wall pressure anticipated, and the maximum allowable pulling tension for each pull. Do not perform any pull until Government reviews and approves the pulling plan.

Pull medium-voltage cables into ducts and utility tunnels with equipment designed for this purpose, including a power-driven winch, cable-feeding flexible tube guide, cable grips, and lubricants. Employ a sufficient number of trained personnel and equipment to ensure correct installation of the cable.

Set up the cable reel at the side of the manhole or tunnel hatch opening and above the duct or hatch level, allowing the cable to enter through the opening without reverse bending. Install a flexible tube guide through the opening in a manner that prevents the cable from rubbing against the edges of structural members.

Ensure that the pulling force for a cable grip on lead-sheathed cable does not exceed the force calculated in the pulling plan for the 1,500 pounds per square inch of sheath cross-sectional area. Use a dynamometer in the pulling line to ensure that the pulling force is not exceeded. Ensure that the pulling force for a nonmetallic-sheathed cable does not exceed the smaller of 1,000 pounds or a value computed from the following equation:

$$TM = 0.036 \times N \times CM$$

Where: TM = maximum allowable pulling tension in pounds

N = number of conductors in the cable

CM = cross-sectional area of each conductor in circular mils

#### 3.2.2.1 Allowable Sidewall Pressure

The allowable sidewall pressure is the smaller of 500 pounds per foot of bend radius or the cable manufacturer's recommended maximum value. Show in the pulling plan submittal the calculations for allowable tension and sidewall pressure as well as the anticipated tension and sidewall pressure for each pull in the project.

Unreel cable from the top of the reel, carefully controlling payout. Attach cable to be pulled through a swivel to the main pulling wire by means of a pulling eye installed by the factory or approved cable splicer.

Attach pulling eyes to the cable conductors of the 3-1/C circuit to prevent damage to the cable structure. Pull the entire 3-1/C circuit simultaneously.

#### 3.2.2.2 Minimum Bending Radius

Minimum bending radius during cable pulling operations is 30 inches. For permanent cable bending/racking the minimum bending radius is 12 times cable diameter.

#### 3.2.2.3 Coating of Cables

Liberally coat cables with a suitable cable-pulling lubricant as it enters the tube guide or duct. Do not use greaser and oil lubricants. Cover nonmetallic sheathed cables with wire-pulling compounds, when required, which have no deleterious effects on the cable. Use rollers, sheaves or tube guides, around which the cable is pulled, conforming to the 30 inches minimum bending radius of the cable during the pulling operations.

#### 3.2.2.4 Pulling Speed

Pull cables into ducts at a speed not to exceed 50 feet per minute and not in excess of maximum permissible pulling tension specified by the cable manufacturer. Cable pulling using a vehicle is not be permitted. Stop pulling operations immediately with any indication of binding or obstruction and do not resume until such difficulty is corrected. Provide sufficient slack for free movement of cable due to expansion or contraction.

#### 3.2.2.5 Cable Splice Support And Sealing

Firmly support cable splices made up in manholes on cable racks as indicated. Do not pull cable splices in ducts. Overlap cable ends at the ends of a section to provide sufficient undamaged cable for splicing. Overlap cables to be spliced in manholes to the centerline of the proposed joint by not less than 2 feet.

Immediately seal cut ends of cables cut in the field to prevent entrance of moisture with heat-shrinkable molded cable end caps.

#### 3.2.3 Splices and Terminations

Make splices in manholes or tunnels except where cable terminations are specifically indicated. Expedite splicing and terminating of cables in order to minimize exposure and cable deterioration.

Use only equipment and materials recommended by the splice manufacturer including calibrated cutting equipment to ensure consistent cut depths when preparing cable ends for the application of the splice kit. Connect the cable concentric neutral/shield wires across one side of the splice by split bundling the splice neutral wiring and connecting each bundle set to a continuous No. 4 AWG solid bare copper conductor via two compression conductors. Ensure the No. 4 AWG conductor extrudes from the cable splice jacket and connects to the manholes grounding system. Make all connections within the splice utilizing long barrel-type compression connectors and appropriate compression tools with proper size dies to ensure a satisfactory mechanical and electrical joint. Ensure bare connections of concentric neutral/shield wires are either contained within the splice kit or sealed via an additional outer covering, consisting of a heavy wall, heat-shrinkable tubing containing adhesive material (mastic) that melts as heat is applied and the outer tubing shrinks to form a moisture proof environmental seal. Provide outer tubing conforming to ANSI C119.1. Ensure splice meets the requirements of IEEE 404 for a 15 kV rating and is rated by the manufacturer for use on 15 kV class feeder cable systems. Take extra precautions to seal around the exit area of the bare copper jumpers with an additional mastic per the splice manufacturer's recommendations.

Terminate cables in approved cable terminations, rated Class 1 per IEEE 48.

Dry terminations with medium voltage pennants, preformed, and hand wrapped stress cones can be used for terminating cables. Provide terminations with adequate means for making external connections to the cable conductors of single-conductor cables (phase and concentric neutral), protecting the cable insulation against moisture, oil, or other contaminants. Take extra precautions in physically protecting and supporting cables, and maintaining the insulation level of the cable.

Ensure that installation includes built-up or prefabricated heat or cold shrink stress-relief cones at the terminals of all shielded cables and at the terminals of single-conductor lead-covered cables rated 15 kV and above, ungrounded.

Field-fabricate cable splices from splicing kits supplied by and in accordance with the cable manufacturer's recommendations for the type, size, and electrical characteristics of the cable specified. Locate cable splices in manholes midway between the cable racks on the walls of the manholes and supported with cable arms at approximately the same elevation as the enclosing duct.

If cable splices in the tunnel are not installed in cable trays, install the cable splices on cable racks or by other approved methods that minimize physical stress on the splice connections. Support splices at approximately the same elevation as the installed cable except where space limitations or existing cable length limitations make this method impractical or impossible.

Support all universal demountable splices in a manner that minimizes physical stress on the splice connections. Support each cable end termination using a pair of saddle supports under the cable end termination or cable with a minimum 12 inches and a maximum 30 inches separation between the supports. Secure the cable end termination and cable to the supports in a manner that prevents movement of termination or cable at the support. Install saddle supports on a galvanized steel framing channel that is anchored to the wall, securely fastened to the cable tray, or installed by other approved methods.

#### 3.2.4 Fireproofing

Provide fireproofing (Arc Proofing) for individual cable conductor in manholes, handholes and vaults which carry current at 2200 volts or more.

Tightly wrap strips of fireproofing tape around each cable spirally in half-lapped wrapping. Extend the tape 1 inch into the ducts. To prevent unraveling, random wrap the fireproofing tape the entire length of the fireproofing with pressure-sensitive glass cloth tape.

#### 3.2.5 Cable Tag Installation

Install cable tags in each manhole and at each termination as specified. Install cable tags over the fireproofing and position the tags so that they are clearly visible without disturbing any cabling or wiring in the manholes and equipment.

### 3.3 FIELD QUALITY CONTROL

After the installation of power cables has been completed, including splices, joints, and terminations, and before the cable is energized, subject each medium voltage cable to field testing in accordance with the

following requirements:

- a. Provide test equipment, labor, and trained technical personnel as necessary to perform the electrical acceptance tests.
- b. Record all tests on an approved medium voltage cable test form and submit completed forms to the Contracting Officer.
- c. Make arrangements to have tests witnessed and approved by the Contracting Officer.
- d. Isolate each power-cable installation completely from extraneous electrical connections at cable splices/terminations and joints. Observe all safety precautions.
- e. Ensure each power cable is first given an insulation resistance test using a meg-ohmmeter with a voltage output of at least 2,500-volts. Apply test for a long enough time to fully charge the cable (no less than one minute). Record readings as indicated on forms provided. The minimum reading is 5000 megohms at an ambient temperature of 68 degrees F. Correct readings taken at other than 68 degrees F ambient temperatures accordingly.
- f. Conform testing to NETA ATS, and NFPA 70B.

Upon successful completion of the insulation resistance test, subject the cable to a Very Low Frequency (VLF) AC high potential test. Adhere general VLF testing measures, parameters, considerations, and results to the following:

- a. Ensure test voltage duration is continuous duty for 30 minutes (non-interrupted)
- b. Provide the test equipment to test the cable capacity in microfarads.
- c. Provide the test equipment to generate the test voltages required for the 30 minute test duration and adhere to the following table:

| <u>VLF Test Voltage for Sinusoidal Waveform</u> |                                                |                                             |
|-------------------------------------------------|------------------------------------------------|---------------------------------------------|
| Cable Rating<br>phase to phase                  | Acceptance<br>(phase to ground test<br>values) | Acceptance<br>(phase to ground test values) |
|                                                 | (New cable)                                    | (Existing cable spliced to<br>new cable)    |
| (rms voltage, KV)                               | (peak voltage, KV)                             | (peak voltage, KV)                          |
| 5                                               | 14                                             | 10                                          |
| 15                                              | 28                                             | 22; (EPR TO EPR)                            |
| 15                                              | 15                                             | 15; (EPR TO NON-EPR)                        |

- d. Ensure the sinusoidal test frequency is 0.1 Hertz.

e. Do not perform test on cable attached to equipment.

Ensure Splices/terminations are clean, dry, and tested per IEEE 48 and IEEE 400.2.

Upon successful completion of the insulation resistance tests, subject the cable to a direct-current high-potential test for 5 minutes applying test voltages in accordance with AEIC CS1 and IEEE 400.2 for paper-impregnated, lead-covered cable; AEIC CS8 and IEEE 400.2 for cross-linked, polyethylene-insulated cable; and AEIC CS8 and IEEE 400.2 for ethylene propylene rubber-insulated cable.

Record leakage current readings every 30 seconds during the first 2 minutes and every minute thereafter for the remainder of the test. When the leakage current continues to increase after the first minute, immediately terminate the test and take steps to find and correct the fault. When a second test becomes necessary, repeat this test procedure.

Upon satisfactory completion of the high-potential test, give the cable a second insulation resistance test as before.

Provide results of the second insulation resistance test that agree with the first test and that indicate no evidence that the cable has been permanently injured by the high-potential test.

Record test data identifying the cable and location, megohm readings versus time, leakage current readings versus time, and cable temperature versus time.

Final acceptance depends upon the satisfactory performance of the cable under test. Do not energize cable until recorded test data has been approved by the Contracting Officer.

Perform radiographic tests on all potheads at the discretion of the Contracting Officer to determine if voids exist in the pothead. Rework unacceptable terminations at no additional expense to the Government.

### 3.4 CLOSEOUT ACTIVITIES

Provide manufacturer's instructions showing the recommended sequence and method of installation for medium-voltage power cables.

1.2 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Cable Installation Plan; G

SD-03 Product Data

Wire and Cable; G

Conductors; G

Cable Manufacturing Data

SD-06 Test Reports

Test Report(s), Inspection Report(s), and Verification Report(s); G

### 1.3 DELIVERY, STORAGE, AND HANDLING

Furnish cables on reels or coils. Each cable and the outside of each reel or coil, must be plainly marked or tagged to indicate the cable length, voltage rating, conductor size, and manufacturer's lot number and reel number. Each coil or reel of cable must contain only one continuous cable without splices. Cables for exclusively dc applications, as specified in paragraph "High-Voltage Test Source," must be identified as such. Shielded cables rated 2,001 volts and above must be reeled and marked in accordance with NEMA WC 26, as applicable. Reels must remain the property of the Contractor..

## PART 2 PRODUCTS

### 2.1 MATERIALS

#### 2.1.1 Wire Table

Furnish wire and cable in accordance with the requirements of the wire table below, conforming to the detailed requirements specified herein.

#### 2.1.2 Rated Circuit Voltages

All power wire and cable must have minimum rated circuit voltages in accordance with NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, or NEMA WC 74/ICEA S-93-639 as applicable. Power wire and cable for circuit voltages rated 0-600 volts must be rated not less than 600 volts. Control wire and cable must have minimum rated circuit voltages in accordance with NEMA WC 57, but must be rated 600 volts if routed in raceway with other conductors that are rated 600 volts.

#### 2.1.3 Conductors

##### 2.1.3.1 Material for Conductors

A.Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1.Encore

2.General Cable

### 3.Southwire

B.Conductors shall be Underwriters Laboratories, Inc. (UL) listed, 600 volt rated, of insulation type specified below or elsewhere in the Specifications.

#### 1.Branch Circuits - Lighting and Power

a. #10 AWG and smaller shall be solid conductors.

b.#8 AWG and larger shall be stranded conductors.

c.Insulation shall be type THHN or THWN

#### 2.Feeders (60A and more): insulation shall be type XHHW-2.

3.For conductors installed in exposed conduit outside of Buildings, in underground conduit or in conduit within or just under roofing material, provide type XHHW.

4.Control Circuits: Use 600 volts U.L. type THWN or XHHW conductors except where subject to abnormally high temperatures such as on or near boilers.

5.Wiring through fluorescent fixtures in continuous rows shall be type THHN.

Conductors must conform to all the applicable requirements of NEMA WC 57, NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, or NEMA WC 74/ICEA S-93-639 as applicable. Copper conductors must be annealed copper material and they may be bare, or tin- or lead-alloy-coated, if required by the type of insulation used.

#### 2.1.3.2 Size

Minimum wire size must be as listed below.

a. No. 12 AWG for power and lighting circuits

b. No. 10 AWG for current transformer secondary circuits

c. No. 14 AWG for potential transformer, relaying, and control circuits

d. No. 16 AWG for annunciator circuits

e. No. 19 AWG for alarm circuits

Minimum wire sizes for rated circuit voltages of 2,001 volts and above must not be less than those listed for the applicable voltage in ANSI/NEMA WC 71/ICEA S-96-659 or NEMA WC 74/ICEA S-93-639, as applicable.

#### 2.1.3.3 Stranding

Conductor stranding classes cited herein must be as defined for control conductors in NEMA WC 57 or as defined for 0-2,000 volts power conductors in NEMA WC 70, as applicable. Lighting conductors No. 10 AWG and smaller must be solid or have Class B stranding. Any conductors used between stationary and moving devices, such as hinged doors or panels, must have Class H or K stranding. All other conductors must have Class B or C

stranding, except that conductors as shown, or in the schedule, as No. 12 AWG may be 19 strands of No. 25 AWG, and conductors shown as No. 10 AWG may be 19 strands of No. 22 AWG. Conductor stranding classes for circuit voltages 2,001 volts and above must be as defined in ANSI/NEMA WC 71/ICEA S-96-659 and NEMA WC 74/ICEA S-93-639, as applicable.

#### 2.1.3.4 Conductor Shielding

Use conductor shielding conforming to NEMA WC 57 for control wire and cable as applicable. Use conductor shielding conforming to ANSI/NEMA WC 71/ICEA S-96-659 or NEMA WC 74/ICEA S-93-639, as applicable, on power cables having a rated circuit voltage above 2,000 volts.

#### 2.1.3.5 Separator Tape

Where conductor shielding, strand filling, or other special conductor treatment is not required, a separator tape between conductor and insulation is permitted.

#### 2.1.4 Insulation

##### 2.1.4.1 Insulation Material

Unless specified otherwise or required by NFPA 70, wires in conduit, other than service entrance, must be 600-volt, conforming to Type HHW conforming to UL 44. Insulation for control wire and cable must meet the requirements of NEMA WC 57. Insulation requirements for wire and cable rated less than 2,000 volts must meet the requirements of NEMA WC 70. Insulation requirements for wire and cable rated 2,001-5,000 volts must meet the requirements of ANSI/NEMA WC 71/ICEA S-96-659. Insulation requirements for wire and cable rated 5,001 volts and greater must meet the requirements of NEMA WC 74/ICEA S-93-639.

For shielded cables of rated circuit voltages above 2,000 volts, the following provisions must also apply:

- a. XLPE, if used, must be tree-retardant.
- b. Insulation must be chemically bonded to conductor shielding.
- c. The insulation material and its manufacturing, handling, extrusion and vulcanizing processes must all be subject to strict procedures to prevent the inclusion of voids, contamination, or other irregularities on or in the insulation. Insulation material must be inspected for voids and contaminants.
- d. Cables with repaired insulation defects discovered during factory testing, or with splices or insulation joints, are prohibited unless specifically approved.

##### 2.1.4.2 Insulation Thickness

The insulation thickness for each conductor must be based on its rated circuit voltage.

##### 2.1.4.2.1 Power Cables, 2,000 Volts and Below

The insulation thickness for single-conductor and multiple-conductor power cables rated 2,000 volts and below must be as required by NEMA WC 70, as

applicable. Some thicknesses of NEMA WC 70 will be permitted only for single-conductor cross-linked thermosetting polyethylene insulated cables without a jacket. NEMA WC 70 ethylene-propylene rubber-insulated conductors must have a jacket.

#### 2.1.4.2.2 Single-Conductor and Multiple-Conductor Control Cables

The insulation thickness of control conductor sizes 22 AWG to 10 AWG used for control and related purposes must be as required by NEMA WC 57, as applicable. Control conductors larger than 10 AWG must be as required by NEMA WC 70.

#### 2.1.5 Metal-Clad Cable

##### 2.1.5.1 General

The metallic covering or sheath must be interlocked metal tape, conforming to the applicable requirements of NEMA WC 57, NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, or NEMA WC 74/ICEA S-93-639. The type of metal for the metallic covering must be galvanized steel. If the covering is of ferrous metal, it must be galvanized. Grounding conductor(s) conforming to NEMA WC 57, NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, or NEMA WC 74/ICEA S-93-639 as applicable must be furnished for each multiple-conductor metal-clad cable. Assembly and cabling must be as specified in paragraph "Cabling." The metallic covering must be applied over an inner jacket or filler tape. The cable must be assembled so that the metallic covering will be tightly bound over a firm core.

##### 2.1.5.2 Jackets

Metal-clad cables may have a jacket under the armor, and must have a jacket over the armor. Jackets must comply with the requirements of NEMA WC 57, NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, or NEMA WC 74/ICEA S-93-639 as applicable. The outer jacket for the metal-clad cable may be of polyvinyl chloride (PVC) only if specifically approved.

#### 2.1.6 Multiple-Conductor Cables

Grounding conductor(s) conforming to NEMA WC 57, NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, or NEMA WC 74/ICEA S-93-639 as applicable must be furnished for each multiple-conductor cable. Assembly and cabling must be as specified in paragraph CABLING.

## 2.2 CABLE IDENTIFICATION

### 2.2.1 Color-Coding

Insulation of individual conductors of multiple-conductor cables must be color-coded in accordance with ICEA S-58-679, except that colored braids will not be permitted. Only one color-code method must be used for each cable construction type. Control cable color-coding must be in accordance with ICEA S-58-679, Method as follows: Power cable color-coding must be as follows:

a. 208/120 volt, three-phase

(1) Phase A - black

- (2) Phase B - red
- (3) Phase C - blue
- (4) Grounded neutral - white
- (5) Insulated grounding conductor - green

b. 480/277 volt, three-phase

- (1) Phase A - brown
- (2) Phase B - orange
- (3) Phase C - yellow

c. 240/120 volt, single phase: Black and red

Other individual conductors must be color-coded as indicated, but such color-coding may be accomplished by applying colored plastic tapes or colored sleeves at terminations.

#### 2.2.2 Cabling

Individual conductors of multiple-conductor cables must be assembled with flame-and moisture-resistant fillers, binders, and a lay conforming to NEMA WC 57, NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, or NEMA WC 74/ICEA S-93-639. Flat twin cables are prohibited. Fillers must be used in the interstices of multiple-conductor round cables with a common covering where necessary to give the completed cable a substantially circular cross section. Fillers must be non-hygroscopic material, compatible with the cable insulation, jacket, and other components of the cable. The rubber-filled or other approved type of binding tape must consist of a material that is compatible with the other components of the cable and must be lapped at least 10 percent of its width.

#### 2.2.3 Dimensional Tolerance

The outside diameters of single-conductor cables and of multiple-conductor cables must not vary more than 5 percent and 10 percent, respectively, from the manufacturer's published catalog data.

### PART 3 EXECUTION

#### 3.1 INSTALLATION INSTRUCTIONS

Submit cable manufacturing data as requested. The following information must be provided by the cable manufacturer for each size, conductor quantity, and type of cable furnished:

- a. Minimum bending radius, in inches - For multiple-conductor cables, this information must be provided for both the individual conductors and the multiple-conductor cable.
- b. Pulling tension and sidewall pressure limits, in pounds.
- c. Instructions for stripping semiconducting insulation shields, if furnished, with minimum effort without damaging the insulation.

- d. Upon request, compatibility of cable materials and construction with specific materials and hardware manufactured by others must be stated. Also, if requested, recommendations must be provided for various cable operations, including installing, splicing, terminating, etc.

### 3.2 CABLE INSTALLATION PLAN

Provide a cable installation plan which includes the following for each raceway.

- a. Raceway name
  - b. Circuit names with wire sizes and quantities
  - c. Maximum tolerable pulling tension
  - d. Maximum tolerable sidewall pressure
  - e. Estimated maximum pulling tension
  - f. Estimated maximum sidewall pressure
  - g. Jam ratio
  - h. Lubricant and coefficient of friction
  - i. Pulling device(s)
  - j. Direction of pull

### 3.3 TEST REPORT(S), INSPECTION REPORT(S), AND VERIFICATION REPORT(S)

#### 3.3.1 Cable Data

Do not begin any wire and cable fabrication until materials are submitted and approved by the Contracting Officer. Submit cable data for approval including, but not limited to, dimensioned sketches showing cable construction and sufficient additional data to show that wire and cable meet the requirements of this Section.

#### 3.3.2 Inspection and Tests

Inspection and tests of wire and cable furnished under these specifications must be made by and at the plant of the manufacturer, and the manufacturer must provide certification and certification reports of completed inspections and completed tests. The Government may require or perform further tests before or after installation. Testing in general must comply with NEMA WC 57, NEMA WC 70, ANSI/NEMA WC 71/ICEA S-96-659, or NEMA WC 74/ICEA S-93-639 as applicable. Specific tests required for particular materials, components, and completed cables must be as specified in the sections of the above standards applicable to those materials, components, and cable types. Tests must also be performed in accordance with the additional requirements specified below. Submit certified copies of test reports.

- A. After installing conductors and cables and before electrical circuitry has been energized, test service entrance and feeder conductors for compliance with requirements.

B. Perform each of the following visual and electrical tests:

- 1) Inspect exposed sections of conductor and cable for physical damage and correct connection according to the single-line diagram.
- 2) Test bolted connections for high resistance using one of the following:
  - a. A low-resistance ohmmeter.
  - b. Calibrated torque wrench.
  - c. Thermographic survey.
- 3) Inspect compression-applied connectors for correct cable match and indentation.
- 4) Inspect for correct identification.
- 5) Inspect cable jacket and condition.
- 6) Insulation-resistance test on each conductor for ground and adjacent conductors. Apply a potential of 500-V dc for a one-minute duration.
- 7) Continuity test on each conductor and cable.
- 8) Uniform resistance of parallel conductors.

C. Cables will be considered defective if they do not pass tests and inspections.

- D. All conductors failing to comply with the manufacturers' minimum standard or recommendations shall be replaced at Contractor's expense.

E. Tests shall be made prior to final connection of equipment.

F. Prepare test and inspection reports to record the following:

- 1) Procedures used.
- 2) Results that comply with requirements.
- 3) Results that do not comply with requirements, and corrective action taken to achieve compliance with requirements.

3.3.2.1 Reports

Furnish results of tests. No wire or cable must be shipped until authorized. Lot number and reel or coil number of wire and cable tested must be indicated on the test reports.

(2014) Installing Seismic Restraints for  
Electrical Equipment

## 1.2 SYSTEM DESCRIPTION

### 1.2.1 General Requirements

Design and provide seismic supports and attachments in accordance with UFC 3-301-01 and ASCE 7-16.

Provide seismic supports and attachments as indicated and in accordance with UFC 3-301-01 and ASCE 7-16.

Components, supports, and attachments must comply with following structural design criteria:

Risk Category: III.

Seismic Design Category: B.

Seismic Design Spectral Response Acceleration Parameter at Short Period (SDS): 0.23.

Seismic Design Spectral Response Acceleration Parameter at period of 1 second (SD1): 0.088.

Apply the seismic requirements described in this section and on the drawings to the electrical components listed in paragraph ELECTRICAL COMPONENTS.

Electrical components and their supports must be attached or anchored to structure.

### 1.2.2 Electrical Components

Provide seismic supports and attachments for the following electrical components in accordance with the requirements of this specification:

Components with Importance Factor ( $I_p$ ) = 1.0:

Control Panels

Light Fixtures

Motors

Switchboards

Transformers

Unit Substations

Distribution Systems Conduit, Cable Tray, Busway, and Raceway

Components with Importance Factor ( $I_p$ ) = 1.5 Designated Seismic Systems

Emergency and standby power systems

Fire detection and suppression systems

Emergency exit lighting

### 1.2.3 Contractor Designed Supports and Attachments

Provide seismic supports and attachments for electrical components.

Contractor must retain services of a Registered Professional Engineer to design supports and attachments for electrical components.

Submit copies of the Design Calculations and Design Drawings.  
Calculations and Drawings must be stamped and signed by Contractor's  
Registered Professional Engineer.

### 1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

#### SD-02 Shop Drawings

## PART 2 PRODUCTS

### 2.1 EQUIPMENT REQUIREMENTS

Equipment must be rugged enough to survive design seismic event.  
Equipment components designated as Designated Seismic Systems must remain operational as required in paragraph SPECIAL TESTING FOR SEISMIC-RESISTING EQUIPMENT.

Submit detail drawings of supports and attachments along with calculations, catalog cuts, templates, and erection and installation details, as appropriate, for the items listed in paragraph ELECTRICAL COMPONENTS. Indicate thickness, type, grade, class of metal, and dimensions; and show construction details, reinforcement, anchorage, and installation with relation to the building construction.

Submit calculations and drawings that are stamped and signed by Contractor's registered professional engineer. Design must be based on actual equipment and system layout. Design must include calculated loads and capacity of materials utilized for the connection of the equipment or system to the structure. Analysis must detail anchoring methods. Include drawing for Mission Critical Equipment and Designated Seismic System Equipment indicating the equipment location in the facility to be used for the installation. Equipment must be rigidly or flexibly mounted as indicated. Roof mounted equipment both vibration isolated and nonisolated, must have support members designed and anchored to building structure.

#### 2.1.1 Rigidly (Base and Suspended) Mounted Equipment

The following specific items of equipment must be constructed and assembled to withstand the seismic forces specified in UFC 3-301-01. Entirely locate each item of rigid electrical equipment and rigidly attach on one side only of a building expansion joint. Provide items such as electrical conduit, which cross the building expansion joint with flexible joints that are capable of accommodating displacements equal to the full width of the joint in each orthogonal direction.

Substations  
Transformers  
Switch Boards and Switch Gear

Equipment furnished under this Contract must be rigidly mounted using cast-in-place anchor bolts or post-installed anchors that are qualified for use in cracked concrete. Cast-in-place anchor bolts must conform to ASTM F1554. For any rigid equipment which is rigidly anchored, provide flexible joints for electrical conduit, cabletray, busway, and raceway, that are capable of accommodating displacements equal to the full width of the joint in both orthogonal directions. Mission critical base mounted and suspended equipment for Risk Category (RC) V, and Designated Seismic Systems (DSS) for RC IV buildings assigned to Seismic Design Category (SDC) C, D, E, or F and Risk Category IV components needed for continued operation after an earthquake must have two nuts provided on each bolt.

#### 2.2 SUPPORTS AND ATTACHMENTS

Material used for members listed in this section must conform with the following:

- a. Plates, rods, and rolled shapes, ASTM A36/A36M, ASTM A572/A572M Grade 50, or ASTM A992/A992M.
- b. Tubes, ASTM A500/A500M, Grade B.
- c. Pipes, ASTM A53/A53M, Grade B.
- d. Angles, ASTM A36/A36M.

- e. Channels (Struts) with in-turned lips and associated hardware for fastening to channels at discrete points conforming to MFMA-4.
- f. Fasteners:
  - (1) High-strength bolts, ASTM F3125/F3125M, Grade A325, heavy hex.
  - (2) Nuts, ASTM A563. Use heavy hex nuts for high strength bolts and anchor bolts.
  - (3) Washers, ASME B18.22M and ASME B18.21.1, except use ASTM F436 washers for high strength bolts.
  - (4) Galvanized coating, ASTM A153/A153M.
  - (5) Direct Tension Indicator Washers, ASTM F959/F959M. Provide ASTM B695, Class 55, Type 1 galvanizing. Submit product data for direct tension indicator washers.
  - (6) Standard bolts, ASTM A307.
- g. Anchor bolts:
  - (1) Cast in anchors: Refer to 05 50 13 MISCELLANEOUS METAL FABRICATIONS for requirements.
  - (2) Post-installed anchors: Refer to Section 05 05 20 POST-INSTALLED CONCRETE AND MASONRY ANCHORS for requirements.
- h. Welding: STRUCTURAL METAL FABRICATIONS

## 2.3 FLEXIBLE FITTINGS

Provide flexible fittings to allow conduit, cabletray, busway, and raceway systems to accommodate seismic movement between equipment and conduit, cabletray, busway, and raceway systems and supporting structure. Use specification grade steel fittings conforming to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM MIL-STD-810. Provide suitable watertight expansion fittings that maintain electrical continuity by bonding jumper or other means. Flexible fittings must accommodate minimum of 4 inches seismic movement in each orthogonal directions.

## PART 3 EXECUTION

### 3.1 SUPPORTS AND ATTACHMENTS

Provide supports and attachments with continuous load path to distribute electrical component seismic loads to structure.

Provide supports and attachments for electrical components that conform to the arrangements shown. Install vertical diagonal braces at a 45-degree slope. Where interference is present, the slope may be minimum of 30 degrees or a maximum of 60 degrees per VISCMA 413.

Provide bolted and welded connections for supports and attachments in accordance with UFC 3-301-01.

Provide welding in accordance with AWS D1.1/D1.1M. Grind visible welds smooth in the finished installation.

### 3.2 BUILDING DRIFT

Do not attach electrical components to two dissimilar structural elements of a building that may respond differentially during an earthquake unless a flexible joint is provided. Electrical components, supports, and attachments must be capable of accommodating building story drifts, deflections, and relative displacements.

### 3.3 CONDUIT, CABLETRAY, BUSWAY, AND RACEWAY

Provide supports and attachments for conduit, cabletray, busway, and raceway conforming to the requirements of UFC 3-301-01.

### 3.4 ANCHORS

#### 3.4.1 General

Submit copies of test results to verify the adequacy of the specific anchor and application, as specified. Ensure housekeeping pads have adequate space to mount equipment and seismic restraint devices allowing adequate edge distance and embedment depth for restraint anchor bolts. Identify position of reinforcing steel and other embedded items prior to drilling holes for post-installed anchors. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength. Fill annular gap with nonshrink grout at equipment anchor bolts where clearance between anchor and equipment support hole exceeds 0.125 inches.

#### 3.4.2 Cast-In-Place Anchors

Use templates to locate cast-in-place bolts accurately and securely in formwork. Provide anchor bolts with an embedded straight length with heavy hex nut and washer to provide required strength and ductility. Anchor bolts that exceed the normal depth of equipment foundation piers or pads must either extend into concrete floor or the foundation or increase depth of the piers or pads to accommodate bolt lengths.

#### 3.4.3 Post-Installed Anchors

Refer to Section 05 05 20 POST-INSTALLED CONCRETE AND MASONRY ANCHORS for requirements.

### 3.5 EQUIPMENT SUPPORT REQUIREMENTS

#### 3.5.1 Suspended Equipment

Provide supports and attachments for components supported from structural systems. Provide supports and attachments that consist of angles, rods, wire rope, bars, channels (struts) or pipes arranged as shown in bracing submittals and secured at both ends with not less than 1/2 inch bolts. Provide sufficient supports and attachments to resist seismic forces as specified in UFC 3-301-01 without exceeding capacity of structural components. Provide, for approval, specific force calculations in accordance with UFC 3-301-01 for the project.

Submit details of supports and attachments for acceptance. In lieu of bracing with vertical supports, these items may be supported with hangers inclined at 45 degrees directed up and radially away from equipment and

oriented symmetrically in 90-degree intervals on the horizontal plane, bisecting the angles of each corner of the equipment, provided that supporting members are properly sized to support operating weight when hangers are inclined. Where interference is present, the inclined hanger slope may be minimum of 30 degrees or a maximum of 60 degrees per VISCMA 413.

### 3.5.2 Floor or Pad Mounted Equipment

#### 3.5.2.1 Shear Resistance

Bolt components to floor or pads. Provide bolts to resist seismic forces in accordance with paragraph ANCHORS.

#### 3.5.2.2 Overturning Resistance

Use the ratio of the overturning moment from seismic forces to the resisting moment due to gravity loads to determine if overturning forces need to be considered in the sizing of anchor bolts. Provide calculations to verify the adequacy of the anchor bolts for combined shear and tension. Provide bolts to resist seismic forces in accordance with paragraph ANCHORS.

### 3.6 SPECIAL TESTING FOR SEISMIC-RESISTING COMPONENTS

Electrical components designated as Designated Seismic Systems required to remain operational after an earthquake must be seismic qualified by shake table testing conforming to ICC ES AC156 Shake Table Test procedures. The manufacturer is to provide a certification by a fully qualified testing agency for the specific components. Prequalified certifications are acceptable unless noted otherwise. Seismic qualification documentation for each component must contain the information required in UFC 3-301-02, Section 2-17.2.5 Component Qualification Documentation.

Components that are required to be certified must bear permanent marking or nameplates constructed of a durable heat and water resistant material.

Provide component identification nameplates in accordance with UFC 3-301-01.

Mechanically attach nameplates to electrical components.

### 3.7 SPECIAL INSPECTION FOR COMPONENTS, SUPPORTS, AND ATTACHMENTS

Perform special inspections for seismic-resisting systems, designated seismic systems, components, supports and attachments, and equipment per Section 01 45 35 SPECIAL INSPECTION attachment Schedule of Special Inspections and ICC IBC 1705.13.4; electrical components per ICC IBC 1705.13.6.

Special Inspector must examine Designated Seismic Systems requiring seismic qualification in accordance with ASCE 7-16 and verify the label, anchorage and mounting conform to the certificate of compliance.

Provide a Statement of Special Inspections and Final Special Inspection Report in accordance with UFC 3-301-01 .

1.2 SYSTEM DESCRIPTION

The power system covered by this specification consists of: the new distribution system and the upstream over-current protective devices.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Field Examination Plan; G

Arc Flash Label Formats; G

SD-06 Test Reports

Field Examination

SD-07 Certificates

System Analyzer; G

SD-11 Closeout Submittals

Model Files; G

Load Flow Study; G

Fault Current Study; G

System Coordination Study; G

Arc Flash Hazard Study; G

#### 1.4 QUALITY ASSURANCE

##### 1.4.1 System Analyzer

The System Analyzer must perform the power system studies. The System Analyzer must be a registered professional electrical engineer with a minimum of 10 years of experience with power system studies. Include a list of three comparable jobs performed by the System Analyzer with specific names and telephone numbers for reference. Include the license number and state of the registered Professional Engineer.

##### 1.4.2 System Verifier

The System Verifier may inspect and record settings, markings, and otherwise document the existing equipment. The System Verifier may also place appropriate hazard labels on equipment. The System Verifier must not make any calibrations or adjustments or place equipment into service. When working with energized equipment, the system verifier must be a Qualified Person per NFPA 70E or working under the direct supervision of a Qualified Person.

#### PART 2 PRODUCTS

Not used.

#### PART 3 EXECUTION

##### 3.1 FIELD EXAMINATION

For each pre- and post-study inspection, submit a field examination plan identifying which facilities must be examined to complete the required work. Include a complete information verification procedure, where Qualified Personnel will be required, PPE requirements for "live" equipment examinations, and equipment to be used within the limited approach boundary of the equipment.

### 3.1.1 General

Perform field inspections of the site and equipment before the first study and after the last study to determine the state and settings of the equipment and to verify the final settings agree with the studies. Perform the post-study inspection(s) after changing settings, after performing acceptance tests, and before placing equipment in service. The post-study inspection may be performed by the testing organization approved in 26 08 00 APPARATUS INSPECTION AND TESTING.

Schedule the field examination by the System Verifier with the Contracting Officer at least 10 business days before conducting examination. Furnish all materials, labor, and equipment necessary to conduct the examination. Maintain a written record of the all equipment examined, equipment location, equipment ratings, settings, personnel involved, and the date the examination was performed. Submit the written record of each field examination.

### 3.1.2 Safety

Where examination of the equipment requires energized equipment to be opened, provide a Qualified Person to directly supervising any non-Qualified Person within the hazard area. Use PPE, protective barriers, danger signs and other safety devices to protect and warn personnel in the vicinity of "live" equipment being examined.

### 3.1.3 Application of Arc Flash Labels

Install arc flash warning labels using Qualified Personnel as necessary after the setting and inspection is complete. For new or modified equipment, install labels before the equipment is energized for the first time after installation/modification or setting changes. Schedule the label placement with the Contracting Officer at least 5 business days before label placement. Furnish all materials, labor, and equipment necessary to place the labels. Maintain a written record of the all equipment that received labels, personnel involved, and the date labels were placed.

## 3.2 POWER SYSTEM STUDIES

Perform power system studies to demonstrate that the equipment selected and system constructed meet the contract requirements for fault current and interrupt ratings, coordination, protection, and Arc Flash Hazard. Submit reports of the studies along with protective device equipment submittals. Apply Arc Flash Hazard labels to equipment after the studies are approved. Update and resubmit the studies after any changes to the equipment or systems which may affect the study results, and re-apply Arc Flash Hazard labels to equipment after the resubmitted studies are approved. The Government is not responsible for any changes to equipment, device ratings, settings, or additional labor for installation of equipment or devices ordered and/or procured before approval of the study.

Perform power system studies to demonstrate the system operation with regard to ratings, coordination, protection, and Arc Flash Hazard.

### 3.2.1 Scope of Studies

All new electric equipment shown on the one line diagram and extend through the downstream protective devices at the load's end and the existing upstream over current protective devices are included in the power study.

The "source bus" is the source of energy for system being analyzed. This may be the energy feed from a utility, the first bus upstream of the work, generators within the work or upstream of the work, or any other source capable of contributing significant energy into the system being analyzed.

In the systems model for the studies, incorporate all existing and new equipment within the scope of the studies. Incorporate any additional sources or load equipment necessary to accurately model the system's performance.

### 3.2.2 Determination of Facts

Determine and document the time-current characteristics, features, ratings, ampacities, and nameplate data for each existing protective device, electrical equipment, and feeder cables.

### 3.2.3 Single Line Diagram

Provide a single line diagram showing the electrical system buses, devices, transformation points, and all sources of load current and fault current, including generator and motor contributions. Provide a diagram from the system model. Each bus, device or transformation point must have a unique identifier. Show the location of switches, breakers, and circuit interrupting devices on the diagram together with available fault data, and the device interrupting rating.

The naming of existing components within the system model and single line diagram must match existing installed equipment names. The naming of new components within the system model and single line diagram must use unique identifiers and be coordinated with the Government.

### 3.2.4 Load Flow Study

Perform the load flow study in accordance with IEEE 3002.2 to identify initial steady-state conditions for the fault current study. For each operating scenario, provide load flow results on the diagram or in the report. Show or describe the loading factors and assumptions used in each operating mode.

### 3.2.5 Fault Current Study

Use the results of the load flow study to perform the fault current study in accordance with IEEE 3002.3. Provide balanced three-phase fault, bolted line-to-line fault, and single line-to-ground fault current values at each voltage transformation point and at each power distribution bus.

For each location, show in tabular form on the diagram or in the report the maximum and minimum available fault currents of all modes of operation for that location.

Where the available fault current at the source bus is not available, describe how the fault contribution from the source bus was determined and why this method is reasonable for the study.

### 3.2.6 System Coordination Study

Use the results of the load flow study and fault current study. For normal modes of operation, demonstrate that selectivity has been obtained between the devices within the scope of the project. Demonstrate the equipment, machines, and conductors are protected from damage from overloads and fault conditions. Include a description of the coordination of the protective devices in this project. Provide a written narrative describing which devices may operate in the event of a fault at each bus; the logic used to arrive at device ratings and settings; situations where system coordination is not achievable due to device limitations; coordination between upstream and downstream devices; and relay settings. Provide recommendations to improve or enhance system reliability, and detail where such changes would involve additions or modifications to the contract and cost damages (addition or reduction). Provide composite coordination plots on a log-log scale. Where recommendations are provided to improve or enhance system reliability, provide separate coordination plots on log-log scale showing the system coordination before and after the implementation of the recommendations. Where coordination has been adjusted to lower arc flash values, include a discussion of the change and the impact on the system within the report.

### 3.2.7 Arc Flash Hazard Study

Perform the arc flash hazard study in accordance with IEEE 1584.1. Utilize the data from the fault current study to determine the worst case incident energy per IEEE 1584 and OSHA 29 CFR 1910.269 Appendix E. Use identified modes of operation to determine the worst case arc flash energy. If not included in another study, include a description of the devices and device settings for the operating modes that provided the highest arc flash energy. The use of a "maintenance switch" to temporarily reduce the Arc Flash incident energy for maintenance work is acceptable. .

### 3.2.8 Study report(s)

- a. Include a narrative describing the studies performed; the bases and methods used; and the desired method of coordinated protection of the power system.
- b. Include descriptive and technical data for existing devices and new protective devices proposed. Include manufacturers published data, nameplate data, and definition of the fixed or adjustable features of the existing or new protective devices. For existing devices, included statements on the condition of the equipment based upon field inspections and owner's statements and reports.
- c. Document utility company data including system voltages, fault MVA,

system X/R ratio, time-current characteristic curves, current transformer ratios, and relay device numbers and settings; generator resistance and reactance values, and time constants; and existing power system data including time-current characteristic curves and protective device ratings and settings. Identify all assumptions about the protection devices, equipment, and system where data was not available.

- d. For each bus in the system, provide fully coordinated composite time-current characteristics (TCC) curves as required to ensure coordinated power system protection between protective devices and equipment. In a tabular format, provide existing and recommended ratings and settings of all protective devices.
- e. Provide an arc flash study report in accordance with IEEE 1584.1.
- f. Provide the calculations performed for the studies, including computer programs utilized. Provide the name of the software package, developer, and version number.
- f. The System Analyzer must stamp the study reports.

### 3.2.9 Arc Flash Labels

Provide arc flash warning labels on electrical equipment likely to require examination, servicing, or maintenance while energized. Typical types of equipment include pad-mounted transformers, switchgear, switchboards, panelboards, disconnect switches, industrial control panels, meter socket enclosures, and motor control centers that are in other than dwelling occupancies. The arc flash label naming must match the naming used in the system modeling and the single line diagram.

Comply with the label requirements specified in UFC 3-560-01. Obtain approval of arc flash label formats before printing.

- a. Provide a 3.5 inch x 5 inch to 4 inch x 6 inch thermal transfer type label of high adhesion polyester for each location device analyzed. The label must remain in place and be legible for at least 5 years in the installed environment.
- b. Labels must be machine printed with no field markings. Provide arc flash labels in the following manner. All labels must be based on implemented overcurrent devices and settings.
  - 1. Provide at least one arc flash label for each 480 volt and 208 volt panelboards.
  - 2. Provide at least one arc flash label for each low voltage (less than 1000 V) switchboard.
  - 3. Where the equipment construction has different hazards levels in different areas, provide a label for each compartment, cubicle, or section separated by barriers a single label representing the worst case hazard for all branch circuits and a separate unique label for the compartment containing the main protective device. On the worst case label, indicate which branch circuit compartments have the worst case hazard.
- c. Use the worst case hazard of all operating scenarios unless mitigation

procedures are used. If mitigation procedures are used, explain the procedures on the label.

### 3.3 MODELING

Develop a software model of the electrical system identified in the scope of the studies. Use the latest version of SKM PowerTools(TM). Develop the model with accurate, verified information. Model existing electrical equipment, machines, devices, and conductors directly connected to, altered by, or otherwise affected by the work. This includes, but is not limited to generators, transformers, switchgear, switchboards, panelboards, motor control centers, motors, voltage regulators, tap changers, protective relays, circuit breakers, switches, fuses, conductors, capacitors, reactors, grounding system, and control equipment.

Provide the final model files in their native editable formats for future use by the Government. Include device information for devices not in the software vendor's standard distribution.

1.2 RELATED REQUIREMENTS

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM applies to this section with additions and modifications specified herein.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-06 Test Reports

Acceptance Tests and Inspections; G

SD-07 Certificates

Qualifications of Organization, and Lead Engineering Technician; G

Acceptance Test and Inspections Procedure; G

1.4 QUALITY ASSURANCE

1.4.1 Qualifications

Engage the services of a qualified testing organization to provide inspection, testing, calibration, and adjustment of the electrical distribution system and generation equipment listed in paragraph ACCEPTANCE TESTS AND INSPECTIONS herein. Organization must be independent of the supplier, manufacturer, and installer of the equipment. The organization must be a first tier subcontractor. No work required by this section of the specification may be performed by a second tier subcontractor.

- a. Submit name and qualifications of organization. Organization must have been regularly engaged in the testing of electrical materials,

devices, installations, and systems for a minimum of 5 years. The organization must have a calibration program, and test instruments used must be calibrated in accordance with NETA ATS.

- b. Submit name and qualifications of the lead engineering technician performing the required testing services. Include a list of three comparable jobs performed by the technician with specific names and telephone numbers for reference. Testing, inspection, calibration, and adjustments must be performed by an engineering technician, certified by NETA (Level III) or the National Institute for Certification in Engineering Technologies (NICET) with a minimum of 5 years' experience inspecting, testing, and calibrating electrical distribution and generation equipment, systems, and devices.

#### 1.4.2 Acceptance Tests and Inspections Reports

Submit certified copies of inspection reports and test reports. Include certification of compliance with specified requirements, identify deficiencies, and recommend corrective action when appropriate. Type and neatly bind test reports to form a part of the final record. Submit test reports documenting the results of each test not more than 10 days after test is completed.

#### 1.4.3 Acceptance Test and Inspections Procedure

Submit test procedure reports for each item of equipment to be field tested at least 45 days prior to planned testing date. Do not perform testing until after test procedure has been approved.

### PART 2 PRODUCTS

Not used.

### PART 3 EXECUTION

#### 3.1 ACCEPTANCE TESTS AND INSPECTIONS

Testing organization will perform acceptance tests and inspections. Test methods, procedures, and test values must be performed and evaluated in accordance with NETA ATS, the manufacturer's recommendations, and paragraph FIELD QUALITY CONTROL of each applicable specification section. Tests identified as optional in NETA ATS are not required unless otherwise specified. Place equipment in service only after completion of required tests and evaluation of the test results have been completed. Supply to the testing organization complete sets of shop drawings, settings of adjustable devices, and other information necessary for an accurate test and inspection of the system prior to the performance of any final testing. Notify Contracting Officer at least 14 days in advance of when tests will be conducted by the testing organization. Perform acceptance tests and inspections on applicable equipment and systems specified in the following sections:

g. Section 26 11 16 SECONDARY UNIT SUBSTATIONS

h.

k. Section 26 24 13 SWITCHBOARDS

### 3.2 SYSTEM ACCEPTANCE

Final acceptance of the system is contingent upon satisfactory completion of acceptance tests and inspections.

### 3.3 PLACING EQUIPMENT IN SERVICE

A representative of the approved testing organization must be present when equipment tested by the organization is initially energized and placed in service.

-- End of Section --

used in these specifications, and on the drawings, must be as defined in  
IEEE 100.

1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S"  
classification. Submittals not having a "G" or "S" classification are for  
information only. When used, a code following the "G" classification  
identifies the office that will review the submittal for the Government.  
Submit the following in accordance with Section 01 33 00 SUBMITTAL  
PROCEDURES:

In addition, submit in accordance with paragraph COORDINATED SUBMITTAL  
REVIEWS herein.

1.4.1 Coordinated Submittal Reviews

- a. Submit transformer submittals to Code DC44, Atlantic Division, Naval  
Facilities Engineering Systems Command for approval. In addition,  
submit one set of the remaining substation components for surveillance.
- b. Submit remaining substation component submittals to Engineer of Record  
for approval. In addition, submit one set of transformer submittals  
for surveillance and to insure alignment of equipment and coordination  
for interconnections.

SD-02 Shop Drawings

Unit Substation Drawings; G

Transformer Drawings (to Code DC44); G

Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Wiring diagrams must identify circuit terminals and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment. Drawings must indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Submittals must include the nameplate data, size, and capacity. Submittals must also include applicable federal, military, industry, and technical society publication references.

SD-03 Product Data

Fuse Curves; G

Secondary Unit Substation Excluding Transformer Data; G

Unit Substation Transformer (Liquid-filled) (to Code DC44); G

SD-06 Test Reports

Acceptance Checks and Tests; G

Unit Substations, Data Package 5; G

SD-11 Closeout Submittals

Assembled Operation and Maintenance Manuals; G

Equipment Test Schedule (to Code DC44 for Liquid-filled Units); G

1.5 QUALITY ASSURANCE

1.5.1 Drawing Requirements

1.5.1.1 Unit Substation Drawings

Drawings must include, but are not limited to the following:

- a. An outline drawing, with dimensional plan view, elevation, foundation plan and side views showing incoming, transformer, and outgoing sections. as part of the total unit substation.
- b. One-line diagram showing all components and their ratings.
- c. Elementary diagrams and wiring diagrams with terminals identified, and indicating prewired interconnections between items of equipment and the interconnection between the items.
- d. Three-line diagram showing bus configuration, bus rating and overcurrent protective devices.
- f. Time-current characteristic fuse curves (on full size logarithmic paper) for the load interrupter switch fuse.

#### 1.5.1.2 Transformer Drawings

Drawings must include, but are not limited to the following:

- a. An outline drawing, with front, top, and side views.
- b. ANSI nameplate data.

#### 1.5.2 Paint Coating System

Submit IEEE C57.12.29 coating system performance requirement tests. When interrupter switchgear and transformer are provided by two different manufacturers, each one must provide certification.

#### 1.5.3 Transformer Efficiencies

Submit certification from the manufacturer indicating conformance with the paragraph SPECIFIED TRANSFORMER EFFICIENCIES".

#### 1.5.4 Substation Product Data

Submittal must include manufacturer's information for each component, device, and accessory provided with the equipment.

#### 1.5.5 Test Reports

Submit report of acceptance test results as specified by paragraph FIELD QUALITY CONTROL.

#### 1.5.6 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship must be in accordance with the mandatory and advisory provisions unless more stringent requirements are specified or indicated.

#### 1.5.7 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products must have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period must include applications of equipment and materials under similar circumstances and of similar size. The product must have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

##### 1.5.7.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

##### 1.5.7.2 Material and Equipment Manufacturing Date

Products manufactured more than 3 years prior to date of delivery to site must not be used, unless specified otherwise.

#### 1.6 MAINTENANCE

##### 1.6.1 Assembled Operation and Maintenance Manuals

Manuals must be assembled in durable, hard covered, water resistant binders. The manual must be assembled and indexed in the order noted in a table of contents. The contents of the assembled operation and maintenance manuals must be as follows:

- a. Manufacturer's O&M information required by the paragraph, SD-10 OPERATION AND MAINTENANCE DATA.
- b. Catalog data required by the paragraph, SD-03 PRODUCT DATA.
- c. Drawing required by the paragraph, SD-02 SHOP DRAWINGS.
- d. Price for spare parts and supply list
- e. Routine and field acceptance test reports

##### 1.6.2 Operation and Maintenance Data

Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA and as specified herein.

#### 1.7 WARRANTY

The equipment items must be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

## PART 2 PRODUCTS

### 2.1 PRODUCT COORDINATION

Products and materials not considered to be secondary unit substations and related accessories are specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

### 2.2 SECONDARY UNIT SUBSTATION

Secondary Unit substations must comply with IEEE C37.121 regardless of the kVA rating specified. Substation must consist of primary incoming sections, one transformer section, and one outgoing section. Substation must be designed for outdoor service with ventilation openings and gasketing provided to ensure a weatherproof assembly under rain, snow, sleet, and hurricane conditions. Substations must be subassembled and coordinated by one manufacturer and must be shipped in complete sections ready for connection at the site. Where practicable, substation must be shipped as one unit. External doors must have provisions for padlocking. Bus bars and conductors must be copper.

#### 2.2.1 Incoming Section

The incoming section must consist of a dual metal-enclosed interrupter switchgear section for connecting the incoming circuits through a fused load interrupter switch to the transformer. Operation of the switchgear must not be affected by opening the low voltage compartment doors. If required for proper connection and alignment, include a transition section with the incoming section.

##### 2.2.1.1 Incoming Section Enclosure

The incoming section enclosure must be NEMA ICS 6 Type 3R, fabricated entirely of type 304L stainless steel. Bases, frames and channels of enclosure must be corrosion resistant and must be fabricated of 304L stainless steel. Base must include any part of enclosure that is within 3 inches of concrete pad. Galvanized steel must be ASTM A123/A123M, ASTM A653/A653M G90 coating, and ASTM A153/A153M, as applicable. Paint enclosure, including bases, ASTM D1535 light gray No. 61 or No. 49. Paint coating system must comply with IEEE C57.12.29.

##### 2.2.1.2 Cable Terminations

Provide medium voltage cable terminations as specified .

##### 2.2.1.3 Surge Arresters

IEEE C62.11, rated 12 kV. Arresters must be intermediate class. Arresters for use at elevations in excess of 6000 feet above mean sea level must be specifically rated for that purpose. Arresters must be equipped with mounting brackets suitable for the indicated installations.

##### 2.2.1.4 Load Interrupter Switch

IEEE C37.20.3. Provide a dual three-pole, single-throw, deadfront, metal-enclosed, load interrupter switch with manual stored energy operator. Switch must be fused, and designed for easy inspection and fuse replacement. The switch must be operated by a manually charged spring

stored energy mechanism which must simultaneously disconnect or connect ungrounded conductors. The moveable blade of the switch must be de-energized when in the open position. The mechanism must enable the switch to close against a fault equal to the momentary rating of the switch without affecting its continuous current carrying or load interrupting ability. A ground bus must extend the width of the switch enclosure and must be bolted directly thereto. Connect frame of unit to ground bus. The door must have an inspection window to allow full view of the position of the three switch blades through the closed door. Switch ratings must be:

- a. 13.8 kV, 95 kV BIL for service on a 15 kV system with a fault close rating of not less than 101 kA amperes asymmetrical.
- b. The switch must be capable of carrying continuously or interrupting 1200 A amperes with a momentary rating of 63 kA amperes at 13.8 kV.
- c. Switch must have provision for padlocking in the open and closed positions.
- d. Fuses must be current limiting type rated as shown on drawings amperes continuous, and 63 kA amperes interrupting capacity.

#### 2.2.1.5 Primary Protective Device Connection

Connections between the primary protective device and transformer must be cable mounted on porcelain insulators, and sized and braced to withstand the specified short-circuit and short-time currents.

#### 2.2.2 Transformer (Liquid-Filled) Sections

IEEE C57.12.29. Less-flammable, bio-degradable liquid-filled. Transformer base, including the tank, radiators, flanges, base, lifting provisions, and hardware, must be fabricated of type 316 stainless steel. Transformer base must include any part of the transformer that is within 3 inches of concrete pad. Paint coating system must comply with IEEE C57.12.29.

##### 2.2.2.1 Transformer Ratings

- a. Cooling Class: ONAN-Liquid-filled, self-cooled.
- b. Frequency: 60 Hz.
- c. Phases: Three phase.
- d. Rated Kilovolt Amperes: 1500 kVA
- e. Voltage Rating: 13,200 V - 480 V. For GrdY - GrdY transformers, provide transformer with five-legged core design for third harmonic suppression.
- f. Impedance: Minimum tested impedance must not be less than 5.75 percent at 85 degrees C.
- g. Insulation Level: 95 kV BIL
- h. Temperature Rise: 55/65 degree C average winding temperature rise

above a 30 degree ambient.

- i. Audible Sound Levels: Audible sound levels must comply with the following:

| <u>kVA Range</u> | <u>DECIBELS (MAX)</u> |
|------------------|-----------------------|
| 225-300          | 55                    |
| 301-500          | 56                    |
| 501-700          | 57                    |
| 701-1000         | 58                    |
| 1001-1500        | 60                    |
| 1501-2000        | 61                    |
| 2001-2500        | 62                    |
| 2501-3000        | 63                    |
| 3001-4000        | 64                    |

#### 2.2.2.2 Transformer Accessories

The transformer must have the following accessories:

- a. Four 2.5 percent full capacity taps, two above and two below rated primary voltage.
- b. Tap changer, with external, pad-lockable, manual type operating handle, for changing tap setting when transformer is de-energized.
- c. Ground pads.
- d. Liquid-level indicator.
- e. Pressure-vacuum gage.
- f. Liquid temperature indicator.
- g. Drain and filter valves.
- h. Pressure relief device, top mounted.
- i. Diagrammatic stainless steel or laser-etched anodized aluminum nameplate in accordance with IEEE C57.12.00 and as modified or supplemented by this section.
- j. Transformer base with provisions for jacking and for rolling in either direction.
- k. Lifting provisions.
- l. Bolted transformer top or welded top with bolted handhole access.

### 2.2.2.3 Specified Transformer Efficiencies

Provide transformer efficiency calculations utilizing the actual no-load and load loss values obtained during the routine tests performed on the actual transformer(s) prepared for this project. Reference no-load losses (NLL) at 20 degrees C. Reference load losses (LL) at 55 degrees C and at 50 percent of the nameplate load. The transformer is not acceptable if the calculated transformer efficiency is less than the efficiency indicated in the "KVA / Efficiency" table below. The table is based on requirements contained within 10 CFR 431, Subpart K. Submit certification, including supporting calculations, from the manufacturer indicating conformance.

| KVA        | EFFICIENCY (percent) |
|------------|----------------------|
| 15         | 98.65                |
| 30         | 98.83                |
| 45         | 98.92                |
| 75         | 99.03                |
| 112.5      | 99.11                |
| 150        | 99.16                |
| 225        | 99.23                |
| 300        | 99.27                |
| 500        | 99.35                |
| 750        | 99.40                |
| 1000       | 99.43                |
| 1500       | 99.48                |
| 2000       | 99.51                |
| 2500       | 99.53                |
| above 2500 | 99.54                |

### 2.2.2.4 Insulating Liquid

- a. Less-flammable transformer liquids: Must meet the requirements of ASTM D6871, and be approved by the FM APP GUIDE for Less or Non-Flammable Liquid Insulated Transformers. Provide identification of transformer as "non-PCB" and "manufacturer's name and type of fluid" on the nameplate.

Provide a fluid that is a biodegradable, electrical insulating, and

cooling liquid classified by UL and approved by FM as "less flammable" with the following properties:

- (1) Aquatic biodegradation: EPA 712-C-98-075, 99 percent.
- (2) Trout toxicity: The fluid must have passed OECD Test 203 following the methods of EPA 821-R-02-012 and be determined to be non-toxic.

#### 2.2.2.4.1 Liquid-Filled Transformer Nameplates

Provide nameplate information in accordance with IEEE C57.12.00 and as modified or supplemented by this section.

#### 2.2.3 Outgoing Section

The outgoing section must consist of a full height air terminal compartment for physical protection of and connection point for the secondary conductors between the transformer and the main switchgear located in building 72A pump room

The outgoing section must consist of a full height air terminal compartment. This compartment must be the connection point for the secondary conductors between the transformer and the switchboard located in the building. Provide one three point latching hinged door, either full height or on the upper half of the outgoing section to provide access to metering. The upper section must contain the current transformers and a watthour meter mounted to a dead front interior barrier as defined below. If using upper half section door only, the lower section must be bolt on type and contain bus bars and lugs to terminate the service entrance conductors. Provide insulated barriers between the upper and lower sections to permit the bus bars to pass between the sections. Provide locking access handle to eliminate unauthorized access.

##### 2.2.3.1 Outgoing Section Enclosure

Provide outgoing section enclosure in accordance with the requirements in paragraph INCOMING SECTION ENCLOSURE.

#### 2.2.4 Switchgear Configuration

##### 2.2.4.1 Duplex Load Interruptor Switches

- a. For 5 or 15 kV ratings, furnish a duplex load interruptor switch for the selection of two incoming sources in series with the load break MVS switch where shown on contract drawing. The duplex load interruptor switches shall have the same continuous current rating. The load interruptor switches shall be arranged and interlocked to permit make-before-break closed-transition operation between two sources. Interlocking logic shall be provided that:
  - (1) Closed transition transfer occurs only when both sources are within voltage, phase, and frequency limits
  - (2) The duration of parallel connection between sources during automatic operation shall be limited to a maximum of 100 milliseconds, unless otherwise approved

- (3) Both switches shall be rated for the sum of the available short circuit currents from both sources during parallel period.
  - (4) Automatic and manual transfer shall be possible without loss of load, subject to synchronism and protection permissive.
  - (5) Manual operation opening of second source to be performed in sequential manner, assumed 30 seconds or less.
- b. Provide mechanical and/or electrical interlocks to prevent closed transition operation unless all permissive conditions are met. The selector switch shall be positively locked in one of the two source positions when closed transition is not being performed.

#### 2.2.4.2 Duplex Automatic Transfer Control

- a. Duplex Automatic transfer control shall provide for a switchgear assembly with a common load bus and two normally energized medium-voltage power sources, designated "normal" and "standby," connected to the load bus. The fused switches connecting the two power sources to the load bus shall be controlled by a microprocessor-based automatic transfer control. Power for the transfer control shall be from the voltage sensing transformers.
- b. In the automatic mode, the load bus is connected to the normal power source. When the normal source fails, the control shall automatically open the normal power source and close the standby source circuit breaker.
- c. Sequence of operation:
  - (1) The default operation shall be with the normal source main breaker closed and the standby main breaker open. Upon detection of an undervoltage to the line side of the normal main breaker and after a field-adjustable time delay, that main breaker shall open and after an additional field-adjustable time delay, the standby breaker shall close restoring power to the facility.
  - (2) Upon restoration of voltage to the line side of the normal main breaker and after a field-adjustable time delay, the standby main breaker shall open and after a field-adjustable time delay, the normal main breaker shall close.
- d. Field-Adjustable Transfer Parameters:
  - (1) Delay the transfer from the normal power source to the standby power source and from the standby power source to the normal source. The time delay is to allow the load voltage to decay before reconnecting to another power source. Delay range: 0 seconds to 30 minutes.
  - (2) Delay the initiation of the transfer sequence. The time delay is recommended to override a momentary power outage or voltage fluctuation. Delay range: 0 seconds to 120 seconds.
  - (3) Delay the transfer from the standby power source to the normal power source: (0 seconds to 30 minutes).

- (4) A relay with contact that changes state when the power is available on the normal source and a relay with contact that changes state when the power is available on the standby source.
- e. Controls and Indicators: In addition to the delay setting controls, provide the following:
  - (1) Interlocks or relay control to prevent transfer when either of the two controlled circuit breakers tripped due to overcurrent or ground fault.
  - (2) Three-position selector switch to select the normal source: Source 1, Source 2, or none.
  - (3) Transfer-control automatic and manual selector.
    - (a) Interlock shall prevent paralleling of the two power sources in manual mode.
    - (b) Open-close control switch for manual electrical operation of each controlled circuit breaker.
    - (c) Selector to place control into programming mode.
    - (d) Circuit breaker control switch for each of the normal and standby source breakers, providing open and close operation.
    - (e) Push button to initiate manual retransfer to the normal source when the transfer controller is in the automatic mode.
  - (4) Meters and display to show the following:
    - (a) Voltage and frequency of both sources.
    - (b) A multi-line display showing the following:
      - 1. Set points of timers, and voltage pickup and dropout set points.
      - 2. Date, time, and reason for at least the last 10 transfers. The display may show the information for one transfer at a time using a scrolling control, with the others held in memory.
      - 3. When the control system is in the transferring process, the display shall show delay countdown in seconds.
      - 4. LED lights to show the following: Normal source available, Standby source available, Normal source connected, Standby source connected, Load bus energized.
      - 5. Voltage Transformers: Primary and secondary protection and disconnecting means for sensing functions and control power.
      - 6. Voltage Sensing Relays: Microprocessor-based IEEE device number 27/47 voltage detection relays for three-phase undervoltage protection and negative sequence voltage protection.

- f. Motor operators, where indicated on the drawings, shall have the following features:
- (1) All motor-operated switches shall consist of a standard manually-operated switch in combination with an electric motor driven linear actuator, which charges the spring. Connection between the linear actuator and switch mechanism shall be by reliable rigid metal-to-metal linkages; not chains or cables. The linear actuator and all associated low voltage wiring shall be located in a low voltage compartment or barriered to separate it from the high voltage.
  - (2) Operating voltage shall be 120 volts, 60 Hz available from an external source as shown on the drawings. The switch shall be capable of manual operation should a loss of control power be encountered.
  - (3) The linear actuator shall be a highly repetitively manufactured item, completely sealed and weather protected, and designed for rugged industrial application. No lubrication or adjustments shall be necessary for its normal operating life. The motor shall be equipped with an automatically reset thermal overload protector.
  - (4) Motor operator shall be easily removable for maintenance purpose.

#### 2.2.5 Control Power Transformers

Transformer must conform to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

#### 2.2.6 Heaters

Provide 120-volt heaters in incoming section and outgoing section. Heaters must be of sufficient capacity to control moisture condensation in the compartments, must be 250 watts minimum, and must be controlled by a thermostat and humidistat located in each section. Thermostat must be industrial type, high limit, to maintain compartments within the range of 60 to 90 degrees F. Humidistat must have a range of 30 to 60 percent relative humidity. If heater voltage is different than substation equipment voltage, provide transformer rated to carry 125 percent of heater full load rating. Transformer must have 220 degrees C insulation system with a temperature rise not exceeding 115 degrees C and must conform to NEMA ST 20. Energize electric heaters while the equipment is in storage or in place prior to being placed in service. Provide method for easy connection of heater to external power source.

#### 2.2.7 Terminal Boards

Provide with engraved plastic terminal strips and screw type terminals for external wiring between components and for internal wiring between removable assemblies. Terminal boards associated with current transformers must be short-circuiting type. Terminate conductors for current transformers with ring-tongue lugs. Terminal board identification must be identical in similar units. External wiring must be color coded consistently for similar terminal boards.

#### 2.2.8 Wire Marking

Mark control and metering conductors at each end. Provide factory-installed, white, plastic tubing, heat stamped with black block type letters on factory-installed wiring. On field-installed wiring, provide white, preprinted, polyvinyl chloride (PVC) sleeves, heat stamped with black block type letters. Each sleeve must be elliptically shaped to securely grip the wire, and must be keyed in such a manner to ensure alignment with adjacent sleeves. Provide specific wire markings using the appropriate combination of individual sleeves. Each wire marker must indicate the device or equipment, including specific terminal number to which the remote end of the wire is attached.

#### 2.2.9 Grounding and Bonding

Provide a continuous ground bus bar. It shall run the length of the switchgear, the ground bus bar shall be accessible from the back of the switchgear. The ground bus bar must be hard-drawn copper of 98 percent minimum conductivity, minimum size 1/4 by 2 inches.

#### 2.2.10 Padlocks

Padlocks must be provided for secondary unit substation equipment and for each fence gate. Padlocks must be keyed alike.

#### 2.2.11 Cast-in-Place Concrete

Concrete associated with electrical work for other than encasement of underground ducts must be 4000 psi minimum 28-day compressive strength unless specified otherwise. All concrete must conform to the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE.

Must be composed of fine aggregate, coarse aggregate, portland cement, and water so proportioned and mixed as to produce a plastic, workable mixture. Fine aggregate must be of hard, dense, durable, clean, and uncoated sand. The coarse aggregate must be reasonably well graded from 3/16 inch to one inch. The fine and coarse aggregates must be free from injurious amounts of dirt, vegetable matter, soft fragments or other deleterious substances. Water must be fresh, clean, and free from salts, alkali, organic matter, and other impurities. Concrete associated with electrical work for other than encasement of underground ducts must be 4000 psi minimum 28-day compressive strength unless specified otherwise. Slump must not exceed 4 inches. Retempering of concrete will not be permitted. Exposed, unformed concrete surfaces must be given a smooth, wood float finish. Concrete must be cured for a period of not less than 7 days, and concrete made with high early strength portland cement must be repaired by patching honeycombed or otherwise defective areas with cement mortar as directed by the Contracting Officer. Air entrain concrete exposed to weather using an air-entraining admixture conforming to ASTM C260/C260M. Air content must be between 4 and 6 percent.

#### 2.3 MANUFACTURER'S NAMEPLATES

Each item of equipment must have a nameplate bearing, as a minimum, the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable. Include additional information as applicable to fully identify the equipment. Nameplates must be made of noncorrosive metal. Equipment containing liquid dielectric must include the type of

dielectric on the nameplate. Sectionalizer switch nameplates must have a schematic with all switch positions shown and labeled. As a minimum, provide nameplates for transformers, circuit breakers, meters, switches, and switchgear.

## 2.4 FIELD FABRICATED NAMEPLATES

ASTM D709. Provide laminated plastic nameplates for each secondary unit substation, equipment enclosure, relay, switch, and device; as specified in this section or as indicated on the drawings. Each nameplate inscription must identify the function and, when applicable, the position. Nameplates must be melamine plastic, 0.125 inch thick, white with black center core. Provide red laminated plastic label with white center core where indicated. Surface must be matte finish. Corners must be square. Accurately align lettering and engrave into the core. Minimum size of nameplates must be one by 2.5 inches. Lettering must be a minimum of 0.25 inch high normal block style.

## 2.5 WARNING SIGNS

Provide warning signs for the enclosures of secondary unit substations having a nominal rating exceeding 600 volts.

- a. When the enclosure integrity of such equipment is specified to be in accordance with IEEE C57.12.29, such as for secondary unit substations, provide self-adhesive warning signs on the outside of the high voltage compartment door(s). Sign must be a decal and must have nominal dimensions of 7 by 10 inches with the legend "DANGER HIGH VOLTAGE" printed in two lines of nominal 2 inch high letters. The word "DANGER" must be in white letters on a red background and the words "HIGH VOLTAGE" must be in black letters on a white background.
- b. When such equipment is guarded by a fence, mount signs on the fence. Provide metal signs having nominal dimensions of 14 by 10 inches with the legend "DANGER HIGH VOLTAGE KEEP OUT" printed in three lines of nominal 3 inch high white letters on a red and black field.

## 2.6 SOURCE QUALITY CONTROL

### 2.6.1 Equipment Test Schedule

The Government reserves the right to witness tests. Provide equipment test schedules for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

#### Test Instrument Calibration

- (1) The manufacturer must have a calibration program which assures that all applicable test instruments are maintained within rated accuracy.
- (2) The accuracy must be directly traceable to the National Institute of Standards and Technology. Test equipment must qualify for the UL standard of Scope of Accreditation ISO ISO/IEC 17025 and ANSI Z540.1.

- (3) Instrument calibration frequency schedule must not exceed 12 months for both test floor instruments and leased specialty equipment.
- (4) Dated calibration labels must be visible on all test equipment.
- (5) Calibrating standard must be of higher accuracy than that of the instrument tested.
- (6) Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:
  - (a) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.
  - (b) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.

#### 2.6.2 Load Interrupter Switch Production Tests

IEEE C37.20.3. Furnish reports of production tests performed on the actual equipment for this project. Required tests must be as follows:

##### Production Tests

- (1) Dielectric
- (2) Mechanical operation
- (3) Grounding of instrument transformer case
- (4) Electrical operation and control wiring

#### 2.6.3 Transformer Design Tests (Liquid-Filled)

In accordance with IEEE C57.12.00 and IEEE C57.12.90. Additionally, IEEE C57.12.80 section 5.1.2 states that "design tests are made only on representative apparatus of basically the same design." Submit design test reports (complete with test data, explanations, formulas, and results), in the same submittal package as the product data and shop drawings for each of the specified transformers. Design tests must have been performed prior to the award of this contract.

- a. Tests must be certified and signed by a registered professional engineer.
- b. Temperature rise: "Basically the same design" for the temperature rise test means a unit-substation transformer with the same coil construction (such as wire wound primary and sheet wound secondary), the same kVA, the same cooling type (ONAN), the same temperature rise rating, and the same insulating liquid as the transformer specified.
- c. Lightning impulse: "Basically the same design" for the lightning impulse dielectric test means a unit-substation transformer with the same BIL, the same coil construction (such as wire wound primary and sheet wound secondary), and a tap changer, if specified. Design lightning impulse tests must include both the primary and secondary

windings of that transformer.

- (1) IEEE C57.12.90 paragraph 10.3 entitled "Lightning Impulse Test Procedures," and IEEE C57.98.
  - (2) State test voltage levels.
  - (3) Provide photographs of oscilloscope display waveforms or plots of digitized waveforms with test report.
- d. Lifting and moving devices: "Basically the same design" for the lifting and moving devices test means a transformer in the same weight range as the transformer specified.
- e. Pressure: "Basically the same design" for the pressure test means a unit-substation transformer with a tank volume within 30 percent of the tank volume of the transformer specified.

#### 2.6.4 Transformer Routine and Other Tests (Liquid-Filled)

In accordance with IEEE C57.12.00 and IEEE C57.12.90. Routine and other tests must be performed by the manufacturer on each of the actual transformers prepared for this project to ensure that the design performance is maintained in production. Submit test reports, by serial number and receive approval before delivery of equipment to the project site. Required tests and testing sequence must be as follows:

- a. Cold resistance measurements (provide reference temperature)
- b. Phase relation
- c. Ratio
- d. Insulation power-factor by manufacturer's recommended test method
- e. No-load losses (NLL) and excitation current
- f. Load losses (LL) and impedance voltage
- g. Dielectric
  - (1) Impulse: Per IEEE C57.12.90 paragraph 10.3 entitled "Lightning Impulse Test Procedures," and IEEE C57.98. Test the primary winding only.
    - (a) State test voltage levels
    - (b) Provide photographs of oscilloscope display waveforms or plots of digitized waveforms with test reports. As an alternative, photographs of oscilloscope display waveforms or plots of digitized waveforms may be hand-delivered at the factory witness test.
  - (2) Applied voltage
  - (3) Induced voltage
- h. Leak

i. Sample insulating liquid. Sample must be tested for:

- (1) Dielectric breakdown voltage
- (2) Acid neutralization number
- (3) Specific gravity
- (4) Interfacial tension
- (5) Color
- (6) Visual condition
- (7) Water in insulating liquid
- (8) Measure dissipation factor or power factor

j. Perform dissolved gas analysis (DGA)

### PART 3 EXECUTION

#### 3.1 INSTALLATION

Electrical installations must conform to IEEE C2, and to the requirements specified herein.

#### 3.2 GROUNDING

IEEE C2, except that grounds and grounding systems must have a resistance to solid earth ground not exceeding 5 ohms.

##### 3.2.1 Grounding Electrodes

Provide driven ground rods as shown on drawings. Connect ground conductors to the upper end of the ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors.

##### 3.2.2 Substation Grounding

Provide bare copper cable not smaller than No. 4/0 AWG not less than 24 inches below grade interconnecting the indicated ground rods. Surge arrester and neutrals must be bonded directly to the transformer enclosure and then to the grounding electrode system with bare copper conductors, sized as shown. Lead lengths must be kept as short as practicable with no kinks or sharp bends. Substation transformer neutral connections must not be smaller than No. 1/0 AWG. When work in addition to that indicated or specified is directed to obtain the specified ground resistance, the provision of the contract covering "Changes" must apply. Fence and equipment connections must not be smaller than No. 4 AWG. Ground fence at each gate post and cornerpost and at intervals not exceeding 10 feet. Bond each gate section to the fence post through a 1/8 by one inch flexible braided copper strap and clamps.

##### 3.2.3 Connections

Make joints in grounding conductors and loops by exothermic weld or compression connector.

### 3.2.4 Grounding and Bonding Equipment

UL 467, except as indicated or specified otherwise.

## 3.3 INSTALLATION OF EQUIPMENT AND ASSEMBLIES

Install and connect unit substations furnished under this section as indicated on project drawings, the approved shop drawings, and as specified herein.

### 3.3.1 Interrupter Switchgear

IEEE C37.20.3.

### 3.3.2 Field Applied Painting

Where field applied painting of enclosures is required to correct damage to the manufacturer's factory applied coatings, provide manufacturer's recommended coatings and apply in accordance with manufacturer's instructions.

### 3.3.3 Field Fabricated Nameplate Mounting

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

### 3.3.4 Warning Sign Mounting

Provide the number of signs required to be readable from each accessible side, but space the signs a maximum of 30 feet apart.

### 3.3.5 Galvanizing Repair

Repair damage to galvanized coatings using ASTM A780/A780M, zinc rich paint, for galvanizing damaged by handling, transporting, cutting, welding, or bolting. Do not heat surfaces that repair paint has been applied to.

## 3.4 FOUNDATION FOR EQUIPMENT AND ASSEMBLIES

### 3.4.1 Exterior Location

Mount unit substation on concrete slab. Unless otherwise indicated, the slab must be at least 8 inches thick, reinforced with a 6 by 6 - W2.9 by W2.9 mesh placed uniformly 4 inches from the top of the slab. Slab must be placed on a 6 inch thick, well-compacted gravel base. Top of concrete slab must be approximately 4 inches above the finished grade. Edges above grade must have 1/2 inch chamfer. The slab must be of adequate size to project at least 8 inches beyond the equipment. Provide conduit turnups and cable entrance space required by the equipment to be mounted. Seal voids around conduit openings in slab with water- and oil-resistant caulking or sealant. Seals must be of sufficient strength and durability to protect all energized live parts of the equipment from rodents, insects, or other foreign matter. Cut off and bush conduits 3 inches above slab surface.

### 3.4.2 Cast-in-Place Concrete

Cast-in-place concrete work must conform to the requirements of Section 03 30 00 CAST-IN-PLACE CONCRETE ACI 318M.

### 3.5 PADLOCKS

Provide padlocks for secondary unit substation equipment and for each fence gate.

### 3.6 FIELD QUALITY CONTROL

#### 3.6.1 Performance of Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

##### 3.6.1.1 Transformers (Liquid-Filled)

###### a. Visual and mechanical inspection

- (1) Compare equipment nameplate data with specifications and approved shop drawings.
- (2) Inspect physical and mechanical condition. Check for damaged or cracked insulators and leaks.
- (3) Verify that cooling fans and pumps operate correctly and that fan and pump motors have correct overcurrent protection.
- (4) Verify operation of all alarm, control, and trip circuits from temperature and level indicators, pressure relief device, and fault pressure relay.
- (5) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.
- (6) Verify correct liquid level in transformer tank.
- (7) Perform specific inspections and mechanical tests as recommended by manufacturer.
- (8) Verify correct equipment grounding.
- (9) Verify the presence of transformer surge arresters.
- (10) Verify that positive pressure is maintained on gas blanketed transformers.

###### b. Electrical Tests

- (1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.
- (2) Perform dissolved gas analysis (DGA).

- (3) Verify that the tap-changer is set at specified ratio.
- (4) Verify proper secondary voltage phase-to-phase and phase-to-neutral after energization and prior to loading.

#### 3.6.1.2 Current Transformers

##### a. Visual and Mechanical Inspection

- (1) Compare equipment nameplate data with specifications and approved shop drawings.
- (2) Inspect physical and mechanical condition.
- (3) Verify correct connection.
- (4) Verify that adequate clearances exist between primary and secondary circuit.
- (5) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.
- (6) Verify that all required grounding and shorting connections provide good contact.

##### b. Electrical Tests

- (1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.
- (2) Perform insulation-resistance tests.
- (3) Perform polarity tests.
- (4) Perform ratio-verification tests.

#### 3.6.1.3 Metering and Instrumentation

##### a. Visual and Mechanical Inspection

- (1) Compare equipment nameplate data with specifications and approved shop drawings.
- (2) Inspect physical and mechanical condition.
- (3) Verify tightness of electrical connections.

##### b. Electrical Tests

- (1) Verify accuracy of meters at 25, 50, 75, and 100 percent of full scale.
- (2) Calibrate watthour meters according to manufacturer's published data.
- (3) Verify all instrument multipliers.

- (4) Verify that current transformer and voltage transformer secondary circuits are intact.

#### 3.6.1.4 Grounding System

##### a. Visual and Mechanical Inspection

- (1) Inspect ground system for compliance with contract plans and specifications.

##### b. Electrical Tests

- (1) Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground testing megger in accordance with manufacturer's instructions to test each ground or group of grounds. The instrument must be equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.
- (2) Submit the measured ground resistance of each ground rod or grounding system, indicating the location of the rod or grounding system. Include the test method and test setup (i.e., pin location) used to determine ground resistance and soil conditions at the time the measurements were made.

#### 3.6.2 Pre-Energization Services

Calibration, testing, adjustment, and placing into service of the installation must be accomplished by a manufacturer's product field service engineer or independent testing company with a minimum of 2 years of current product experience. The following services must be performed subsequent to testing but prior to the initial energization. The equipment must be inspected to ensure that installation is in compliance with the recommendations of the manufacturer and as shown on the detail drawings. Terminations of conductors at major equipment must be inspected to ensure the adequacy of connections. Bare and insulated conductors between such terminations must be inspected to detect possible damage during installation. If factory tests were not performed on completed assemblies, tests must be performed after the installation of completed assemblies. Components must be inspected for damage caused during installation or shipment to ensure packaging materials have been removed. Components capable of being both manually and electrically operated must be operated manually prior to the first electrical operation. Components capable of being calibrated, adjusted, and tested must be calibrated, adjusted, and tested in accordance with the instructions of the equipment manufacturer.

#### 3.6.3 Follow-Up Verification

Upon completion of acceptance checks, settings, and tests, the Contractor must show by demonstration in service that circuits and devices are in

good operating condition and properly performing the intended function. Test must require each item to perform its function not less than three times. As an exception to requirements stated elsewhere in the contract, the Contracting Officer must be given 5 working days' advance notice of the dates and times for checks, settings, and tests.

## 1.2 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE Stds Dictionary.

## 1.3 RELATED REQUIREMENTS

Section 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS applies to this section, with the additions and modifications specified herein.

## 1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

### SD-02 Shop Drawings

Panelboards; G

Transformers; G

Cable Trays; G

Wireways; G

Marking Strips Drawings; G

### SD-03 Product Data

Receptacles; G

## 1.5 QUALITY ASSURANCE

### 1.5.1 Fuses

Submit coordination data as specified in paragraph, FUSES of this section.

### 1.5.2 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with NFPA 70 unless more stringent requirements are specified or indicated. NECA NEIS 1 shall be considered the minimum standard for workmanship.

### 1.5.3 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship and:

- a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.
- b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.
- c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

The contractor is responsible for implementing protective device settings as recommended by the System Coordination Study 26 05 73 POWER SYSTEM STUDIES. Where protective devices require a programming tool or cord the contractor is responsible for providing such equipment.

#### 1.5.3.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

#### 1.5.3.2 Material and Equipment Manufacturing Date

Products manufactured more than 3 years prior to date of delivery to site are not acceptable.

## 1.6 MAINTENANCE

### 1.6.1 Electrical Systems

Submit operation and maintenance data in accordance with Section 01 78 23, OPERATION AND MAINTENANCE DATA and as specified herein. Submit operation

and maintenance manuals for electrical systems that provide basic data relating to the design, operation, and maintenance of the electrical distribution system for the building. Include the following:

- a. Single line diagram of the "as-built" building electrical system.
- b. Schematic diagram of electrical control system (other than HVAC, covered elsewhere).
- c. Manufacturers' operating and maintenance manuals on active electrical equipment.

#### 1.7 WARRANTY

Provide equipment items supported by service organizations that are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

#### 1.8 SEISMIC REQUIREMENTS

Provide seismic details conforming to SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT.

### PART 2 PRODUCTS

#### 2.1 MATERIALS AND EQUIPMENT

As a minimum, meet requirements of UL, where UL standards are established for those items, and requirements of NFPA 70 for all materials, equipment, and devices.

#### 2.2 CONDUIT AND FITTINGS

Conform to the following:

##### 2.2.1 Rigid Metallic Conduit

###### 2.2.1.1 Rigid, Threaded Zinc-Coated Steel Conduit

ANSI C80.1, UL 6.

##### 2.2.2 Rigid Nonmetallic Conduit

PVC Type EPC-40 and EPC-80 in accordance with NEMA TC 2, UL 651, or fiberglass conduit, in accordance with NEMA TC 14.

##### 2.2.3 Intermediate Metal Conduit (IMC)

UL 1242, zinc-coated steel only.

##### 2.2.4 Electrical, Zinc-Coated Steel Metallic Tubing (EMT)

UL 797, ANSI C80.3.

##### 2.2.5 Plastic-Coated Rigid Steel and IMC Conduit

NEMA RN 1, Type 40( 40 mils thick).

#### 2.2.6 Flexible Metal Conduit

UL 1, limited to 6 feet.

##### 2.2.6.1 Liquid-Tight Flexible Metal Conduit, Steel

UL 360, limited to 6 feet.

#### 2.2.7 Fittings for Metal Conduit, EMT, and Flexible Metal Conduit

UL 514B. Ferrous fittings: cadmium- or zinc-coated in accordance with UL 514B.

##### 2.2.7.1 Fittings for Rigid Metal Conduit and IMC

Threaded-type. Split couplings unacceptable.

##### 2.2.7.2 Fittings for EMT

Steel compression type.

#### 2.2.8 Fittings for Rigid Nonmetallic Conduit

NEMA TC 3 for PVC and NEMA TC 14 for fiberglass, and UL 514B.

#### 2.2.9 Liquid-Tight Flexible Nonmetallic Conduit

UL 1660.

### 2.3 CABLE TRAYS

NEMA VE 2. Provide the following:

Submit cable tray design, including dimensional layout, load and seismic calculations, and fill calculations. Dimensional layout includes cable spacings, cable tray splices, and supports. Fill calculations include an index of cables for each section and identification of the lb/ft, cross sectional area, and insulation voltage class for each cable.

- a. Cable trays: form a wireway system, with a nominal depth as indicated. Cable tray is to have a span/load class per NEMA VE 2.
- b. Cable trays: constructed of fiberglass.
- c. Cable trays: include splice and end plates, dropouts, and miscellaneous hardware.
- d. Edges, fittings, and hardware: finished free from burrs and sharp edges.
- e. Fittings: ensure not less than load-carrying ability of straight tray sections and have manufacturer's minimum standard radius.
- f. Radius of bends: as indicated.

##### 2.3.1 Trough-Type Cable Trays

Provide size as indicated. Cable tray must be suitable for use as an equipment grounding conductor.

### 2.3.2 Ladder-Type Cable Trays

Provide size as indicated Cable tray must be suitable for use as an equipment grounding conductor.

### 2.3.3 Channel-Type Cable Trays

Provide size as indicated Cable tray must be suitable for use as an equipment grounding conductor.

### 2.3.4 Solid Bottom-Type Cable Trays

Provide size as indicated Provide solid covers.

## 2.4 OUTLET BOXES AND COVERS

UL 514A, cadmium- or zinc-coated, if ferrous metal. UL 514C, if nonmetallic.

### 2.4.1 Floor Outlet Boxes

Provide the following:

- a. Boxes: adjustable and concrete tight.
- b. Each outlet: consisting of cast-metal body with threaded openings, for conduits,, and cover plate with 3/4 inch threaded plug.
- d. Receptacle outlets: consisting of surface-mounted aluminum or stainless steel housing with duplex-type receptacle as specified herein.
- e. Provide gaskets where necessary to ensure watertight installation.
- f. Provide plugs with installation instructions to the Contracting Officer for 5 percent of outlet boxes for the capping of outlets upon removal of service fittings.

## 2.5 CABINETS, JUNCTION BOXES, AND PULL BOXES

UL 50; volume greater than 100 cubic inches, NEMA Type 1 enclosure; sheet steel, hot-dip, zinc-coated. Where exposed to wet, damp, or corrosive environments, NEMA Type 4X.

## 2.6 WIRES AND CABLES

Provide wires and cables in accordance applicable requirements of NFPA 70 and UL for type of insulation, jacket, and conductor specified or indicated. Do not use wires and cables manufactured more than 24 months prior to date of delivery to site.

### 2.6.1 Conductors

Provide the following:

- a. Conductor sizes and capacities shown are based on copper, unless indicated otherwise.

- b. Conductors No. 8 AWG and larger diameter: stranded.
- c. Conductors No. 10 AWG and smaller diameter: solid.
- d. Conductors for remote control, alarm, and signal circuits, classes 1, 2, and 3: stranded unless specifically indicated otherwise.
- e. All conductors: copper.

#### 2.6.1.1 Equipment Manufacturer Requirements

When manufacturer's equipment requires copper conductors at the terminations or requires copper conductors to be provided between components of equipment, provide copper conductors or splices, splice boxes, and other work required to satisfy manufacturer's requirements.

#### 2.6.2 Color Coding

Provide color coding for service, feeder, branch, control, and signaling circuit conductors.

##### 2.6.2.1 Ground and Neutral Conductors

Provide color coding of ground and neutral conductors as follows:

- a. Grounding conductors: Green.
- b. Neutral conductors: White.
- c. Exception, where neutrals of more than one system are installed in same raceway or box, other neutrals color coding: white with a different colored (not green) stripe for each.

##### 2.6.2.2 Ungrounded Conductors

Provide color coding of ungrounded conductors in different voltage systems as follows:

- a. 208/120 volt, three-phase
  - (1) Phase A - black
  - (2) Phase B - red
  - (3) Phase C - blue
- b. 480/277 volt, three-phase
  - (1) Phase A - brown
  - (2) Phase B - orange
  - (3) Phase C - yellow
- c. 120/240 volt, single phase: Black and red
- d. On three-phase, four-wire delta system, high leg: orange, as required by NFPA 70.

### 2.6.3 Insulation

Unless specified or indicated otherwise or required by NFPA 70, provide power and lighting branch wires rated for 600-volts, Type THWN/THHN conforming to UL 83 feeders 60 amps and greater Type XHHW conforming to UL 44, except that grounding wire may be type TW conforming to UL 83; remote-control and signal circuits: Type TW or TF, conforming to UL 83. Where equipment or devices require 90-degree Centigrade (C) conductors, provide only conductors with 90-degree C insulation or better.

### 2.6.4 Bonding Conductors

ASTM B1, solid bare copper wire for sizes No. 8 AWG and smaller diameter; , Class B, stranded bare copper wire for sizes No. 6 AWG and larger diameter.

### 2.6.5 Service Entrance Cables

Service Entrance (SE) and Underground Service Entrance (USE) Cables, UL 854.

### 2.6.6 Nonmetallic Sheathed Cable

UL 719, Type NM or NMC.

### 2.6.7 Wire and Cable for 400 Hertz (Hz) Circuits

Insulated copper conductors.

### 2.6.8 Metal-Clad Cable

UL 1569; NFPA 70, Type MC cable.

### 2.6.9 Cord Sets and Power-Supply Cords

UL 817.

## 2.7 SPLICES AND TERMINATION COMPONENTS

UL 486A-486B for wire connectors and UL 510 for insulating tapes. Connectors for No. 10 AWG and smaller diameter wires: insulated, pressure-type in accordance with UL 486A-486B or UL 486C (twist-on splicing connector). Provide solderless terminal lugs on stranded conductors.

## 2.8 DEVICE PLATES

Provide the following:

- a. UL listed, one-piece device plates for outlets to suit the devices installed.
- b. For metal outlet boxes, plates on unfinished walls: zinc-coated sheet steel or cast metal having round or beveled edges.
- c. Screws: machine-type with countersunk heads in color to match finish of plate.
- d. Sectional type device plates are not be permitted.

- e. Plates installed in wet locations: gasketed and UL listed for "wet locations."

## 2.9 SWITCHES

### 2.9.1 Toggle Switches

NEMA WD 1, UL 20, single pole mounting strap with grounding screw. Include the following:

- a. Handles: gray thermoplastic.
- b. Wiring terminals: screw-type, side-wired or of the solderless pressure type having suitable conductor-release arrangement.
- c. Contacts: silver-cadmium and contact arm - one-piece copper alloy.
- d. Switches: rated quiet-type ac only, 120/277 volts, with current rating and number of poles indicated.

### 2.9.2 Switch with Red Pilot Handle

NEMA WD 1. Provide the following:

- a. Pilot lights that are integrally constructed as a part of the switch's handle.
- b. Pilot light color: red and illuminate whenever the switch is closed or "on".
- c. Pilot lighted switch: rated 20 amps and 120 volts or 277 volts as indicated.
- d. The circuit's neutral conductor to each switch with a pilot light.

### 2.9.3 Breakers Used as Switches

For 120- and 277-Volt fluorescent fixtures, mark breakers "SWD" in accordance with UL 489.

### 2.9.4 Disconnect Switches

NEMA KS 1. Provide heavy duty-type switches where indicated, where switches are rated higher than 240 volts, and for double-throw switches. Utilize Class R fuseholders and fuses for fused switches, unless indicated otherwise. Provide horsepower rated for switches serving as the motor-disconnect means. Provide switches in NEMA 4X enclosure as indicated per NEMA ICS 6.

## 2.10 FUSES

NEMA FU 1. Provide complete set of fuses for each fusible switch. Coordinate time-current characteristics curves of fuses serving motors or connected in series with circuit breakers or other circuit protective devices for proper operation. Submit coordination data for approval. Provide fuses with a voltage rating not less than circuit voltage.

#### 2.10.1 Fuseholders

Provide in accordance with UL 4248-1.

#### 2.10.2 Cartridge Fuses, Current Limiting Type (Class R)

UL 248-12, Class RK-5 time-delay type. Provide only Class R associated fuseholders in accordance with UL 4248-12.

#### 2.10.3 Cartridge Fuses, High-Interrupting Capacity, Current Limiting Type (Classes J, L, and CC)

UL 248-8, UL 248-10, UL 248-4, Class J for zero to 600 amperes, Class L for 601 to 6,000 amperes, and Class CC for zero to 30 amperes.

#### 2.10.4 Cartridge Fuses, Current Limiting Type (Class T)

UL 248-15, Class T for zero to 1,200 amperes, 300 volts; and zero to 800 amperes, 600 volts.

### 2.11 RECEPTACLES

Provide the following:

- a. UL 498, general purpose specification grade, grounding-type. Residential grade receptacles are not acceptable.
- b. Ratings and configurations: as indicated.
- c. Bodies: gray as per NEMA WD 1.
- d. Face and body: thermoplastic supported on a metal mounting strap.
- e. Dimensional requirements: per NEMA WD 6.
- f. Screw-type, side-wired wiring terminals or of the solderless pressure type having suitable conductor-release arrangement.
- g. Grounding pole connected to mounting strap.
- h. The receptacle: containing triple-wipe power contacts and double or triple-wipe ground contacts.
- i. Controlled receptacles: as required per ASHRAE 90.1. Provide marking for controlled receptacle per NFPA 70.

#### 2.11.1 Weatherproof Receptacles

Provide receptacles, UL listed for use in "wet locations" with integral GFCI protection. Include cast metal box with gasketed, hinged, lockable and weatherproof while-in-use, polycarbonate, UV resistant/stabilized extra-duty rated hood.

#### 2.11.2 Ground-Fault Circuit Interrupter Receptacles

UL 943, duplex type for mounting in standard outlet box. Provide device capable of detecting current leak when the current to ground is 6 milliamperes or higher, and tripping per requirements of UL 943 for Class A ground-fault circuit interrupter devices. Provide screw-type,

side-wired wiring terminals or pre-wired (pigtail) leads.

### 2.11.3 Special Purpose Receptacles

Receptacles serving are special purpose. Provide in ratings indicated. Furnish one matching plug with each receptacle.

## 2.12 PANELBOARDS

Provide panelboards in accordance with the following:

- a. UL 67 and UL 50 having a short-circuit current rating as indicated.
- b. Panelboards for use as service disconnecting means: additionally conform to UL 869A.
- c. Panelboards: circuit breaker-equipped.
- d. Designed such that individual breakers can be removed without disturbing adjacent units or without loosening or removing supplemental insulation supplied as means of obtaining clearances as required by UL.
- e. "Specific breaker placement" is required in panelboards to match the breaker placement indicated in the panelboard schedule on the design drawings. If it is not possible to match "specific breaker placement" during construction, obtain Government approval prior to device installation.
- f. Use of "Subfeed Breakers" is not acceptable.
- g. Main breaker: "separately" mounted "above" branch breakers.
- h. Where "space only" is indicated, make provisions for future installation of breakers.
- i. Directories: indicate load served by each circuit in panelboard.
- j. Directories: indicate source of service to panelboard (e.g., Panel PA served from Panel MDP).
- k. Provide new directories for existing panels modified by this project as indicated.
- l. Type directories and mount in holder behind transparent protective covering.
- m. Panelboards: listed and labeled for their intended use.
- n. Panelboard nameplates: provided in accordance with paragraph FIELD FABRICATED NAMEPLATES.

### 2.12.1 Enclosure

Provide panelboard enclosure in accordance with the following:

- a. UL 50.
- b. Cabinets mounted outdoors surface on unistrut .

- c. Cabinets: painted in accordance with paragraph FIELD APPLIED PAINTING.
- d. Outdoor cabinets: NEMA 4X a removable steel plate 1/4 inch thick in the bottom for field drilling for conduit connections.
- e. Front edges of cabinets: form-flanged or fitted with structural shapes welded or riveted to the sheet steel, for supporting the panelboard front.
- f. All cabinets: fabricated such that no part of any surface on the finished cabinet deviates from a true plane by more than 1/8 inch.
- g. Holes: provided in the back of indoor surface-mounted cabinets, with outside spacers and inside stiffeners, for mounting the cabinets with a 1/2 inch clear space between the back of the cabinet and the wall surface.
- h. Flush doors: mounted on hinges that expose only the hinge roll to view when the door is closed.
- i. Each door: fitted with a combined catch and lock latch.
- j. Keys: two provided with each lock, with all locks keyed alike.
- k. Finished-head cap screws: provided for mounting the panelboard fronts on the cabinets.

#### 2.12.2 Panelboard Buses

Support bus bars on bases independent of circuit breakers. Design main buses and back pans so that breakers may be changed without machining, drilling, or tapping. Provide isolated neutral bus in each panel for connection of circuit neutral conductors. Provide separate ground bus identified as equipment grounding bus per UL 67 for connecting grounding conductors; bond to steel cabinet.

#### 2.12.3 Circuit Breakers

UL 489, solid state-type having a minimum short-circuit current rating equal to the short-circuit current rating of the panelboard in which the circuit breaker will be mounted. Breaker terminals: UL listed as suitable for type of conductor provided. Where indicated on the drawings, provide circuit breakers with shunt trip devices. Series rated circuit breakers and plug-in circuit breakers are unacceptable.

##### 2.12.3.1 Multipole Breakers

Provide common trip-type with single operating handle. Design breaker such that overload in one pole automatically causes all poles to open. Maintain phase sequence throughout each panel so that any three adjacent breaker poles are connected to Phases A, B, and C, respectively.

##### 2.12.3.2 Circuit Breaker With Ground-Fault Circuit Interrupter

UL 943 and NFPA 70. Provide with auto-monitoring (self-test) and lockout features, "push-to-test" button, visible indication of tripped condition, and ability to detect and trip when current imbalance is 6 milliamperes or higher per requirements of UL 943 for Class A ground-fault circuit

interrupter devices.

## 2.13 ENCLOSED CIRCUIT BREAKERS

UL 489. Individual molded case circuit breakers with voltage and continuous current ratings, number of poles, overload trip setting, and short circuit current interrupting rating as indicated. Enclosure type as indicated. Provide solid neutral.

## 2.14 TRANSFORMERS

Provide transformers in accordance with the following:

- a. NEMA ST 20, general purpose, dry-type, self-cooled, ventilated.
- b. Provide transformers in NEMA4X enclosure.
- c. Taps for transformers 15 kVA and larger: Two 2.5 percent taps Full Capacity Above Nominal (FCAN) and two 2.5 percent taps Full Capacity Below Nominal (FCBN).
- d. Transformer insulation system:
  - (1) 220 degrees C insulation system for transformers 15 kVA and greater, with temperature rise not exceeding 115 degrees C under full-rated load in maximum ambient of 40 degrees C.
- e. Transformer of 115 degrees C temperature rise: capable of carrying continuously 115 percent of nameplate kVA without exceeding insulation rating.
- f. Transformers: quiet type with maximum sound level at least 3 decibels less than NEMA standard level for transformer ratings indicated.

### 2.14.1 Specified Transformer Efficiency

Transformers, indicated and specified with: 480V primary, 80 degrees C or 115 degrees C temperature rise, kVA ratings of 37.5 to 100 for single phase or 30 to 500 for three phase, energy efficient type. The transformer is not acceptable if the calculated transformer efficiency is less than the efficiency indicated in 10 CFR 431, Subpart K.

### 2.14.2 K-Rated Transformers

Provide K-rated transformers for non-linear loads in accordance with the following:

- a. Transformer insulation: UL recognized 220 degrees C system. Neither the primary nor the secondary temperature is allowed to exceed 220 degrees C at any point in the coils while carrying their full rating of non-sinusoidal load.

- b. Transformers are to be UL listed and labeled for K-13 K-Factor rating as indicated in accordance with UL 1561.
- c. Transformers evaluated by the UL K-Factor evaluation: listed for 115 degrees C average temperature rise only.
- d. Transformers with K-Factor ratings with temperature rise of 150 degrees C rise are not acceptable.
- e. K-Factor rated transformers impedance: allowed range of 3 percent to 5 percent, with a minimum reactance of 2 percent to prevent excessive neutral current when supplying loads with large amounts of third harmonic.

## 2.15 MOTOR CONTROLLERS

Provide motor controllers in accordance with the following:

- a. UL 508, NEMA ICS 1, and NEMA ICS 2.
- b. Provide controllers with thermal overload protection in each phase, and one spare normally open auxiliary contact, and one spare normally closed auxiliary contact.
- c. Provide controllers for motors rated 1-hp 746 watts and above with electronic phase-voltage monitors designed to protect motors from phase-loss, undervoltage, and overvoltage.
- d. Provide protection for motors from immediate restart by a time adjustable restart relay.
- e. When used with pressure, float, or similar automatic-type or maintained-contact switch, provide a hand/off/automatic selector switch with the controller.
- f. Connections to selector switch: wired such that only normal automatic regulatory control devices are bypassed when switch is in "hand" position.
- g. Safety control devices, such as low and high pressure cutouts, high temperature cutouts, and motor overload protective devices: connected in motor control circuit in "hand" and "automatic" positions.
- h. Control circuit connections to hand/off/automatic selector switch or to more than one automatic regulatory control device: made in accordance with indicated or manufacturer's approved wiring diagram.
- i. Provide selector switch with the means for locking in any position.
- j. Provide a disconnecting means, capable of being locked in the open position, for the motor that is located in sight from the motor location and the driven machinery location. As an alternative, provide a motor controller disconnect, capable of being locked in the open position, to serve as the disconnecting means for the motor if it is in sight from the motor location and the driven machinery location.
- k. Overload protective devices: provide adequate protection to motor windings; be thermal inverse-time-limit type; and include manual reset-type pushbutton on outside of motor controller case.

- l. Cover of combination motor controller and manual switch or circuit breaker: interlocked with operating handle of switch or circuit breaker so that cover cannot be opened unless handle of switch or circuit breaker is in "off" position.
- m. Minimum short circuit withstand rating of combination motor controller: 65 KAIC rms symmetrical amperes.
- n. Provide controllers in hazardous locations with classifications as indicated.

#### 2.15.1 Control Wiring

Provide control wiring in accordance with the following:

- a. All control wire: stranded tinned copper switchboard wire with 600-volt flame-retardant insulation Type SIS meeting UL 44, or Type MTW meeting UL 1063, and passing the VW-1 flame tests included in those standards.
- b. Hinge wire: Class K stranding.
- c. Current transformer secondary leads: not smaller than No. 10 AWG.
- d. Control wire minimum size: No. 14 AWG.
- e. Power wiring for 480-volt circuits and below: the same type as control wiring with No. 12 AWG minimum size.
- f. Provide wiring and terminal arrangement on the terminal blocks to permit the individual conductors of each external cable to be terminated on adjacent terminal points.

#### 2.15.2 Control Circuit Terminal Blocks

Provide control circuit terminal blocks in accordance with the following:

- a. NEMA ICS 4.
- b. Control circuit terminal blocks for control wiring: molded or fabricated type with barriers, rated not less than 600 volts.
- c. Provide terminals with removable binding, fillister or washer head screw type, or of the stud type with contact and locking nuts.
- d. Terminals: not less than No. 10 in size with sufficient length and space for connecting at least two indented terminals for 10 AWG conductors to each terminal.
- e. Terminal arrangement: subject to the approval of the Contracting Officer with not less than four spare terminals or 10 percent, whichever is greater, provided on each block or group of blocks.
- f. Modular, pull apart, terminal blocks are acceptable provided they are of the channel or rail-mounted type.
- g. Submit data showing that any proposed alternate will accommodate the specified number of wires, are of adequate current-carrying capacity,

and are constructed to assure positive contact between current-carrying parts.

#### 2.15.2.1 Types of Terminal Blocks

- a. Short-Circuiting Type: Short-circuiting type terminal blocks: furnished for all current transformer secondary leads with provision for shorting together all leads from each current transformer without first opening any circuit. Terminal blocks: comply with the requirements of paragraph CONTROL CIRCUIT TERMINAL BLOCKS above.
- b. Load Type: Load terminal blocks rated not less than 600 volts and of adequate capacity: provided for the conductors for NEMA Size 3 and smaller motor controllers and for other power circuits, except those for feeder tap units. Provide terminals of either the stud type with contact nuts and locking nuts or of the removable screw type, having length and space for at least two indented terminals of the size required on the conductors to be terminated. For conductors rated more than 50 amperes, provide screws with hexagonal heads. Conducting parts between connected terminals must have adequate contact surface and cross-section to operate without overheating. Provide each connected terminal with the circuit designation or wire number placed on or near the terminal in permanent contrasting color.

#### 2.15.3 Control Circuits

Control circuits: maximum voltage of 120 volts derived from control transformer in same enclosure. Transformers: conform to UL 506, as applicable. Transformers, other than transformers in bridge circuits: provide primaries wound for voltage available and secondaries wound for correct control circuit voltage. Size transformers so that 80 percent of rated capacity equals connected load. Provide disconnect switch on primary side. Provide fuses in each ungrounded primary feeder. Provide one fused secondary lead with the other lead grounded.

#### 2.15.4 Enclosures for Motor Controllers

NEMA ICS 6.

#### 2.15.5 Multiple-Speed Motor Controllers and Reversible Motor Controllers

Across-the-line-type, electrically and mechanically interlocked. Multiple-speed controllers: include compelling relays and multiple-button, station-type with pilot lights for each speed.

#### 2.15.6 Pushbutton Stations

Provide with "start/stop" momentary contacts having one normally open and one normally closed set of contacts, and red lights to indicate when motor is running. Stations: heavy duty, oil-tight design.

#### 2.15.7 Pilot and Indicating Lights

Provide LED cluster lamps.

#### 2.16 MANUAL MOTOR STARTERS (MOTOR RATED SWITCHES)

Single pole designed for surface mounting with overload protection and pilot lights.

### 2.16.1 Pilot Lights

Provide yoke-mounted, seven element LED cluster light module. Color: green in accordance with NEMA ICS 2.

## 2.17 ELECTRICAL HEATING

This section includes material, equipment, and installation requirements for a complete electric heat trace system, including multi-loop control panel, heat trace cables, branch circuit wiring, temperature sensors, and all associated componenets.

A. Submit shop drawings for approval prior to ordering equipment. Include the following:

- a. Panel layout, internal wiring diagram, and circuit breaker schedule.
- b. Heat trace cable routing diagram with tag numbers and lengths
- c. RTD sensor locations and integration method
- d. Panel dimensions, mounting details, and nameplate schedule
- e. Commissioning checklist and test procedure.

B. Provide products listed and labeled by UL or other recognized testing agency.

C. Installation shall conform to NEC, UFC, and local authority requirements.

D. Provide manufacturer's standard warranty for all supplied heat trace system components.

### 2.17.1 Heat Trace Control Panel & Cables

A. Rating: 480/277V, 3-phase, 4-wire, 70A minimum main input.

B. Minimum twelve (12) branch circuits, each with individual protection

C. Features shall include:

- a. SCR control, PID mode or duty-cycle based
- b. Integrated RTD input, ambient or pipe sensing.
- c. Local touchscreen HMI interface.
- d. Ethernet or Modbus RTU communication.
- e. NEMA 4X enclosure.
- f. Built-in GFCI monitoring and alarming.

D. Provide self-regulating or constant wattage heat trace cable as approved by manufacturer.

E. Total of twelve (12) individual cable runs anticipated.

F. Cable shall be UL-listed and suitable for application environment.

G. Provide lighted end seal kits for each heat trace circuit. Kits shall visibly illuminate when the associated heat trace cable is energized. Light indicators shall be suitable for outdoor use and comply with the cable manufacturer's recommendations.

## 2.17.2 Installation & Commissioning

- A. Install panel, wiring, and cables per manufacturer's instructions and NEC Article 427.
- B. Provide separate branch circuit conduit and wiring from panel to each heat trace cable.
- C. Secure cables with fiberglass or manufacturer-approved tape only - zip ties not permitted.
- D. Install junction boxes, RTDs, and labels at all required locations
- E. Perform the following tests and verifications prior to acceptance
  - a. Insulation resistance testing (pre- and post-insulation).
  - b. Verify correct operation of SCR, alarms, GFCI, and setpoints.
  - c. Configure touchscreen HMI with labels and modes
  - d. Submit startup report including circuit loads, insulation tests, setpoints, and alarm testing.
- F. Notify Engineer five (5) business days prior to startup.
- G. Commissioning shall not be considered complete until all circuits function as intended and documentation is accepted by the Engineer.

## 2.18 GROUNDING AND BONDING EQUIPMENT

### 2.18.1 Ground Rods

UL 467. Ground rods: cone pointed copper-clad steel, with minimum diameter of 3/4 inch and minimum length 10 feet. Sectional type rods may be used for rods 20 feet or longer.

### 2.18.2 Ground Bus

Copper ground bus: provided in the electrical equipment rooms as indicated.

### 2.18.3 Secondary Bonding Busbar

Provide corrosion-resistant grounding busbar suitable for indoor installation in accordance with TIA-607. Busbars: plated for reduced contact resistance. If not plated, clean the busbar prior to fastening the conductors to the busbar and apply an anti-oxidant to the contact area to control corrosion and reduce contact resistance. . The Primary bonding busbar (PBB) and the Secondary bonding busbar (SBB): sized in accordance with the immediate application requirements and with consideration of future growth. Provide Secondary bonding busbars with the following:

- a. Predrilled copper busbar provided with holes for use with standard sized lugs,

- b. Minimum dimensions of 0.25 in thick by 4 in wide for the PBB and 2 in wide for SBBs with length as indicated;
- c. Listed by a nationally recognized testing laboratory.

#### 2.19 MANUFACTURER'S NAMEPLATE

Provide on each item of equipment a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

#### 2.20 FIELD FABRICATED NAMEPLATES

Provide field fabricated nameplates in accordance with the following:

- a. ASTM D709.
- b. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings.
- c. Each nameplate inscription: identify the function and, when applicable, the position.
- d. Nameplates: melamine plastic, 0.125 inch thick, white with black center core.
- e. Provide red laminated plastic label with white center core where indicated.
- f. Surface: matte finish. Corners: square. Accurately align lettering and engrave into the core.
- g. Minimum size of nameplates: one by 2.5 inches.
- h. Lettering size and style: a minimum of 0.25 inch high normal block style.

#### 2.21 WARNING SIGNS

Provide warning signs for flash protection in accordance with NFPA 70E for switchboards, panelboards, industrial control panels, and motor control centers that are in other than dwelling occupancies and are likely to require examination, adjustment, servicing, or maintenance while energized. Provide field installed signs to warn qualified persons of potential electric arc flash hazards when warning signs are not provided by the manufacturer. Provide marking that is clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

#### 2.22 FIRESTOPPING MATERIALS

Provide firestopping around electrical penetrations in accordance with Section 07 84 00 FIRESTOPPING.

#### 2.23 WIREWAYS

UL 870. Material: steel epoxy painted 16 gauge for heights and depths up

to 6 by 6 inches, and 14 gauge for heights and depths up to 12 by 12 inches. Provide in length indicated required for the application with hinged-screw-cover NEMA 4X enclosure per NEMA ICS 6.

## 2.24 SURGE PROTECTIVE DEVICES

Provide parallel type surge protective devices (SPD) which comply with UL 1449 at the , panelboards. Provide surge protectors in a NEMA 4X enclosure per NEMA ICS 6. Do not install SPD inside a panelboard or switchboard enclosure. However, SPD may be installed in a separate compartment of a switchgear provided that it is supplied by a dedicated circuit breaker. SPD must have the same short-circuit current rating as the protected equipment and must not be installed at a point of system where the available fault current is in excess of that rating. Use Type 1 or Type 2 SPD and connect on the load side of a dedicated circuit breaker. Submit performance and characteristic curves.

Provide the following modes of protection:

### FOR SINGLE PHASE AND THREE PHASE WYE CONNECTED SYSTEMS-

- Phase to phase ( L-L )
- Each phase to neutral ( L-N )
- Neutral to ground ( N-G )
- Phase to ground ( L-G )

SPDs at the service entrance: provide with a minimum surge current rating of 80,000 amperes for L-L mode minimum and 40,000 amperes for other modes (L-N, L-G, and N-G) and downstream SPDs rated 40,000 amperes for L-L mode minimum and 20,000 amperes for other modes (L-N, L-G, and N-G).

The minimum MCOV (Maximum Continuous Operating Voltage) rating for L-N and L-G modes of operation: 120 percent of nominal voltage for 240 volts and below; 115 percent of nominal voltage above 240 volts to 480 volts.

Provide EMI/RFI filtering per UL 1283 for each mode with the capability to attenuate high frequency noise. Minimum attenuation: 20db.

## 2.25 FACTORY APPLIED FINISH

Provide factory-applied finish on electrical equipment in accordance with the following:

- a. NEMA 250 corrosion-resistance test and the additional requirements as specified herein.
- b. Interior and exterior steel surfaces of equipment enclosures: thoroughly cleaned followed by a rust-inhibitive phosphatizing or equivalent treatment prior to painting.
- c. Exterior surfaces: free from holes, seams, dents, weld marks, loose scale or other imperfections.
- d. Interior surfaces: receive not less than one coat of corrosion-resisting paint in accordance with the manufacturer's standard practice.
- e. Exterior surfaces: primed, filled where necessary, and given not less

than two coats baked enamel with semigloss finish.

- f. Equipment located indoors: ANSI Light Gray, and equipment located outdoors: ANSI Light Gray.
- g. Provide manufacturer's coatings for touch-up work and as specified in paragraph FIELD APPLIED PAINTING.

## 2.26 SOURCE QUALITY CONTROL

### 2.26.1 Transformer Factory Tests

Submittal: include routine NEMA ST 20 transformer test results on each transformer and also provide the results of NEMA "design" and "prototype" tests that were made on transformers electrically and mechanically equal to those specified.

## 2.27 COORDINATED POWER SYSTEM PROTECTION

Prepare analyses as specified in Section 26 05 73 POWER SYSTEM STUDIES.

## PART 3 EXECUTION

### 3.1 INSTALLATION

Electrical installations, including weatherproof and hazardous locations and ducts, plenums and other air-handling spaces: conform to requirements of NFPA 70 and to requirements specified herein.

#### 3.1.1 Underground Service

Underground service conductors and associated conduit: continuous from service entrance equipment to outdoor power system connection.

#### 3.1.2 Hazardous Locations

Perform work in hazardous locations, as defined by NFPA 70, in strict accordance with NFPA 70 for particular "Class," "Division," and "Group" of hazardous locations involved. Provide conduit and cable seals where required by NFPA 70. Provide conduit with tapered threads.

#### 3.1.3 Service Entrance Identification

Service entrance disconnect devices, switches, and enclosures: labeled and identified as such.

##### 3.1.3.1 Labels

Wherever work results in service entrance disconnect devices in more than one enclosure, as permitted by NFPA 70, label each enclosure, new and existing, as one of several enclosures containing service entrance disconnect devices. Label, at minimum: indicate number of service disconnect devices housed by enclosure and indicate total number of enclosures that contain service disconnect devices. Provide laminated plastic labels conforming to paragraph FIELD FABRICATED NAMEPLATES. Use lettering of at least 0.25 inch in height, and engrave on black-on-white matte finish. Service entrance disconnect devices in more than one enclosure: provided only as permitted by NFPA 70.

#### 3.1.4 Wiring Methods

Provide insulated conductors installed in rigid steel conduit, IMC, rigid nonmetallic conduit, or EMT, except where specifically indicated or specified otherwise or required by NFPA 70 to be installed otherwise. Grounding conductor: separate from electrical system neutral conductor. Provide insulated green equipment grounding conductor for circuit(s) installed in conduit and raceways. Shared neutral, or multi-wire branch circuits, are not permitted with arc-fault circuit interrupters. Minimum conduit size: 1/2 inch in diameter for low voltage lighting and power circuits. Vertical distribution in multiple story buildings: made with metal conduit in fire-rated shafts, with metal conduit extending through shafts for minimum distance of 6 inches. Firestop conduit which penetrates fire-rated walls, fire-rated partitions, or fire-rated floors in accordance with Section 07 84 00 FIRESTOPPING.

##### 3.1.4.1 Pull Wire

Install pull wires in empty conduits. Pull wire: plastic having minimum 200-pound force tensile strength. Leave minimum 36 inches of slack at each end of pull wire.

##### 3.1.4.2 Metal-Clad Cable

Install in accordance with NFPA 70, Type MC cable.

#### 3.1.5 Conduit Installation

Unless indicated otherwise, conceal conduit under floor slabs and within finished walls, ceilings, and floors. Keep conduit minimum 6 inches away from parallel runs of flues and steam or hot water pipes. Install conduit parallel with or at right angles to ceilings, walls, and structural members where located above accessible ceilings and where conduit will be visible after completion of project. Run conduits in crawl space under floor slab as if exposed.

##### 3.1.5.1 Restrictions Applicable to Aluminum Conduit

- a. Do not install underground or encase in concrete or masonry.
- b. Do not use brass or bronze fittings.
- c. Do not use when the enclosed conductors must be shielded from the effects of High-altitude Electromagnetic Pulse (HEMP).

##### 3.1.5.2 Restrictions Applicable to EMT

- a. Do not install underground.
- b. Do not encase in concrete, mortar, grout, or other cementitious materials.
- c. Do not use in areas subject to physical damage including but not limited to equipment rooms where moving or replacing equipment could physically damage the EMT.
- d. Do not use in hazardous areas.
- e. Do not use outdoors.

- f. Do not use in fire pump rooms.
- g. Do not use when the enclosed conductors must be shielded from the effects of High-altitude Electromagnetic Pulse (HEMP).

#### 3.1.5.3 Restrictions Applicable to Nonmetallic Conduit

##### a. PVC Schedule 40.

- (1) Do not use where subject to physical damage, including but not limited to, mechanical equipment rooms, electrical equipment rooms, fire pump rooms, and where restrictions are applying to both PVC Schedule 40 and PVC Schedule 80.
- (2) Do not use above grade, except where allowed in this section for rising through floor slab or indicated otherwise.

##### b. PVC Schedule 80.

- (1) Do not use where subject to physical damage, including but not limited to, hospitals, power plant, missile magazines, and other such areas.
- (2) Do not use in hazardous (classified) areas.
- (3) Do not use in penetrating fire-rated walls or partitions, or fire-rated floors.

#### 3.1.5.4 Restrictions Applicable to Flexible Conduit

Use only as specified in paragraph FLEXIBLE CONNECTIONS. Do not use when the enclosed conductors must be shielded from the effects of High-altitude Electromagnetic Pulse (HEMP).

#### 3.1.5.5 Underground Conduit

Plastic-coated rigid steel; plastic-coated steel IMC; PVC, Type EPC-40; or fiberglass. Convert nonmetallic conduit, to plastic-coated rigid, steel conduit before rising through floor slab. Plastic coating: extend minimum 6 inches above floor.

#### 3.1.5.6 Conduit for Circuits Rated Greater Than 600 Volts

Rigid metal conduit or IMC only.

#### 3.1.5.7 Stub-Ups

Provide conduits stubbed up through concrete floor for connection to free-standing equipment with adjustable top or coupling threaded inside for plugs, set flush with finished floor. Extend conductors to equipment in rigid steel conduit, except that flexible metal conduit may be used 6 inches above floor. Where no equipment connections are made, install screwdriver-operated threaded flush plugs in conduit end.

#### 3.1.5.8 Conduit Support

Support conduit by pipe straps, wall brackets, threaded rod conduit hangers, or ceiling trapeze. Plastic cable ties are not acceptable.

Fasten by wood screws to wood; by toggle bolts on hollow masonry units; by concrete inserts or expansion bolts on concrete or brick; and by machine screws, welded threaded studs, or spring-tension clamps on steel work. Threaded C-clamps may be used on rigid steel conduit only. Do not weld conduits or pipe straps to steel structures. Do not exceed one-fourth proof test load for load applied to fasteners. Provide vibration resistant and shock-resistant fasteners attached to concrete ceiling. Do not cut main reinforcing bars for any holes cut to depth of more than 1 1/2 inches in reinforced concrete beams or to depth of more than 3/4 inch in concrete joints. Fill unused holes. In partitions of light steel construction, use sheet metal screws. In suspended-ceiling construction, run conduit above ceiling. Do not support conduit by ceiling support system. Conduit and box systems: supported independently of both (a) tie wires supporting ceiling grid system, and (b) ceiling grid system into which ceiling panels are placed. Do not share supporting means between electrical raceways and mechanical piping or ducts. Identify independent conduit support in both fire and non-fire rated assemblies per NFPA 70. Coordinate installation with above-ceiling mechanical systems to assure maximum accessibility to all systems. Spring-steel fasteners may be used for lighting branch circuit conduit supports in suspended ceilings in dry locations. Support exposed risers in wire shafts of multistory buildings by U-clamp hangers at each floor level and at 10 foot maximum intervals. Where conduit crosses building expansion joints, provide suitable watertight expansion fitting that maintains conduit electrical continuity by bonding jumpers or other means. For conduits greater than 2 1/2 inches inside diameter, provide supports to resist forces of 0.5 times the equipment weight in any direction and 1.5 times the equipment weight in the downward direction.

#### 3.1.5.9 Directional Changes in Conduit Runs

Make changes in direction of runs with symmetrical bends or cast-metal fittings. Make field-made bends and offsets with hickey or conduit-bending machine. Do not install crushed or deformed conduits. Avoid trapped conduits. Prevent plaster, dirt, or trash from lodging in conduits, boxes, fittings, and equipment during construction. Free clogged conduits of obstructions.

#### 3.1.5.10 Locknuts and Bushings

Fasten conduits to sheet metal boxes and cabinets with two locknuts where required by NFPA 70, where insulated bushings are used, and where bushings cannot be brought into firm contact with the box; otherwise, use at least minimum single locknut and bushing. Provide locknuts with sharp edges for digging into wall of metal enclosures. Install bushings on ends of conduits, and provide insulating type where required by NFPA 70.

#### 3.1.5.11 Flexible Connections

Provide flexible steel conduit between 3 and 6 feet in length; for equipment subject to vibration, noise transmission, or movement; and for motors. Install flexible conduit to allow 20 percent slack. Minimum flexible steel conduit size: 1/2 inch diameter. Provide liquid tight flexible nonmetallic conduit in wet and damp locations for equipment subject to vibration, noise transmission, movement or motors. Provide separate ground conductor across flexible connections. Plastic cable ties are not acceptable as a support method.

### 3.1.6 Cable Tray Installation

Install and ground in accordance with NFPA 70. Install cable trays parallel with or at right angles to ceilings, walls, and structural members. Cable tray and tray supports must not partially nor completely obstruct access to the room. Support in accordance with NEMA VE 2 and with manufacturer recommendations. Coat contact surfaces of aluminum connections with an antioxidant compound prior to assembly. Adjacent cable tray sections: bonded together by connector plates of an identical type as the cable tray sections. For grounding of cable tray system provide No. 2 AWG bare copper wire throughout cable tray system, and bond to each section, except use No. 1/0 aluminum wire if cable tray is aluminum. Terminate cable trays 10 inches from both sides of smoke and fire partitions. Install conductors run through smoke and fire partitions in 4 inch rigid steel conduits with grounding bushings, extending 12 inches beyond each side of partitions. Seal conduit on both ends to maintain smoke and fire ratings of partitions. Firestop penetrations in accordance with Section 07 84 00, FIRESTOPPING. Provide supports to resist forces of 0.5 times the equipment weight in any direction and 1.5 times the equipment weight in the downward direction.

### 3.1.7 Boxes, Outlets, and Supports

Provide boxes in wiring and raceway systems wherever required for pulling of wires, making connections, and mounting of devices or fixtures. Boxes for metallic raceways: cast-metal, hub-type when located in wet locations, when surface mounted on outside of exterior surfaces, when surface mounted on interior walls exposed up to 7 feet above floors and walkways, or when installed in hazardous areas and when specifically indicated. Boxes in other locations: sheet steel, except that aluminum boxes may be used with aluminum conduit, and nonmetallic boxes may be used with nonmetallic sheathed cable conduit system. Provide each box with volume required by NFPA 70 for number of conductors enclosed in box. Boxes for mounting lighting fixtures: minimum 4 inches square, or octagonal, except that smaller boxes may be installed as required by fixture configurations, as approved. Boxes for use in masonry-block or tile walls: square-cornered, tile-type, or standard boxes having square-cornered, tile-type covers. Provide gaskets for cast-metal boxes installed in wet locations and boxes installed flush with outside of exterior surfaces. Provide separate boxes for flush or recessed fixtures when required by fixture terminal operating temperature; provide readily removable fixtures for access to boxes unless ceiling access panels are provided. Support boxes and pendants for surface-mounted fixtures on suspended ceilings independently of ceiling supports. Fasten boxes and supports with wood screws on wood, with bolts and expansion shields on concrete or brick, with toggle bolts on hollow masonry units, and with machine screws or welded studs on steel. Threaded studs driven in by powder charge and provided with lock washers and nuts or nail-type nylon anchors may be used in lieu of wood screws, expansion shields, or machine screws. In open overhead spaces, cast boxes threaded to raceways need not be separately supported except where used for fixture support; support sheet metal boxes directly from building structure or by bar hangers. Where bar hangers are used, attach bar to raceways on opposite sides of box, and support raceway with approved-type fastener maximum 24 inches from box. When penetrating reinforced concrete members, avoid cutting reinforcing steel.

#### 3.1.7.1 Boxes

Boxes for use with raceway systems: minimum 1 1/2 inches deep, except where shallower boxes required by structural conditions are approved. Boxes for other than lighting fixture outlets: minimum 4 inches square, except that 4 by 2 inch boxes may be used where only one raceway enters outlet.

#### 3.1.7.2 Pull Boxes

Construct of at least minimum size required by NFPA 70 of code-gauge galvanized sheet steel, and compatible with nonmetallic raceway systems, except where cast-metal boxes are required in locations specified herein. Provide boxes with screw-fastened covers. Where several feeders pass through common pull box, tag feeders to indicate clearly electrical characteristics, circuit number, and panel designation.

#### 3.1.7.3 Extension Rings

Extension rings are not permitted for new construction. Use only on existing boxes in concealed conduit systems where wall is furred out for new finish.

#### 3.1.8 Mounting Heights

Mount panelboards, enclosed circuit breakers, motor controller and disconnecting switches so height of center of grip of the operating handle of the switch or circuit breaker at its highest position is maximum 79 inches above floor or working platform or as allowed in Section 404.8 per NFPA 70. Mount lighting switches 48 inches above finished floor. Mount receptacles and telecommunications outlets 18 inches above finished floor, unless otherwise indicated.. Mount other devices as indicated.. Measure mounting heights of receptacle outlet boxes in the to the bottom of the outlet box.

#### 3.1.9 Conductor Identification

Provide conductor identification within each enclosure where tap, splice, or termination is made. For conductors No. 6 AWG and smaller diameter, provide color coding by factory-applied, color-impregnated insulation. For conductors No. 4 AWG and larger diameter, provide color coding by plastic-coated, self-sticking markers; colored nylon cable ties and plates; or heat shrink-type sleeves. manufacturer's recommendations.

##### 3.1.9.1 Marking Strips

Provide marking strips for identification of power distribution, control, data, and communications cables in accordance with the following:

- a. Provide white or other light-colored plastic marking strips, fastened by screws to each terminal block, for wire designations.
- b. Use permanent ink for the wire numbers
- c. Provide reversible marking strips to permit marking both sides, or provide two marking strips with each block.
- d. Size marking strips to accommodate the two sets of wire numbers.

- e. Assign a device designation in accordance with NEMA ICS 1 to each device to which a connection is made. Mark each device terminal to which a connection is made with a distinct terminal marking corresponding to the wire designation used on the Contractor's schematic and connection diagrams.
- f. The wire (terminal point) designations used on the Contractor's wiring diagrams and printed on terminal block marking strips may be according to the Contractor's standard practice; however, provide additional wire and cable designations for identification of remote (external) circuits for the Government's wire designations.
- g. Prints of the marking strips drawings submitted for approval will be so marked and returned to the Contractor for addition of the designations to the terminal strips and tracings, along with any rearrangement of points required.

#### 3.1.10 Splices

Make splices in accessible locations. Make splices in conductors No. 10 AWG and smaller diameter with insulated, pressure-type connector. Make splices in conductors No. 8 AWG and larger diameter with solderless connector, and cover with insulation material equivalent to conductor insulation.

#### 3.1.11 Terminating Aluminum Conductors

#### 3.1.12 Covers and Device Plates

Install with edges in continuous contact with finished wall surfaces without use of mats or similar devices. Plaster fillings are not permitted. Install plates with alignment tolerance of 1/16 inch. Use of sectional-type device plates are not permitted. Provide gasket for plates installed in wet locations.

#### 3.1.13 Electrical Penetrations

Seal openings around electrical penetrations through fire resistance-rated walls, partitions, floors, or ceilings in accordance with Section 07 84 00 FIRESTOPPING.

#### 3.1.14 Grounding and Bonding

Provide in accordance with NFPA 70. Ground exposed, non-current-carrying metallic parts of electrical equipment, metallic raceway systems, grounding conductor in metallic and nonmetallic raceways, system grounds, grounding conductor of nonmetallic sheathed cables, and neutral conductor of wiring systems. Make ground connection at main service equipment, and extend grounding conductor to point of entrance of metallic water service. Make connection to water pipe by suitable ground clamp or lug connection to plugged tee. If flanged pipes are encountered, make connection with lug bolted to street side of flanged connection. Supplement metallic water service grounding system with additional made electrode in compliance with NFPA 70. Make ground connection to driven ground rods on exterior of building. Bond additional driven rods together with a minimum of 4 AWG soft bare copper wire buried to a depth of at least 12 inches. Interconnect all grounding media in or on the structure to provide a common ground potential. This includes lightning protection, electrical service, telecommunications system grounds, as well as underground

metallic piping systems. Make interconnection to the gas line on the customer's side of the meter. Use main size lightning conductors for interconnecting these grounding systems to the lightning protection system.

In addition to the requirements specified herein, provide telecommunications grounding. Where ground fault protection is employed, ensure that connection of ground and neutral does not interfere with correct operation of fault protection.

#### 3.1.14.1 Ground Rods

Provide ground rods and measure the resistance to ground using the fall-of-potential method described in IEEE 81. Do not exceed 25 ohms under normally dry conditions for the maximum resistance of a driven ground. If this resistance cannot be obtained with a single rod, additional rods, spaced on center. Spacing for additional rods must be a minimum of 10 feet, or if sectional type rods are used, additional sections may be coupled and driven with the first rod. In high-ground-resistance, UL listed chemically charged ground rods may be used. If the resultant resistance exceeds 25 ohms measured not less than 48 hours after rainfall, notify the Contracting Officer who will decide on the number of ground rods to add.

#### 3.1.14.2 Grounding Connections

Make grounding connections which are buried or otherwise normally inaccessible, excepting specifically those connections for which access for periodic testing is required, by exothermic weld or high compression connector.

- a. Make exothermic welds strictly in accordance with the weld manufacturer's written recommendations. Welds which are "puffed up" or which show convex surfaces indicating improper cleaning are not acceptable. Mechanical connectors are not required at exothermic welds.
- b. Make high compression connections using a hydraulic or electric compression tool to provide the correct circumferential pressure. Provide tools and dies as recommended by the manufacturer. Use an embossing die code or other standard method to provide visible indication that a connector has been adequately compressed on the ground wire.

#### 3.1.14.3 Ground Bus

Provide a copper ground bus in the electrical equipment rooms as indicated. Noncurrent-carrying metal parts of transformer neutrals and other electrical equipment: effectively grounded by bonding to the ground bus. Bond the ground bus to both the entrance ground, and to a ground rod or rods as specified above having the upper ends terminating approximately 4 inches above the floor. Make connections and splices of the brazed, welded, bolted, or pressure-connector type, except use pressure connectors or bolted connections for connections to removable equipment. For raised floor equipment rooms in computer and data processing centers, provide a minimum of four, one at each corner, ground buses connected to the building grounding system. Use bolted connections in lieu of thermoweld, so they can be changed as required by additions and alterations.

#### 3.1.14.4 Resistance

Maximum resistance-to-ground of grounding system: do not exceed 5 ohms under dry conditions. Where resistance obtained exceeds 25 ohms, contact Contracting Officer for further instructions.

#### 3.1.15 Equipment Connections

Provide power wiring for the connection of motors and control equipment under this section of the specification. Except as otherwise specifically noted or specified, automatic control wiring, control devices, and protective devices within the control circuitry are not included in this section of the specifications and are provided under the section specifying the associated equipment.

#### 3.1.16 Government-Furnished Equipment

Contractor rough-in for Government-furnished equipment make connections to Government-furnished equipment to make equipment operate as intended, including providing miscellaneous items such as plugs, receptacles, wire, cable, conduit, flexible conduit, and outlet boxes or fittings.

#### 3.1.17 Repair of Existing Work

Perform repair of existing work, demolition, and modification of existing electrical distribution systems as follows:

##### 3.1.17.1 Workmanship

Lay out work in advance. Exercise care where cutting, channeling, chasing, or drilling of floors, walls, partitions, ceilings, or other surfaces is necessary for proper installation, support, or anchorage of conduit, raceways, or other electrical work. Repair damage to buildings, piping, and equipment using skilled craftsmen of trades involved.

##### 3.1.17.2 Existing Concealed Wiring to be Removed

Disconnect existing concealed wiring to be removed from its source. Remove conductors; cut conduit flush with floor, underside of floor, and through walls; and seal openings.

##### 3.1.17.3 Removal of Existing Electrical Distribution System

Removal of existing electrical distribution system equipment includes equipment's associated wiring, including conductors, cables, exposed conduit, surface metal raceways, boxes, and fittings, back to equipment's power source as indicated.

##### 3.1.17.4 Continuation of Service

Maintain continuity of existing circuits of equipment to remain. Maintain existing circuits of equipment energized. Restore circuits wiring and power which are to remain but were disturbed during demolition back to original condition.

#### 3.1.18 Surge Protective Devices

Connect the surge protective devices in parallel to the power source, keeping the conductors as short and straight as practically possible.

Maximum allowed lead length is 3 feet avoiding 90 degree bends. Do not locate surge protective devices inside a panelboard or switchboard enclosure.

### 3.2 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets. Provide nameplate on all equipment in access controlled spaces and areas.

### 3.3 WARNING SIGN MOUNTING

Provide the number of signs required to be readable from each accessible side. Space the signs in accordance with NFPA 70E.

### 3.4 FIELD APPLIED PAINTING

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Where field painting of enclosures for panelboards, load centers or the like is specified to match adjacent surfaces, to correct damage to the manufacturer's factory applied coatings, or to meet the indicated or specified safety criteria, provide manufacturer's recommended coatings and apply in accordance to manufacturer's instructions.

### 3.5 FIELD QUALITY CONTROL

Furnish test equipment and personnel and submit written copies of test results. Give Contracting Officer 14 working days notice prior to each test. Where applicable, test electrical equipment in accordance with NETA ATS.

#### 3.5.1 Devices Subject to Manual Operation

Operate each device subject to manual operation at least five times, demonstrating satisfactory operation each time.

#### 3.5.2 600-Volt Wiring Test

Test wiring rated 600 volt and less to verify that no short circuits or accidental grounds exist. Perform insulation resistance tests on wiring No. 6 AWG and larger diameter using instrument which applies voltage of 1,000 volts DC for 600 volt rated wiring and 500 volts DC for 300 volt rated wiring per NETA ATS to provide direct reading of resistance. All existing wiring to be reused must also be tested.

#### 3.5.3 Transformer Tests

Perform the standard, not optional, tests in accordance with the Inspection and Test Procedures for transformers, dry type, air-cooled, 600 volt and below; as specified in NETA ATS. Measure primary and secondary voltages for proper tap settings. Tests need not be performed by a recognized independent testing firm or independent electrical consulting firm.

#### 3.5.4 Ground-Fault Receptacle Test

Test ground-fault receptacles with a "load" (such as a plug in light) to

verify that the "line" and "load" leads are not reversed. Press the TEST button and then the RESET button to verify by LED status that the device is a self-test model as specified in UL 943.

#### 3.5.5 Grounding System Test

Test grounding system to ensure continuity, and that resistance to ground is not excessive. Test each ground rod for resistance to ground before making connections to rod; tie grounding system together and test for resistance to ground. Make resistance measurements in dry weather, not earlier than 48 hours after rainfall. Submit written results of each test to Contracting Officer, and indicate location of rods as well as resistance and soil conditions at time measurements were made.

#### 3.5.6 Phase Rotation Test

Perform phase rotation test to ensure proper rotation of service power prior to operation of new or reinstalled equipment using a phase rotation meter. Follow the meter manual directions performing the test.

1.2 RELATED REQUIREMENTS

Section 26 08 00 APPARATUS INSPECTION AND TESTING applies to this section, with the additions and modifications specified herein.

1.3 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE 100.

1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification

identifies the office that will review the submittal for the Government.  
Submit the following in accordance with Section 01 33 00 SUBMITTAL  
PROCEDURES:

SD-02 Shop Drawings

Switchboard Drawings; G

SD-03 Product Data

Switchboard; G

SD-06 Test Reports

Switchboard Design Tests; G

Switchboard Production Tests; G

Acceptance Checks and Tests; G

SD-07 Certificates

Cybersecurity Installation Certification; G

Submit certification indicating conformance with the paragraph  
CYBERSECURITY INSTALLATION CERTIFICATION.

SD-10 Operation and Maintenance Data

Switchboard Operation and Maintenance, Data Package 5; G

SD-11 Closeout Submittals

Assembled Operation and Maintenance Manuals; G

Equipment Test Schedule; G

Request for Settings; G

1.5 QUALITY ASSURANCE

1.5.1 Product Data

Include manufacturer's information on each submittal for each component, device and accessory provided with the switchboard including:

- a. Circuit breaker type, interrupting rating, and trip devices, including available settings.
- b. Manufacturer's instruction manuals and published time-current curves (in electronic format) of the main secondary breaker and largest secondary feeder device.

1.5.2 Switchboard Drawings

Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a

coordinated installation. Identify circuit terminals on wiring diagrams and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment. Indicate on the drawings adequate clearance for operation, maintenance, and replacement of operating equipment devices. Include the nameplate data, size, and capacity on submittal. Also include applicable federal, military, industry, and technical society publication references on submittals. Include the following:

- a. One-line diagram including breakers, fuses, current transformers, and meters.
- b. Outline drawings including front elevation, section views, footprint, and overall dimensions.
- c. Bus configuration including dimensions and ampere ratings of bus bars.
- d. Markings and NEMA nameplate data, including fuse information (manufacturer's name, catalog number, and ratings).
- e. Circuit breaker type, interrupting rating, and trip devices, including available settings.
- f. Wiring diagrams and elementary diagrams with terminals identified, and indicating prewired interconnections between items of equipment and the interconnection between the items.
- g. Manufacturer's instruction manuals and published time-current curves (in electronic format) of the main secondary breaker and largest secondary feeder device. Use this information (designer of record) to provide breaker settings that ensures protection and coordination are achieved. For Navy installations, provide electronic format curves using SKM's Power Tools for Windows device library electronic format or EasyPower device library format depending on installation modeling software requirements.
- h. Provisions for future expansion by adding switchboard sections.

#### 1.5.3 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" or "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Provide equipment, materials, installation, and workmanship in accordance with the mandatory and advisory provisions unless more stringent requirements are specified or indicated.

#### 1.5.4 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship, and:

- a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.

- b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.
- c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

#### 1.5.4.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

#### 1.5.4.2 Material and Equipment Manufacturing Date

Products manufactured more than one year prior to date of delivery to site are not acceptable.

### 1.6 MAINTENANCE

#### 1.6.1 Switchboard Operation and Maintenance Data

Submit Operation and Maintenance Manuals in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

#### 1.6.2 Assembled Operation and Maintenance Manuals

Assemble and securely bind manuals in durable, hard covered, water resistant binders. Assemble and index the manuals in the following order with a table of contents:

- a. Manufacturer's O&M information required by the paragraph SD-10, OPERATION AND MAINTENANCE DATA.
- b. Catalog data required by the paragraph SD-03, PRODUCT DATA.
- c. Drawings required by the paragraph SD-02, SHOP DRAWINGS.
- d. Prices for spare parts and supply list.
- e. Information on metering.
- f. Design test reports.
- g. Production test reports.

#### 1.6.3 Spare Parts

Provide spare parts as specified below. Provide spare parts that are of the same material and workmanship, meet the same requirements, and are interchangeable with the corresponding original parts furnished.

- a. Quantity 2 - Fuses of each type and size.

### 1.7 WARRANTY

Provide equipment items that are supported by service organizations

reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

## PART 2 PRODUCTS

### 2.1 PRODUCT COORDINATION

Products and materials not considered to be switchboards and related accessories are specified in the drawings and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

### 2.2 SWITCHBOARD

NEMA PB 2 and UL 891.

#### 2.2.1 Ratings

Provide equipment with the following ratings:

- a. Voltage rating: 480Y/277 volts AC, 4-wire as indicated.
- b. Continuous current rating of the main bus: as indicated.
- c. as indicated.
- d. UL listed and labeled as service entrance equipment.

#### 2.2.2 Construction

Provide the following:

- a. Switchboard: consisting of one or more vertical sections bolted together to form a rigid assembly and aligned as indicated.
- b. All circuit breakers: front accessible.
- c. Rear aligned switchboards: front accessible load connections.
- d. Where indicated, "space for future" or "space" means to include a vertical bus provided behind a blank front cover. Where indicated, "provision for future" means full hardware provided to mount a breaker suitable for the location.
- e. Completely factory engineered and assembled, including protective devices and equipment indicated with necessary interconnections, instrumentation, and control wiring.

##### 2.2.2.1 Enclosure

Provide the following:

- a. Enclosure: NEMA ICS 6 Type 4X as indicated fabricated entirely of 12 gauge ASTM A240/A240M 304L stainless steel.
- b. Enclosure: bolted together with removable bolt-on side and hinged rear covers, and sloping roof downward toward rear.
- c. Front doors: provided with stainless steel padlockable vault handles

with a three point catch.

- d. Bases, frames and channels of enclosure: corrosion resistant and fabricated of ASTM A240/A240M type 304 or 304L stainless steel. Separate sections using vertical steel barriers.
- e. Base: includes any part of enclosure that is within 3 inches of concrete pad.
- f. Galvanized steel: ASTM A123/A123M, ASTM A653/A653M G90 coating, and ASTM A153/A153M, as applicable. Galvanize after fabrication where practicable.
- g. Paint color: ASTM D1535 light gray No. 61 over rust inhibitor.
- h. Paint coating system: comply with IEEE C57.12.29 for stainless steel.

#### 2.2.2.2 Bus Bars

Provide the following:

- a. Bus bars: copper with silver-plated contact surfaces.
  - (1) Phase bus bars: uninsulated
  - (2) Neutral bus: rated 100 percent of the main bus continuous current rating.
- b. Make bus connections and joints with hardened steel bolts.
- c. Main-bus : rated at the full ampacity of the main throughout the switchboard. Vertical rating equals the horizontal bus rating for single section, for multiple sections the vertical equals 50% of horizontal bus.
- d. Minimum one-quarter by 2 inch copper ground bus secured to each vertical section along the entire length of the switchboard.

#### 2.2.2.3 Main Section

Provide the main section for the main an individually mounted fixed insulated-case circuit breaker.

#### 2.2.2.4 Distribution Sections

Provide the distribution sections consisting of individually mounted insulated-case circuit breakers as indicated.

#### 2.2.3 Protective Device

Provide main and branch protective devices as indicated.

##### 2.2.3.1 Insulated-Case Breaker

Provide the following:

- a. UL 489. UL listed and labeled, 100 percent rated main breaker manually operated with electronic adjustable trip LSI features, low voltage, insulated-case circuit breaker, with a short-circuit current rating as

indicated at 480V volts.

- b. Breaker frame size: as required to accommodate the number of conductors per phase.
- c. Series rated circuit breakers are unacceptable.

#### 2.2.3.2 Molded-Case Circuit Breaker

Provide the following:

- a. UL 489. UL listed and labeled, standard rated branch breakers, manually operated with electronic adjustable trip LSI feature for all circuit breakers 150A and greater and LI features for all circuit breakers 125A and below, low voltage molded-case circuit breaker, with a short-circuit current rating as indicated at 480V volts.
- b. Breaker frame size: as required to accommodate the number of conductors per phase.
- c. Series rated circuit breakers are unacceptable.

#### 2.2.4 Electronic Trip Units

Equip main and distribution breakers as indicated with a solid-state tripping system consisting of three current sensors and a microprocessor-based trip unit that provides true rms sensing adjustable time-current circuit protection. Include the following:

- a. Current sensors ampere rating: the same as the breaker frame rating.
- b. Trip unit ampere rating: as indicated.
- c. Ground fault protection: as indicated.
- d. Electronic trip units: provide additional features as indicated:
  - (1) Breakers: include long delay pick-up and time settings, and LED indication of cause of circuit breaker trip. Include short delay pick-up and time settings, instantaneous settings, and ground fault settings as indicated.
  - (2) Breakers: include provisions for communication via a network twisted pair cable for remote monitoring and control. Provide the following communications protocol: Modbus, IEC 61850.
  - (3) For electronic trip units that are rated for or can be adjusted to 1,200 amperes or higher, provide arc energy reduction capability with an energy-reducing maintenance switch with local status indicator.

#### 2.2.5 Metering

##### 2.2.5.1 Digital Meters

IEEE C37.90.1 for surge withstand. Provide true rms, plus/minus one percent accuracy, programmable, microprocessor-based meter enclosed in a sealed case with the following features.

a. Display capability:

- (1) Multi-Function Meter: Display a selected phase to neutral voltage, phase to phase voltage, percent phase to neutral voltage THD, percent phase to phase voltage THD; a selected phase current, neutral current, percent phase current THD, percent neutral current; selected total PF, kW, KVA, kVAR, FREQ, kVAh, kWh. Detected alarm conditions include over/under current, over/under voltage, over/under KVA, over/under frequency, over/under selected PF/kVAR, voltage phase reversal, voltage imbalance, reverse power, over percent THD.
- b. Design meters to accept input from standard 5A secondary instrument transformers and direct voltage monitoring range to 600 volts, phase to phase.
- c. Provide programming via a front panel display and a communication interface accessible by a computer.
- d. Provide password secured programming stored in non-volatile EEPROM memory.
- e. Provide digital communications in a Modbus RTU protocol via a RS485 serial port.
- f. Provide meter that calculates and stores average max/min demand values with time and date for all readings based on a user selectable sliding window averaging period.
- g. Provide meter with programmable hi/low set limits with two Form C dry contact relays when exceeding alarm conditions.
- h. Provide meter with a display of Total Harmonic Distortion (THD) measurement to a minimum of the thirty-first order.
- i. Include historical trend logging capability with the ability to store up to 100,000 data points with intervals of 1 second to 180 minutes. Provide a unit that can store and time stamp up to 1000 programmable triggered conditions.

#### 2.2.6 Terminal Boards

Provide with engraved plastic terminal strips and screw type terminals for external wiring between components and for internal wiring between removable assemblies. Provide short-circuiting type terminal boards associated with current transformer. Terminate conductors for current transformers with ring-tongue lugs. Provide terminal board identification that is identical in similar units. Provide color coded external wiring that is color coded consistently for similar terminal boards.

#### 2.2.7 Wire Marking

Mark control and metering conductors at each end. Provide factory installed, white, plastic tubing, heat stamped with black block type letters on factory-installed wiring. On field-installed wiring, provide white, preprinted, polyvinyl chloride (PVC) sleeves, heat stamped with black block type letters. Provide a single letter or number on each sleeve, elliptically shaped to securely grip the wire, and keyed in such a manner to ensure alignment with adjacent sleeves. Provide specific wire

markings using the appropriate combination of individual sleeves. Indicate on each wire marker the device or equipment, including specific terminal number to which the remote end of the wire is attached.

### 2.3 MANUFACTURER'S NAMEPLATE

Provide a nameplate on each item of equipment bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent is not acceptable. This nameplate and method of attachment may be the manufacturer's standard if it contains the required information.

### 2.4 FIELD FABRICATED NAMEPLATES

ASTM D709. Provide laminated plastic nameplates for each switchboard, equipment enclosure, relay, switch, and device; as specified in this section or as indicated on the drawings. Identify on each nameplate inscription the function and, when applicable, the position. Provide nameplates of melamine plastic, 0.125 inch thick, white with black center core. Provide matte finish surface. Provide square corners. Accurately align lettering and engrave into the core. Provide nameplates with minimum size of one by 2.5 inches. Provide lettering that is a minimum of 0.25 inch high normal block style.

### 2.5 SOURCE QUALITY CONTROL

#### 2.5.1 Equipment Test Schedule

The Government reserves the right to witness tests. Provide equipment test schedules for tests to be performed at the manufacturer's test facility. Submit required test schedule and location, and notify the Contracting Officer 30 calendar days before scheduled test date. Notify Contracting Officer 15 calendar days in advance of changes to scheduled date.

Provide the following as part of test equipment calibration:

- a. Provide a calibration program which assures that all applicable test instruments are maintained within rated accuracy.
- b. Accuracy: Traceable to the National Institute of Standards and Technology.
- c. Instrument calibration frequency schedule: less than or equal to 12 months for both test floor instruments and leased specialty equipment.
- d. Dated calibration labels: visible on all test equipment.
- e. Calibrating standard: higher accuracy than that of the instrument tested.
- f. Keep up-to-date records that indicate dates and test results of instruments calibrated or tested. For instruments calibrated by the manufacturer on a routine basis, in lieu of third party calibration, include the following:
  - (1) Maintain up-to-date instrument calibration instructions and procedures for each test instrument.

- (2) Identify the third party/laboratory calibrated instrument to verify that calibrating standard is met.

## 2.5.2 Switchboard Design Tests

NEMA PB 2 and UL 891.

### 2.5.2.1 Design Tests

Furnish documentation showing the results of design tests on a product of the same series and rating as that provided by this specification.

- a. Short-circuit current test.
- b. Enclosure tests.
- c. Dielectric test.

### 2.5.2.2 Additional Design Tests

In addition to normal design tests, perform the following tests on the actual equipment. Furnish reports which include results of design tests performed on the actual equipment.

- a. Temperature rise tests.
- b. Continuous current.

## 2.5.3 Switchboard Production Tests

NEMA PB 2 and UL 891. Furnish reports which include results of production tests performed on the actual equipment for this project. These tests include:

- a. 60-hertz dielectric tests.
- b. Mechanical operation tests.
- c. Electrical operation and control wiring tests.
- d. Ground fault sensing equipment test.

## 2.6 COORDINATED POWER SYSTEM PROTECTION

Provide a power system study as specified in Section 26 05 73 POWER SYSTEM STUDIES.

## 2.7 ARC FLASH WARNING LABEL

Provide warning label for switchboards. Locate this self-adhesive warning label on the outside of the enclosure warning of potential electrical arc flash hazards and appropriate PPE required. Provide label format as indicated.

## PART 3 EXECUTION

### 3.1 INSTALLATION

Conform to IEEE C2, and to the requirements specified herein. Provide new

equipment and materials unless indicated or specified otherwise.

### 3.2 GROUNDING

NFPA 70 and IEEE C2, except that grounds and grounding systems with a resistance to solid earth ground not exceeding 15 ohms.

#### 3.2.1 Grounding Electrodes

Provide driven ground rods as shown on the drawings. Connect ground conductors to the upper end of the ground rods by exothermic weld or compression connector. Provide compression connectors at equipment end of ground conductors.

#### 3.2.2 Equipment Grounding

Provide bare copper cable not smaller than No. 4/0 AWG not less than 24 inches below grade connecting to the indicated ground rods. When work in addition to that indicated or specified is directed to obtain the specified ground resistance, the provision of the contract covering "Changes" applies.

#### 3.2.3 Connections

Make joints in grounding conductors and loops by exothermic weld or compression connector.

#### 3.2.4 Grounding and Bonding Equipment

UL 467, except as indicated or specified otherwise.

### 3.3 INSTALLATION OF EQUIPMENT AND ASSEMBLIES

Install and connect equipment furnished under this section as indicated on project drawings, the approved shop drawings, and as specified herein.

#### 3.3.1 Switchboard

ANSI/NEMA PB 2.1.

#### 3.3.2 Meters and Instrument Transformers

ANSI C12.1.

#### 3.3.3 Field Applied Painting

Where field painting of enclosures is required to correct damage to the manufacturer's factory applied coatings, provide manufacturer's recommended coatings and apply in accordance with manufacturer's instructions.

#### 3.3.4 Galvanizing Repair

Repair damage to galvanized coatings using ASTM A780/A780M, zinc rich paint, for galvanizing damaged by handling, transporting, cutting, welding, or bolting. Do not heat surfaces that repair paint has been applied to.

### 3.3.5 Field Fabricated Nameplate Mounting

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

## 3.4 FOUNDATION FOR EQUIPMENT AND ASSEMBLIES

### 3.4.1 Interior Location

Mount switchboard on concrete slab as follows:

- a. Unless otherwise indicated, provide the slab with dimensions at least 4 inches thick.
- b. Install slab such that the top of the concrete slab is approximately 4 inches above the finished grade.
- c. Provide edges above grade 1/2 inch chamfer.
- d. Provide slab of adequate size to project at least 8 inches beyond the equipment.
- e. Provide conduit turnups and cable entrance space required by the equipment to be mounted.
- f. Seal voids around conduit openings in slab with water- and oil-resistant caulking or sealant.
- g. Cut off and bush conduits 3 inches above slab surface.

## 3.5 FIELD QUALITY CONTROL

Submit request for settings of breakers to the Contracting Officer after approval of switchboard and at least 30 days in advance of their requirement.

### 3.5.1 Performance of Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

#### 3.5.1.1 Switchboard Assemblies

- a. Visual and Mechanical Inspection
  - (1) Compare equipment nameplate data with specifications and approved shop drawings.
  - (2) Inspect physical, electrical, and mechanical condition.
  - (3) Verify appropriate anchorage, required area clearances, and correct alignment.
  - (4) Clean switchboard and verify shipping bracing, loose parts, and documentation shipped inside cubicles have been removed.
  - (5) Inspect all doors, panels, and sections for paint, dents,

scratches, fit, and missing hardware.

- (6) Verify that fuse and circuit breaker sizes and types correspond to approved shop drawings as well as to the circuit breaker's address for microprocessor-communication packages.
- (7) Verify that current transformer ratios correspond to approved shop drawings.
- (8) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.
- (9) Confirm correct operation and sequencing of electrical and mechanical interlock systems.
- (10) Confirm correct application of manufacturer's recommended lubricants.
- (11) Inspect insulators for evidence of physical damage or contaminated surfaces.
- (12) Verify correct barrier installation and operation.
- (13) Exercise all active components.
- (14) Inspect all mechanical indicating devices for correct operation.
- (15) Verify that filters are in place and vents are clear.
- (16) Test operation, alignment, and penetration of instrument transformer withdrawal disconnects.
- (17) Inspect control power transformers.

b. Electrical Tests

- (1) Perform insulation-resistance tests on each bus section.
- (2) Perform dielectric withstand voltage tests.
- (3) Perform insulation-resistance test on control wiring; Do not perform this test on wiring connected to solid-state components.
- (4) Perform control wiring performance test.
- (5) Perform primary current injection tests on the entire current circuit in each section of assembly.
- (6) Perform phasing check on double-ended switchboard to ensure correct bus phasing from each source.
- (7) Verify operation of switchboard heaters.

3.5.1.2 Circuit Breakers

Low Voltage - Insulated-Case and Low Voltage Molded Case with Solid State Trips

a. Visual and Mechanical Inspection

- (1) Compare nameplate data with specifications and approved shop drawings.
- (2) Inspect circuit breaker for correct mounting.
- (3) Operate circuit breaker to ensure smooth operation.
- (4) Inspect case for cracks or other defects.
- (5) Inspect all bolted electrical connections for high resistance using low resistance ohmmeter, verifying tightness of accessible bolted connections and/or cable connections by calibrated torque-wrench method, or performing thermographic survey.
- (6) Inspect mechanism contacts and arc chutes in unsealed units.

b. Electrical Tests

- (1) Perform contact-resistance tests.
- (2) Perform insulation-resistance tests.
- (3) Perform Breaker adjustments for final settings in accordance with Government provided settings.
- (4) Perform long-time delay time-current characteristic tests
- (5) Determine short-time pickup and delay by primary current injection.
- (6) Determine ground-fault pickup and time delay by primary current injection.
- (7) Determine instantaneous pickup current by primary injection.
- (8) Verify correct operation of any auxiliary features such as trip and pickup indicators, zone interlocking, electrical close and trip operation, trip-free, and anti-pump function.

3.5.1.3 Current Transformers

a. Visual and Mechanical Inspection

- (1) Compare equipment nameplate data with specifications and approved shop drawings.
- (2) Inspect physical and mechanical condition.
- (3) Verify correct connection.
- (4) Verify that adequate clearances exist between primary and secondary circuit.
- (5) Inspect all bolted electrical connections for high resistance using low-resistance ohmmeter, verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey.

- (6) Verify that all required grounding and shorting connections provide good contact.

b. Electrical Tests

- (1) Perform resistance measurements through all bolted connections with low-resistance ohmmeter, if applicable.
- (2) Perform insulation-resistance tests.
- (3) Perform polarity tests.
- (4) Perform ratio-verification tests.

3.5.1.4 Metering and Instrumentation

a. Visual and Mechanical Inspection

- (1) Compare equipment nameplate data with specifications and approved shop drawings.
- (2) Inspect physical and mechanical condition.
- (3) Verify tightness of electrical connections.

b. Electrical Tests

- (1) Determine accuracy of meters at 25, 50, 75, and 100 percent of full scale.
- (2) Calibrate watthour meters according to manufacturer's published data.
- (3) Verify all instrument multipliers.
- (4) Electrically confirm that current transformer and voltage transformer secondary circuits are intact.

3.5.1.5 Grounding System

a. Visual and Mechanical Inspection

- (1) Inspect ground system for compliance with contract plans and specifications.

b. Electrical Tests

- (1) IEEE 81. Perform ground-impedance measurements utilizing the fall-of-potential method. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground resistance tester in accordance with manufacturer's instructions to test each ground or group of grounds. Use an instrument equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test.

- (2) Submit the measured ground resistance of each ground rod and grounding system, indicating the location of the rod and grounding system. Include the test method and test setup (i.e., pin location) used to determine ground resistance and soil conditions at the time the measurements were made.

#### 3.5.1.6 Cybersecurity Installation Certification

Furnish a certification that control systems are installed in accordance with DoD Instruction 8500.01, DoD Instruction 8510.01, and as required by individual Service Implementation Policy.

#### 3.5.2 Follow-Up Verification

Upon completion of acceptance checks, settings, and tests, show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. Trip circuit breakers by operation of each protective device. Test each item to perform its function not less than three times. As an exception to requirements stated elsewhere in the contract, provide the Contracting Officer five working days advance notice of the dates and times for checks, settings, and tests.

## 1.2 RELATED REQUIREMENTS

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM applies to this section with additions and modifications specified herein.

## 1.3 SYSTEM DESCRIPTION

### 1.3.1 Performance Requirements

#### 1.3.1.1 Electromagnetic Interference Suppression

Computing devices, as defined by 47 CFR 15 and EN 61800-3 rules and regulations, must be certified to comply with the requirements for class A computing devices and labeled.

#### 1.3.1.2 Electromechanical and Electrical Components

Ensure electrical and electromechanical components of the Adjustable Speed Drive (ASD) do not cause electromagnetic interference to adjacent electrical or electromechanical equipment while in operation.

### 1.3.2 Electrical Requirements

#### 1.3.2.1 Power Line Surge Protection

IEEE C62.41.1 and IEEE C62.41.2, IEEE 519, IEC 61000-3-12 Control panel must have surge protection, included within the panel to protect the unit from damaging transient voltage surges. Surge protective device must be mounted near the incoming power source and properly wired to all three

phases and ground. Fuses must not be used for surge protection.

#### 1.3.2.2 Sensor and Control Wiring Surge Protection

I/O functions as specified must be protected against surges induced on control and sensor wiring installed outdoors and as shown. Test the inputs and outputs in both normal mode and common mode using the following two waveforms:

- a. A 10 microsecond by 1000 microsecond waveform with a peak voltage of 1500 volts and a peak current of 60 amperes.
- b. An 8 microsecond by 20 microsecond waveform with a peak voltage of 1000 volts and a peak current of 500 amperes.

#### 1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

##### SD-02 Shop Drawings

## 1.5 QUALITY ASSURANCE

### 1.5.1 Schematic Diagrams

Submit diagrams showing circuits and device elements for each replaceable module. Schematic diagrams of printed circuit boards are permitted to group functional assemblies as devices, provided that sufficient information is provided for government maintenance personnel to verify proper operation of the functional assemblies.

### 1.5.2 Interconnecting Diagrams

Show interconnections between equipment assemblies, and external interfaces, including power and signal conductors. Include for enclosures and external devices.

### 1.5.3 Installation Drawings

Show floor plan of each site, with ASD's and motors indicated. Indicate ventilation requirements, adequate clearances, and cable routes. Submit drawings for government approval prior to equipment construction or integration. Immediately record modifications to original drawings made during installation for inclusion into the as-built drawings.

### 1.5.4 Equipment Schedule

Provide schedule of equipment supplied. Schedule must provide a cross reference between manufacturer data and identifiers indicated in shop drawings. Schedule must include the total quantity of each item of equipment supplied and data indicating compatibility with motors being driven. For complete assemblies, such as ASD's, provide the serial numbers of each assembly, and a sub-schedule of components within the assembly. Provide recommended spare parts listing for each assembly or component.

### 1.5.5 Installation Instructions

Provide installation instructions issued by the manufacturer of the equipment, including notes and recommendations, prior to shipment to the site. Provide operation instructions prior to acceptance testing.

### 1.5.6 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship and:

- a. Have been in satisfactory commercial or industrial use for 2 years prior to bid opening including applications of equipment and materials under similar circumstances and of similar size.

- b. Have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period.
- c. Where two or more items of the same class of equipment are required, provide products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

#### 1.6 DELIVERY AND STORAGE

Store delivered equipment to protect from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

#### 1.7 WARRANTY

The complete system must be warranted by the manufacturer for a period of five years. Repair or replace any component failing to perform its function as specified and documented at no additional cost to the Government. Items repaired or replaced must be warranted for an additional period of at least one year from the date that it becomes functional again, as specified in FAR 52.246-21 Warranty of Construction.

#### 1.8 MAINTENANCE

##### 1.8.1 Spare Parts

Manufacturers provide spare parts in accordance with recommended spare parts list.

- a. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - (1) Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than 3 of each size and type.
  - (2) Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than 3 of each size and type.
  - (3) Indicating Lights: 4 of each type and color installed.
  - (4) Auxiliary Contacts: Furnish 2 spare(s) for each size and type of magnetic controller installed.
  - (5) Power Contacts: Furnish 3 spare(s) for each size and type of magnetic contactor installed.

##### 1.8.2 Operation and Maintenance Data

Provide in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Provide service and maintenance information including preventive maintenance, assembly, and disassembly procedures. Include electrical drawings from electrical general sections. Provide additional information necessary to provide complete operation, repair, and maintenance information, detailed to the smallest replaceable unit. Include copies of as-built submittals. Provide routine preventative maintenance instructions, and equipment required. Provide instructions on how to modify program settings, and modify the control program. Provide

instructions on drive adjustment, trouble-shooting, and configuration.  
Provide instructions on process tuning and system calibration.

#### 1.8.3 Maintenance Support

During the warranty period, provide on-site, on-call maintenance services by drive manufacturer's personnel on the following basis: The service must be on a per-call basis with 36 hour response. Contractor is responsible for the maintenance of all hardware and software of the system during the warranty period. Various personnel of different expertise must be sent on-site depending on the nature of the maintenance service required. Costs must include travel, local transportation, living expenses, and labor rates of the service personnel while responding to the service request. The provisions of this Section are not in lieu of, nor relieve the Contractor of, warranty responsibilities covered in this specification. Should the result of the service request be the uncovering of a system defect covered under the warranty provisions, all costs for the call, including the labor necessary to identify the defect, must be borne by the Contractor.

#### 1.8.4 Technical Support

Provide the ASDs with manufacturer's technical telephone support in English, readily available during normal working hours.

### PART 2 PRODUCTS

#### 2.1 ADJUSTABLE SPEED DRIVES (ASD)

Provide adjustable speed drive to control the speed of induction motor(s). The ASD must include the following minimum functions, features and ratings.

- a. Input circuit breaker per UL 489 with a minimum of 65,000 amps symmetrical interrupting capacity and door interlocked external operator.
- b. A converter stage per UL 61800-5-1 must change fixed voltage, fixed frequency, ac line power to a fixed dc voltage. The converter must utilize a full wave bridge design incorporating diode rectifiers. Silicon Controlled Rectifiers (SCR) are not acceptable. The converter must be insensitive to three phase rotation of the ac line and must not cause displacement power factor of less than .95 lagging under any speed and load condition.
- c. An inverter stage must change fixed dc voltage to variable frequency, variable ac voltage for application to a standard NEMA MG 1 Part 30 motor designed for use with adjustable frequency power supplies. Switch the inverter to produce a sine coded pulse width modulated (PWM) output waveform.
- d. The ASD shall be capable of supplying 110 percent of rated full load current for one minute at maximum ambient temperature.
- e. The ASD must be designed to operate from a 480V volt, plus or minus 10 percent, three phase, 60 Hz supply, and control motors with a corresponding voltage rating.
- f. Acceleration and deceleration time must be independently adjustable

from one second to 60 seconds.

Adjust decelerating time by providing an external dynamic braking resistor designed to meet NEMA ICS 61800-2 to be capable of decelerating six times the motor inertia with no more than 150 percent of rated current with the motor at its base speed. Required deceleration time may be achieved using not only dynamic braking resistor but with other methods described in NEMA ICS 7.2-2015 paragraph 5.2.5.

- g. Adjustable full-time current limiting must limit the current to a preset value which must not exceed 110 percent of the controller rated current. The current limiting action must maintain the V/Hz ratio constant so that variable torque can be maintained. Short time starting override must allow starting current to reach 175 percent of controller rated current to maximum starting torque.
- h. The controllers must be capable of producing an output frequency over the range of 3 Hz to 60 Hz (20 to one speed range), without low speed cogging. Over frequency protection must be included such that a failure in the controller electronic circuitry must not cause frequency to exceed 110 percent of the maximum controller output frequency selected.
- i. Minimum and maximum output frequency must be adjustable over the following ranges: 1) Minimum frequency 3 Hz to 50 percent of maximum selected frequency; 2) Maximum frequency 40 Hz to 60 Hz.
- j. The controller efficiency at any speed must not be less than 96 percent.
- k. The controllers must be capable of being restarted into a motor coasting in the forward direction without tripping.
- l. Protection of power semiconductor components must be accomplished without the use of fast acting semiconductor output fuses. Subjecting the controllers to any of the following conditions must not result in component failure or the need for fuse replacement:
  - (1) Short circuit at controller output
  - (2) Ground fault at controller output
  - (3) Open circuit at controller output
  - (4) Input undervoltage
  - (5) Input overvoltage
  - (6) Loss of input phase
  - (7) AC line switching transients
  - (8) Instantaneous overload
  - (9) Sustained overload exceeding 115 percent of controller rated current
  - (10) Over temperature

(11) Phase reversal

- m. Solid state motor overload protection must be included such that current exceeding an adjustable threshold must activate a 60 second timing circuit. Should current remain above the threshold continuously for the timing period, the controller will automatically shut down. Havesensor in each phase, Class 10/20 selectable tripping characteristic selected to protect motor against voltage and current unbalance and single phasing, Class II ground-fault protection, with start and run delays to prevent nuisance trip on starting, analog communication module, NC/NO isolated overload alarm contact, external overload, reset push button.
- n. Include slip compensation circuit that will sense changing motor load conditions and adjust output frequency to provide speed regulation of NEMA MG 1 Part 30 designed for use with adjustable frequency power supplies motors to within plus or minus 0.5 percent of maximum speed without the necessity of a tachometer generator.
- o. The controller shall not create any feedback noise on the input line that will adversely affect electronic or microprocessor based equipment (such as computers or electron microscopes), and the controller shall not impress voltage or current spikes on modes the system. The minimum requirements shall conform to IEEE Standard 519, Special Applications for Line Notching and Distortion. The manufacturer shall provide at no additional cost any equipment to meet this requirement; i.e., A.C. line filters of the RLC type and/or isolation transformer, or both as required to meet full compliance with IEEE 519, if controller does not meet all standards.
- p. The ASD must include external fault reset capability. All the necessary logic to accept an external fault reset contact must be included.
- q. Provide critical speed lockout circuitry to prevent operating at frequencies with critical harmonics that cause resonant vibrations. The ASD must have a minimum of three user selectable bandwidths.
- r. General Requirements
  - (1) Provide a factory-assembled bypass system consisting of IEC-rated bypass and isolation contactors, configured to enable motor operation in the event of ASD (adjustable speed drive) failure, or to allow for safe isolation during maintenance.
  - (2) The bypass system shall support manual and automatic transfer of the motor between VFD output and bypass power, using a field-selectable control mode.
  - (3) Provide mechanical and electrical interlocks between bypass and isolation contactors to prevent simultaneous energization.
  - (4) Include a selector switch, transfer delay timer, and status indication lights (e.g., "Drive," "Bypass," and "Fault") mounted on the enclosure door.
  - (5) Bypass systems shall maintain motor overload and short-circuit protection while operating in bypass mode.

s. Bypass Type Based on Motor Size

(1) Motors less than 50 HP:

- (a) Provide an Across-the-Line (ATL) Bypass.
- (b) ATL bypass shall use full-voltage contactors rated for motor duty, with short-circuit protection coordinated with the motor branch circuit.
- (c) System shall support automatic restart on VFD failure, with adjustable time delay.

(2) Motors 50 HP and above:

- (a) Provide a Soft Starter Bypass.
- (b) Soft starter shall be solid-state, three-phase, with adjustable start and stop ramps, and integrated overload protection.
- (c) Soft starter shall be configured for full-voltage start with reduced current to minimize mechanical stress and power system voltage dip.
- (d) Provide control logic to automatically transfer to soft start mode upon VFD fault or loss of signal, with a manual override switch.

t. Additional Requirements for All Bypass Systems

- (1) All bypass components shall be UL listed and suitable for the voltage and motor ratings specified.
- (2) Enclosures shall be NEMA 1 or NEMA 12 as required, with adequate ventilation and labeled wiring terminals.
- (3) Provide remote bypass status indication and fault outputs for interface with BAS/SCADA systems, where applicable.
- (4) Provide all wiring, relays, and terminal blocks necessary to fully integrate the bypass system with the drive and motor controls.

u. LINE CONDITIONING AND FILTERING

- (1) Input Line Conditioning: Based on the manufacturer's harmonic analysis study and report, provide input filtering, as required, to limit total demand (harmonic current) distortion and total harmonic voltage demand at the defined point of common coupling to meet IEEE 519 recommendations.
- (2) The variable frequency drive (VFD) shall include as a minimum an integral 3% line reactors to reduce line noise generated by the inverter and 5% DC reactor to limit harmonics. The VFD manufacturer shall prepare and submit calculations confirming that the line harmonics and notching generated by the VFD do not exceed the levels for a general system as stated in the Institute of Electrical and Electronics Engineers Standard 519 "Guide for

Harmonic Control of Static Power Converters" to a maximum of 5% Total Voltage Harmonic Distortion (VTHD), and 8% TDD for current at Point of Common Coupling (PCC). The POC shall be assumed as the Service switchboard for VTHD and TDD calculations.

- (3) Line notch area shall not exceed 22,800 (V/S) and 20% notch depth.
  - (4) The manufacturer shall provide additional line reactors or isolation transformers to ensure that this standard is met, as necessary.
  - (5) Independent timed linear acceleration and deceleration functions will be provided, adjustable from 4 to 20 seconds.
  - (6) Output Filtering: Motor dv/dt filter shall be provided for motor cable runs exceeding 100 feet for motors with a peak voltage insulation rating less than 1600 Vac. The dv/dt filter shall be located at the AFD and shall reduce the dv/dt clamp any voltage overshoots of the AFD output. It will return the energy in the voltage overshoots to the AFD Dc bus. A power dissipating resistance device is not acceptable.
  - (7) The adjustable speed drive shall be designed to meet the guidelines regarding emissions of Radio Frequency and Electro-magnetic Interference (RFI/EMI) set by FCC Class A guidelines through the use of a tuned line filter, adjuste
- v. Minimum Operating Conditions. Designed and constructed ASD's to operate within the following service conditions:
- (1) Ambient Temperature Rating: 0 to 120 degrees F.
  - (2) Non-condensing relative humidity rating: less than 95 percent.
  - (3) Ambient rating: Not exceed 3,300 feet.
- w. Adjustable frequency drives for motors 50 hp and above shall be 18 pulse drives to mitigate the impact of harmonics on the building electric system.

#### 18 PULSE VFD REQUIREMENTS

- (1) The VFD shall provide microprocessor-based control for three-phase induction motors. The controller's full load output current rating shall be based on 50 degree C ambient at 250HP and below and 40 degree ambient above 250HP VT and no less than a 3.6 kHz switching frequency to reduce motor noise and avoid increased motor losses. Drive shall have been tested to and UL listed as conforming to the requirements of UL508C at rated load currents and ambient temperature per this specification. Drive shall have a UL listed interrupting rating of 100kAIC.
- (2) The VFD shall be of the Pulse Width Modulated (PWM) design converting the utility input voltage and frequency to a variable voltage and frequency output via a two-step operation. Adjustable Current Source VFD is not acceptable. Insulated Gate Bipolar Transistors (IGBT's) shall be used in the inverter section. Bipolar Junction Transistors, GTO's or SCR's are not acceptable. The VFD shall run at the above listed switching frequency.

- (3) The VFD shall have an efficiency at full load and speed that exceeds 95%. The efficiency shall exceed 90% at 50% speed and load. The VFDs shall maintain the line side displacement power factor at no less than 0.96, regardless of speed and load.
- (4) 18 pulse drive shall include the following protective features, as a minimum: Input line fuses, Metal Oxide Varistor (MOV), and Lineside choke rated 7.5% of rated line current.
- (5) The VFDs shall have a one (1) minute overload current rating of 110% for variable torque loads 150% for constant torque loads.
- (6) The AFDs shall be capable of operating of operating any NEMA design B squirrel cage induction motor, regardless of manufacturer, with a horsepower and current rating within the capacity of the VFD.
- (7) For systems with a standby generator, the harmonic distortion shall meet the distortion levels shown in table 10.3 of IEEE519-1992 for ISC/IL<20. The contractor shall provide the following data for the stand

#### 2.1.1 ASD for Industrial Application

Provide the following operator control and monitoring devices mounted on the front panel of the ASD:

- a. Manual speed potentiometer.
- b. Hand-Off-Auto (HOA) switch.
- c. Power on light.
- d. Drive run power light.
- e. Local display capable of including ASD status, frequency, motor RPM, phase current, fault diagnostic in descriptive text, and all programmed parameters.

#### 2.1.2 ASD for Pump Application

ASDs must have the following features:

- a. A local operator control providing the following functions:
  - (1) Remote/Local operator selection with password access.
  - (2) Run/Stop and manual speed commands.
  - (3) All programming functions.
  - (4) Scrolling through all display functions.
- b. A local operator control panel with the following data displayed:
  - (1) ASD status.
  - (2) Frequency.

- (3) Motor RPM.
- (4) Phase current.
- (5) Scrolling through all display functions.
- (6) Fault diagnostics in descriptive text.
- (7) All programmed parameters.
- c. Standard PI loop controller with input terminal for controlled variable and parameter settings.
- d. User interface terminals for remote control of ASD speed, speed feedback, and an isolated form C SPDT relay, which energizes on a drive fault condition.
- e. An isolated form C SPDT auxiliary relay which energizes on a run command.
- f. An adjustable carrier frequency with 16 KHz minimum upper limit.
- g. A built-in or external line reactor with 3 percent minimum impedance to protect the DC bus capacitors and rectifier section diodes, reduce power line transient voltage, line notching, DC bus over-voltage tripping and improve the inverter over-current and over-voltage conditions.
- h. Historical logging information and displays:
  - (1) Real-time clock with current time and date.
  - (2) Running log of total power versus time.
  - (3) Total run time.
  - (4) Fault log, maintaining last four faults with time and data stamp for each.
- i. The ASD must be capable of automatic control by a remote 4-20 mA, 0 to 10 VDC signal, by BACnet network command, or manually by the ASD control panel.
- j. ASDs must include the following operator programmable parameters:
  - (1) Upper and lower limit frequency.
  - (2) Acceleration and deceleration rate.
  - (3) Variable torque volts per Hertz curve.
  - (4) Starting voltage level.
  - (5) Starting frequency level.
  - (6) Display speed scaling.
  - (7) Enable/disable soft stall feature.

- (8) Motor overload level.
  - (9) Motor stall level.
  - (10) Jump frequency and hysteresis band.
  - (11) PWM carrier frequency.
- k. ASD must have the following protective features:
- (1) An electronic adjustable inverse time current limit with consideration for additional heating of the motor at frequencies below 45Hz, for the protection of the motor.
  - (2) An electronic adjustable soft stall feature, allowing the ASD to lower the frequency to a point where the motor will not exceed the full-load amperage when an overload ASD will automatically return to the requested frequency when load conditions permit.
  - (3) A separate electronic stall at 110 percent ASD rated current, and a separate hardware trip at 190 percent current.
  - (4) The ability to shut down if inadvertently started into a rotating load without damaging the ASD or the motor.
  - (5) The ability to keep a log of a minimum of four previous fault conditions, indicating the fault type and time of occurrence in descriptive text.
  - (6) The ability to sustain 110 percent rated current for 60 seconds.
  - (7) The ability to shutdown safely or protect against and record the following fault conditions:
    - (a) Over current (and an indication if the over current was during acceleration, deceleration, or running).
    - (b) Over current internal to the drive.
    - (c) Motor overload at start-up.
    - (d) Over voltage from utility power.
    - (e) Motor running overload.
    - (f) Over voltage during deceleration.
    - (g) ASD over heat.
    - (h) Load and ground fault.
    - (h) Abnormal parameters or data in ASD EEPROM.

## 2.2 ENCLOSURES

Provide equipment enclosures conforming to NEMA 250, Type 4X stainless steel NEMA ICS 7, and NEMA ICS 6, with a heater if located outdoors. An HMCP device shall provide the disconnecting means. The operating handle

shall protrude through the door, but the disconnect shall not be mounted on the door. The handle shall indicate ON, OFF, and tripped conditions. The handle shall have provisions to accommodate a minimum of three padlocks in the OFF position. Interlocks shall prevent unauthorized opening or closing of the ASD door with the disconnect handle in the ON position. The door handle interlock should have provisions to be defeated by qualified maintenance personnel.

## 2.3 WIRES AND CABLES

All wires and cables must conform to NEMA 250, NEMA ICS 7, NFPA 70.

## 2.4 NAMEPLATES

Nameplates external to NEMA enclosures must conform with the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide manufacturer's standard, permanent nameplates for internal areas of enclosures.

## 2.5 SOURCE QUALITY CONTROL

### 2.5.1 ASD Test Plan

To ensure quality, each ASD must be subject to a series of in-plant quality control inspections before approval for shipment from the manufacturer's facilities. Provide test plans.

### 2.5.2 ASD Test Report

To ensure quality, each ASD must be subject to a series of in-plant quality control inspections before approval for shipment from the manufacturer's facilities. Provide test reports.

## 2.6 ACCESSORIES

- a. General Requirements for Control-Circuit and Pilot Devices: NEMA ICS 5; factory installed in VFC enclosure cover unless otherwise indicated.
  - (1) Push Buttons: Lockable.
  - (2) Pilot Lights: Push to test.
  - (3) Selector Switches: Rotary type.
  - (4) Stop and Lockout Push-Button Station: Momentary-break, push-button station with a factory-applied hasp arranged so padlock can be used to lock push button in depressed position with control circuit open.
- b. NC/NO bypass contactor auxiliary contact(s).
- c. Control Relays: Auxiliary and adjustable solid-state time-delay relays.
- d. Phase-Failure, Phase-Reversal, and Undervoltage and Overvoltage Relays: Solid-state sensing circuit with isolated output contacts for hard-wired connections. Provide adjustable undervoltage, overvoltage, and time-delay settings.
  - (1) Current Transformers: Continuous current rating, basic impulse insulating level (BIL) rating, burden, and accuracy class suitable

for connected circuitry. Comply with IEEE C57.13.

e. Supplemental Digital Meters:

- (1) Elapsed-time meter.
- (2) Kilowatt meter.
- (3) Kilowatt-hour meter.

- f. Breather and drain assemblies, to maintain interior pressure and release condensation in NEMA 250, Type 4, Type 4X, Type 12 enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.
- g. Space heaters, with NC auxiliary contacts, to mitigate condensation in NEMA 250, Type 3R and Type 4X enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.
- h. Cooling Fan and Exhaust System: For NEMA 250, Type 1 or Type 12; UL 508 component recognized: Supply fan, with composite intake and exhaust grills and filters; 120-V ac; obtained from integral CPT.
- i. Sun shields installed on fronts, sides, and tops of enclosures installed outdoors and subject to direct and extended sun exposure.
- j. Spare control-wiring terminal blocks wired.

### PART 3 EXECUTION

#### 3.1 INSTALLATION

Per NEMA ICS 3.1, install equipment in accordance with the approved manufacturer's printed installation drawings, instructions, wiring diagrams, and as indicated on project drawings and the approved shop drawings. A field representative of the drive manufacturer must supervise the installation of all equipment, and wiring.

#### 3.2 GROUNDING

Per NEMA ICS 7.2, ASD must be solidly grounded to the main distribution.

a. General

Grounding shall comply with NEC Article 250, NEMA ICS 7.2, and Section 26 20 00 - Grounding and Bonding for Electrical Systems.

b. VFD Enclosure Grounding

- (1) VFD enclosures shall be solidly grounded to the building electrical service ground.
- (2) Provide copper equipment grounding conductors (EGCs) in all raceways feeding the VFDs, sized per NEC Table 250.122.
- (3) Bond all metallic conduit, cable tray, and enclosures entering or exiting the VFD with grounding bushings or locknuts.

c. Motor Grounding

- (1) Ground all pump motor frames to the facility equipment ground system using UL-listed grounding lugs.
- (2) For outdoor or remote pump installations, provide a supplemental grounding electrode system consisting of two ground rods spaced a minimum of 6 feet apart and bonded with a minimum #6 AWG bare copper conductor. Ground rods shall comply with NEC 250.52(A)(5) and 250.53(G).

d. VFD Output Cable Shielding and EMI Mitigation

- (1) VFD output conductors shall be shielded or use VFD-rated armored cable.
- (2) Terminate shielding at the VFD end only unless manufacturer recommends otherwise.
- (3) Maintain separation between VFD output cables and low-voltage signal/control wiring to reduce electromagnetic interference.

e. Testing and Verification

- (1) Verify and document equipment ground continuity between VFD and motor.
- (2) Measure and record grounding system resistance; ensure resistance to earth does not exceed 5 ohms unless otherwise noted.

### 3.3 FIELD QUALITY CONTROL

Specified products must be tested as a system for conformance to specification requirements prior to scheduling the acceptance tests. Conduct performance verification tests in the presence of Government representative, observing and documenting complete compliance of the system to the specifications. Submit a signed copy of the test results, certifying proper system operation before scheduling tests.

#### 3.3.1 ASD Test

A proposed test plan must be submitted to the contracting officer at least 28 calendar days prior to proposed testing for approval. The tests must conform to NEMA ICS 1, NEMA ICS 7, and all manufacturer's safety regulations. The Government reserves the right to witness all tests and review any documentation. Inform the Government at least 14 working days prior to the dates of testing. Perform the ASD test engaging a qualified testing agency's field supervisor currently certified by NETA to supervise on-site testing.

a. Acceptance Testing Preparation:

- (1) Test insulation resistance for each VFC element, bus, component, connecting supply, feeder, and control circuit.
- (2) Test continuity of each circuit.

b. Tests and Inspections:

- (1) Inspect VFC, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
  - (2) Test insulation resistance for each VFC element, component, connecting motor supply, feeder, and control circuits.
  - (3) Test continuity of each circuit.
  - (4) Verify that voltages at VFC locations are within 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify Construction Manager before starting the motor(s).
  - (5) Test each motor for proper phase rotation.
  - (6) Perform tests according to the Inspection and Test Procedures for Adjustable Speed Drives stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
  - (7) Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
  - (8) Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- c. VFCs will be considered defective if they do not pass tests and inspections.
- d. Prepare test and inspection reports, including a certified report that identifies the VFC and describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

### 3.3.2 Performance Verification Tests

"Performance Verification Test" plan must provide the step by step procedure required to establish formal verification of the performance of the ASD. Compliance with the specification requirements must be verified by inspections, review of critical data, demonstrations, and tests. The Government reserves the right to witness all tests, review data, and request other such additional inspections and repeat tests as necessary to ensure that the system and provided services conform to the stated requirements. Inform the Government 14 calendar days prior to the date the test is to be conducted.

### 3.3.3 Endurance Test

Immediately upon completion of the performance verification test, the endurance test must commence. The system must be operated at varying rates for not less than 192 consecutive hours, at an average effectiveness level of 0.9998, to demonstrate proper functioning of the complete PCS. Continue the test on a day-to-day basis until performance standard is met. The contractor is not allowed in the building during the endurance test. The system must respond as designed.

### 3.4 DEMONSTRATION

#### 3.4.1 Training

Coordinate training requirements with the Contracting Officer. Provide video tapes, if available, of all training provided to the Government for subsequent use in training new personnel. Provide all training aids, texts, and expendable support material for a self-sufficient presentation shall be provided, the amount of which to be determined by the contracting officer.

##### 3.4.1.1 Instructions to Government Personnel

Provide the services of competent instructors with minimum two-year field experience with the operation and maintenance of similar ASDs who will give full instruction to designated personnel in operation, maintenance, calibration, configuration, and programming of the complete control system. Orient the training specifically to the system installed. Instructors must be thoroughly familiar with the subject matter they are to teach. The number of training days of instruction furnished must be as specified. A training day is defined as eight hours of instruction, including two 15-minute breaks and excluding lunch time; Monday through Friday. Provide a training manual for each student at each training phase which describes in detail the material included in each training program. Provide one additional copy for archiving. Provide equipment and materials required for classroom training. Provide a list of additional related courses, and offers, noting any courses recommended. List each training course individually by name, including duration, approximate cost per person, and location of course. Unused copies of training manuals must be turned over to the Government at the end of last training session.

##### 3.4.1.2 Operating Personnel Training Program

Provide one 2-hour training session at the site at a time and place mutually agreeable between the Contractor and the Government. Provide session to train 4 operation personnel in the functional operations of the system and the procedures that personnel will follow in system operation. This training shall include:

- a. System overview
- b. General theory of operation
- c. System operation
- d. Alarm formats
- e. Failure recovery procedures
- f. Troubleshooting

##### 3.4.1.3 Engineering/Maintenance Personnel Training

Accomplish the training program as specified. Training must be conducted on site at a location designated by the Government. Provide a one-day training session to train four engineering personnel in the functional operations of the system. This training must include:

- a. System overview

- b. General theory of operation
- c. System operation
- d. System configuration
- e. Alarm formats
- f. Failure recovery procedures
- g. Troubleshooting and repair
- h. Maintenance and calibration
- i. System programming and configuration

Safety Light Emitting Diode (LED)  
Equipment for Use in Lighting Products

## 1.2 RELATED REQUIREMENTS

Materials not considered to be luminaires, luminaire accessories, or lighting equipment are specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

## 1.3 DEFINITIONS

- a. Unless otherwise specified or indicated, electrical and electronics terms used in these specifications and on the drawings, must be as defined in IEEE 100 and ANSI/IES LS-1.
- b. For LED luminaire light sources, "Useful Life" is the operating hours before reaching 70 percent of the initial rated lumen output (L70) with no catastrophic failures under normal operating conditions. This is also known as 70 percent "Rated Lumen Maintenance Life" as defined in ANSI/IES LM-80.
- c. For LED luminaires, "Luminaire Efficacy" (LE) is the appropriate measure of energy efficiency, measured in lumens/watt. This is gathered from LM-79 data for the luminaire, in which absolute photometry is used to measure the lumen output of the luminaire as one entity, not the source separately and then the source and housing together.
- d. Total harmonic distortion (THD) is the root mean square (RMS) of all the harmonic components divided by the total fundamental current.

## 1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

### SD-02 Shop Drawings

Luminaire Drawings; G

### SD-03 Product Data

Luminaires; G

Light Sources; G

LED Drivers; G

Luminaire Warranty; G

Mini Inverters; G

Exit Signs; G

Emergency Drivers; G

#### SD-04 Samples

Luminaire Samples; G

#### SD-05 Design Data

Luminaire Design Data; G

Photometric Plan; G

#### SD-06 Test Reports

ANSI/IES LM-79 Test Report; G

ANSI/IES LM-80 Test Report; G

ANSI/IES TM-21 Test Report; G

ANSI/IES TM-30 Test Report; G

#### SD-07 Certificates

LED Driver and Dimming Switch Compatibility Certificate; G

#### SD-10 Operation and Maintenance Data

Lighting System, Data Package 5; G

Maintenance Staff Training Plan; G

End-User Training Plan; G

### 1.5 QUALITY ASSURANCE

Data, drawings, and reports must employ the terminology, classifications and methods prescribed by the IES Lighting Library as applicable, for the lighting system specified.

#### 1.5.1 Luminaire Drawings

Include dimensions, accessories installation details, and construction details. Photometric data, including CRI, CCT, LED driver type, zonal lumen data, and candlepower distribution data must accompany shop drawings.

#### 1.5.2 Luminaire Design Data

- a. Provide safety certification and file number for the luminaire family

that must be listed, labeled, or identified in accordance with the NFPA 70. Applicable testing bodies are determined by the US Occupational Safety Health Administration (OSHA) as Nationally Recognized Testing Laboratories (NRTL) and include: CSA (Canadian Standards Association), ETL (Edison Testing Laboratory), and UL (Underwriters Laboratories).

- b. Provide long term lumen maintenance projections for each LED luminaire in accordance with ANSI/IES TM-21. Data used for projections must be obtained from testing in accordance with ANSI/IES LM-80.

#### 1.5.3 ANSI/IES LM-79 Test Report

Submit test report on manufacturer's standard production model of specified luminaire. Testing must be performed at the same operating drive current as specified luminaire. Include all applicable and required data in IES format as outlined under "14.0 Test Report" in ANSI/IES LM-79.

#### 1.5.4 ANSI/IES LM-80 Test Report

Submit report on manufacturer's standard production LED light source (package, array, or module) of specified luminaire. Testing must be performed at the same operating drive current as specified luminaire. Include all applicable and required data as outlined under "8.0 Test Report" in ANSI/IES LM-80.

#### 1.5.5 ANSI/IES TM-21 Test Report

Submit test report on manufacturer's standard production LED light source (package, array, or module) of specified luminaire. Testing must be performed at the same operating drive current as specified luminaire. Include all applicable and required data, as well as required interpolation information as outlined under "7.0 Report" in ANSI/IES TM-21.

#### 1.5.6 ANSI/IES TM-30 Test Report

Submit color vector graphic in accordance with ANSI/IES TM-30 on manufacturer's standard production LED light source (package, array, or module) of specified luminaire. Include spectral distribution of test LED light source.

#### 1.5.7 LED Driver and Dimming Switch Compatibility Certificate

Submit certification from the luminaire, driver, or dimmer switch manufacturer that ensures compatibility and operability between devices without flickering and to specified dimming levels.

#### 1.5.8 Photometric Plan

##### 1.5.8.1 Computer-generated Photometric Plans

Computer-generated photometric plans for each space are required to verify proposed luminaires and locations meet the required performance criteria of the design using the applicable light loss factor (LLF).

Target illumination levels are provided for each Interior Application. Depending on the application and the recommendations provided by the IES, values are given as one of the following:

- a. Minimum: No values anywhere on the calculation grid may be less than this value, within a 10 percent margin of error.
- b. Minimum Average: An average, taken over the entire task area for the application, may not be less than this value, within a 10 percent margin of error.
- c. Maximum: No values anywhere on the calculation grid may be greater than this value, within a 10 percent margin of error.
- d. Maximum Average: An average, taken over the entire task area for the application, may not be greater than this value, within a 10 percent margin of error.
- e. Uniformity: Unless otherwise noted, uniformity is calculated as a ratio of the average calculated illuminance over the minimum calculated illuminance of the calculation grid.

#### 1.5.8.2 Schematic Photometric Plan Calculations

Schematic photometric plan calculations must include:

- a. Horizontal illuminance measurements at workplane or other designated height above finished floor, taken at a maximum of every one foot across the task area.
- b. Average maintained illuminance level.
- c. Minimum and maximum maintained illuminance levels.
- d. Lighting power density (Watts per square foot).
- e. LLF. Recommended LLF is 0.81 for LED luminaires but LLF varies based on environment and application.

#### 1.5.8.3 Final Photometric Plan Calculations

Final photometric plan calculations must include:

- a. Horizontal illuminance measurements at workplane or other designated height above finished floor, taken at a maximum of every one foot across the task area.
- b. Where applicable, vertical illuminance measurements at designated surface, taken at a maximum of every one foot across task area.
- c. Minimum and maximum maintained illuminance levels.
- d. Average maintained illuminance level.
- e. Average to minimum and maximum to minimum ratios for horizontal illuminance.
- f. Lighting power density (Watts per square foot).
- g. LLF. Recommended LLF is 0.81 for LED luminaires but LLF varies based on environment and application.

#### 1.5.9 Test Laboratories

Test laboratories for the ANSI/IES LM-79 and ANSI/IES LM-80 test reports must be one of the following:

- a. National Voluntary Laboratory Accreditation Program (NVLAP) accredited for solid-state lighting testing as part of the Energy-Efficient Lighting Products laboratory accreditation program for both LM-79 and LM-80 testing.
- b. One of the qualified labs listed on the Department of Energy - LED Lighting Facts Approved Testing Laboratories List for LM-79 testing.
- c. One of the EPA-Recognized Laboratories listed for LM-80 testing.

#### 1.5.10 Regulatory Requirements

Equipment, materials, installation, and workmanship must be in accordance with the mandatory and advisory provisions of NFPA 70, unless more stringent requirements are specified or indicated. Provide luminaires and assembled components that are approved by and bear the label of UL for the applicable location and conditions unless otherwise specified.

#### 1.5.11 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design, and workmanship. Products must have been in satisfactory commercial or industrial use for six months prior to bid opening. The six-month period must include applications of equipment and materials under similar circumstances and of similar size. The product must have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the six-month period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

##### 1.5.11.1 Alternative Qualifications

Products having less than a six-month field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

##### 1.5.11.2 Material and Equipment Manufacturing Date

Do not use products manufactured more than six months prior to date of delivery to site, unless specified otherwise.

#### 1.6 WARRANTY

Support all equipment items by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

#### 1.6.1 Luminaire Warranty

Provide and transfer to the government the original LED luminaire manufacturers standard commercial warranty for each different luminaire manufacturer used in the project.

- a. Provide a written five year minimum replacement warranty for material, luminaire finish, and workmanship. Provide written warranty document that contains all warranty processing information needed, including customer service point of contact, whether or not a return authorization number is required, return shipping information, and closest return location to the luminaire location.

- (1) Finish warranty must include failure and substantial deterioration such as blistering, cracking, peeling, chalking, or fading.

- (2) Material warranty must include:

- (a) All LED drivers and integral control equipment.

- (b) Replacement when more than 15 percent of LED sources in any lightbar or subassembly(s) are defective, non-starting, or operating below 70 percent of specified lumen output.

- (c) Replacement when more than 15 percent of LED sources in any lightbar or subassembly(s) show a color shift greater than 0.003 delta u'v' from the zero hour measurement stated in the ANSI/IES LM-79 Test Report.

- b. Warranty period must begin in accordance with the manufacturer's standard warranty starting date.

- c. Provide replacements that are promptly shipped, without charge, to the using Government facility point of contact and that are identical to or an improvement upon the original equipment. All replacements must include testing of new components and assembly.

#### 1.7 OPERATION AND MAINTENANCE MANUALS

##### 1.7.1 Lighting System

Provide operation and maintenance manuals for the lighting system in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA that provide basic data relating to the design, operation, and maintenance of the lighting system for the building. Additional requirements for the Navy are provided in Section 01 78 24.00 20 FACILITY DATA WORKBOOK (FDW). Include the following:

- a. Manufacturers' operating and maintenance manuals.
- b. Luminaire shop drawings for modified and custom luminaires.
- c. Luminaire Manufacturers' standard commercial warranty information as specified in paragraph LUMINAIRE WARRANTY.

PART 2 PRODUCTS

2.1 PRODUCT COORDINATION

2.2 LUMINAIRES

UL 1598, NEMA C82.77-10. Provide luminaires as indicated in the luminaire schedule and NL plates or details on project plans, complete with light source, wattage, and lumen output indicated. All luminaires of the same type must be provided by the same manufacturer. Luminaires must be specifically designed for use with the driver and light source provided.

2.2.1 Luminaire Samples

Submit one sample of each luminaire type , complete with light source, LED driver rated for 120 V operation, and 6 feet pigtail with 3-prong Edison plug. Sample will be returned to the Contractor for installation in the project work.

2.2.2 Luminaires

UL 8750, ANSI/IES LM-79, ANSI/IES LM-80. For all luminaires, provide:

- a. Complete system with LED drivers and light sources.
- b. Housings constructed of non-corrosive materials. All new aluminum housings must be anodized or powder-coated. All new steel housings must be treated to be corrosion resistant.
- c. ANSI/IES TM-21, ANSI/IES LM-80. Minimum L70 lumen maintenance value of 50,000 hours unless otherwise indicated in the luminaire schedule. Luminaire drive current value must be identical to that provided by test data for luminaire in question.
- d. Minimum efficacy as specified in the luminaire schedule. Theoretical models of initial lamp lumens per watt are not acceptable. If efficacy values are not listed in the luminaire schedule, provide luminaires that meet the following minimum values:

| Luminaire Style                                       | Minimum Luminaire Efficacy |
|-------------------------------------------------------|----------------------------|
|                                                       |                            |
|                                                       |                            |
|                                                       |                            |
| Linear, Ambient (indirect wall mount, linear pendent) | 100 LPW                    |
| High Bay, Low Bay, and Industrial Locations           | 100 LPW                    |
|                                                       |                            |
|                                                       |                            |

| Luminaire Style | Minimum Luminaire Efficacy |
|-----------------|----------------------------|
|                 |                            |
|                 |                            |
|                 |                            |

- e. UL listed for dry or damp location typical of interior installations. Any luminaire mounted on the exterior of the building must be UL listed for wet location typical of exterior installations.
- f. LED driver and light source package, array, or module are accessible for service or replacement without removal or destruction of luminaire.
- g. Lenses constructed of heat tempered borosilicate glass, UV-resistant acrylic, or silicone.

#### 2.2.2.1 Luminaire Conversion Kits

Provide luminaire conversion kits that meet UL 1598C Standard for Light-Emitting Diode (LED) Retrofit Luminaire Conversion Kits.

### 2.3 LIGHT SOURCES

NEMA ANSLG C78.377, NEMA SSL 3. Provide type, delivered lumen output, and wattage as indicated in the luminaire schedule on project plans.

#### 2.3.1 LED Light Sources

Provide LED light sources that meet the following requirements:

- a. NEMA ANSLG C78.377. Emit white light and have a nominal CCT of 3500 and 4000 Kelvin.
- b. Minimum Color Rendering Index (CRI) of 90.
- c. Directive 2011/65/EU. Restriction of Hazardous Substances (RoHS) compliant.
- d. Light source color consistency by utilizing a binning tolerance within a 3-step McAdam ellipse.
- e. Color maintenance value of no greater than 0.003 ( $\Delta u'v'$ ) at 6000 hours as listed in ANSI/IES LM-79 Test Report.

### 2.4 LED DRIVERS

NEMA SSL 1, UL 8750. Provide LED drivers that are electronic, UL Class 1 or Class 2, constant-current type and that comply with the following requirements:

- a. The combined driver and LED light source system does not exceed the minimum luminaire efficacy values as listed in the luminaire schedule provided.

- b. Operates at a voltage of 120-277 volts at 50/60 hertz, with input voltage fluctuations of plus/minus 10 percent.
- c. Power Factor (PF) greater than or equal to 0.90 at full input power and across specified dimming range.
- d. Maximum Total Harmonic Distortion (THD) less than 20 percent at full input power and across specified dimming range.
- e. Operates for at least 50,000 hours at maximum case temperature and 90 percent non-condensing relative humidity.
- f. Withstands Category A surges of 2 kV without impairment of performance. Provide surge protection that is integral to the driver.
- g. Integral thermal protection that reduces the output power to protect the driver and light source from damage if the case temperature approaches or exceeds the driver's maximum operating temperature.
- h. 47 CFR 15. Complies with the requirements of the Federal Communications Commission (FCC) rules and regulations, Non-Consumer (Class A) for EMI/RFI (conducted and radiated).
- i. Class A sound rating.
- j. Directive 2011/65/EU. Restriction of Hazardous Substances (RoHS) compliant.
- k. Provide dimming capability as indicated in the luminaire schedule on project plans. Dimmable drivers must dim down to 10 percent. Dimmable drivers must be controlled by a Class 2 low voltage 0-10VDC controller

## 2.5 LIGHTING CONTROLS

## 2.6 EXIT AND EMERGENCY LIGHTING EQUIPMENT

### 2.6.1 Exit Signs

UL 924, NFPA 101. Provide wattage as indicated in the luminaire schedule on project plans. Provide LED Exit Signs that meet the following criteria:

- a. Housing constructed of .Edge-lit type with clear acrylic, edge-lit face and aluminum trim having .
- b. UL listed for damp location.
- c. Configured for universal mounting.
- d. 6 inch high, 3/4 inch stroke red lettering on face of sign with chevrons on either side of lettering to indicate direction.
- e. Single or double face as indicated in project plans and luminaire schedule.

#### 2.6.1.1 Exit Signs with Battery Backup

Equip with automatic power failure device, test switch, and pilot light, and fully automatic high/low trickle charger in a self-contained power

pack. Battery must be sealed, maintenance free nickel-cadmium type, and must operate unattended for a period of not less than five years. Emergency run time must be a minimum of 1-1/2 hours. LEDs must have a minimum rated life of 10 years. Provide self-diagnostic circuitry integral to emergency LED driver.

#### 2.6.2 LED Emergency Drivers

UL 924, NFPA 101. Provide LED emergency driver with automatic power failure detection, test switch and LED indicator (or combination switch/indicator) located on luminaire exterior, and fully-automatic solid-state charger, battery and inverter integral to a self-contained housing. Provide self-diagnostic function integral to emergency driver. Integral nickel-cadmium battery is required to supply a minimum of 90 minutes of emergency power at 10 watts, constant output. Driver must be RoHS compliant, rated for installation in plenum-rated spaces and damp locations, and be warranted for a minimum of five years.

#### 2.6.3 Self-Diagnostic Circuitry for LED Drivers

UL 924, NFPA 101. Provide emergency lighting unit with fully-automatic, integral self-testing/diagnostic electronic circuitry. Circuitry must provide for a one minute diagnostic test every 28 days, and a 30 minute diagnostic test every six months, minimum. Any malfunction of the unit must be indicated by LED(s) visible from the exterior of the luminaire. A manual test switch must also be provided to perform a diagnostic test at any given time.

#### 2.6.4 Mini Inverters

UL 924, NFPA 101. Provide mini inverters that are designed to provide power to emergency luminaires. Provide mini inverters that are suitable for damp installations, operate at a voltage of 120-277 volts at 50/60 hertz, and are capable of operating 0-10V dimming override. Provide mini inverters that supply a minimum of 90 minutes of emergency power.

#### 2.6.5 Central Emergency Lighting System

UL 924, NFPA 101, NFPA 110 level 1, NFPA 70. Provide a central power system providing emergency power at 120 volts, 60 hertz, for a minimum period of 90 minutes. Design the system to handle surges during loss and recovery of the voltage, and to deliver its full rated output to the designated lamp load. Provide backup ac source for power.

##### 2.6.5.1 Operation

Provide system such that when the lighting system loses normal supply voltage, it automatically disengages itself from the normal input line, and switches to a self-contained inverter with built-in protection when the output is shorted or overloaded. Ensure that, when normal line voltage resumes, the emergency system automatically switches back to normal operation. Size the transfer switch for this function to handle 125 percent of full load. Provide the battery system with self-contained inverters with overload protection.

##### 2.6.5.2 Charger

Provide a completely automatic battery charger that maintains the batteries in a fully charged condition and recharges the batteries to full

capacity within 24 hours after full discharge in accordance with UL 924.

#### 2.6.5.3 Batteries

Provide sealed nickel-cadmium batteries, maintenance-free for a period of not less than 0 years under normal operating conditions.

#### 2.6.5.4 Accessories

Provide visual indicators to indicate normal power, inverter power, and battery-charger operation. Provide a low-voltage test switch to simulate power failure by interrupting the input line, voltage meter, electrolyte level detector to automatically disable the charging circuit in the event of a fault, and low-voltage cutoff to prevent extreme battery power dissipation.

#### 2.6.5.5 Enclosure

Provide a free-standing cabinet with floor stand and constructed of 12-gage sheet steel with baked-on enamel finish and a locking latch.

### 2.7 LUMINAIRE MOUNTING ACCESSORIES

#### 2.7.1 Suspended Luminaires

- a. Provide hangers capable of supporting twice the combined weight of luminaires supported by hangers.
- b. Hangers must allow luminaires to swing within an angle of 45 degrees. Brace pendants 4 feet or longer to limit swinging. Provide with swivel hangers to ensure a plumb installation for rigid stem pendants. Provide cadmium-plated steel with a swivel-ball tapped for the conduit size indicated.
- c. Single-unit suspended luminaires must have twin-stem hangers. Multiple-unit or continuous row luminaires with a separate power supply cord must have a tubing or stem for wiring at one point and a tubing or rod suspension provided for each unit length of chassis, including one at each end.
- d. Provide all linear pendent and surface mounted luminaires with two supports per four-foot section or three per eight-foot section unless otherwise recommended by manufacturer.
- e. Provide rods in minimum 0.18 inch diameter.

#### 2.7.2 Recess and Surface Mounted Luminaires

Provide access to light source and LED driver from bottom of luminaire. Provide trim and lenses for the exposed surface of flush-mounted luminaires as indicated on project drawings and specifications. Luminaires recessed in ceilings which have a fire resistive rating of one hour or more must be enclosed in a box which has a fire resistive rating equal to that of the ceiling. For surface mounted luminaires with brackets, provide flanged metal stem attached to outlet box, with threaded end suitable for supporting the luminaire rigidly in design position. Flanged part of luminaire stud must be of broad base type, secured to outlet box at not fewer than three points.

### 2.7.3 Luminaire Support Hardware

#### 2.7.3.1 Wire

ASTM A641/A641M. Galvanized, soft tempered steel, minimum 0.11 inches in diameter, or galvanized, braided steel, minimum 0.08 inches in diameter.

#### 2.7.3.2 Wire for Humid Spaces

ASTM A580/A580M. Composition 302 or 304, annealed stainless steel, minimum 0.11 inches in diameter.

ASTM B164. UNS N04400, annealed nickel-copper alloy, minimum 0.11 inches in diameter.

#### 2.7.3.3 Threaded Rods

Threaded steel rods, 3/16 inch diameter, zinc or cadmium coated.

#### 2.7.3.4 Straps

Galvanized steel, one by 3/16 inch, conforming to ASTM A653/A653M, with a light commercial zinc coating or ASTM A1008/A1008M with an electrodeposited zinc coating conforming to ASTM B633, Type RS.

### 2.8 EQUIPMENT IDENTIFICATION

#### 2.8.1 Manufacturer's Nameplate

Each item of equipment must have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

#### 2.8.2 Labels

UL 1598. All luminaires must be clearly marked for operation of specific light sources and LED drivers. The labels must be easy to read when standing next to the equipment, and durable to match the life of the equipment to which they are attached. Note the following light source characteristics in the format "Use Only \_\_\_\_\_":

- a. Correlated Color Temperature (CCT) and Color Rendering Index (CRI) for all luminaires.
- b. Driver and dimming protocol.

All markings related to light source type must be clear and located to be readily visible to service personnel, but unseen from normal viewing angles when light sources are in place. LED drivers must have clear markings indicating dimming type and indicate proper terminals for the various outputs.

### 2.9 FACTORY APPLIED FINISH

NEMA 250. Provide all luminaires and lighting equipment with factory-applied painting system that as a minimum, meets requirements of corrosion-resistance testing.

## PART 3 EXECUTION

### 3.1 INSTALLATION

IEEE C2, NFPA 70.

#### 3.1.1 Light Sources

When light sources are not provided as an integral part of the luminaire, deliver light sources of the type, wattage, lumen output, color temperature (CCT), color rendering index (CRI), and voltage rating indicated to the project site and install just prior to project completion, if not already installed in the luminaires from the factory.

#### 3.1.2 Luminaires

Set luminaires plumb, square, and level with ceiling and walls, in alignment with adjacent luminaires and secure in accordance with manufacturers' directions and approved drawings. Provide accessories as required for ceiling construction type indicated on Finish Schedule. Luminaire catalog numbers do not necessarily denote specific mounting accessories for type of ceiling in which a luminaire may be installed. Provide wires, straps, or rods for luminaire support in this section. Install luminaires with vent holes free of air blocking obstacles.

##### 3.1.2.1 Suspended Luminaires

Measure mounting heights from the bottom of the luminaire for ceiling-mounted luminaires and to center of luminaire for wall-mounted luminaires. Obtain architect approval of the exact mounting height on the job before commencing installation and, where applicable, after coordinating with the type, style, and pattern of the ceiling being installed. Support suspended luminaires from structural framework of ceiling or from inserts cast into slab.

- a. Provide suspended luminaires with 45 degree swivel hangers so that they hang plumb and level.
- b. Locate so that there are no obstructions within the 45 degree range in all directions.
- c. The stem, canopy and luminaire must be capable of 45 degree swing.
- d. Rigid pendent stem, aircraft cable, rods, or chains 4 feet or longer excluding luminaire must be braced to prevent swaying using three cables at 120 degree separation.
- e. Suspended luminaires in continuous rows must have internal wireway systems for end to end wiring and must be properly aligned to provide a straight and continuous row without bends, gaps, light leaks or filler pieces.
- f. Utilize aligning splines on extruded aluminum luminaires to assure minimal hairline joints.
- g. Support steel luminaires to prevent "oil-canning" effects.
- h. Match supporting pendants with supported luminaire. Aircraft cable must be stainless steel.

- i. Match finish of canopies to match the ceiling, and provide low profile canopies unless otherwise shown.
- j. Maximum distance between suspension points must be 10 feet or as recommended by the manufacturer, whichever is less.

#### 3.1.2.2 Recessed and Semi-Recessed Luminaires

- a. Support recessed and semi-recessed luminaires independently from the building structure by a minimum of two wires, straps or rods per luminaire and located near opposite corners of the luminaire. Secure horizontal movement with clips provided by manufacturer. Ceiling grid clips are not allowed as an alternative to independently supported luminaires.
- b. Support round luminaires or luminaires smaller in size than the ceiling grid independently from the building structure by a minimum of four wires, straps or rods per luminaire, spaced approximately equidistant around.
- c. Do not support luminaires by acoustical tile ceiling panels.
- d. Where luminaires of sizes less than the ceiling grid are indicated to be centered in the acoustical panel, support each independently and provide at least two 3/4 inch metal channels spanning, and secured to, the ceiling tees for centering and aligning the luminaire.
- e. Adjust aperture rings on all applicable ceiling recessed luminaires to accommodate various ceiling material thickness. Coordinate cut-out size in ceiling to ensure aperture covers cut-out entirely. Install aperture rings such that the bottom of the ring is flush with finished ceiling or not more than 1/16 inch above. Do not install luminaires such that the aperture ring extends below the finished ceiling surface.
- f. For luminaire recessed in plaster ceilings, provide plaster frames for setting. Install setting such that the bottom of the frame is flush with finished ceiling. Support luminaires with plaster frames utilizing yokes or leveling lugs. Do not mount luminaires or support elements to ducts or pipes. Yokes must support a luminaire by no fewer than two bolts each.

#### 3.1.2.3 Field Applied Painting

Provide field applied painting for all luminaire type . Paint lighting equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Provide painting as specified in Section 09 90 00 PAINTS AND COATINGS.

#### 3.1.3 LED Drivers

Provide LED drivers integral to luminaire as constructed by the manufacturer.

#### 3.1.4 Exit Signs

NFPA 101. Wire exit signs and emergency lighting units ahead of the local

switch, to the normal lighting circuit located in the same room or area.

Connect exit signs on separate circuits and serve from a separate circuit breaker. . Paint source of control red and provide lockout capability.

### 3.2 FIELD QUALITY CONTROL

#### 3.2.1 Tests

##### 3.2.1.1 Lighting Control Verification Tests

Verify lighting control system and devices operate according to approved sequence of operations. Verification tests are to be completed after commissioning.

- a. Verify wall box dimmers and scene wallstations operate as described in sequence of operations.

##### 3.2.1.2 Emergency Lighting Test

Interrupt power supply to demonstrate proper operation of emergency lighting. If adjustments are made to the lighting system, re-test system to show compliance with standards.

### 3.3 CLOSEOUT ACTIVITIES

#### 3.3.1 Commissioning

NFPA 101. Factory Trained Field Service Technician is responsible for calibration and programming sequences for input devices and systems in accordance with the requirements described in the sequence of operation.

#### 3.3.2 Training

##### 3.3.2.1 Maintenance Staff Training

Submit a Maintenance Staff Training Plan at least 30 calendar days prior to training session that describes training procedures for Owner's personnel in the operation and maintenance of lighting and lighting control system. Provide on-site training which demonstrates full system functionality, assigning schedules, calibration adjustments for light levels and sensor sensitivity, integration procedures for connecting to third-party devices, and manual override including information on appropriate use. Provide protocols for troubleshooting, maintenance, repair, and replacement, and literature on available system updates and process for implementing updates.

##### 3.3.2.2 End-User Training

Submit an End-User Training Plan at least 30 calendar days prior to training session that describes training procedures for end-users on the lighting control system. Provide users with a list of control devices located within user-occupied spaces, such as photosensors and occupancy and vacancy sensors, including information on the proper operation and schedule for each device. Provide demonstration for each type of interface. Provide users with the building schedule as currently commissioned, including conditional programming based on astronomic time

clock functionality. Provide users with the correct contact information for maintenance personnel who will be available to address any lighting control issues.

Provide laminated instructions to the user at each scene wallstation. Provide only instructions relevant to the functionality of the specific scene wallstation. Provide a description of each labeled scene control button. If the room utilizes occupancy/vacancy sensors or photosensors, include a description of this functionality on the instruction sheet.

## 1.2 RELATED REQUIREMENTS

Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM , apply to this section with additions and modifications specified herein.

## 1.3 DEFINITIONS

Unless otherwise specified or indicated, electrical and electronics terms used in this specification shall be as defined in TIA-568.1, TIA-568.2, TIA-568.3, TIA-569, TIA-606 and IEEE 100 and herein.

### 1.3.1 Campus Distributor (CD)

A distributor from which the campus backbone cabling emanates. (International expression for main cross-connect (MC).)

### 1.3.2 Building Distributor (BD)

A distributor in which the building backbone cables terminate and at which connections to the campus backbone cables may be made. (International expression for intermediate cross-connect (IC).)

### 1.3.3 Floor Distributor (FD)

A distributor used to connect horizontal cable and cabling subsystems or equipment. (International expression for horizontal cross-connect (HC).)

### 1.3.4 Telecommunications Room (TR)

An enclosed space for housing telecommunications equipment, cable, terminations, and cross-connects. The room is the recognized cross-connect between the backbone cable and the horizontal cabling.

### 1.3.5 Entrance Facility (EF) (Telecommunications)

An entrance to the building for both private and public network service cables (including wireless) including the entrance point at the building wall and continuing to the equipment room.

### 1.3.6 Equipment Room (ER) (Telecommunications)

An environmentally controlled centralized space for telecommunications equipment that serves the occupants of a building. Equipment housed therein is considered distinct from a telecommunications room because of the nature of its complexity.

### 1.3.7 Open Cable

Cabling that is not run in a raceway as defined by NFPA 70. This refers to cabling that is "open" to the space in which the cable has been

installed and is therefore exposed to the environmental conditions associated with that space.

#### 1.3.8 Open Office

A floor space division provided by furniture, moveable partitions, or other means instead of by building walls.

#### 1.3.9 Pathway

A physical infrastructure utilized for the placement and routing of telecommunications cable.

### 1.4 SYSTEM DESCRIPTION

The building telecommunications cabling and pathway system shall include permanently installed backbone and horizontal cabling, horizontal and backbone pathways, service entrance facilities, work area pathways, telecommunications outlet assemblies, conduit, raceway, and hardware for splicing, terminating, and interconnecting cabling necessary to transport telephone and data (including LAN) between equipment items in a building. The horizontal system shall be wired in a star topology from the telecommunications work area to the floor distributor or campus distributor at the center or hub of the star. The backbone cabling and pathway system includes intrabuilding and interbuilding interconnecting cabling, pathway, and terminal hardware. The intrabuilding backbone provides connectivity from the floor distributors to the building distributors or to the campus distributor and from the building distributors to the campus distributor as required. The backbone system shall be wired in a star topology with the campus distributor at the center or hub of the star. The interbuilding backbone system provides connectivity between the campus distributors and is existing. Provide telecommunications pathway systems referenced herein as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. The telecommunications contractor must coordinate with the NMCI/COSC/NGEN contractor concerning access to and configuration of telecommunications spaces. The telecommunications contractor may be required to coordinate work effort within the telecommunications spaces with the NMCI/COSC/NGEN contractor.

### 1.5 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

#### SD-02 Shop Drawings

Telecommunications Drawings; G

Telecommunications Space Drawings; G

In addition to Section 01 33 00 SUBMITTAL PROCEDURES, provide shop drawings in accordance with paragraph SHOP DRAWINGS.

#### SD-03 Product Data

Telecommunications Cabling (backbone and horizontal); G

Patch Panels; G

Telecommunications Outlet/Connector Assemblies; G

Equipment Support Frame; G

Connector Blocks; G

Spare Parts; G

Submittals shall include the manufacturer's name, trade name, place of manufacture, and catalog model or number. Include performance and characteristic curves. Submittals shall also include applicable federal, military, industry, and technical society publication references. Should manufacturer's data require supplemental information for clarification, the supplemental information shall be submitted as specified in paragraph REGULATORY REQUIREMENTS and as required in Section 01 33 00 SUBMITTAL PROCEDURES.

#### SD-06 Test Reports

Telecommunications Cabling Testing; G

#### SD-07 Certificates

Telecommunications Contractor Qualifications; G

Key Personnel Qualifications; G

Manufacturer Qualifications; G

Test Plan; G

#### SD-09 Manufacturer's Field Reports

Factory Reel Tests; G

#### SD-10 Operation and Maintenance Data

Telecommunications Cabling and Pathway System Data Package 5; G

#### SD-11 Closeout Submittals

Record Documentation; G

### 1.6 QUALITY ASSURANCE

#### 1.6.1 Shop Drawings

In exception to Section 01 33 00 SUBMITTAL PROCEDURES, submitted plan drawings shall be a minimum of 11 by 17 inches in size using a minimum scale of 1/8 inch per foot. Include wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure a coordinated installation. Wiring diagrams shall identify circuit terminals and indicate the internal wiring for each item of equipment and the interconnection between each item of equipment.

Drawings shall indicate adequate clearance for operation, maintenance, and replacement of operating equipment devices. Submittals shall include the nameplate data, size, and capacity. Submittals shall also include applicable federal, military, industry, and technical society publication references.

#### 1.6.1.1 Telecommunications Drawings

Provide drawings in accordance with TIA-606. The identifier for each termination and cable shall appear on the drawings. Drawings shall depict final telecommunications installed wiring system infrastructure in accordance with TIA-606. The drawings should provide details required to prove that the distribution system shall properly support connectivity from the EF telecommunications and ER telecommunications, CD's, and FD's to the telecommunications work area outlets. Provide a plastic laminated schematic of the as-installed telecommunications cable system showing cabling, CD's, BD's, FD's, and the EF and ER for telecommunications keyed to floor plans by room number. Mount the laminated schematic in the EF telecommunications space as directed by the Contracting Officer. The following drawings shall be provided as a minimum:

- a. T1 - Layout of complete building per floor - Building Area/Serving Zone Boundaries, Backbone Systems, and Horizontal Pathways. Layout of complete building per floor. The drawing indicates location of building areas, serving zones, vertical backbone diagrams, telecommunications rooms, access points, pathways, grounding system, and other systems that need to be viewed from the complete building perspective.
- b. T2 - Serving Zones/Building Area Drawings - Drop Locations and Cable Identification (ID'S). Shows a building area or serving zone. These drawings show drop locations, telecommunications rooms, access points and detail call outs for common equipment rooms and other congested areas.
- c. T4 - Typical Detail Drawings - Faceplate Labeling, Firestopping, Americans with Disabilities Act (ADA), Safety, Department of Transportation (DOT). Detailed drawings of symbols and typicals such as faceplate labeling, faceplate types, faceplate population installation procedures, detail racking, and raceways.

#### 1.6.1.2 Telecommunications Space Drawings

Provide T3 drawings in accordance with TIA-606 that include telecommunications rooms plan views, pathway layout (cable tray, racks, ladder-racks, etc.), mechanical/electrical layout, and cabinet, rack and wall elevations. Drawings shall show layout of applicable equipment including incoming cable stub or connector blocks, building protector assembly, outgoing cable connector blocks, patch panels and equipment spaces and cabinet/racks. Drawings shall include a complete list of equipment and material, equipment rack details, proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearance for maintenance and operation. Drawings may also be an enlargement of a congested area of T1 or T2 drawings.

#### 1.6.2 Telecommunications Qualifications

Work under this section shall be performed by and the equipment shall be

provided by the approved telecommunications contractor and key personnel. Qualifications shall be provided for: the telecommunications system contractor, the telecommunications system installer, and the supervisor (if different from the installer). A minimum of 30 days prior to installation, submit documentation of the experience of the telecommunications contractor and of the key personnel.

#### 1.6.2.1 Telecommunications Contractor

The telecommunications contractor shall be a firm which is regularly and professionally engaged in the business of the applications, installation, and testing of the specified telecommunications systems and equipment. The telecommunications contractor shall demonstrate experience in providing successful telecommunications systems within the past 3 years of similar scope and size. Submit documentation for a minimum of three and a maximum of five successful telecommunication system installations for the telecommunications contractor.

#### 1.6.2.2 Key Personnel

Provide key personnel who are regularly and professionally engaged in the business of the application, installation and testing of the specified telecommunications systems and equipment. There may be one key person or more key persons proposed for this solicitation depending upon how many of the key roles each has successfully provided. Each of the key personnel shall demonstrate experience in providing successful telecommunications systems within the past 3 years.

Supervisors and installers assigned to the installation of this system or any of its components shall be Building Industry Consulting Services International (BICSI) Registered Cabling Installers, Technician Level. Submit documentation of current BICSI certification for each of the key personnel.

In lieu of BICSI certification, supervisors and installers assigned to the installation of this system or any of its components shall have a minimum of 3 years experience in the installation of the specified copper and fiber optic cable and components. They shall have factory or factory approved certification from each equipment manufacturer indicating that they are qualified to install and test the provided products. Submit documentation for a minimum of three and a maximum of five successful telecommunication system installations for each of the key personnel. Documentation for each key person shall include at least two successful system installations provided that are equivalent in system size and in construction complexity to the telecommunications system proposed for this solicitation. Include specific experience in installing and testing telecommunications systems and provide the names and locations of at least two project installations successfully completed using optical fiber and copper telecommunications cabling systems. All of the existing telecommunications system installations offered by the key persons as successful experience shall have been in successful full-time service for at least 18 months prior to the issuance date for this solicitation. Provide the name and role of the key person, the title, location, and completed installation date of the referenced project, the referenced project owner point of contact information including name, organization, title, and telephone number, and generally, the referenced project description including system size and construction complexity.

Indicate that all key persons are currently employed by the

telecommunications contractor, or have a commitment to the telecommunications contractor to work on this project. All key persons shall be employed by the telecommunications contractor at the date of issuance of this solicitation, or if not, have a commitment to the telecommunications contractor to work on this project by the date that the bid was due to the Contracting Officer.

Note that only the key personnel approved by the Contracting Officer in the successful proposal shall do work on this solicitation's telecommunications system. Key personnel shall function in the same roles in this contract, as they functioned in the offered successful experience. Any substitutions for the telecommunications contractor's key personnel requires approval from The Contracting Officer.

#### 1.6.2.3 Minimum Manufacturer Qualifications

Cabling, equipment and hardware manufacturers shall have a minimum of 3 years experience in the manufacturing, assembly, and factory testing of components which comply with TIA-568.1, TIA-568.2 and TIA-568.3.

#### 1.6.3 Test Plan

Provide a complete and detailed test plan for the telecommunications cabling system including a complete list of test equipment for the components and accessories for each cable type specified, 60 days prior to the proposed test date. Include procedures for certification, validation, and testing.

#### 1.6.4 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship shall be in accordance with the mandatory and advisory provisions of NFPA 70 unless more stringent requirements are specified or indicated.

#### 1.6.5 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products shall have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period shall include applications of equipment and materials under similar circumstances and of similar size. The product shall have been on sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items shall be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

##### 1.6.5.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests,

is furnished.

#### 1.6.5.2 Material and Equipment Manufacturing Date

Products manufactured more than 1 year prior to date of delivery to site shall not be used, unless specified otherwise.

#### 1.7 DELIVERY AND STORAGE

Provide protection from weather, moisture, extreme heat and cold, dirt, dust, and other contaminants for telecommunications cabling and equipment placed in storage.

#### 1.8 ENVIRONMENTAL REQUIREMENTS

Connecting hardware shall be rated for operation under ambient conditions of 32 to 140 degrees F and in the range of 0 to 95 percent relative humidity, noncondensing.

#### 1.9 WARRANTY

The equipment items shall be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

#### 1.10 MAINTENANCE

##### 1.10.1 Operation and Maintenance Manuals

Commercial off the shelf manuals shall be furnished for operation, installation, configuration, and maintenance of products provided as a part of the telecommunications cabling and pathway system, Data Package 5. Submit operations and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA and as specified herein not later than 2 months prior to the date of beneficial occupancy. In addition to requirements of Data Package 5, include the requirements of paragraphs TELECOMMUNICATIONS DRAWINGS, TELECOMMUNICATIONS SPACE DRAWINGS, and RECORD DOCUMENTATION. Ensure that these drawings and documents depict the as-built configuration.

##### 1.10.2 Record Documentation

Provide T5 drawings including documentation on cables and termination hardware in accordance with TIA-606. T5 drawings shall include schedules to show information for cut-overs and cable plant management, patch panel layouts and cover plate assignments, cross-connect information and connecting terminal layout as a minimum. T5 drawings shall be provided on electronic media using Windows based computer cable management software. Provide the following T5 drawing documentation as a minimum:

- a. Cables - A record of installed cable shall be provided in accordance with TIA-606. The cable records shall include the required data fields for each cable and complete end-to-end circuit report for each complete circuit from the assigned outlet to the entry facility in accordance with TIA-606. Include manufacture date of cable with submittal.
- b. Termination Hardware - A record of installed patch panels,

cross-connect points, distribution frames, terminating block arrangements and type, and outlets shall be provided in accordance with TIA-606. Documentation shall include the required data fields as a minimum in accordance with TIA-606.

### 1.10.3 Spare Parts

In addition to the requirements of Section 01 78 23 OPERATION AND MAINTENANCE DATA, provide a complete list of parts and supplies, with current unit prices and source of supply, and a list of spare parts recommended for stocking.

## PART 2 PRODUCTS

### 2.1 COMPONENTS

Components shall be UL or third party certified. Where equipment or materials are specified to conform to industry and technical society reference standards of the organizations, submit proof of such compliance. The label or listing by the specified organization will be acceptable evidence of compliance. In lieu of the label or listing, submit a certificate from an independent testing organization, competent to perform testing, and approved by the Contracting Officer. The certificate shall state that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard. Provide a complete system of telecommunications cabling and pathway components using star topology. Provide support structures and pathways, complete with outlets, cables, connecting hardware and telecommunications cabinets/racks. Cabling and interconnecting hardware and components for telecommunications systems shall be UL listed or third party independent testing laboratory certified, and shall comply with NFPA 70 and conform to the requirements specified herein.

### 2.2 TELECOMMUNICATIONS PATHWAY

Provide telecommunications pathways in accordance with TIA-569 and as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Provide system furniture pathways in accordance with UL 1286.

### 2.3 TELECOMMUNICATIONS CABLING

Cabling shall be UL listed for the application and shall comply with TIA-568.0, TIA-568.1, TIA-568.2, TIA-568.3 and NFPA 70. Provide a labeling system for cabling as required by TIA-606 and UL 969. Ship cable on reels or in boxes bearing manufacture date for for unshielded twisted pair (UTP) in accordance with ICEA S-90-661 and optical fiber cables in accordance with ICEA S-83-596 for all cable used on this project. Cabling manufactured more than 12 months prior to date of installation shall not be used.

#### 2.3.1 Horizontal Cabling

Provide horizontal cable in compliance with NFPA 70 and performance characteristics in accordance with TIA-568.1.

##### 2.3.1.1 Horizontal Copper

Provide horizontal copper cable, UTP, 100 ohm in accordance with TIA-568.2,

UL 444, ANSI/NEMA WC 66, ICEA S-90-661 . Provide four each individually twisted pair, minimum size 24 AWG conductors, Category 6, with a blue thermoplastic jacket. Cable shall be imprinted with manufacturers name or identifier, flammability rating, gauge of conductor, transmission performance rating (category designation) and length marking at regular intervals in accordance with ICEA S-90-661. Provide plenum (CMP), riser (CMR), or general purpose (CM or CMG) communications rated cabling in accordance with NFPA 70. Substitution of a higher rated cable shall be permitted in accordance with NFPA 70. Cables installed in conduit within and under slabs shall be UL listed and labeled for wet locations in accordance with NFPA 70.

#### 2.3.1.2 Horizontal Optical Fiber

Provide optical fiber horizontal cable in accordance with ICEA S-83-596 and TIA-568.3. Cable shall be tight buffered, multimode, 50/125-um diameter, OM2. Cable shall be imprinted with manufacturer, flammability rating and fiber count at regular intervals not to exceed 40 inches.

Provide plenum (OFNP), riser (OFNR), or general purpose (OFN or OFNG) rated non-conductive, fiber optic cable in accordance with NFPA 70. Substitution of a higher rated cable shall be permitted in accordance with NFPA 70. Cables installed in conduit within and under slabs be UL listed and labeled for wet locations in accordance with NFPA 70. The cable jacket shall be of single jacket construction with color coding of cordage jacket, fiber, unit, and group in accordance with TIA/EIA-598.

#### 2.3.2 Work Area Cabling

##### 2.3.2.1 Work Area Copper

Provide work area copper cable in accordance with TIA-568.2, with a blue, thermoplastic jacket.

##### 2.3.2.2 Work Area Optical Fiber

Provide optical work area cable in accordance with TIA-568.3.

#### 2.4 TELECOMMUNICATIONS SPACES

Provide connecting hardware and termination equipment in the telecommunications entrance facility and telecommunication equipment room to facilitate installation as shown on design drawings for terminating and cross-connecting permanent cabling. Provide telecommunications interconnecting hardware color coding in accordance with TIA-606.

##### 2.4.1 Equipment Support Frame

Provide in accordance with ECIA EIA/ECA 310-E and UL 50.

- a. Cabinets, wall-mounted modular type, 16 gauge steel or 11 gauge aluminum construction, minimum, treated to resist corrosion. Cabinet shall have lockable front door, louvered side panels, 250 CFM roof mounted fan, ground lug, and top and bottom cable access. Cabinet shall be compatible with 19 inches panel mounting. All cabinets shall be keyed alike. A duplex AC outletsurge protected power strip with 6 duplex 20 amp receptacles shall be provided within the cabinet.

#### 2.4.2 Connector Blocks

Provide insulation displacement connector (IDC) Type 110 for Category 6 systems. Provide blocks for the number of horizontal and backbone cables terminated on the block plus 25 percent spare.

#### 2.4.3 Cable Guides

Provide cable guides specifically manufactured for the purpose of routing cables, wires and patch cords horizontally and vertically on 19 inches equipment cabinets. Cable guides of ring or bracket type devices mounted on cabinet panels for horizontal cable management and individually mounted for vertical cable management. Mount cable guides with screws, or nuts and lockwashers.

#### 2.4.4 Patch Panels

Provide ports for the number of horizontal and backbone cables terminated on the panel plus 25 percent spare. Provide pre-connectorized optical fiber and copper patch cords for patch panels. Provide patch cords, as complete assemblies, with matching connectors as specified. Provide fiber optic patch cables with crossover orientation in accordance with TIA-568.3. Patch cords shall meet minimum performance requirements specified in TIA-568.1, TIA-568.2 and TIA-568.3 for cables, cable length and hardware specified.

##### 2.4.4.1 Modular to 110 Block Patch Panel

Provide in accordance with TIA-568.1 and TIA-568.2. Panels shall be third party verified and shall comply with EIA/TIA Category 6 requirements. Panel shall be constructed of 0.09 inches minimum aluminum and shall be wall mounted and compatible with an ECIA EIA/ECA 310-E 19 inches equipment cabinet. Panel shall provide 48 non-keyed, 8-pin modular ports, wired to T568A. Patch panels shall terminate the building cabling on Type 110 IDCs and shall utilize a printed circuit board interface. The rear of each panel shall have incoming cable strain-relief and routing guides. Panels shall have each port factory numbered and be equipped with laminated plastic nameplates above each port.

##### 2.4.4.2 Fiber Optic Patch Panel

Provide panel for maintenance and cross-connecting of optical fiber cables. Panel shall be constructed of 16 gauge steel or 11 gauge aluminum minimum and shall be wall mounted and compatible with a ECIA EIA/ECA 310-E 19 inches equipment rack. Each panel shall provide 12 adapters as duplex LC in accordance with TIA/EIA-604-10 with zirconia ceramic alignment sleeves, alignment sleeves. Provide dust cover for unused adapters. The rear of each panel shall have a cable management tray a minimum of 8 inches deep with removable cover, incoming cable strain-relief and routing guides. Panels shall have each adapter factory numbered and be equipped with laminated plastic nameplates above each adapter.

#### 2.5 TELECOMMUNICATIONS OUTLET/CONNECTOR ASSEMBLIES

##### 2.5.1 Outlet/Connector Copper

Outlet/connectors shall comply with FCC Part 68, TIA-568.1, and TIA-568.2. UTP outlet/connectors shall be UL 1863 listed, non-keyed, 8-pin modular,

constructed of high impact rated thermoplastic housing and shall be third party verified and shall comply with TIA-568.2 Category 6 requirements. Outlet/connectors provided for UTP cabling shall meet or exceed the requirements for the cable provided. Outlet/connectors shall be terminated using a Type 110 IDC PC board connector, color-coded for both T568A and T568B wiring. Each outlet/connector shall be wired T568A. UTP outlet/connectors shall comply with TIA-568.2 for 200 mating cycles. UTP outlet/connectors installed in outdoor or marine environments shall be jell-filled type containing an anti-corrosive, memory retaining compound.

#### 2.5.2 Optical Fiber Adapters(Couplers)

Provide optical fiber adapters suitable for duplex LC in accordance with TIA/EIA-604-10 with zirconia ceramic alignment sleeves, as indicated. Provide dust cover for adapters. Optical fiber adapters shall comply with TIA-455-21 for 500 mating cycles.

#### 2.5.3 Optical Fiber Connectors

Provide in accordance with TIA-455-21. Optical fiber connectors shall be duplex LC in accordance with TIA/EIA-604-10 with zirconia ceramic alignment sleeves, ferrule, epoxyless crimp style compatible with 50/125 multimode fiber. The connectors shall provide a maximum attenuation of 0.3 dB at 850 nm with less than a 0.2 dB change after 500 mating cycles.

#### 2.5.4 Cover Plates

Telecommunications cover plates shall comply with UL 514C, and TIA-568.1, TIA-568.2, TIA-568.3; flush or oversized design constructed of high impact thermoplastic material ivory in color. Provide labeling in accordance with the paragraph LABELING in this section.

### 2.6 GROUNDING AND BONDING PRODUCTS

Provide in accordance with UL 467, TIA-607, and NFPA 70. Components shall be identified as required by TIA-606. Provide ground rods, bonding conductors, and grounding busbars as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

### 2.7 FIRESTOPPING MATERIAL

Provide as specified in Section 07 84 00 FIRESTOPPING.

### 2.8 MANUFACTURER'S NAMEPLATE

Each item of equipment shall have a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

### 2.9 FIELD FABRICATED NAMEPLATES

ASTM D709. Provide laminated plastic nameplates for each equipment enclosure, relay, switch, and device; as specified or as indicated on the drawings. Each nameplate inscription shall identify the function and, when applicable, the position. Nameplates shall be melamine plastic, 0.125 inches thick, white with black center core. Surface shall be matte finish. Corners shall be square. Accurately align lettering and engrave into the core. Minimum size of nameplates shall be one by 2.5 inches.

Lettering shall be a minimum of 0.25 inches high normal block style.

## 2.10 TESTS, INSPECTIONS, AND VERIFICATIONS

### 2.10.1 Factory Reel Tests

Provide documentation of the testing and verification actions taken by manufacturer to confirm compliance with TIA-568.1, TIA-568.2, TIA-568.3, and TIA-526-14 for multimode optical fiber cables.

## PART 3 EXECUTION

### 3.1 INSTALLATION

Install telecommunications cabling and pathway systems, including the horizontal and backbone cable, pathway systems, telecommunications outlet/connector assemblies, and associated hardware in accordance with NECA/BICSI 568, TIA-568.1, TIA-568.2, TIA-568.3, TIA-569, NFPA 70, and UL standards as applicable. Provide cabling in a star topology network. Pathways and outlet boxes shall be installed as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Install telecommunications cabling with copper media in accordance with the following criteria to avoid potential electromagnetic interference between power and telecommunications equipment. The interference ceiling shall not exceed 3.0 volts per meter measured over the usable bandwidth of the telecommunications cabling. Cabling shall be run with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.

#### 3.1.1 Cabling

Install UTP, and optical fiber telecommunications cabling system as detailed in TIA-568.1, TIA-568.2, TIA-568.3. Screw terminals shall not be used except where specifically indicated on plans. Use an approved insulation displacement connection (IDC) tool kit for copper cable terminations. Do not exceed manufacturers' cable pull tensions for copper and optical fiber cables. Provide a device to monitor cable pull tensions. Do not exceed 25 pounds pull tension for four pair copper cables. Do not chafe or damage outer jacket materials. Use only lubricants approved by cable manufacturer. Do not over cinch cables, or crush cables with staples. For UTP cable, bend radii shall not be less than four times the cable diameter. Cables shall be terminated; no cable shall contain unterminated elements. Cables shall not be spliced. Label cabling in accordance with paragraph LABELING in this section.

##### 3.1.1.1 Open Cable

Use only where specifically indicated on plans for use in cable trays, or below raised floors. Install in accordance with TIA-568.1, TIA-568.2 and TIA-568.3. Do not exceed cable pull tensions recommended by the manufacturer. Copper cable not in a wireway or pathway shall be suspended a minimum of 8 inches above ceilings by cable supports no greater than 60 inches apart. Cable shall not be run through structural members or in contact with pipes, ducts, or other potentially damaging items. Placement of cable parallel to power conductors shall be avoided, if possible; a minimum separation of 12 inches shall be maintained when such placement cannot be avoided.

Plenum cable shall be used where open cables are routed through plenum

areas. Cable routed exposed under raised floors shall be plenum rated. Plenum cables shall comply with flammability plenum requirements of NFPA 70. Install cabling after the flooring system has been installed in raised floor areas. Cable 6 feet long shall be neatly coiled not less than 12 inches in diameter below each feed point in raised floor areas.

#### 3.1.1.2 Backbone Cable

- a. Copper Backbone Cable. Install intrabuilding backbone copper cable, in indicated pathways, between the campus distributor, located in the telecommunications entrance facility or room, the building distributors and the floor distributors located in telecommunications rooms and telecommunications equipment rooms as indicated on drawings.
- b. Optical fiber Backbone Cable. Install intrabuilding backbone optical fiber in indicated pathways. Do not exceed manufacturer's recommended bending radii and pull tension. Prepare cable for pulling by cutting outer jacket 10 inches leaving strength members exposed for approximately 10 inches. Twist strength members together and attach to pulling eye. Vertical cable support intervals shall be in accordance with manufacturer's recommendations.

#### 3.1.1.3 Horizontal Cabling

Install horizontal cabling as indicated on drawings. Do not untwist Category 6 UTP cables more than one half inch from the point of termination to maintain cable geometry. Provide slack cable in the form of a figure eight (not a service loop) on each end of the cable, 10 feet in the telecommunications room, and 12 inches in the work area outlet.

#### 3.1.2 Pathway Installations

Provide in accordance with TIA-569 and NFPA 70. Provide building pathway as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

#### 3.1.3 Cable Tray Installation

Install cable tray as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Only CMP and OFNP type cable shall be installed in a plenum.

#### 3.1.4 Work Area Outlets

##### 3.1.4.1 Terminations

Terminate UTP cable in accordance with TIA-568.1, TIA-568.2 and wiring configuration as specified. Terminate fiber optic cables in accordance with TIA-568.3.

##### 3.1.4.2 Cover Plates

As a minimum, each outlet/connector shall be labeled as to its function and a unique number to identify cable link in accordance with the paragraph LABELING in this section.

##### 3.1.4.3 Cables

Unshielded twisted pair and fiber optic cables shall have a minimum of 12 inches of slack cable loosely coiled into the telecommunications outlet boxes. Minimum manufacturer's bend radius for each type of cable shall

not be exceeded.

#### 3.1.4.4 Pull Cords

Pull cords shall be installed in conduit serving telecommunications outlets that do not have cable installed.

#### 3.1.5 Telecommunications Space Termination

Install termination hardware required for Category 6 and optical fiber system. An insulation displacement tool shall be used for terminating copper cable to insulation displacement connectors.

##### 3.1.5.1 Connector Blocks

Connector blocks shall be cabinet mounted in orderly rows and columns. Adequate vertical and horizontal wire routing areas shall be provided between groups of blocks. Install in accordance with industry standard wire routing guides in accordance with TIA-569.

##### 3.1.5.2 Patch Panels

Patch panels shall be mounted in equipment cabinets with sufficient ports to accommodate the installed cable plant plus 25 percent spares.

- a. Fiber Optic Patch Panel. Fiber optic cable loop shall be provided as recommended by the manufacturer. The outer jacket of each cable entering a patch panel shall be secured to the panel to prevent movement of the fibers within the panel, using clamps or brackets specifically manufactured for that purpose.

##### 3.1.5.3 Equipment Support Frames

Install in accordance with TIA-569:

- a. Cabinets, wall-mounted modular type. Mount cabinet to plywood backboard in accordance with manufacturer's recommendations. Mount cabinet so height of highest panel does not exceed 78 inches above floor.

#### 3.1.6 Electrical Penetrations

Seal openings around electrical penetrations through fire resistance-rated wall, partitions, floors, or ceilings as specified in Section 07 84 00 FIRESTOPPING.

#### 3.1.7 Grounding and Bonding

Provide in accordance with TIA-607, NFPA 70 and as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM.

### 3.2 LABELING

#### 3.2.1 Labels

Provide labeling in accordance with TIA-606. Handwritten labeling is unacceptable. Stenciled lettering for voice and data circuits shall be provided using thermal ink transfer process .

### 3.2.2 Cable

Cables shall be labeled using color labels on both ends with identifiers in accordance with TIA-606.

### 3.2.3 Termination Hardware

Workstation outlets and patch panel connections shall be labeled using color coded labels with identifiers in accordance with TIA-606.

## 3.3 FIELD APPLIED PAINTING

Paint electrical equipment as required to match finish of adjacent surfaces or to meet the indicated or specified safety criteria. Painting shall be as specified in Section 09 90 00 PAINTS AND COATINGS.

### 3.3.1 Painting Backboards

If backboards are required to be painted, then the manufactured fire retardant backboard must be painted with fire retardant paint, so as not to increase flame spread and smoke density and must be appropriately labeled. Label and fire rating stamp must be unpainted.

## 3.4 FIELD FABRICATED NAMEPLATE MOUNTING

Provide number, location, and letter designation of nameplates as indicated. Fasten nameplates to the device with a minimum of two sheet-metal screws or two rivets.

## 3.5 TESTING

### 3.5.1 Telecommunications Cabling Testing

Perform telecommunications cabling inspection, verification, and performance tests in accordance with TIA-568.1, TIA-568.2, TIA-568.3. Test equipment shall conform to TIA-1152. Perform optical fiber field inspection tests via attenuation measurements on factory reels and provide results along with manufacturer certification for factory reel tests. Remove failed cable reels from project site upon attenuation test failure.

#### 3.5.1.1 Inspection

Visually inspect UTP and optical fiber jacket materials for UL or third party certification markings. Inspect cabling terminations in telecommunications rooms and at workstations to confirm color code for T568A or T568B pin assignments, and inspect cabling connections to confirm compliance with TIA-568.1, TIA-568.2, TIA-568.3, . Visually confirm Category 6, marking of outlets, cover plates, outlet/connectors, and patch panels.

#### 3.5.1.2 Verification Tests

UTP backbone copper cabling shall be tested for DC loop resistance, shorts, opens, intermittent faults, and polarity between conductors, and between conductors and shield, if cable has overall shield. Test operation of shorting bars in connection blocks. Test cables after termination but prior to being cross-connected.

For multimode optical fiber, perform optical fiber end-to-end attenuation tests in accordance with TIA-568.3 and TIA-526-14 using Method A, Optical Power Meter and Light Source for multimode optical fiber. Perform verification acceptance tests.

#### 3.5.1.3 Performance Tests

Perform testing for each outlet and MUTOA as follows:

- a. Perform Category 6 link tests in accordance with TIA-568.1 and TIA-568.2. Tests shall include wire map, length, insertion loss, NEXT, PSNEXT, ELFEXT, PSELFEXT, return loss, propagation delay, and delay skew.
- b. Optical fiber Links. Perform optical fiber end-to-end link tests in accordance with TIA-568.3.

#### 3.5.1.4 Final Verification Tests

Perform verification tests for UTP and optical fiber systems after the complete telecommunications cabling and workstation outlet/connectors are installed.

- a. Data Tests. These tests assume the Information Technology Staff has a network installed and are available to assist with testing. Connect to the network interface device at the demarcation point. Log onto the network to ensure proper connection to the network.

1.2 RELATED SECTIONS

Section 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS, applies to this section, with the additions and modifications specified

herein. In addition, refer to the following sections for related work and coordination:

Section 21 13 13 WET PIPE SPRINKLER SYSTEM, FIRE PROTECTION

Section 07 84 00 FIRESTOPPING for additional work related to firestopping.

### 1.3 SUMMARY

#### 1.3.1 Scope

- a. This work includes designing and modifying the existing fire alarm system as described herein and on the contract drawing Building 72. Include system wiring, raceways, pull boxes, terminal cabinets, outlet and mounting boxes, control equipment, initiating devices, notification appliances, supervising station fire alarm transmitters, and other accessories and miscellaneous items required for a complete operational system even though each item is not specifically mentioned or described. Provide system complete and ready for operation. Existing interior fire alarm system was manufactured by King-Fisher. Design and installation must comply with UFGS 25 05 11 and UFC 4-010-06.
- b. Provide equipment, materials, installation, workmanship, inspection, and testing in strict accordance with NFPA 72, except as modified herein. The system layout on the drawings show the intent of coverage and suggested locations. Final quantity, system layout, and coordination are the responsibility of the Contractor.
- c. The fire alarm system must be independent of the building security, building management, and energy/utility monitoring systems other than for control functions.

#### 1.3.2 Qualified Fire Protection Engineer (QFPE)

The QFPE in this section is the same as FPQC in Section 01 45 00.00 22. Wherever Qualified Fire Protection Engineer (QFPE) or QFPE appears in this section, substitute with Fire Protection Qualify Control Specialist (FPQC) Services of the QFPE must include:

- a. Reviewing SD-02, SD-03, and SD-05 submittal packages for completeness and compliance with the provisions of this specification. Construction (shop) drawings and calculations must be prepared and signed by the fire alarm designer.
- b. Providing a letter documenting that the SD-02, SD-03, and SD-05 submittal package has been reviewed and noting any outstanding comments. The QFPE must affix their professional engineering stamp with signature to this letter, indicating approval prior to submitting to the DFPE.
- c. Performing in-progress construction surveillance prior to installation of ceilings (rough-in inspection).
- d. Witnessing pre-Government and final Government functional performance testing and performing a final installation review.

- e. Signing applicable certificates under SD-07.

#### 1.4 DEFINITIONS

Wherever mentioned in this specification or on the drawings, the equipment, devices, and functions must be defined as follows:

##### 1.4.1 Terminal Cabinet

A steel cabinet with locking, hinge-mounted door where terminal strips are securely mounted inside the cabinet.

##### 1.4.2 Designated Fire Protection Engineer (DFPE)

The DoD fire protection engineer that oversees that Area of Responsibility for that project. This is sometimes referred to as the "cognizant" fire protection engineer. Interpret reference to "authority having jurisdiction" and/or AHJ in referenced standards to mean the Designated Fire Protection Engineer (DFPE). The DFPE may be responsible for review of the contractor submittals having a "G" designation, and for witnessing final inspection and testing.

##### 1.4.3 Qualified Fire Protection Engineer (QFPE)

A QFPE is an individual who is a licensed professional engineer (P.E.), who has passed the fire protection engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and has relevant fire protection engineering experience.

#### 1.5 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval.

Shop drawings (SD-02), product data (SD-03) and calculations (SD-05) must be prepared by the fire alarm designer and combined and submitted as one complete package. The QFPE must review the SD-02/SD-03/SD-05 submittal package for completeness and compliance with the Contract provisions prior to submission to the Government. The QFPE must provide a Letter of Confirmation that they have reviewed the submittal package for compliance with the contract provisions. This letter must include their registered professional engineer stamp and signature. Partial submittals and submittals not reviewed by the QFPE will be returned by the Government disapproved without review.

Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

##### SD-01 Preconstruction Submittals

Qualified Fire Protection Engineer (QFPE); G

Fire alarm system designer; G

Technician; G

Installer; G

Test Technician; G

SD-02 Shop Drawings

Wiring Diagrams; G

System Layout; G

Notification Appliances; G

Initiating devices; G

Battery Power; G

Voltage Drop Calculations; G

SD-03 Product Data

Manual Stations; G

Notification Appliances; G

Alarm Wiring; G

Back Boxes and Conduit; G

Terminal Cabinets; G

Environmental Enclosures or Guards; G

SD-05 Design Data

SD-06 Test Reports

Test Procedures; G

SD-07 Certificates

Verification of Compliant Installation; G

Request for Government Final Test; G

SD-10 Operation and Maintenance Data

Operation and Maintenance (O&M) Instructions; G

SD-11 Closeout Submittals

As-Built Drawings; G

## 1.6 SYSTEM OPERATION

Fire alarm system components requiring power, except for the FACU(s) power supply, must operate on 24 volts DC unless noted otherwise in this section.

Provide a fire alarm system that is a complete, supervised fire alarm reporting system. Activate the system into the alarm mode by actuation of any alarm initiating device. Remain in the alarm mode until the initiating device is reset and the fire alarm control unit is reset and restored to normal. Audible and visual appliances and systems must comply with NFPA 72. Operate fire alarm system components requiring power, except for the control unit power supply, on 24 Volts dc.

### 1.6.1 Alarm Initiating Devices and Notification Appliances (Visual, Audible)

- a. Connect alarm initiating devices to initiating device circuits (IDC) Class "B" and installed in accordance with NFPA 72.
- b. Connect notification appliances to notification appliance circuits (NAC) Class "B".

### 1.6.2 Functions and Operating Features

The sequence of operation for the existing system will not be modified. All manual pull stations water flow devices will be set as an alarm function. All monitor modules connected to tamper switches will be set as supervisory functions.

## 1.7 EXISTING EQUIPMENT

- a. Equipment and devices must be compatible and operable with the existing fire alarm system and must not impair reliability or operational functions of existing supervising station fire alarm system..

## 1.8 QUALITY ASSURANCE

### 1.8.1 Submittal Documents

#### 1.8.1.1 Preconstruction Submittals

Within 36 days of contract award but not less than 14 days prior to commencing any work on site, the Contractor must submit the following for review and approval. SD-02, SD-03 and SD-05 submittals received prior to the review and approval of the qualifications of the fire alarm subcontractor and QFPE must be returned disapproved without review. All resultant delays must be the sole responsibility of the Contractor.

#### 1.8.1.2 Shop Drawings

Shop drawings must not be smaller than the Contract Drawings. Drawings must comply with the requirements of NFPA 72 and NFPA 170. Minimum scale for floor plans must be 1/8"=1'.

#### 1.8.1.3 Wiring Diagrams

Electronic copies of point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the FACU and remote FACU, initiating circuits, switches, relays and terminals, including pathway diagrams between the control unit and shared communications equipment within the protected premises. Point-to-point wiring diagrams must be job specific and must not indicate connections or circuits not being utilized. Provide complete riser diagrams indicating the wiring sequence of all devices and their connections to the control equipment. Include a color-code schedule for the wiring.

#### 1.8.1.4 System Layout

Electronic copies of plan view drawing showing device locations, terminal cabinet locations, junction boxes, other related equipment, conduit routing, conduit sizes, wire counts, conduit fill calculations, wire color-coding, circuit identification in each conduit, and circuit layouts for all floors. Indicate candela rating of each visual notification appliance. Indicate the addresses of all devices, modules, relays, and similar. Indicate if the environment for the FACU is within its environmental listing (e.g. temperature/humidity).

Provide a complete description of the system operation in matrix format similar to the "Typical Input/Output Matrix" included in the Annex of NFPA 72.

#### 1.8.1.5 Notification Appliances

Calculations and supporting data on each circuit to indicate that there is at least 25 percent spare capacity for notification appliances. Annotate data for each circuit within the project on the drawings.

#### 1.8.1.6 Initiating Devices

Calculations and supporting data on each circuit to indicate that there is at least 25 percent spare capacity for initiating devices. Annotate data for each circuit within the project on the drawings.

#### 1.8.1.7 Battery Power

Calculations and supporting data as required in paragraph Battery Power Calculations for alarm, alert, and supervisory power requirements. Calculations including ampere-hour requirements for each system component and each control unit component, and the battery recharging period, must be included on the drawings.

#### 1.8.1.8 Voltage Drop Calculations

Voltage drop calculations for each notification circuit indicating that sufficient voltage is available for proper operation of the system and all components, at a minimum rated voltage of the system operating on batteries. Include the calculations on the system layout drawings. Due to the lack of existing as-builts, this calculation will be a rough estimation using the distance between the control panel and the end of the circuit.

#### 1.8.1.9 Product Data

Electronic copies of annotated descriptive data to show the specific model, type, and size of each item. Catalog cuts must also indicate the NRTL listing. The data must be highlighted to show model, size, and options that are intended for consideration. Data must be adequate to demonstrate compliance with all contract requirements. Product data for all equipment must be combined into a single submittal.

Provide an equipment list identifying the type, quantity, make, and model number of each piece of equipment to be provided under this submittal. The equipment list must include the type, quantity, make and model of spare equipment. Types and quantities of equipment submitted must coincide with the types and quantities of equipment used in the battery calculations and those shown on the shop drawings.

#### 1.8.1.10 As-Built Drawings

The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of the as-built (marked-up) drawings must be provided at the time of, or prior to the final Government test.

### 1.8.2 Qualifications

#### 1.8.2.1 Fire Alarm System Designer

The fire alarm system designer must be certified as a Level III(minimum) Technician by National Institute for Certification in Engineering Technologies (NICET) in the Fire Alarm Systems subfield of Fire Protection Engineering Technology or meet the qualifications for a QFPE.

#### 1.8.2.2 Technician

Fire alarm technicians with a minimum of four years of experience must be utilized to install and terminate fire alarm devices, cabinets and control units. The fire alarm technicians installing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

#### 1.8.2.3 Installer

Fire alarm installer with a minimum of two years of experience utilized to assist in the installation of fire alarm devices, cabinets and control units. A licensed electrician must be allowed to install wire, cable, conduit and backboxes for the fire alarm system. The fire alarm installer must be factory trained in the installation, adjustment, testing, and operation of the equipment specified herein and on the drawings.

#### 1.8.2.4 Test Technician

Fire alarm technicians with a minimum of eight years of experience and NICET Level III utilized in testing and certification of the installation of the fire alarm devices, cabinets and control units. The fire alarm technicians testing the equipment must be factory trained in the installation, adjustment, testing, and operation of the equipment installed as part of this project.

#### 1.8.2.5 Manufacturer

Components must be of current design and must be in regular and recurrent production at the time of installation. Provide design, materials, and devices for a protected premises fire alarm system, complete, conforming to NFPA 72, except as specified herein.

#### 1.8.3 Regulatory Requirements

Equipment and material must be listed or approved. Listed or approved, as used in this Section, means listed, labeled or approved by a Nationally Recognized Testing Laboratory (NRTL) such as UL Fire Prot Dir or FM APP GUIDE. The omission of these terms under the description of any item of equipment described must not be construed as waiving this requirement. All listings or approvals by testing laboratories must be from an existing ANSI or UL published standard. The recommended practices stated in the manufacturer's literature or documentation must be considered as mandatory requirements.

#### 1.9 DELIVERY, STORAGE, AND HANDLING

Protect equipment delivered and placed in storage from the weather, humidity, and temperature variation, dirt and dust, and other contaminants.

#### 1.10 MAINTENANCE

### PART 2 PRODUCTS

#### 2.1 GENERAL PRODUCT REQUIREMENT

All fire alarm equipment must be listed for use under the applicable reference standards.

## 2.2 MATERIALS AND EQUIPMENT

### 2.2.1 Standard Products

Provide materials, equipment, and devices that have been tested by a nationally recognized testing laboratory and listed for fire protection service when so required by NFPA 72 or this specification. Select material from one manufacturer, where possible, and not a combination of manufacturers, for any particular classification of materials. Material and equipment must be the standard products of a manufacturer regularly engaged in the manufacture of the products for at least 2 years prior to bid opening.

### 2.3 MANUAL STATIONS

Provide metal or plastic, surface mounted, double-action, manual stations, that are not subject to operation by jarring or vibration. Stations must be equipped with screw terminals for each conductor. Stations that require the replacement of any portion of the device after activation are not permitted. Stations must be finished in red with molded raised lettering operating instructions of contrasting color. The use of a key must be required to reset the station.

### 2.4 Notification Appliances

#### 2.4.1 Audible Notification Appliances

Audible appliances must conform to the applicable requirements of UL 464. Appliances must be connected into notification appliance circuits. Surface mounted audible appliances must be painted red. Recessed audible appliances must be installed with a grill that is painted red.

##### 2.4.1.1 Horns

Horns must be surface-mounted, with the matching mounting backbox surface mounted vibrating type suitable for use in an electrically supervised circuit. Horns must produce a sound rating of at least 85 dBA at 10 feet. Horns used in exterior locations must be specifically listed or approved for outdoor use and be provided with metal housing and protective grilles. Horns must be explosionproof in the corrosive storage room.

#### 2.4.2 Visual Notification Appliances

Visual notification appliances must conform to the applicable requirements of UL 1638, UL 1971 and conform to the Architectural Barriers Act (ABA). Visual Notification Appliances must have clear high intensity optic lens, xenon flash tubes, or light emitting diode (LED) and be marked "Alert" in letters of contrasting color. The light pattern must be disbursed so that it is visible above and below the strobe and from a 90 degree angle on both sides of the strobe. Strobe flash rate must be 1 flash per second and a minimum of 15 candela based on the UL 1971 test. Strobe must be surface mounted.

### 2.5 WIRING

Provide wiring materials under this section as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM with the additions and modifications specified herein.

### 2.5.1 Alarm Wiring

IDC wiring must be solid copper cable in accordance with the manufacturers requirements. Copper initiating device circuit field wiring must be No. 16 AWG size conductors at a minimum. Visual notification appliance circuit conductors, that contain audible alarm appliances, must be copper No. 14 AWG size conductors at a minimum. Wire size must be sufficient to prevent voltage drop problems. Circuits operating at 24 VDC must not operate at less than the listed voltages for the detectors and/or appliances. Power wiring, operating at 120 VAC minimum, must be a minimum No. 12 AWG solid copper having similar insulation. Acceptable power-limited cables are FPL, FPLR or FPLP as appropriate with red colored covering. Nonpower-limited cables must comply with NFPA 70.

## 2.6 SYSTEM MONITORING

### 2.6.1 Valves

Each valve affecting the proper operation of a fire protection system, including automatic sprinkler control valves, sprinkler service entrance valve, isolating valves for pressure type waterflow or supervision switches, and valves at backflow preventers, whether supplied under this contract or existing, must be electrically monitored to ensure its proper position. Provide each tamper switch with a separate zone, unless they are within the same room, then a maximum of five can use the same zone.

## 2.7 ENVIRONMENTAL ENCLOSURES OR GUARDS

Environmental enclosures must be provided to permit fire alarm components to be used in areas that exceed the environmental limits of the listing. The enclosure must be listed for the device or appliance as either a manufactured part number or as a listed compatible accessory for the component is currently listed. Guards required to deter mechanical damage must be either a listed manufactured part or a listed accessory for the category of the initiating device or notification appliance.

## PART 3 EXECUTION

### 3.1 VERIFYING ACTUAL FIELD CONDITIONS

Before commencing work, examine all adjoining work on which the contractor's work is in any way dependent for perfect workmanship according to the intent of this specification section, and report to the Contracting Officer's Representative any condition which prevents performance of first class work. No "waiver of responsibility" for incomplete, inadequate or defective adjoining work will be considered unless notice has been filed before submittal of a proposal.

### 3.2 INSTALLATION

#### 3.2.1 Manual Stations

Locate manual stations as required by NFPA 72 and as indicated on the drawings. Mount stations so they are located no farther than 5 feet from the exit door they serve, measured horizontally. Manual stations must be mounted at 44 inches measured to the operating handle.

### 3.2.2 Notification Appliances

- a. Locate notification appliance devices as required by NFPA 72. Where more than two visual notification appliances are located in the same room or corridor or field of view, provide synchronized operation. Devices must use screw terminals for all field wiring.
- b. Audible and visual notification appliances mounted on the exterior of the building, within unconditioned spaces, or in the vicinity of showers must be listed weatherproof appliances installed on weatherproof backboxes.
- c. Speakers must not be located in close proximity to the FACU or LOC so as to cause feedback when the microphone is in use.

### 3.3 SYSTEM FIELD WIRING

#### 3.3.1 Wiring within Cabinets, Enclosures, and Boxes

Provide wiring installed in a neat and professional manner and installed parallel with or at right angles to the sides and back of any box, enclosure, or cabinet. Conductors that are terminated, spliced, or otherwise interrupted in any enclosure, cabinet, mounting, or junction box must be connected to screw-type terminal blocks. Mark each terminal in accordance with the wiring diagrams of the system. The use of wire nuts or similar devices is prohibited. Wiring to conform with NFPA 70.

Indicate the following in the wiring diagrams:

- a. Point-to-point wiring diagrams showing the points of connection and terminals used for electrical field connections in the system, including interconnections between the equipment or systems that are supervised or controlled by the system. Diagrams must show connections from field devices to the FACU and remote fire alarm control units, initiating circuits, switches, relays and terminals.
- b. Complete riser diagrams indicating the wiring sequence of devices and their connections to the control equipment. Include a color code schedule for the wiring. Include floor plans showing the locations of devices and equipment.

#### 3.3.2 Terminal Cabinets

Provide a terminal cabinet at the base of any circuit riser, on each floor at each riser, and where indicated on the drawings. Terminal size must be appropriate for the size of the wiring to be connected. Conductor terminations must be labeled and a drawing containing conductors, their labels, their circuits, and their interconnection must be permanently mounted in the terminal cabinet. Minimum size is 8 inches by 8 inches. Only screw-type terminals are permitted. Provide an identification label, that displays "FIRE ALARM TERMINAL CABINET" with 2-inch lettering, on the front of the terminal cabinet.

#### 3.3.3 Alarm Wiring

- a. Voltages must not be mixed in any junction box, housing or device, except those containing power supplies and control relays.
- b. Utilize shielded wiring where recommended by the manufacturer. For

shielded wiring, ground the shield at only one point, in or adjacent to the FACU.

- c. Pigtail or T-tap connections to initiating device circuits, supervisory alarm circuits, and notification appliance circuits are prohibited.
- d. Color coding is required for circuits and must be maintained throughout the circuit. Conductors used for the same functions must be similarly color coded. Conform wiring to NFPA 70.
- e. Pull all conductors splice free. The use of wire nuts, crimped connectors, or twisting of conductors is prohibited. Where splices are unavoidable, the location of the junction box or pull box where they occur must be identified on the as-built drawings. The number and location of splices must be subject to approval by the Designated Fire Protection Engineer (DFPE).

#### 3.3.4 Back Boxes and Conduit

In addition to the requirements of Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, provide all wiring in rigid metal conduit or intermediate metal conduit unless specifically indicated otherwise. Minimum conduit size must be 3/4-inch in diameter. Do not use electrical non-metallic tubing (ENT) or flexible non-metallic tubing and associated fittings.

- a. Galvanized rigid steel (GRS) conduit must be utilized where exposed to weather, where subject to physical damage, and where exposed on exterior of buildings. Intermediate metal conduit (IMC) may be used in lieu of GRS as allowed by NFPA 70.
- b. Electrical metallic tubing (EMT) is permitted above suspended ceilings or exposed where not subject to physical damage. Do not use EMT underground, encased in concrete, mortar, or grout, in hazardous locations, where exposed to physical damage, outdoors or in fire pump rooms. Use die-cast compression connectors.
- c. For rigid metallic conduit (RMC), only threaded type fitting are permitted for wet or damp locations.
- d. Flexible metal conduit is permitted for initiating device circuits 6 feet in length or less. Flexible metal conduit is prohibited for notification appliance circuits and signaling line circuits. Use liquid tight flexible metal conduit in damp and wet locations.
- e. Schedule 40 (minimum) polyvinyl chloride (PVC) is permitted where conduit is routed underground or underground below floor slabs. Convert non-metallic conduit, other than PVC Schedule 40 or 80, to plastic-coated rigid, or IMC, steel conduit before turning up through floor slab.
- f. Exterior wall penetrations must be weathertight. Conduit must be sealed to prevent the infiltration of moisture.

#### 3.3.5 Conductor Terminations

Labeling of conductors at terminal blocks in terminal cabinets, FACU, and

remote FACU must be provided at each conductor connection. Each conductor or cable must have a shrink-wrap label to provide a unique and specific designation. Each terminal cabinet, FACU, and remote FACU must contain a laminated drawing that indicates each conductor, its label, circuit, and terminal. The laminated drawing must be neat, using 12 point lettering minimum size, and mounted within each cabinet, control unit, or unit so that it does not interfere with the wiring or terminals. Maintain existing color code scheme where connecting to existing equipment.

### 3.4 FIRESTOPPING

Provide firestopping for holes at conduit penetrations through floor slabs, fire-rated walls, partitions with fire-rated doors, corridor walls, and vertical service shafts in accordance with Section 07 84 00 FIRESTOPPING.

### 3.5 PAINTING

- a. In unfinished areas (including areas above drop ceilings), paint all exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceway, junction boxes and covers red. In lieu of painting conduit, the contractor may utilize red conduit with a factory applied finish.
- b. In finished areas, paint exposed electrical conduit (serving fire alarm equipment), fire alarm conduit, surface metal raceways, junction boxes, and electrical boxes to match adjacent finishes. The inside cover of the junction box must be identified as "Fire Alarm" and the conduit must have painted red bands 3/4-inch wide at 10-foot centers and at each side of a floor, wall, or ceiling penetration.
- c. Painting must comply with Section 09 90 00 PAINTS AND COATINGS.

### 3.6 FIELD QUALITY CONTROL

#### 3.6.1 Test Procedures

Submit detailed test procedures, prepared and signed by the NICET Level III Fire Alarm Technician, and the representative of the installing company, and reviewed by the QFPE 5 days prior to performing system tests. Detailed test procedures must list all components of the installed system such as initiating devices and circuits, notification appliances and circuits, control devices/equipment, batteries, transmitting and receiving equipment, power sources/supply, annunciators, special hazard equipment, emergency communication equipment, interface equipment, and surge protective devices. Test procedures must include sequence of testing, time estimate for each test, and sample test data forms. The test data forms must be in a check-off format (pass/fail with space to add applicable test data; similar to the forma in NFPA 72 and NFPA 4.) The test procedures and accompanying test data forms must be used for the pre-Government testing and the Government testing. The test data forms must record the test results and must:

- a. Identify the NFPA Class of all Initiating Device Circuits (IDC), and Notification Appliance Circuits (NAC).
- b. Identify each test required by NFPA 72 Test Methods and required test herein to be performed on each component, and describe how these tests must be performed.

- c. Identify each component and circuit as to type, location within the facility, and unique identity within the installed system. Provide necessary floor plan sheets showing each component location, test location, and alphanumeric identity.
- d. Identify all test equipment and personnel required to perform each test (including equipment necessary for smoke detector testing. The use of magnets is not permitted.
- e. Provide space to identify the date and time of each test. Provide space to identify the names and signatures of the individuals conducting and witnessing each test.

### 3.6.2 Pre-Government Testing

#### 3.6.2.1 Verification of Compliant Installation

Conduct inspections and tests to ensure that devices and circuits are functioning properly. Tests must meet the requirements of paragraph entitled "Minimum System Tests" as required by NFPA 72. The contractor and an authorized representative from each supplier of equipment must be in attendance at the pre-Government testing to make necessary adjustments. After inspection and testing is complete, provide a signed Verification of Compliant Installation letter by the QFPE that the installation is complete, compliant with the specification and fully operable. The letter must include the names and titles of the witnesses to the pre-Government tests. Provide all completion documentation as required by NFPA 72 including all referenced annex sections and the test reports noted below.

- a. NFPA 72 Record of Completion.
- b. NFPA 72 Record of Inspection and Testing.
- c. Fire Alarm and Emergency Communication System Inspection and Testing Form.
- d. Audibility test results with marked-up test floor plans.
- e. Documentation that all tests identified in the paragraph "Minimum System Tests" are complete.

#### 3.6.2.2 Request for Government Final Test

When the verification of compliant installation has been completed, submit a formal request for Government final test to the Designated Fire Protection Engineer (DFPE). Government final testing will not be scheduled until the DFPE has received copies of the request for Government final testing and Verification of Compliant Installation letter with all required reports. Government final testing will not be performed until after the connections to the installation-wide fire reporting system has been completed and tested to confirm communications are fully functional. Submit request for test at least 5 calendar days prior to the requested test date.

### 3.6.3 Correction of Deficiencies

If equipment was found to be defective or non-compliant with contract requirements, perform corrective actions and repeat the tests. Tests must be conducted and repeated if necessary until the system has been demonstrated to comply with all contract requirements.

### 3.6.4 Government Final Tests

The tests must be performed in accordance with the approved test procedures in the presence of the DFPE. Furnish instruments and personnel required for the tests. The following must be provided at the job site for Government Final Testing:

- a. The manufacturer's technical representative.
- b. The contractor's Qualified Fire Protection Engineer (QFPE).
- c. Marked-up red line drawings of the system as actually installed.
- d. Copy of pre-Government Test Certificate, test procedures and completed test data forms.
- e. Audibility test results with marked-up floor plans.

Government Final Tests will be witnessed by the Designated Fire Protection Engineer and Qualified Fire Protection Engineer (QFPE). At this time, any and all required tests noted in the paragraph "Minimum System Tests" must be repeated at their discretion.

## 3.7 MINIMUM SYSTEM TESTS

### 3.7.1 System Tests

Test the system in accordance with the procedures outlined in NFPA 72. The required tests are as follows:

- a. Verify the absence of unwanted voltages between circuit conductors and ground. The tests must be accomplished at the pre-Government test with results available at the final system test.
- b. Verify that the control unit is in the normal condition as detailed in the manufacturer's O&M manual.
- c. Test each initiating device and notification appliance and circuit for proper operation and response at the control unit. Smoke detectors must be tested in accordance with manufacturer's recommended calibrated test method. Use of magnets is prohibited. Testing of duct smoke detectors must comply with the requirements of NFPA 72 except disconnect at least 20 percent of devices. If there is a failure at these devices, then supervision must be tested at each device.
- d. Test the system for specified functions in accordance with the contract drawings and specifications and the manufacturer's O&M manual.

- e. Test both primary power and secondary power. Verify, by test, the secondary power system is capable of operating the system for the time period and in the manner specified.
- f. Determine that the system is operable under trouble conditions as specified.
- g. Visually inspect wiring.
- h. Test the battery charger and batteries.
- i. Verify that red-line drawings are accurate.
- j. Measure the current in circuits to ensure there is the calculated spare capacity for the circuits.
- k. Measure voltage readings for circuits to ensure that voltage drop is not excessive.
- l. Measure the voltage drop at the most remote appliance (based on wire length) on each notification appliance circuit.
- m. Verify the documentation cabinet is installed and contains all as-built shop drawings, product data sheets, design calculations, site-specific software data package, and all documentation required by paragraph titled "Test Reports".

### 3.7.2 Audibility Tests

Sound pressure levels from audible notification appliances must be a minimum of 15 dBa over ambient with a maximum of 110 dBa in any occupiable area. The provisions for audible notification (audibility) must be met with doors, fire shutters, movable partitions, and similar devices closed.

## 3.8 SYSTEM ACCEPTANCE

Following acceptance of the system, as-built drawings and O&M manuals must be delivered to the Contracting Officer for review and acceptance. The drawings must show the system as installed, including deviations from both the project drawings and the approved shop drawings. These drawings must be submitted within two weeks after the final Government test of the system. At least one set of as-built (marked-up) drawings must be provided at the time of, or prior to the Final Government Test.

- a. The drawings must be prepared electronically and sized no less than the contract drawings. Furnish one set of CDs or DVDs containing software back-up and CAD based drawings in latest version of AutoCAD and DXF and portable document formats of as-built drawings and schematics.
- b. Include complete wiring diagrams showing connections between devices and equipment, both factory and field wired.
- c. Include a riser diagram and drawings showing the as-built location of devices and equipment.
- d. Provide Operation and Maintenance (O&M) Instructions.

In existing buildings, the transfer of devices from the existing system to

the new system and the permission to begin demolition of the old fire alarm system will not be permitted until the as-built drawings and O&M manuals are received.

Maine DEP Hazardous Waste Regulation  
Chapter 50-588

## 1.2 DEFINITIONS

### 1.2.1 Structural Fill

Soil material placed to support buildings, walls, pads, pavements, and other similar facilities.

### 1.2.2 Utility Bedding Material

Structural Fill or Sand placed to directly support pipes, conduits, cables, and appurtenant structures. Bedding may also be used to provide a cushion between utilities and bedrock, obstacles, obstructions and other unyielding materials.

### 1.2.3 Flowable Fill

Fill placed in a plastic or liquid form that flows to near its final placement location with limited assistance and subsequently cures or solidifies to provide a stable or impermeable barrier.

### 1.2.4 Satisfactory Materials

Satisfactory materials for fill, backfill, and/or any in-situ soils to remain in place comprise any materials classified by ASTM D2487 as GW, GP, GM, GP-GM, GW-GM, SW, SP, SM, or SW-SM and shall be free of debris, roots, wood, scrap material, vegetation, refuse, soft unsound particles, and frozen, deleterious, or objectionable materials. Maximum particle size to be no greater than one-half of the allowable lift thickness.

#### 1.2.5 Unsatisfactory Materials

Materials which do not comply with the requirements for satisfactory materials are unsatisfactory. Unsatisfactory materials also include man-made fills; trash; refuse; backfills from previous construction; roots and other organic matter or frozen material; and suspected contaminated materials (excavated material with any of the following characteristics: significant petroleum and/or chemical odor; an oily sheen; and/or material with staining or significant change of color). Rock, boulders or stones with a particle diameter greater than one-half the lift thickness at the intended location, asphalt, or concrete materials shall be separated from any excess soils requiring disposal and shall be transported & disposed of by the Contractor. Notify the Contracting Officer when encountering any contaminated materials.

#### 1.2.6 Hard/Unyielding Materials

Hard/Unyielding materials comprise weathered rock, dense consolidated deposits, or conglomerate materials which are not included in the definition of "rock" with stones greater than 6 inches in any dimension or as defined by the pipe manufacturer, whichever is smaller. These materials usually require the use of heavy excavation equipment, ripper teeth, or jack hammers for removal.

#### 1.2.7 Unstable Material

Unstable materials are too weak to adequately support the utility pipe, conduit, equipment, appurtenant structure, or pavement. Satisfactory material may become unstable due to ineffective drainage, dewatering, becoming frozen, excessive loading.

#### 1.2.8 Rock

Solid homogeneous interlocking crystalline material with firmly cemented, laminated, or foliated masses or conglomerate deposits, neither of which can be removed without systematic drilling, drilling and the use of expansion jacks or feather wedges, or the use of backhoe-mounted pneumatic hole punchers or rock breakers; also large boulders, buried masonry, or concrete other than pavement exceeding 1 cubic yard in volume. Removal of hard material will not be considered rock excavation because of intermittent drilling that is performed merely to increase production.

SPECIAL NOTE: BLASTING IS NOT PERMITTED ON PORTSMOUTH NAVAL SHIPYARD.

#### 1.2.9 Capillary Water Barrier

A layer of clean, poorly graded crushed rock, stone, or natural sand or gravel having a high porosity which is placed beneath a building slab with or without a vapor barrier to cut off the capillary flow of pore water to the area immediately below a slab.

#### 1.2.10 Non- Hazardous Soil

Non-hazardous soils shall include all soils which, upon generation, do not meet the definition of a hazardous waste as defined by the EPA Hazardous Waste Regulations 40 CFR 260 through 40 CFR 268, 40 CFR 273, and 40 CFR 279 and the State of Maine DEP Hazardous Waste Regulations Chapter 50-855.

#### 1.2.11 Hazardous Soils

Hazardous soils shall include all soils which, upon generation, do meet the definition of a hazardous waste as defined by the EPA Hazardous Waste Regulations 40 CFR 260, 40 CFR 268, 40 CFR 273, and 40 CFR 279 and the State of Maine DEP Hazardous Waste Regulations Chapter 850-855.

#### 1.2.12 Installation Restoration (IR) Sites

A known, demarcated area impacted by past waste disposal operations and/or hazardous substance spills currently regulated by the Navy and outside Federal and State agencies.

#### 1.2.13 Degree of Compaction (Proctor)

Degree of compaction required, except as noted in the second sentence, is expressed as a percentage of the maximum density obtained by the test procedure presented in ASTM D1557 abbreviated as a percent of laboratory maximum dry density (MDD). Since ASTM D1557 applies only to soils that have 30 percent or less by weight of their particles retained on the 3/4 inch sieve, express the degree of compaction for material having more than 30 percent by weight of their particles retained on the 3/4 inch sieve as a percentage of the maximum density in accordance with ASTM D1557.

#### 1.2.14 Borrow

Soil brought to the project site from an external location for the purposes of project construction.

#### 1.2.15 Subgrade

Earth materials exposed in the bottom of the excavation for utilities, building foundation slabs, and pavement areas including shoulders.

### 1.3 SUBSURFACE DATA

Subsurface soil boring logs are shown in project plans. These data represent available subsurface information; however, variations may exist between boring locations.

### 1.4 CRITERIA FOR BIDDING

Base bids on the following criteria:

#### 1.4.1 General Criteria

- a. Surface elevations are as indicated
- b. Ground water elevation is estimated to be at or near mean high water level of the Piscataqua River. Approximate groundwater elevations are indicated on the boring logs. The Contractor shall include all costs associated with all dewatering efforts. Failure by the Contractor to plan for groundwater conditions shall not be the basis for any claim nor equitable price or contract time adjustments.
- c. Testing results used for geotechnical analysis or collection of any soil waste characterization samples cannot also be used for waste characterization unless Code 106.3 reviews and approves the sampling plan and has oversight of the sampling process.

- d. Removal of soils and rock beyond the lines and grades indicated will not be grounds for claims for additional payment.
- e. Blasting will not be permitted on the Shipyard. Contractors means and methods may include hoe ramming or other approved methods. Provide protection of adjacent facilities as necessary during prosecution of work.

#### 1.4.2 Soil Management Criteria

The project will involve the excavation and handling of soil in areas within and outside the limits of one or more IR sites, which are also referred to as Operable Units (OUs). The limits of work and the IR site boundaries are shown in the project plans. The management of soil in IR and non-IR areas of the project shall conform to the soil management criteria described herein.

IR site where non-hazardous soil is assumed to be present.

This section applies to IR sites where non-hazardous soil is assumed to present (previously remediated) but is still regulated under a Land Use Control (LUC). This section specifically applies to OU1, OU2 (with the exception of an area beneath a 2-foot soil cover around Building 310), OU7, and OU9 (with the exception of an area beneath the Building 62 Annex).

- a. Coordination with PWD ME EV IR Coordinator must occur at least three weeks prior to the start of work to allow adequate time for PWD ME EV notification to EPA and MEDEP. The notification must include a site plan identifying IR site boundaries and the proposed activities therein.
- b. The Government is responsible for soil testing, transport, and disposal.
- c. The Contractor is responsible for soil excavation, stockpiling, onsite management, and loading (into Government furnished trucks and/or containers).
- d. A site specific HASP is not required as the IR site has been remediated to below acceptable Construction Worker exposure levels. Contractor must stop work and notify the PWD ME Construction Manager (CM) if suspect soil contamination is encountered (e.g. - presence of staining, odor, debris).
- e. Reuse of excavated soil is prohibited.
- f. Soil stockpiles must be located within the IR site boundary.
- g. Soil stockpiles must be placed on and covered with 6 mil poly sheeting and surrounded with erosion and sediment controls to prevent runoff. Soil stockpiles must follow MEDEP Erosion and Sediment Control Best Management Practices.
- h. Soil stockpiles must remain covered unless being actively worked or sampled.
- i. Contractor must coordinate directly with Code 106.3 to schedule soil testing (at least seven days prior to desired date).
- j. Soil stockpiles must not be added to once Government soil sampling

activities are complete.

- k. Contractor must clearly placard stockpiles with "Pending Characterization" while awaiting Government soil characterization test results and either "Non-Hazardous" or "Hazardous" based on those results. Signs must be clearly legible and designed to withstand weathering for the duration of the project.
- l. Contractor must coordinate directly with Code 106.3 to schedule Government furnished trucks and/or containers.

Excavation outside IR site where non-hazardous soil is assumed present.

- a. The Contractor is responsible for all aspects of soil management from generation to disposal; including, excavation, stockpiling, onsite management, testing, loading, transport, and disposal. Refer to Section 01 57 19.00 22 TEMPORARY ENVIRONMENTAL CONTROLS - PORTSMOUTH NAVAL SHIPYARD (PWD ME).
- b. The Contractor is responsible for waste characterization testing of excess soil. The Contractor must submit an Excess Soil Disposal & Sampling Plan to PWD ME EV and Code 106.3 for review and approval prior to performing sampling and analysis.
- c. A site specific HASP is not required. Contractor must stop work and notify the PWD ME CM if suspect soil contamination is encountered (e.g. - presence of staining, odor, debris).
- d. Reuse of excavated soil as backfill is allowed given project specifications are met.
- e. Soil stockpiles must follow MEDEP Erosion and Sediment Control Best Management Practices. Refer to Section 01 57 19.00 22 TEMPORARY ENVIRONMENTAL CONTROLS - PORTSMOUTH NAVAL SHIPYARD (PWD ME).
- f. Contractor must use an experienced environmental professional for the collection of soil samples for disposal characterization.
- g. Code 106.3 must be present onsite to witness Contractor soil sampling events, which must be scheduled at least seven days prior.
- h. Contractor must use a laboratory that has Maine state certification and NELAP/NELAC accreditation for all test methods required for soil analysis (see requirements in 1.5.4).
- i. Soil stockpiles must not be added to once Contractor sample collection is complete.
- j. Contractor must provide Code 106.3 with all documentation pertaining to the sampling event and results. Documentation includes but is not limited to: analytical results, maps and diagrams, copy of chain of custody and Contractor sampling field log book entry.
- k. Contractor must clearly placard stockpiles with "Pending Characterization" while awaiting Contractor soil characterization test results and either "Non-Hazardous" or "Hazardous" based on those results. Signs must be clearly legible and designed to withstand weathering for the duration of the project.

- l. Contractor must not ship any soil without the written approval of the PWD ME CM and Code 106.3.
- m. Once loaded into trucks and/or containers, the Contractor must transport the soil to Building 357 for processing (e.g. - weigh load, manifest paperwork) prior to leaving the Shipyard.
- n. Soil transported off the Shipyard must be disposed of at a licensed non-municipal landfill disposal facility, preapproved by Code 106.3.
- o. The Contractor must provide documentation to the PWD ME CM and Code 106.3 that soil removed from the Shipyard was disposed of at the approved landfill disposal facility.
- p. Sampled soil stockpiles must be placed on and covered with 6 mil poly sheeting and surrounded with erosion and sediment controls to prevent runoff.
- q. Sampled soil stockpiles must follow MEDEP Erosion and Sediment Control Best Management Practices' and 'Sampled soil stockpiles must remain covered unless being actively worked or sampled.

Excavation outside an IR site where hazardous or potential hazardous soil is discovered.

- a. The Government is responsible for soil testing, transport, and disposal.
- b. The Contractor is responsible for soil excavation, stockpiling, onsite management, and loading (into Government furnished trucks and/or containers).
- c. A site specific HASP describing proper HAZWOPER site controls must be developed, approved by the Contracting Officer, and implemented for worker protection.
- d. Reuse of excavated soil is prohibited.
- e. Soil stockpiles must be located within the project footprint, as close to the excavation as possible.
- f. Soil stockpiles must be placed on and covered with 6 mil poly sheeting and surrounded with erosion and sediment controls to prevent runoff. Soil stockpiles must follow MEDEP Erosion and Sediment Control Best Management Practices.
- g. Soil stockpiles must remain covered unless being actively worked or sampled.
- h. Contractor must segregate soil stockpiles based on evidence of contamination (e.g. - presence of staining, odor, debris) from other materials excavated.
- i. Contractor must coordinate directly with Code 106.3 to schedule soil testing (at least seven days prior to desired date).
- j. Soil stockpiles must not be added to once Government soil sample collection activities are complete.

- k. Contractor must clearly placard stockpiles with "Pending Characterization" while awaiting Government soil characterization test results and either "Non-Hazardous" or "Hazardous" based on those results. Signs must be clearly legible and designed to withstand weathering for the duration of the project.
- l. Contractor must coordinate directly with Code 106.3 to schedule Government furnished trucks and/or containers.

#### 1.5 SUBMITTALS

Government approval is required for submittals with a "G" classification. Submittals not having a "G" classification are for Contractor Quality Control approval. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

##### SD-01 Preconstruction Submittals

Shoring and Sheet piling Plan; G  
Excavation and Trenching Plan; G  
Dewatering Work Plan; G  
Archeologists Qualifications; G  
Preconstruction Meeting; G  
Excess Soil Disposal & Sampling Plan; G  
Submit 15 days prior to starting work.

##### SD-03 Product Data

Flowable Fill Mix Design; G  
Geotextiles

##### SD-06 Test Reports

Dewatering Performance Records; G  
Material Test Report; G  
Contractor Sampling Field Log Book Entry; G  
Laboratory gradation test; G  
Laboratory compaction tests; G  
Pipe Inspection Report; G  
Geotechnical Evaluation Report; G

Submit copies of all laboratory and field test reports within 24 hours of the completion of the test. If applicable, submit unit price item rock quantity surveys at least 24 hours in advance of removal.

## 1.6 QUALITY CONTROL

### 1.6.1 Geotechnical Engineer

The Contractor shall hire a Professional Geotechnical Engineer to provide inspection of excavations and soil/groundwater conditions throughout construction. The Geotechnical Engineer is responsible for performing pre-construction and periodic site visits throughout construction to assess site conditions. The Geotechnical Engineer is responsible for preparing and updating the Excavation and Trenching Plan and Dewatering Work Plan as construction progresses to reflect changing conditions and submit an updated plan if necessary. Submit a monthly Geotechnical Evaluation report, informing the Contractor and Contracting Officer of the status of the plan and an accounting of the Contractor's adherence to the plan addressing any present or potential problems. The Contractor is responsible for arranging meetings with the Geotechnical Engineer and Contracting Officer throughout the contract duration.

The Geotechnical Engineer shall be available to meet with the Contracting Officer at any time throughout the contract duration to review the performance of the dewatering system and temporary support of excavation systems.

### 1.6.2 Qualified Technician

Provide a Qualified Technician to inspect, monitor, sample, and perform field testing. The technician qualifications need to be one of the following: a current National Institute for Certification in Engineering Technologies (NICET) Level II minimum certification in Construction Materials Testing Soils; a Geologist-in-Training with minimum one-year experience; an Engineer-in-Training with minimum one-year experience; a Registered Geologist; or a Professional Engineer.

### 1.6.3 Lab Validation

Perform testing by a Corps validated commercial testing laboratory or Contractor established testing laboratory meeting the requirements of Section 01 45 00.00 22 QUALITY CONTROL and approved by the Contracting Officer. Submit testing laboratory validation for the testing to be performed. Do not permit work requiring testing until testing facilities have been inspected, Corps validated and approved by the Contracting Officer.

### 1.6.4 Preconstruction Meeting

Conduct a preconstruction meeting at the jobsite at least five business days prior to the start of earthwork operations on the project. The preconstruction meeting is to be arranged by the Contractor and is to follow the written agenda submitted prior to the meeting. The purpose of this meeting is to review the requirements of this specification and the associated plans. The following individuals must be in attendance at this meeting: Contractor's Project Manager and Project Superintendent, earthwork subcontractor's Project Manager and Site Foreman, Contractor's Geotechnical Engineer and Testing Agency, Government Geotechnical Engineer and Civil Engineer, and Government Construction Manager and Engineering Technician.

The minutes of this meeting are to be recorded by the Contractor and published via email within 48 hours to all attendees. The minutes must be

re-published within 48 hours via email pending any subsequent comments from the attendees.

#### 1.7 DELIVERY, STORAGE, and HANDLING

Perform in a manner to prevent contamination or segregation of material.

#### 1.8 GENERAL SOIL MANAGEMENT REQUIREMENTS

##### 1.8.1 Soil Transported Off Base

Any soil transported off base from the Shipyard must be disposed of at a licensed non-municipal landfill disposal facility, which has been preapproved by Code 106.3.

##### 1.8.2 Bulk Materials in Contact With Soil

Bulk materials which are in contact with soil (e.g. - undisturbed bedrock, asphalt, concrete) may be transported off base for disposal or recycling, given there are no suspected hazardous constituents associated with the materials (e.g., PCB paint) and soil is completely removed prior to being loaded for transport (field determination by PWD ME Construction Manager (CM) or Engineering Tech (ET)). Information regarding the destination of these materials must be submitted to the PWD ME CM.

#### 1.9 SOIL SAMPLING FOR WASTE CHARACTERIZATION

Testing parameters must meet the requirements of the selected landfill disposal facility including the type, number, and frequency of tests. Chemical analysis of the samples must be performed by a laboratory that has Maine state certification and National Environmental Laboratory Accreditation Program (NELAP/NELAC) accreditation for all test methods required for soil analysis and a Quality Systems Manual that conforms to the standards of ISO 17025.

#### 1.10 SITE WASTE REMOVAL (SWR) MEETING

A SWR meeting must be held with the PWD ME CM and Code 106.3 prior to the removal of excavated soil from a project site to ensure all pertinent requirements of this PNSY Standard Operating Procedure for Site Waste Removal (SWR) Process (see Attachment B) have been met.

No transport of soil will be allowed until full concurrence is provided by the PWD ME CM and Code 106.3 following the satisfactory completion of the SWR.

#### 1.11 REQUIREMENTS FOR TRANSPORTING BACKFILL ON BASE

Aggregates containing less than 10% fines (material passing the number 4 sieve) transported to the Shipyard from off base to be used as backfill do not require testing.

All other backfill materials which do not meet the above conditions must be tested for the following contaminants:

- Total Petroleum Hydrocarbons (TPH) (GC/FID)
- Total 8 RCRA Metals (7060, 7740, etc.)
- Total Volatiles (8260)
- Total Semi-Volatiles (8270)

- Total Pesticides (8081)
- Total Herbicides (8151)
- Total PCB's (8082)
- Ignitability/flash (1010-liquids, 1030-solids)
- Corrosivity/pH (9045)
- Reactive Sulfide (7.3.4.1)

Off base soil must not contain any contaminant concentration which exceeds the most current "Residential Scenario" values listed in Appendix 1 of the MEDEP Remedial Action Guidelines found at <https://www.maine.gov/dep/spills/publications/guidance/>. TPH concentrations must not exceed 100 mg/kg. If the total concentration of any Toxicity Characteristic Leaching Procedure (TCLP) regulated contaminant listed in 40 CFR 261.24 is greater than or equal to twenty times its regulatory threshold, TCLP analysis will be required. The off base soil must not contain any TCLP concentration which exceeds the current EPA values listed in 40 CFR 261.24, Table 1 Maximum Concentration of Contaminants for Toxicity Characteristic EPA limits.

Representative sampling and testing of the backfill must be conducted at a rate of 1 sample for every 1,000 tons, with a minimum of 1 sample per borrow source. Contractor must use a licensed, Maine state-certified and NELAP accredited laboratory for the chemical analysis. Backfill must not be transported on base until all laboratory test results have been approved by PWD ME EV.

Borrow pits must meet all appropriate state certification guidelines. Written confirmation that the purchased backfill material did not come from a chemically impacted area must be provided by borrow pit supplier. Proof of certification and written confirmation must be provided to the PWD ME EV prior to backfill being brought on base.

NOTE: Should any clean backfill be removed for excess soil disposal, testing is required even if the project profile amount covers the amount being disposed of.

#### 1.12 EXCESS SOIL DISPOSAL & SAMPLING PLAN

The Contractor shall submit an Excess Soil Disposal & Soil Sampling Plan indicating the licensed facility that will be used for off site disposal of excess non-hazardous soil material. The Excess Soil Disposal & Soil Sampling Plan shall include all information required in Attachment A "Environmental Sampling Plan Expectations for Non-Shipyard Personnel" and the following:

1. Introduction - Provide a location and description of the excavation work required to complete the work under the contract. A site plan showing the limits of excavation and planned stockpile locations for soils to be reused and unsuitable or excess soils requiring disposal.
2. Excavation - Provide quantities of excavated materials. Provide an estimated quantity of soils to be reused and soils requiring off site disposal.
3. Soil Characterization - The Contractor shall collect representative soil samples to confirm the material meets the requirements of the Contractor's selected licensed disposal facility. The soil samples shall be sent to a laboratory that has Maine state certification and National Environmental Laboratory Accreditation Program (NELAP/NELAC)

accreditation for all test methods required for soil analysis and Quality Systems Manual that conforms to the standards of ISO 17025. The quantity & location of soil samples and laboratory tests shall be based on the disposal facility requirements.

The Contractor shall specify the sample collection methods and procedures. Soil sampling can be conducted post-excavation from stockpiles or pre-excavation in-situ using test pits or soil borings. The Contractor's Excess Soil Disposal and Sampling Plan shall identify the preferred method. For in-situ sampling, the plan must specify the quantity, locations, and depths of test pits/borings. All sampling plans and procedures require approval from Code 106.3.

4. Soil Sampling - The Contractor shall provide the analytical sampling requirements based on the licensed facility that will be accepting the soils for disposal. The soil shall be tested using a laboratory that has Maine state certification and National Environmental Laboratory Accreditation Program (NELAP) accreditation for all test methods required for soil analysis and Quality Systems Manual that conforms to the standards of ISO 17025.
5. Stockpiling - Provide description on how the soils (soils to be reused & excess soils requiring disposal) will be stockpiled within the limits of work and in accordance with the requirements provided in the plans & contract documents. The location of the proposed stockpile areas shall be shown on a site plan.
6. Transportation on base - The excess soils shall be transported directly to Building 357 from the project site to be inspected, weighed & manifested by the Government prior to leaving the Shipyard. B357 is open Monday-Friday from 8 am to 2 pm. The contractor shall coordinate deliveries with the Contracting Officer & PNSY 106.3 at least 14 calendar days prior to making any shipments to B357. The licensed facility must be approved by PWD ME Environmental & PNSY Code 106.3 prior to any soil leaving the Shipyard. The Contractor shall contact Code 106.3 for information regarding the appropriate disposal facilities and what is CURRENTLY approved.
7. Transportation off base - Provide a description of how the soils will be transported to the approved disposal facility. The Contractor shall provide documentation to the Contracting Officer that soil removed from the Shipyard was disposed of at the approved disposal facility.

## 1.13 QUALITY ASSURANCE

### 1.13.1 Excavation and Trenching Plan

Provide Manufacturers Tabulated Data for trench boxes and other pre-manufactured support systems to be used on the project. See EM 385-1-1, Section 25, Excavation and Trenching for requirements.

Provide shop drawings and calculations for site specific support systems including, but not limited to, soldier pile and lagging and timber sheeting. See EM 385-1-1, Section 25, Excavation and Trenching for requirements.

### 1.13.2 Dewatering Work Plan

The Contractor shall submit procedures for accomplishing dewatering work

to the Contracting Officer for approval. The Dewatering Work Plan submittal shall be prepared by a Professional Geotechnical Engineer licensed in the State of Maine with specialized experience in geotechnical engineering. The requirements of the plan are specified in Paragraph entitled DEWATERING herein.

#### 1.13.3 Utilities

Movement of construction machinery and equipment over pipes and utilities during construction shall be at the Contractor's risk. Perform work adjacent to non-Government utilities as indicated in accordance with procedures outlined by utility company. Excavation made with power-driven equipment is not permitted within three (3) feet of known Government-owned utility or subsurface construction. For work immediately adjacent to or for excavations exposing a utility or other buried obstruction, excavate by hand. Start hand excavation on each side of the indicated obstruction and continue until the obstruction is uncovered or until clearance for the new grade is assured. Support uncovered lines or other existing work affected by the contract excavation until approval for backfill is granted by the Contracting Officer. Report damage to utility lines or subsurface construction immediately to the Contracting Officer.

#### 1.13.4 Post- Review Archaeological Discoveries

In the event that a potential archaeological resource is encountered during ground disturbing activities, stop work within the surrounding area immediately and notify the CM.

If suspected human remains (including but not limited to bone, bone fragments, teeth, mummified flesh, burials, and cremations) are encountered, stop work in the surrounding area immediately and notify the CM. The remains shall be treated with respect and not be disturbed or photographed. In coordination with the CM, provide the materials and labor necessary to secure the area to prevent damage and protect the discovery.

Work may not resume until direction is provided by the CM. All artifacts remain property of the GOV.

#### 1.13.5 Archaeological Monitoring

If archaeological monitoring is required for the project, ensure all earthwork activities are conducted in coordination with 01 44 00.22. If archaeological resources are determined to be significant, the KTR may be required, in coordination with the COR, to provide a qualified archaeologist meeting the Secretary of the Interior's Professional Qualification Standards and on the State of Maine's Level II-approved list to monitor excavations. Submit archeologists qualifications.

### PART 2 PRODUCTS

#### 2.1 SOIL MATERIALS

##### 2.1.1 Structural Fill

Satisfactory Material consisting of well-graded sand and gravel mixture free of roots, topsoil, loam, where indicated, organic material, and any other deleterious materials, as well as clods of silt or clay, and meet the following gradation requirements or meet the SHS MEDOT, Section 703.20

Gravel Borrow specification:

| Screen or Sieve Size | Percent Passing |
|----------------------|-----------------|
| 6 inches             | 100             |
| 3 inches             | 70 - 100        |
| No. 4                | 35 - 70         |
| No. 40               | 5 - 35          |
| No. 200              | 0 - 10          |

2.1.2 Ordinary Fill

Satisfactory Material consisting of a mixture of sand and gravel meeting the SHS MEDOT, Section 703.19 Granular Borrow with 20 percent or less passing the No. 200 sieve and no stone greater than one-half the loose lift thickness, or 6 inches, whichever is smaller.

2.1.3 Sand

Clean, coarse-grained sand classified as SP-SM, material and gradation requirements for Maine DOT 703.22: Underdrain Backfill Material, Type C.

2.1.4 Crushed stone

Clean, quarried material meeting the material and gradation requirements for SHS MEDOT 703.13: Crushed Stone  $\frac{3}{4}$  inch.

2.1.5 Gravel Subbase

Clean, quarried material meeting the material and gradation requirements for SHS MEDOT 703.10: Aggregate for Untreated Surface Course and Leveling Course, Type A.

2.2 FLOWABLE FILL

Design and submit flowable fill mix design to consist of Portland cement, fly ash, and/or slag cement and fine aggregate. Include the dry weights of cementitious material(s); quality and gradation of aggregates in the saturated surface-dry weights along with gradation tests; quantities, types, and names of admixtures; and quantity of water per cubic yard. The maximum unconfined compressive strength to be 100 psi at 28 days in accordance with ASTM D4832. The aggregates in accordance with ASTM C33/C33M Fine Aggregates. Air-entrain fill in accordance with ASTM C260/C260M. The air content to be between 8 and 15 percent in accordance with ASTM D6023. Portland cement to be Type I or II in accordance with ASTM C150/C150M. Fly ash to be Class C in accordance with ASTM C618. Provide slag cement in Grade 100 or 120 in accordance with ASTM C989/C989M.

2.3 BURIED WARNING AND IDENTIFICATION MARKERS

Provide polyethylene plastic and metallic core or metallic-faced, acid- and alkali-resistant, polyethylene plastic warning tape manufactured specifically for warning and identification of buried utility lines as indicated on the drawings. Provide tape on rolls, 3 inches minimum width, color coded as specified below for the intended utility with warning and identification imprinted in bold black letters continuously over the entire tape length. Warning and identification to read, "CAUTION, BURIED

(intended service) LINE BELOW" or similar wording. Provide permanent color and printing, unaffected by moisture or soil.

| Warning Tape Color Codes |                                                 |
|--------------------------|-------------------------------------------------|
| Red                      | Electric                                        |
| Yellow                   | Gas, Oil; Steam, Air, Other Dangerous Materials |
| Orange                   | CCTV, Telephone and Other Communications        |
| Blue                     | Water Systems                                   |
| Green                    | Sewer Systems                                   |
| Purple                   | Reclaimed Water                                 |
| White                    | Proposed Excavation                             |
| Pink                     | Temporary Survey Markings                       |
|                          |                                                 |

#### 2.3.1 Warning Tape for Metallic Piping

Provide acid and alkali-resistant polyethylene plastic tape conforming to the width, color, and printing requirements specified above, with a minimum thickness of 0.004 inch and a minimum strength of 1500 psi lengthwise, and 1250 psi crosswise, with a maximum 350 percent elongation.

#### 2.3.2 Detectable Warning Tape for Non-Metallic Piping

Provide polyethylene plastic tape conforming to the width, color, and printing requirements specified above, with a minimum thickness of 0.004 inch, and a minimum strength of 1500 psi lengthwise and 1250 psi crosswise. Manufacture tape with integral wires, foil backing, or other means of enabling detection by a metal detector when tape is buried up to 3 feet deep. Encase metallic element of the tape in a protective jacket or provide with other means of corrosion protection.

#### 2.3.3 Detection Wire for Non-Metallic Piping

Insulate a single strand, solid copper detection wire with a minimum of 12 AWG.

#### 2.4 BORROW

Obtain borrow materials required in excess of those furnished from excavations from sources outside of Government property. Borrow materials shall meet the requirements for Soil Materials for intended use as defined herein.

#### 2.5 GEOTEXTILE

Provide Geotextile meeting the requirements of AASHTO M288 - geotextile for separation. Submit material product data for all Geotextiles utilized.

## PART 3 EXECUTION

### 3.1 PROTECTION

Perform all work specified in accordance with applicable requirements of the Corps of Engineers publication EM 385-1-1 Safety and Health Requirements Manual. Provide a Geotechnical Engineer to monitor construction activities and to prepare necessary work plans and reports; see paragraph QUALITY CONTROL.

Use equipment of type and size appropriate for the site conditions (soil character and moisture content). Maintenance of exposed subgrades and fills is the responsibility of the Contractor. The Contractor is required to prevent damage by ineffective drainage, dewatering, and heavy loads and equipment by implementing precautionary measures. Repair or replace any defects or damage.

#### 3.1.1 Shoring and Sheeting

Submit a Shoring and Sheeting Plan where needed to complete and provide shoring bracing, cribbing, trench boxes, underpinning, and sheeting where the Work is shown. Submit drawings and calculations, certified by a registered professional engineer, describing the methods for shoring and sheeting of excavations. Drawings to include material sizes and types, arrangement of members, and the sequence and method of installation and removal. Calculations are to include data and references used.

In addition to requirements detailed in EM 385-1-1, the Contractor shall include provisions in the Shoring and Sheeting Plan that will accomplish the following:

- a. Stabilize features, prevent undermining or unintended horizontal and vertical movement of pavements, foundations, utility pipelines, structures, slabs, and other adjacent structures.
- b. Prevent slippage or movement in banks or slopes adjacent to the excavation.
- c. All shoring materials installed permanently below grade shall consist of material not susceptible to rot.

#### 3.1.2 Machinery and Equipment

Movement of construction machinery and equipment over pipes during construction shall be at the Contractor's risk. Repair, or remove and provide new pipe for existing or newly installed pipe that has been displaced or damaged.

#### 3.1.3 Underground Utilities

The location of the existing utilities shown on the plans are approximate. The contractor shall physically field verify the location and elevation of the existing utilities indicated prior to starting construction. The Contractor shall submit a PWD Maine Dig Safe Utility Request Form and contact DIG SAFE (1-888-344-7233). The Contractor shall confirm the location of all existing underground utilities prior to commencing any excavation work.

Perform work adjacent to utilities as indicated. Excavation made with

power-driven equipment is not permitted within 3 feet of known utility or subsurface construction. For work immediately adjacent to or for excavations exposing a utility or other buried obstruction, excavate by hand. Start hand excavation on each side of the indicated obstruction and continue until the obstruction is uncovered or until clearance for the new grade is assured. Support uncovered lines or other existing work affected by the contract excavation until approval for backfill is granted by the Contracting Officer. Report damage to utility lines or subsurface construction immediately to the Contracting Officer.

#### 3.1.4 Drainage and Dewatering

Provide for the collection and disposal of surface and subsurface water encountered during construction. Prepare a Dewatering Plan that complies with State and Federal regulations, and the requirements specified herein.

##### 3.1.4.1 Drainage

Provide for the collection and disposal of surface and subsurface water encountered during construction. Construct storm drainage features (ponds/basins) at the earliest stages of site development, and throughout construction grade the construction area to provide positive surface water runoff away from the construction activity and provide temporary ditches, swales, and other drainage features and equipment as required to keep soils from becoming unstable, prevent erosion, or undermining of structures and utilities. Remove unstable material from working platforms for equipment operation and soil support for subsequent construction features and provide new material as specified herein. It is the responsibility of the Contractor to assess the site conditions to employ necessary measures to permit construction to proceed. Excavated slopes and backfill surfaces shall be protected to prevent erosion and sloughing. Excavation shall be performed so that the site, the area immediately surrounding the site, and the area affecting operations at the site shall be continually and effectively drained.

##### 3.1.4.2 Dewatering

Control groundwater flowing toward or into excavations to prevent sloughing of excavation slopes and walls, boils, uplift and heave in the excavation and to eliminate interference with orderly progress of construction. French drains, sumps, ditches or trenches are not allowed within 3 feet of the foundation of any structure, except with specific written approval, and after specific contractual provisions for restoration of the foundation area have been made. Perform control measures by the time the excavation reaches the water level in order to maintain the integrity of the in-situ material. While the excavation is open, maintain the water level continuously, at least 2 feet below the working level. Submit a Dewatering Work Plan outlining procedures for accomplishing dewatering work. Operate dewatering system continuously until construction work below existing water levels is complete. Measure and record performance of dewatering system at same time each day by use of observation wells or piezometers installed in conjunction with the dewatering system. Submit dewatering performance records weekly.

- a. The majority of the Portsmouth Naval Shipyard experiences shallow groundwater areas. Dewatering work and other aspects of the project must be planned under the assumption groundwater may be encountered up to the elevation of the highest tide. Any groundwater elevations shown on drawings accompanying the specifications are elevations which

existed at the time of subsurface investigations, and are for reference only.

- b. The Contractor shall hire a Professional Geotechnical Engineer licensed in the State of Maine with specialized experience in geotechnical engineering aspects of design and construction to prepare a project specific dewatering plan.

The dewatering plan shall at a minimum address anticipated dewatering discharge volumes, pumping rates required to maintain construction in the dry, demonstrate adequate capacity to treat and dispose the discharge volume, and illustrate on a site plan the location proposed for dewatering discharge treatment systems and disposal locations. The plan shall describe implementation of construction dewatering practices in accordance with Maine Erosion and Sediment Control Best Management Practices (Maine DEPLW0588, latest edition). At no point shall construction dewatering be discharged to storm sewers. The Geotechnical Engineer shall stamp and date the dewatering plan prior to submission to the Contracting Officer.

The Geotechnical Engineer shall be responsible for performing pre-construction site inspections and periodic site visits throughout construction to assess site conditions. The Geotechnical Engineer shall update the excavation, sheeting and dewatering plans as construction progresses to reflect changing conditions and shall submit an updated plan to the Contracting Officer. The Geotechnical Engineer shall submit a written report to the Contractor's Quality Control Manager and Contracting Officer, at least weekly, addressing the performance of the dewatering efforts, the Contractor's adherence to the plan and addressing any present or potential problems and recommendations.

The Geotechnical Engineer shall be available to meet with the Contracting Officer at any time throughout the contract duration to review the performance of the dewatering system.

- c. The Contractor's dewatering efforts shall control groundwater flowing toward or into excavations to prevent sloughing of excavation slopes and walls, boils, uplift and heave in the excavation and to eliminate interference with orderly progress of the construction. Dewatering Pits, french drains, sumps, ditches or trenches shall not be permitted within three (3) feet of the foundation of any structure. Control measures shall be taken by the time the excavation reaches the water level in order to maintain the integrity of the in situ material. The water level shall be maintained continuously as recommended by the Contractor's Geotechnical Engineer.
- d. The Contractor shall collect system performance records weekly. Relieve hydrostatic head in pervious zones below subgrade elevation in layered soils to prevent uplift.
- e. All water removed by the dewatering system shall be discharged back into the subsurface using infiltration pits (width of excavation must exceed the depth) or other means defined by the Contractor's Geotechnical Engineer and approved by the Contracting Officer. The dewatering system shall include temporary above ground storage tanks (ie. Frac Tanks) to manage the water based on soil infiltration rates. The size and number of storage tanks shall be defined by the Contractor's Geotechnical Engineer based on the required dewatering

pump rates, soil infiltration rates, planned work schedule and shall be presented in the dewatering plan.

- f. If contaminated groundwater is encountered while dewatering, dewatering operations shall cease and the contractor shall notify the Contracting Officer to request disposal requirements, issued by PWD-ME Environmental Division and PNSY Environmental Division. Discharge of hazardous substances (e.g. petroleum) shall not be permitted under any circumstances.

Dewatering in an IR Site or an area where hazardous soil is present:

If dewatering is being performed within an IR site, the pumped water shall be discharged into infiltration pits located within the same IR boundary. All groundwater discharges generated within the boundaries of an IR Site shall be infiltrated into the subsurface within the boundaries of the same IR site from which the discharge was generated. Under no circumstances shall water be released to the storm drain system, sanitary sewer, a wetland resource, or river.

Dewatering outside of an IR site where non-hazardous soil is assumed to be present:

If dewatering pumps are located outside of an IR site, the pumped water shall be discharged into infiltration pits located within the same area outside of the IR boundary. Under no circumstances shall water be released to the storm drain system, sanitary sewer, a wetland resource, or the river.

- g. The water in the storage tanks shall be discharged into infiltration pits (width of excavation must exceed the depth) within the limits of work. Multiple infiltration pits may be required. The locations of the infiltration pits shall be identified by the Contractors' Geotechnical Engineer and approved by the Contracting Officer. Under no circumstances shall water be released to the storm drain system, sanitary sewer, a wetland resource, or the river, unless specifically approved by the Contracting Officer.
- h. The Contractor shall include in the bid all necessary controls required to manage all dewatering activities required to complete the work within the specified contract time and in accordance with the plans and specifications. Failure by the Contractor to plan for groundwater conditions and dewatering requirements necessary to complete the work shall not be the basis for any claim nor an equitable price or contract time adjustment.

### 3.1.5 Protection of Graded Surfaces

Protect newly backfilled, graded, and topsoiled areas from traffic, erosion, and settlements that may occur. Repair or reestablish damaged grades, elevations, or slopes.

### 3.2 BORROW

Select borrow material to meet the requirements and conditions of the fill or embankment for which it is to be used. Obtain borrow material from approved private sources. Unless otherwise provided in the contract, the Contractor is responsible for obtaining the right to procure material, pay royalties and other charges involved, and bear the expense of developing

the sources, including rights-of-way for hauling from the owners. Unless specifically provided, do not obtain borrow within the limits of the project site without prior written approval.

#### 3.2.1 Contractor Furnished Borrow Area(s)

Obtain approved borrow materials from approved offsite sources. If a borrow source is selected that is not a commercial entity from which soil material is directly purchased, submit a Borrow Plan that includes the borrow source location, geotechnical test results showing the fill material meets the Contract requirements, environmental test results in accordance with paragraph REQUIREMENTS FOR TRANSPORTING BACKFILL ON BASE, and any Federal, State, and local permits required for excavation and reclamation of the borrow area.

### 3.3 SURFACE PREPARATION

#### 3.3.1 Clearing and Grubbing

Remove pavement, concrete, and other items that would interfere with construction operations within lines 5 feet outside of each building and structure lines.

#### 3.3.2 Stripping

Strip suitable soil from the site where excavation or grading is indicated and stockpile separately from other excavated material. Material unsuitable for use as fill shall be wasted, except that material meeting the requirements for backfill may be used for backfilling.

#### 3.3.3 Stockpiling Operations

Place and grade stockpiles of satisfactory, unsatisfactory, and wasted materials as specified. Keep stockpiles in a neat and well drained condition, giving due consideration to drainage at all times. Clear, grub, and seal by rubber-tired equipment, the ground surface at stockpile locations; separately stockpile excavated satisfactory and unsatisfactory materials. Protect stockpiles of satisfactory materials from contamination which may destroy the quality and fitness of the stockpiled material. Do not create stockpiles that could obstruct the flow of any stream, endanger a partly finished structure, impair the efficiency or appearance of any structure, or be detrimental to the completed work in any way. If the Contractor fails to protect the stockpiles, and any material becomes unsatisfactory, remove and replace such material with satisfactory material from approved sources.

Separately stockpile soil from IR and non-IR areas. Coordinate stockpiling requirements with Soil Management Criteria for IR and non-IR areas.

### 3.4 EXCAVATION

Excavate to contours, elevation, and dimensions indicated. Keep excavations free from water. Excavate soil disturbed or weakened by Contractor's operations, and soils softened or made unstable for subsequent construction due to exposure to weather. Use material removed from excavations meeting the specified requirements in the construction of fills, embankments, subgrades, shoulders, bedding (as backfill), and for similar purposes to minimize surplus material and to minimize additional material brought on site. Do not excavate below indicated depths

and/or limits identified in SHS MEDOT Section 203, Excavation and Embankments and SHS MEDOT Section 206, except to remove unstable material as determined by the Geotechnical Engineer and confirmed by the Contracting Officer. Remove and replace excavations below the grades shown with appropriate materials as directed by the Contracting Officer. Structural Excavation will not be permitted except to remove unsatisfactory material, and shall be in accordance with paragraph OVER EXCAVATION.

If at any time during excavation, the Contractor encounters material that may be classified as rock or as hard/unyielding material, uncover such material, and notify the Contracting Officer. Do not proceed with the excavation of this material until the Contracting Officer has classified the materials as common excavation or rock excavation. Failure on the part of the Contractor to uncover such material, notify the Contracting Officer, and allow sufficient time for classification and delineation of the undisturbed surface of such material will cause the forfeiture of the Contractor's right of claim to any classification or volume of material to be paid for other than that allowed by the Contracting Officer for the areas of work in which such deposits occur.

#### 3.4.1 Trench Excavation Requirements

Excavate trenches as indicated on the Drawings. Slope trench walls below the top of the pipe, or make vertical, and of such width as indicated on the Drawings. Do not exceed the trench width below the top of pipe of 24 inches plus pipe outside diameter (O.D.) for pipes of less than 24 inches inside diameter, and do not exceed 36 inches plus pipe outside diameter for pipe sizes larger than 24 inches inside diameter. Where recommended trench widths are exceeded, provide redesign, stronger pipe, or special installation procedures. The Contractor is responsible for the cost of redesign, stronger pipe, or special installation procedures without any additional cost to the Government.

##### 3.4.1.1 Bottom Preparation

Grade the bottoms of trenches accurately to provide uniform bearing and support for the bottom quadrant of each section of the pipe. Excavate bell holes to the necessary size at each joint or coupling to eliminate point bearing. Remove stones of 6 inch or greater in any dimension, or as recommended by the pipe manufacturer, whichever is smaller, to avoid point bearing.

##### 3.4.1.2 Removal of Unyielding Material

Where bedrock or unyielding material is encountered in the bottom of the trench, notify the Contracting Officer. Following approval, remove such material 6 inch below the required trench grade and replaced with crushed stone.

##### 3.4.1.3 Removal of Unstable Material

Where unstable material is encountered in the bottom of the trench, remove such material to the depth directed and replace it to the proper grade with crushed stone wrapped in geotextile or Structural Fill. When removal of unstable material is required due to the Contractor's fault or neglect in performing the work, the Contractor is responsible for excavating the resulting material and replacing it without additional cost to the Government.

#### 3.4.1.4 Excavation for Appurtenances

Provide excavation for manholes, vaults, catch-basins, inlets, or similar structures sufficient size to permit the placement of structures, and placement and compaction of backfill

#### 3.4.2 OVER Excavation

Excavation below the grades shown will not be permitted except to remove unsatisfactory material. Unsatisfactory material extending below the grades shown shall be classified by Contracting Officer and removed as directed. Refill with crushed stone wrapped in geotextile or structural fill material, depending on location with respect to structures and compact as required in herein. Satisfactory material removed below the depths indicated, without specific direction of the Contracting Officer, shall be replaced with satisfactory materials to the indicated excavation grade; except as specified for spread footings. Determination of elevations and measurements of approved over depth excavation of unsatisfactory material below grades indicated shall be done under the direction of the Contracting Officer. No extra payment will be made for removal of unsuitable soils and replacement with satisfactory material or select fills as may be directed by the Contracting Officer. Make excavations to the lines, grades, and elevations shown, or as directed. Provide trenches and foundation pits of sufficient size to permit the placement and removal of forms for the full length and width of structure footings and foundations as shown. Clean rock or other hard foundation material of loose debris and cut to a firm, level, stepped, or serrated surface. Remove loose disintegrated rock and thin strata.

Concrete placement is not allowed until footing subgrades have been inspected and approved by the Contracting Officer.

#### 3.4.3 Pile Cap Excavation

Stop the excavation at an elevation 6 to 12 inches above the bottom of the footing before installing the micropiles. After pile installation has been completed, complete the remainder of the excavation to the elevations shown.

#### 3.4.4 Rock Excavation

Excavate rock encountered in the cut section the excavation depth indicated on the Drawings and replace with . Roughen level surfaces and cut sloped surfaces into benches for bond with concrete. Protect shale from conditions causing decomposition along joints or cleavage planes and other types of erosion. BLASTING IS NOT PERMITTED ON PORTSMOUTH NAVAL SHIPYARD

#### 3.5 CONTROL OF EXCAVATIONS AND EXCAVATED MATERIALS

All Excavation work shall conform with all applicable OSHA and EM385-1-1 requirements. All excavation activities shall conform with Shipyard requirements. All excavations shall be closed as soon as work within the excavation is complete. Excavated materials shall not be allowed to spread in an uncontrolled manner nor become contaminated with other debris. All excavations shall be properly barricaded with barricades and suitable warning devices in a good state of repair. The Government will not provide barricades for Contractor use. The following controls also apply:

### 3.5.1 Unnatural Fill Materials/Industrial Debris

Upon discovery of Unnatural Fill Materials / Industrial Debris, notify the Contracting Officer, who will arrange for the PWD ME Environmental Division to inspect the materials.

### 3.5.2 Excavated Materials to be Reused as Backfill

Excavated non-hazardous soil materials from excavations which will remain open for LESS THAN TWO WEEKS may remain at the site of excavation.

## 3.6 SUBGRADE PREPARATION

### 3.6.1 General Requirements

Shape subgrade to line, grade, and cross section as indicated. Remove unsatisfactory and unstable material in surfaces to receive fill or in excavated areas, as determined by proof rolling, and replaced with satisfactory materials as directed by the Contracting Officer. Do not place material on surfaces that are muddy, frozen, contain frost, or otherwise containing unstable material. Scarify the surface to a depth of 6 inches prior to placing fill. Step, plow, break up or bench sloped surfaces steeper than 1 vertical to 4 horizontal prior to scarifying. When subgrades are less than the specified density, the ground surface shall be broken up to a minimum depth of 6 inches, pulverized, and compacted to the specified density. Place 6 inches of loose fill and blend with scarified material. When subgrade is part fill and part excavation or natural ground, scarify to a depth of 12 inches.

#### 3.6.1.1 Proof Rolling and Compaction

After stripping, excavating, and rough grading to the planned elevation, proof roll the exposed subgrade of all building and pavement locations with six passes of a loaded 10 yard tandem axle dump truck or 15 ton, pneumatic-tired or smooth drum roller. Operate the roller or truck in a systematic manner to ensure the number of passes over all areas, and at speeds between 2.5 to 3.5 miles per hour. When proof rolling under buildings, the building subgrade is considered to extend 5 feet beyond the building lines, and make one-half of the passes with the roller in a direction perpendicular to the other passes.

After excavating and rough grading trenches to the planned elevation, proof compact exposed soil subgrades with six passes of a vibratory plate compactor.

Notify the Contracting Officer a minimum of 3 days prior to proof rolling and compacting. Proof rolling and compacting shall be performed in the presence of the Contracting Officer. Subgrade materials that exhibit excessive deflection and/or rutting during proof rolling and compaction need to be undercut as directed by the Contracting Officer and replaced with fill and backfill material.

Perform proof rolling and compaction on exposed subgrade that is unfrozen and free of surface water.

### 3.6.2 Subgrade for Structures, Spread Footings, and Concrete Slabs

Do not excavate below depth shown for structures, spread footings, and

concrete slabs. If over excavation occurs, notify the Contracting Officer and remove, replace, and compact as directed. After final rolling, the surface of the subgrade for buildings and pavements must not show deviations greater than 0.05 foot when tested with a 12-foot straightedge applied both parallel and at right angles to the centerline of the area.

### 3.6.3 Subgrade for Pavements and Shoulders

Compact top 12 inches of subgrade for pavements and shoulders to at least 95 percent of ASTM D1557.

## 3.7 FILLING AND COMPACTION

Prepare subgrade on which backfill is to be placed and provide compaction requirements for backfill materials in conformance with the applicable portions of paragraphs for SUBGRADE PREPARATION. Do not place material on surfaces that are muddy, frozen, or contain frost. Finish compaction by pneumatic-tired rollers, steel-wheeled rollers, or other approved equipment well suited to the soil being compacted. Moisten material as necessary to plus or minus 2 percent of optimum moisture. Compact and test each lift before placing overlaying lift.

Compaction using water jetting will not be permitted.

### 3.7.1 Trench Backfill

Backfill trenches to the grade shown. Do not backfill the trench until all specified tests are performed.

Backfill as rapidly as construction, testing, and acceptance of work permits. Place and compact trench backfill in 6 inch lifts to top of trench and in 6 inch lifts to one foot over pipe outside structures and paved areas.

#### 3.7.1.1 Replacement of Unyielding Material

Replace unyielding material removed from the bottom of the trench with satisfactory material or initial backfill material.

#### 3.7.1.2 Replacement of Unstable Material

Replace unstable material removed from the bottom of the trench or excavation with satisfactory material placed in layers not exceeding 6 inches loose thickness.

#### 3.7.1.3 Bedding and Initial Backfill

Provide bedding of the type and thickness shown. Place initial backfill material and compact it with approved tampers to a height of at least one foot above the utility pipe or conduit. Bring up the backfill evenly on both sides of the pipe for the full length of the pipe. Take care to ensure thorough compaction of the fill under the haunches of the pipe. Except where shown or when specified otherwise in the individual piping section, provide bedding for buried piping in accordance with PART 2 paragraph UTILITY BEDDING MATERIAL. Compact backfill to top of pipe to 85 percent of ASTM D1557. Provide plastic piping with bedding to spring line of pipe.

#### 3.7.1.4 Final Backfill

Do not begin backfill until construction below finish grade has been approved, underground utilities systems have been inspected, tested and approved, forms removed, and the excavation cleaned of trash and debris. Bring backfill to indicated finish grade. Where pipe is coated or wrapped for protection against corrosion, the backfill material up to an elevation 2 feet above sewer lines and one foot above other utility lines need to be free from stones larger than one inch in any dimension. Heavy equipment for spreading and compacting backfill are not to be operated closer to foundation or retaining walls than a distance equal to the height of backfill above the top of footing; compact remaining area in layers not more than 4 inches in compacted thickness with power-driven hand tampers suitable for the material being compacted. Place backfill carefully around pipes or tanks to avoid damage to coatings, wrappings, or tanks. Do not place backfill against foundation walls prior to 7 days after completion of the walls. As far as practicable, bring backfill up evenly on each side of the wall and sloped to drain away from the wall.

Fill the remainder of the trench, except for special materials for buildings and pavements with satisfactory material. Place backfill material and compact as follows:

##### 3.7.1.4.1 Trenches, Buildings, Railroads, and Pavements

Place backfill up to the required elevation as specified. Do not permit water flooding or jetting methods of compaction. Compact as specified for Structural Fill.

##### 3.7.1.4.2 Turfed or Seeded Areas and Miscellaneous Areas

Deposit backfill in layers of a maximum of 12 inches loose thickness, and compact it to 85 percent maximum density for cohesive soils and 90 percent maximum density for cohesionless soils.

#### 3.7.1.5 Electrical Distribution System

Provide a minimum cover of 24 inches from the finished grade to direct burial cable and conduit or duct line, unless otherwise indicated.

#### 3.7.1.6 Displacement of Features

After other required tests have been performed and the trench backfill compacted to the finished grade surface, inspect the pipe to determine whether unexpected or damaging displacement has occurred. Conduct walk-through inspection of pipe sizes larger than 48 inches. Inspect pipes smaller than 48 inches using remote methods using closed circuit television, sonar, or hybrid that can provide a 360-degree inspection of the pipe. Prepare and submit a pipe inspection report consisting of digital video or photos. If, in the judgment of the Contracting Officer, the interior of the pipe shows poor alignment or any other defects that would cause improper functioning of the system, replace or repair the defects as directed at no additional cost to the Government.

#### 3.7.1.7 Buried Tape And Detection Wire

##### 3.7.1.7.1 Buried Warning and Identification Tape

Provide buried utility lines with utility identification tape. Bury tape

12 inches below finished grade; under pavements and slabs, bury tape 6 inches below top of subgrade.

#### 3.7.1.7.2 Buried Detection Wire

Bury detection wire directly above non-metallic piping at a distance not to exceed 12 inches above the top of pipe. Extend the wire continuously and unbroken, from manhole to manhole. Terminate the ends of the wire inside the manholes at each end of the pipe, with a minimum of 3 feet of wire, coiled, remaining accessible in each manhole. Furnish insulated wire over its entire length. Install wires at manholes between the top of the corbel and the frame, and extend up through the chimney seal between the frame and the chimney seal. For force mains, terminate the wire in the valve pit at the pump station end of the pipe.

#### 3.7.2 Structural Fill Placement

Place fill and backfill beneath and adjacent to structures in successive horizontal layers of loose material not more than 6 inches in depth, or in loose layers not more than 6 inches in depth when using hand-operated compaction equipment. Do not place over wet or frozen materials. Compact to at least 95 percent of laboratory maximum density per ASTM D1557 except as otherwise specified. Perform compaction in such a manner as to prevent wedging action or eccentric loading upon or other damage to the structure.

Moisture condition fill and backfill material to within range of plus 2 or minus 2 percent of optimum moisture content at the time of compaction.

#### 3.7.3 Backfill for Appurtenances

After the manhole, catchbasin, inlet, or similar structure has been constructed and the concrete has been allowed to cure for 2 days, place backfill in such a manner that the structure is not be damaged by the shock of falling earth. Deposit the backfill material, compact it as specified for final backfill, and bring up the backfill evenly on all sides of the structure to prevent eccentric loading and excessive stress.

#### 3.7.4 Flowable Fill

Place fill in a manner to completely fill voids in the location indicated. Do not place when atmospheric temperatures are expected to be below 33 degrees F at any time during the 3 day period following placement.

### 3.8 FINISHING/FINISH OPERATIONS

During construction, keep embankments and excavations shaped and drained. Maintain ditches and drains along subgrade to drain effectively at all times. Do not disturb the finished subgrade by traffic or other operation. Protect and maintain the finished subgrade in a satisfactory condition until ballast, subbase, base, or pavement is placed. Do not permit the storage or stockpiling of materials on finished subgrade. Do not lay subbase, base course, ballast, or pavement until the subgrade has been checked and approved, and in no case place subbase, base, surfacing, pavement, or ballast on a muddy, spongy, frozen or otherwise unstable subgrade.

Finish the surface of excavations, embankments, and subgrades to a smooth and compact surface in accordance with the lines, grades, and cross

sections or elevations shown. Provide the degree of finish for graded areas within 0.1 foot of the grades and elevations indicated except as indicated for subgrades specified in paragraph SUBGRADE PREPARATION. Finish gutters and ditches in a manner that will result in effective drainage. Finish the surface of areas to be turfed to a smoothness suitable for the application of turfing materials. Repair graded, topsoiled, or backfilled areas prior to acceptance of the work, and re-established grades to the required elevations and slopes.

#### 3.8.1 Capillary Water Barrier

Place a capillary water barrier under concrete floor and area-way slabs grade directly on the subgrade and compact with a minimum of two passes of a hand-operated plate-type vibratory compactor.

#### 3.8.2 Grading Around Structures

Construct areas within 5 feet outside of each building and structure line true-to-grade, shape to drain, and maintain free of trash and debris until final inspection has been completed and the work has been accepted.

#### 3.8.3 Grading

Finish grades as indicated within one-tenth of one foot. Grade areas to drain water away from structures. Maintain areas free of trash and debris. For existing grades that will remain but which were disturbed by Contractor's operations, grade as directed.

### 3.9 FIELD QUALITY CONTROL

#### 3.9.1 Sampling

Take the number and size of samples required to perform the following tests.

#### 3.9.2 Testing

Perform one of each of the following tests for each material used. Provide additional tests for each source change. Laboratory testing shall have been completed within 12 month.

##### 3.9.2.1 Soil Material Testing

Test soil materials defined in Section 2.1 in accordance with ASTM C136 for conformance to ASTM D2487 gradation limits; ASTM D1140 for material finer than the No. 200 sieve; ASTM D4318 for liquid limit and for plastic limit; ASTM D1557 for moisture density relations, as applicable.

Submit Laboratory gradation test and Laboratory compaction tests results for each soil material proposed for use as fill and backfill.

### 3.10 TESTING

Test density in accordance with ASTM D6938. Perform density test at the start of the job and as follows:

- a. Density testing per the following will be required at the expense of the Contractor.
- b. Bedding and backfill in trenches: One test per 50 linear feet in each lift.
- c. Other site areas as follows:

| Material Type   | Location of Material  | Test Frequency                                                                                                | Degree of Compaction |
|-----------------|-----------------------|---------------------------------------------------------------------------------------------------------------|----------------------|
| Structural Fill | Below Structures      | One test per lift per each independent foundation or one every per 100 sq ft (whichever results in more tests | 95%                  |
| Structural Fill | Adjacent to Structure | One test per lift per 200 square feet of each lift                                                            | 95%                  |
| Ordinary Fill   | Below pavement        | One test per lift per 100 linear feet of trench placed                                                        | 95%                  |

Perform testing as indicated in the Table above. Submit Material Test Reports within 24 hours of tests being completed.

MEDEP Remedial Action Guidelines (RAGS) for Soil Exposure Pathway to Construction Worker used.

**Bold** = Detected

Exceeds Soil RAG

~ = No RAG Available

U= Indicates the compound was analyzed for but not detected above the specified level.

J = Estimated value

B = Indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample.

SECTION 31 63 33

DRILLED MICROPILES

02/25

PART 1 GENERAL

1.1 GENERAL

- a. This work shall consist of designing and constructing drilled micropiles (micropiles) as shown on the Contract Drawings and approved working drawings prepared as specified herein. The Contractor is responsible for furnishing all design, materials, products, accessories, tools, equipment, services, transportation, labor and supervision, and manufacturing techniques required for design, installation, and testing of drilled micropiles.
- b. The Contractor shall select the micropile type, size, pile top attachment, installation means and methods, estimate the ground-grout bond value and determine the required grout bond length and final micropile diameter. The Contractor shall design and install micropile that will develop the load capacities indicated on the Contract Drawings. The micropile load capacities shall be confirmed by verification and proof load testing as required and must meet the test acceptance criteria specified herein. The Contractor's micropile design shall conform to requirements set forth in this specification and any micropile design minimums and/or maximums as shown on the Contract Drawings.
- c. Existing utilities within 10 feet of the proposed drilled micropiles shall be exposed prior to drilled micropile installation.
- d. Micropile testing shall include a verification test within the equipment pad; and proof tests on at least one production pile within the equipment pad and on at least one production pile below the break tank pad.

1.4 ADMINISTRATIVE REQUIREMENTS

Work shall not begin until the construction submittals have been received, reviewed, and accepted in writing by the Contracting Officer. Any submittals that are found to be unacceptable by the engineer shall be revised, resubmitted and accepted prior to commencing work.

Submit the following:

1.4.1 Contractor Experience Requirements

- a. The micropile Contractor shall have Contractor Experience in the construction and load testing of drilled micropiles and have successfully constructed at least 5 projects in the last 5 years involving construction totaling at least 100 micropiles of similar capacity to those required in these Contract Drawings and specifications.
- b. The Contractor Experience shall include previous drilling and grouting in soil and rock similar to project conditions. The Contractor shall submit construction details, structural details and load test results for at least three previous successful micropile load tests from different projects of similar scope to this project.
- c. The Contractor shall assign a Professional Engineer, licensed in the State of Maine, to supervise the work. This engineer shall have experience on at least 10 projects of similar scope to this project completed over the past 5 years. The Contractor shall not use manufacturers representatives to satisfy the supervising engineer requirements of this section. The contractor may use a single independent consultant for this purpose, provided the consultant has specific experience as listed above, and operates their business specifically for the purpose of transferring technology and skills in micropiling to contractors.
- d. The on-site Foreman Operators and Drill Rig Operators shall also have experience on at least 10 projects over the past 5 years installing drilled micropiles of equal or greater capacity than required in these Contract Drawings and specifications.
- e. The Contractor shall assign a Professional Engineer, licensed in the State of Maine, to design the micropiles. This engineer shall also be responsible for design, supervision and reporting of the verification and Product Proof Test. This engineer shall have experience in the design of at least 3 successfully completed drilled micropile projects

over the past 5 years, with micropiles of similar capacity to those required in these Contract Drawings and specifications in soil and rock similar to the project conditions.

- f. At least 45 calendar days before the planned start of micropile construction, the Contractor shall submit 5 copies of the completed Project Reference List and a Personnel List. The project reference list shall include a brief project description with the owner's name and current phone number and load test reports. The personnel list shall identify the supervising project engineer, drill rig operators, and on-site foremen to be assigned to the project. The personnel list shall contain a summary of each individual's experience and be complete enough for the Engineer to determine whether each individual satisfies the required qualifications.
- g. Work shall not start, nor materials ordered, until the Contracting Officers written approval of the Contractors experience qualification is given. The Contracting Officer may suspend work if the Contractor uses non-approved personnel. If work is suspended, the Contractor shall be fully liable for all resulting cost and no adjustment in contract time will result from the suspension.

#### 1.4.2 Micropile Design Requirements

- a. The micropiles shall be designed to meet the specific loading conditions, as shown on the Contract Drawings and approved working drawings. The micropile design shall conform to all required minimum and/or maximum properties shown on the Contract Drawings and the Service Load Design (SLD) procedures contained in the FHWA Micropile Design and Construction Reference Manual , FHWA NHI-05-039.
- b. Micropiles shall be designed to derive their support entirely by side resistance within bedrock. Side friction in the sand and fill, and end bearing resistance shall be ignored. Micropiles shall have a minimum bond length of 5 feet in bedrock.
- c. Steel pipe used for micropile permanent casing shall incorporate an additional 1/16 inch thickness of sacrificial steel for corrosion protection.
- d. The Contractor shall prepare and submit to the Contracting Officer Working Drawings. The working drawings shall include all information required for the design, plans, construction and quality control of the piling. This information should include the following, but not necessarily be limited to:

##### (1) Design Computations

- (a) A written summary report which describes the overall micropile design.
- (b) Applicable code requirements and design references.
- (c) Micropile Structures critical design cross-section(s) geometry including soil/rock strata and piezometric levels and location, magnitude and direction of applied loadings.
- (d) Design Criteria and Notes including, soil/rock shear strengths (friction angle and cohesion), unit weights, and

grout-to-ground bond values and micropile drillhole diameter assumptions for each soil/rock strata.

- (e) Safety and Strength Factors used in the design of the ground-grout bond values, surcharges, soil/rock and material unit weights, steel, grout and concrete materials.
- (f) Design Calculations - sheets with the project number, micropile structure location, designation, date of preparation, initials of designer and checker, and page number at the top of each page. Provide an index page with the design calculations.
- (g) Design Criteria and Notes including an explanation of any symbols and computer program used in the design.
- (h) Pile to footing connection calculations.

#### 1.4.3 Plans

- a. A plan view of the Micropile Structures identifying:
  - (1) A reference elevation datum.
  - (2) Right-of-way and permanent or temporary construction easement limits, location of all known active and abandoned utilities, adjacent structures or other potential interference. The centerline of any buried utility (including, but not limited to, drainage structures, drainage pipes, and electrical duct bank) within 10 feet of the proposed micropile location.
  - (3) Subsurface exploration locations shown on the plan view of the proposed Micropiles with appropriate reference baselines to fix the locations of the exploration relative to the micropile structure.
- b. An elevation view of the micropile structure(s) identifying:
  - (1) Micropile locations and elevations; vertical and horizontal spacing; batter and alignment and the location of existing subsurface features.
  - (2) Existing and finish grade profiles both behind and in front of the micropile structure.
- c. Design parameters and applicable codes.
- d. General notes for constructing the Micropile Structures including construction sequencing or other special construction requirements.
- e. A listing of the summary of quantities on the elevation drawing of each micropile structure showing pay item estimated quantities.
- f. Micropile typical sections including micropile spacing and inclination; minimum drillhole diameter; pipe casing and reinforcing bar size and details; splice type and locations; centralizers and spacers; grout bond zone and casing plunge length (if used); corrosion protection details; and connection details to the substructure footing, anchorage, plates, etc.

- g. A typical detail of verification and production proof test micropiles defining the micropile length, minimum drillhole diameter, inclination, and load test bonded and unbonded test lengths.
- h. Details, dimensions and schedules for all micropiles, casing and reinforcing steel, including reinforcing bar bending details.
- i. Details for constructing micropile structures around drainage facilities (if applicable).

#### 1.4.4 Construction Procedures

- a. Detailed step-by-step description of the proposed micropile construction procedure, including personnel, testing and equipment to assure quality control. This step-by-step procedure shall be shown in sufficient detail to allow the Contracting Officer to monitor the construction and quality of the micropiles.
- b. Proposed start date and time schedule and micropile Installation schedule providing the following:
  - (1) Micropile number.
  - (2) Micropile design load.
  - (3) Type and size of rebar.
  - (4) Minimum total bond length.
  - (5) Total micropile length.
  - (6) Micropile top footing attachment.
- c. If welding of casing is proposed, submit the welding procedure. All welding shall be done in accordance with the current AWS Structural Welding Code.
- d. Information on space requirements for Installation equipment that verify the proposed equipment can perform at the site.
- e. Plans describing how surface water, drill flush, and excess waste grout will be controlled and disposed.
- f. Proposed Grouting Plans. The grouting plan shall include complete descriptions, and details for the following:
  - (1) Grout mix design and type of materials to be used in the grout including certified test data and trial batch reports. The Contractor shall also provide specific gravity of the wet mix design.
  - (2) Methods and equipment for accurately monitoring and recording the grout depth and grout volume as the grout is being placed.
  - (3) Estimated curing time for grout to achieve specified strength. Previous test results for the proposed grout mix completed within one year of the start of grouting may be submitted for initial verification and acceptance and start of production work.

(4) Procedure and equipment for Contractor monitoring of grout quality. At a minimum, the Contractor shall be required to use a Baroid Mud Balance (per API RP-13B-1) to check the specific gravity of the mixed grout prior to placement of the grout into each drilled micropile.

- g. Computations showing that the proposed equipment used for flushing the micropile during installation (i.e. pumps for water flushing and compressors for air flushing) will maintain the required up-hole (flushing) velocities.

#### 1.4.5 Pile Load Test

- a. Detailed Plans for the proposed micropile load testing method. This shall include all drawings, details, and structural design calculations necessary to clearly describe the proposed test method, reaction load system capacity and equipment setup, types and accuracy of apparatus to be used for applying and measuring the test loads and pile top movements in accordance with this specification.
- b. Plan showing the proposed location of the verification test pile.
- c. Calibration Reports and data for each test jack, pressure gauge and master pressure gauge and electronic load cell to be used. The calibration tests shall have been performed by an independent testing laboratory, and tests shall have been performed within 90 calendar days of the date submitted. Testing shall not commence until the Contracting Officer has reviewed and accepted the jack, pressure gauge, master pressure gauge and electronic load cell calibration data.

#### 1.4.6 Reports

- a. Micropile Installation Records
- (1) The micropile Contractor shall prepare and submit to the Contracting Officer full-length installation records for each micropile installed. The records shall be submitted within one work shift after that pile installation is completed. The data shall be recorded on a micropile installation log. A separate log shall be provided for each micropile.
- b. Upon completion of the micropile verification load test, the Contractor shall prepare and submit a professional engineer stamped report of the test results for review and acceptance by the Contracting Officer. This report shall include the acceptance criteria for the micropile verification test, design skin friction in bedrock, and written confirmation of the micropiles capacity.
- c. Upon completion of each micropile proof load test, the Contractor shall prepare and submit a professional engineer stamped report of the test results for review and acceptance by the Contracting Officer. This report shall include the acceptance criteria for the micropile proof test and written confirmation of the micropiles capacity.

#### 1.5 QUALITY CONTROL

- a. Codes, Regulations, Reference Standards and Specifications:

- (1) Codes and regulations of the jurisdictional authorities.
- (2) American Society of State Highway and Transportation Officials (AASHTO), latest edition.
- (3) FHWA Micropile Design and Construction Reference Manual, FHWA NHI-05-039, 2005

- b. The work shall be performed and supervised by personnel experienced in the installation and testing of micropiles of similar size and soil conditions. Personnel shall be subject to the approval of the Contracting Officer.

## PART 2 PRODUCTS

### 2.1 MATERIALS

Furnish materials new and without defects. Materials for micropiles shall consist of the following:

#### 2.1.1 Admixtures for Grout

Accelerators are not permitted. Expansive admixtures and admixtures containing chlorides are not permitted.

#### 2.1.2 Cement

All cement shall be Portland cement conforming to ASTM C150/C150M, Types II, III or V.

#### 2.1.3 Centralizers and Spacers

Centralizers and spacers shall be fabricated from schedule 40 PVC pipe or tube, steel, or material non-detrimental to the reinforcing steel. Wood shall not be used. Centralizers and spacers shall be securely attached to the reinforcement; sized to position the reinforcement within 0.25 inch of plan location from center of pile; sized to allow grout tremie pipe insertion to the bottom of the drillhole; and sized to allow grout to freely flow up the drillhole and casing and between adjacent reinforcing bars.

#### 2.1.4 Grout

Neat cement or fine aggregate/cement mixture. The designer is responsible for indicating the 3 day and 28 day compressive strengths. The grout shall conform to the specification ASTM C109/C109M and to any minimum and/or maximum properties shown on the Contract Drawings.

#### 2.1.5 Permanent Casing Pipe

Permanent steel casing/pipe shall conform to required minimum and/or maximum properties shown on the Contract Drawings. The permanent steel casing/pipe shall be designed to withstand the design service loadings shown on the Contract Drawings and the proof/verification tests loading described in this specification. The steel casing/pipe shall conform to one or more of the following specifications ASTM A252. The designer will be responsible for indicating the applicable material specification(s) and any welding or fabrication conditions that apply.

#### 2.1.6 Reinforcing Bars

Reinforcing steel shall be deformed bars in accordance with ASTM A615/A615M. The grade, thickness and number of bars shall be indicated by the designer and shall conform to any minimum and/or maximum properties shown on the Contract Drawings. Continuous spiral deformations (i.e. continuous threadbars) shall be used. Bar tendon couplers, if required, shall develop the ultimate tensile strength of the bars without evidence of any failure.

### PART 3 EXECUTION

#### 3.1 PRE-CONSTRUCTION MEETING

A pre-construction meeting will be scheduled by the Contracting Officer and held prior to the start of micropile construction. The Contracting Officer, prime Contractor, micropile specialty Contractor and micropile design engineer shall attend the meeting. Attendance is mandatory. The pre-construction meeting will be conducted to clarify the construction requirements for the work, to coordinate the construction schedule and activities, and to identify contractual relationships and delineation of responsibilities amongst the prime Contractor and the various Subcontractors; specifically those pertaining to excavation for micropile structures, installation of temporary sheeting, anticipated subsurface conditions, micropile installation and testing, micropile structure survey control and site drainage control.

#### 3.2 SITE DRAINAGE CONTROL

- a. The Contractor shall control and properly dispose of drill flush and construction related waste, including excess grout, in accordance with any related specifications within the contract documents and all applicable codes and regulations. Drill flush shall be conveyed by pipe, hose or conduit away from the location where the micropile is being drilled and away from any adjacent structure or facility. The acceptable distance required to convey the drill flush away from the micropile location shall be determined by the Contracting Officer. Provide positive control and discharge of all surface water that will affect construction of the micropile installation. Maintain all pipes or conduits used to control surface water during construction. Repair damage caused by surface water at no additional cost. Upon substantial completion of the work, remove surface water control pipes or conduits from the site. Alternatively, with the approval of the Contracting Officer, pipes or conduits may be left in place if fully grouted.
- b. Immediately contact the Contracting Officer if unanticipated existing subsurface drainage structures or other utilities are discovered during excavation or drilling. Suspend work in these areas until remedial measures meeting the Contracting Officer's approval are implemented.

#### 3.3 MICROPILE ALLOWABLE CONSTRUCTION TOLERANCES

- a. Centerline of piling shall not be more than 3 inches from indicated plan location. Centerline of reinforcing steel shall not be more than 0.5 inches from the centerline of the pile.
- b. Pile shall be plumb or battered within 2 percent of total-length plan alignment.

- c. Top elevation of pile shall be plus 1 inch or minus 1 inch maximum from vertical elevation indicated.

#### 3.4 MICROPILE INSTALLATION

- a. The micropile Contractor shall select the drilling method, the grouting procedure and the grouting pressure used for installation of the micropiles. The micropile Contractor shall also determine the micropile casing size, final drillhole diameter and bond length, and central tendon reinforcement steel sizing necessary to develop the specified load capacities and load testing requirements. All micropile material properties and dimensions shall conform to minimum/maximum properties/dimensions as shown in the contract drawings. The micropile Contractor is also responsible for estimating the grout take. There will be no extra payment for grout overruns.
- b. The permanent and/or temporary casing shall be drilled a minimum 6 inches into bedrock or to a depth within the ledge so as to prevent subsidence of overburden into the bond zone portion of the drill hole (i.e. the rock socket). The Contract Drawings include boring logs and record drawings with information on bedrock depth. Any difference in the depth to bedrock and corresponding required length of permanent casing installed and accepted by the Contracting Officer from the information shown on the Contract Drawings shall be measured for payment and/or credit. There will be no payment for differences in required length of temporary casing.
- c. The drilling equipment and methods shall be suitable for drilling through the conditions to be encountered, without causing damage to the overburden, any overlying or adjacent structures, buried structures or utilities, or services. If called for in the drilling method description, or by the nature of the stratum to be drilled through, the micropile Contractor shall furnish an overburden casing of the type and thickness, which can be installed without distortion. Casings that fail, fracture, or otherwise distort during drilling or after drilling shall, unless otherwise directed, be withdrawn or replaced at the micropile Contractor's expense. The drillhole must be open along its full length to at least the design minimum drillhole diameter prior to placing grout and reinforcement.
- d. The up-hole (flushing) velocity shall be maintained within the following ranges:
  - (1) For air flush or air/water mist flush the minimum velocity is 5,000 ft/sec and the maximum velocity is 6,800 ft/sec.
  - (2) For water flush the minimum velocity is 40 ft/sec and the maximum is 390 ft/sec.
- e. Temporary casing or other approved method of pile drillhole support will be required in caving or unstable ground to permit the pile shaft to be formed the minimum design drillhole diameter. The Contractor's proposed method(s) to provide drillhole support and to prevent detrimental ground movements shall be reviewed by the Contracting Officer. Detrimental ground movement is defined as movement which requires remedial repair measures, in order to maintain site conditions as determined by the Contracting Officer. Use of drilling fluid containing bentonite or any other non-reverting drilling fluid is not allowed.

- f. During construction, the Contractor shall observe the ground conditions in the vicinity of the micropile construction site on a daily basis for signs of ground heave or subsidence. Immediately notify the Contracting Officer if signs of movements are observed. The micropile Contractor shall immediately suspend or modify drilling or grouting operations if ground heave or subsidence is observed, if the micropile structure is adversely affected, or if adjacent structures are damaged from the drilling or grouting. If the Contracting Officer determines that the movements require corrective action, the micropile Contractor shall take corrective actions necessary to stop the movement or perform repairs.
- g. Reinforcement may be placed prior to grouting the drillhole. Reinforcement surface shall be free of deleterious substances such as soil, mud, grease or oil that might contaminate the grout or coat the reinforcement and impair bond. Pile reinforcement groups, if used, shall be sufficiently strong to withstand the installation and grouting process without damage or disturbance.
- h. The micropile Contractor shall check pile top elevations and adjust all installed micropiles to the planned elevations.
- i. Centralizers and spacers shall be provided at 10ft centers maximum spacing. The upper and lower most centralizer shall be located a maximum of 3ft from the top and bottom of the micropile. Centralizers and spacers shall permit the free flow of grout without misalignment of the reinforcing bar(s) and permanent casing. The reinforcing steel shall be inserted into the drill hole to the desired depth without difficulty. Partially inserted reinforcing bars shall not be driven or forced into the hole. The micropile Contractor shall re-drill and reinsert reinforcing steel when necessary to facilitate insertion.
- j. Lengths of casing and reinforcing bars to be spliced shall be secured in proper alignment and in a manner to avoid eccentricity or angle between the axes of the two lengths to be spliced. Splices and threaded joints shall meet the requirements of the rebar material. Threaded pipe casing joints shall be located at least two casing diameters (OD) from a splice in any reinforcing bar. When multiple bars are used, bar splices shall be staggered at least 1 foot.
- k. Micropiles shall be grouted the same day the load transfer bond length is drilled. The grouting equipment used shall be a colloidal grout plant, and shall produce a grout free of lumps and undispersed cement. Paddle type mixers are not acceptable. The micropile Contractor shall have means and methods of measuring the grout quantity and pumping pressures during the grouting operations. The grout pump shall be equipped with a pressure gauge to monitor grout pressure. A second pressure gauge shall be placed at the point of injection into the pile top. The pressure gauge shall be capable of measuring pressures of at least 145 psi or twice the actual grout pressure used, whichever is greater. The grout shall be kept in agitation prior to placing. Grout shall be placed within one hour of mixing. The grouting equipment shall be sized to enable each pile to be grouted in one continuous operation. The grout shall be injected from the lowest point of the drill hole and injection shall continue until uncontaminated grout flows from the top of the pile. The grout may be pumped through grout tubes, casing, or drill rods. Temporary casing, if used, shall be extracted in stages ensuring that, after each length of casing is

removed the grout level is brought back up to the ground level before the next length is removed. The tremie pipe or casing shall always extend below the level of the existing grout in the drillhole. The grout takes shall be controlled to prevent excessive heave or fracturing of rock or soil formations. Upon completion of grouting, the grout tube may remain in the hole, but must be filled with grout.

- l. If the Contractor elects to use a post-grouting system, Working Drawings and details shall be submitted to the Contracting Officer for review.
- m. Grout within the micropile verification and proof test piles shall attain the minimum required 3-day compressive strength prior to load testing. During production, micropile grout shall be tested by the Contractor for compressive strength in accordance with ASTM C109/C109M at a frequency of no less than one set of three 2 inch grout cubes, or 3 cylinders, from each grout plant each day of operation or per every 10 piles, whichever occurs more frequently. The compressive strength shall be the average of the 3 cubes tested.
- n. Grout consistency as measured by grout density shall be determined by the micropile Contractor per API RP-13B-1 at a frequency of at least one test per pile, conducted just prior to start of pile grouting. The Baroid Mud Balance used in accordance with API RP 13B-1 is an approved device for determining the grout density of neat cement grout.
- o. Provide grout cube/cylinder compressive strength and grout density test results to the Contracting Officer within 24 hours of testing.

### 3.5 OBSTRUCTION REMOVAL DURING MICROPILE INSTALLATION

- a. Naturally occurring cobbles, boulders, bedrock, claystones, sand and gravel layers, glacial deposits, and other dense, well bounded in-situ soils shall not be considered as obstructions. The Contractor is also advised as to the presence of existing timber piles large rip-rap boulders, which also may be encountered during micropile installation. Encountering such conditions is to be anticipated and is consistent with the general nature of the subsurface conditions. The cost associated with these conditions shall be incidental to and included in the micropile bid prices.
- b. The Contractor shall notify the Contracting Officer immediately upon encountering any potential obstruction which unavoidably and completely stops the advancement of the micropile drill progress, despite the Contractor's most diligent and practical efforts. The Contractor's notification may be oral, but if oral, shall also be confirmed by the Contractor in writing within 24 hours. The notification shall include all pertinent information relating to the nature, depth, plan location coordinates, expected extent of the potential obstruction. The Contractor shall also provide physical evidence, acceptable to the Contracting Officer, of the material comprising the potential obstruction and evidence that the potential obstruction is not bedrock.
- c. The Contractor shall remove or penetrate the obstruction by the most diligent, practical means and shall comply with noise and vibration limitations and other specified requirements, and shall maintain excavation support and protection of nearby structures and utilities at all times.

- d. At all times during the removal of obstructions, the Contractor shall diligently pursue the removal or penetration of the obstructions using all the necessary and appropriate means and methods. The Contractor shall have on hand at all times, readily available, equipment, tools, materials, and labor appropriate for the effective removal of all types of potential obstructions. No payment shall be made for idle time due to the contractor's failure to have readily available such equipment, tools, materials, or labor.
- e. At any time during the course of obstruction removal, the Contracting Officer may provide alternative direction.
- f. If in the judgment of the Contracting Officer, obstructions make it impossible to install certain micropiles at locations to the required depths shown on the Working Drawings after resorting to all usual methods, the Contracting Officer may order that additional micropile or micropiles be installed or that other remedial actions be taken, for which the Contractor will be paid in accordance with the unit prices established in this Contract.
- g. Fill with grout any drill holes which are abandoned at the direction of the Contracting Officer because of unmovable obstructions.

### 3.6 VERIFICATION AND PROOF TESTS

- a. Perform verification of piles at the locations indicated on the approved submittal. Perform proof testing on piles selected by Contracting Officer. Perform compression load testing in accord with ASTM D1143/D1143M and tension load testing in accord with ASTM D3689/D3689M, except as modified herein.
- b. Perform one(1) pre-production verification pile load test to verify the design of the pile system and the construction methods proposed prior to installing any production piles. Sacrificial verification test pile shall be constructed in conformance with the approved Working Drawings. Verification test pile(s) shall be installed within the equipment pad at a location(s) approved by the Contracting Officer.
- c. Proof load tests shall be performed on production piles to verify that the Contractor installed micropiles will meet the compression and/or tensile load capacities and load test acceptance criteria and to verify the length of the micropile load transfer bond zone is adequate. The micropile verification load test results must verify the Contractor's design and installation methods. Two (2) proof load test shall be performed: one on a pile supporting the equipment pad and one on a pile supporting the break tank pad.
- d. The drilling method, grouting method, permanent casing length, micropile diameter (cased and uncased) and bond zone length for the verification test pile shall be identical to those specified for the production piles at the given locations. The verification test micropile structural steel sections shall be sized to safely resist the maximum test load.
- e. The maximum verification and proof test loads applied to the micropile shall not exceed 80 percent of the structural capacity of the micropile structural elements; including steel yield in tension, steel yield or buckling in compression, or grout crushing in compression.

Any required increase in strength of the verification and proof test pile elements above the strength required for the production piles shall be provided for in the Contractor's bid price.

- f. Testing equipment shall include dial gauges, dial gauge independent reference frame, load jack and pressure gauge, electronic load cell (with readout device), and a reaction frame. The load cell is required only for the creep test portion of the verification test. The contractor shall provide a description of test setup and jack, pressure gauge and load cell calibration curves in accordance with the Submittals Section.
- g. Design the testing reaction frame to be sufficiently rigid and of adequate dimensions such that excessive deformation of the testing equipment does not occur. Align the jack, bearing plates, load cell, and stressing anchorage such that unloading and repositioning of the equipment will not be required during the test.
- h. Apply and measure the test load with a hydraulic jack and pressure gauge. The pressure gauge shall be graduated in 100psi increments or less. The jack and pressure gauge shall have a pressure range not exceeding twice the anticipated maximum test pressure. Jack ram travel shall be sufficient to allow the test to be done without resetting the equipment. Monitor the creep test load hold during verification tests with both the pressure gauge and the electronic load cell. Use the load cell to accurately maintain a constant load hold during the creep test load hold increment of the verification test.
- i. Measure the pile top movement with dial gauges capable of measuring to 0.001 inches. The dial gauge shall have a travel sufficient to allow the test to be done without having to reset the gauge. Visually align the gauge to be parallel with the axis of the micropile and support the gauge independently from the jack, pile or reaction frame. Use a minimum of two dial gauges when the test setup requires reaction against the ground or single reaction piles on each side of the test pile.
- j. Test verification piles as follows:
  - (1) Test verification piles to the following loads; Alignment Load (AL) and the Maximum Design Load (DL). The DL loads are provided on the contract drawings. The AL is the minimum load applied to the micropile during testing needed to keep the testing equipment correctly positioned. The AL shall not exceed 5% of the DL. The verification pile load tests shall be made by incrementally loading the micropile in accordance with the following cyclic load schedule for both compression and tension loading:

| Verification Load Test Table |          |              |                  |
|------------------------------|----------|--------------|------------------|
| Step                         | Loading  | Applied Load | Hold Time (min.) |
| 1                            | Apply AL | 0.05 DL      | 2.5              |

| Verification Load Test Table                                                                                                                                                                                                                                                                                  |                                                             |                                                                                                       |                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| 2                                                                                                                                                                                                                                                                                                             | Cycle 1                                                     | 0.15 DL<br>0.30 DL<br>0.45 DL<br>AL                                                                   | 2.5<br>2.5<br>2.5<br>1.0                                            |
| 3                                                                                                                                                                                                                                                                                                             | Cycle 2                                                     | 0.15 DL<br>0.45 DL<br>0.60 DL<br>0.75 DL<br>0.90 DL<br>1.00 DL<br>AL                                  | 1.0<br>1.0<br>2.5<br>2.5<br>2.5<br>2.5<br>1.0                       |
| 4                                                                                                                                                                                                                                                                                                             | Cycle 3                                                     | 0.15 DL<br>1.00 DL<br>1.15 DL<br>1.30 DL                                                              | 1.0<br>1.0<br>2.5<br>Creep Test - See Below                         |
| Hold the load for the Creep Test at least 10 minutes while recording movement at 1, 2, 3, 4, 5, 6, and 10-minute intervals. If the total movement measuring during the load hold exceeds the specified maximum value, the load should be extended for an additional 50 minutes (i.e., 1 hr. total hold time). |                                                             |                                                                                                       |                                                                     |
| 5                                                                                                                                                                                                                                                                                                             | Cycle 3 cont'd                                              | 1.45 DL<br>AL                                                                                         | 2.5<br>1.0                                                          |

| 7                                                                                                                                                                                                                                                                                                             | Remove the load and compare results to acceptable criteria. |                                                                                                       |                                                                     |

- (2) Pile top movement shall be measured at each load increment. The load-hold period shall start as soon as each test load increment is applied. Dial gauges shall be reset to zero after the initial AL is applied.
- (3) Acceptance criteria for micropile verification load test is:
  - (a) The total vertical movement at the micropile head for the 1.0 DL load increment should not exceed 0.5-inch.
  - (b) The total vertical movement at the end of the 1.3 DL load increment should not exceed 0.04-inch for the hold time between 1 and 10 minutes and should not exceed 0.08-inch between 6 and 60 minutes if held longer.

- (c) The failure load is defined as the load where the slope of the load versus micropile head deflection first exceeds 0.025-in./kip.
  - (4) If a verification tested micropile fails to meet the acceptance criteria, the Contractor shall modify the design, the construction procedure, or both. These modifications may include modifying the installation methods, increasing the bond length, or changing the micropile type. Any modification that necessitates changes to the structure shall be submitted as a revision to the working drawings and require the Contracting Officer's review and acceptance. Any modifications of design or construction procedures or cost of additional verification test piles and load testing shall be at the Contractor's expense. At the completion of verification testing, test piles shall be removed down to the elevation specified by the Contracting Officer.
- k. Perform proof tests as follows:
- (1) Perform proof load tests on production piles selected by the Contracting Officer. A minimum of 2 micropiles shall be proof tested. Upon completion of each test, the Contractor shall prepare and submit a professional engineer stamped report of the test results for review and acceptance by the Contracting Officer.
  - (2) Test proof test piles to a maximum test load of 1.60 times the Maximum Design Load (DL). The DL load is provided on the contract drawings. Proof tests shall be made by incrementally loading the micropile in accordance with the following schedule:
    - (a) Increase load by 15% DL up to 130% DL (creep test load). Each increment shall be held for 2.5 minutes except for the creep test load which shall be held for 10 minutes. If creep exceeds 0.04-inch during the creep test hold, hold for an additional 50 minutes.
    - (b) Increase load by 15% DL up to 160% DL. Each increment shall be held for 2.5 minutes except for the 160% DL which shall be held for 10 minutes.
    - (c) Decrease the load in 30% increments. Each increment shall be held for 4 minutes.
    - (d) Measure rebound at zero load for 30 minutes.
  - (3) The acceptance criteria for micropile proof load tests are:
    - (a) At the end of the 1.3 DL test load increment, test piles shall have a creep rate not exceeding 0.04 inch/log cycle time (1 to 10 minutes) or 0.08 inch/log cycle time (6 to 60 minutes). The creep rate shall be linear or decreasing throughout the creep load hold period.
    - (b) Failure does not occur at the 1.67 DL maximum test load. Failure is defined as the load at which attempts to further increase the test load simply result in continued pile movement.

- (4) If a proof-tested micropile fails to meet the acceptance criteria, the Contractor shall immediately proof test another micropile within that footing. For failed piles and further construction of other piles, the Contractor shall modify the design, the construction procedure, or both. These modifications may include installing replacement micropiles, incorporating piles at not more than 50% of the maximum load attained, post-grouting the tested pile and re-proof testing the pile, modifying installation methods, increasing the bond length, or changing the micropile type. Any modification that necessitates changes to the structure design shall require the Contracting Officer's prior review and acceptance. Any modifications of design or construction procedures, or cost of additional verification test piles and verification and/or proof load testing, or replacement production micropiles, shall be at the Contractor's expense.

l. Load test reports:

- (1) Within 3 days after completion of the load tests, submit the Verification Load Test Report and Proof Load Test Reports. The load test reports shall include.
  - (a) Test pile installation log(s)
  - (b) Information on the load test including, at a minimum, the load testing sequence, rates and durations of load increments, equipment calibrations, graphical and tabular measurements of deflection, and drawings indicating the test pile and reaction pile locations.
  - (c) Comparison of the load test data to the Acceptance Criteria provided herein and statement regarding the load carrying capacity of the pile relative to the design loads.
  - (d) The submittals shall be prepared by, signed and sealed by the Contractor's Professional Engineer.
  - (e) Production pile installation shall not begin prior to approval of the verification load test report.

SECTION 32 11 26

HOT-MIX BITUMINOUS BASE COURSE FOR ROADS AND STREETS  
05/20

PART 1 GENERAL

1.1 UNIT PRICES

1.1.1 Measurement

The amount paid for will be the number of 2000-pound tons of bituminous mixture used in the accepted work. Weigh bituminous mixture after mixing. No payment will be made for defective areas until corrected.

1.1.2 Basis for Payment

The quantities of bituminous base course will be paid for at the respective contract unit prices in the bid schedule. Payment will constitute full compensation for preparing and reconditioning the underlying layer; for furnishing all material, equipment, plant, and tools; and for all labor and other incidentals necessary to complete the work required by this section.

### 1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

#### SD-03 Product Data

Sources of Aggregates

Job Mix Formula; G

#### SD-06 Test Reports

Sources of Aggregates

Bituminous Materials

Test Section; G

Service Record; G

#### SD-09 Manufacturer's Field Reports

Batch Tickets

### 1.4 QUALITY CONTROL

#### 1.4.1 Qualifications

Perform sampling and testing using an approved commercial testing laboratory or on-site facilities. Submit accreditation of the commercial laboratory by an independent evaluation authority, indicating conformance to ASTM D3666, including all applicable test procedures. Do not start work requiring testing until the facilities have been inspected and approved. Schedule and provide payment for laboratory inspections. Additional payment or a time extension due to failure to acquire the required laboratory validation is not allowed. Maintain this certification for the duration of the project.

#### 1.4.2 Test Results

Verify that materials comply with the specification. When a material source is changed, test the new material for compliance. When deficiencies are found, repeat the initial analysis and retest the material already placed to determine the extent of unacceptable material. Replace or repair all in-place unacceptable material to conform to the contract requirements. Submit copies of field tests results within 24 hours after the tests are performed and certified copies of tests results for approval not less than 30 days before material is required for the work.

#### 1.4.3 Batch Tickets

Provide batch tickets in accordance with AASHTO M 156.

#### 1.4.4 Aggregates

Select sources of aggregates and submit a plan for operation of a new source of aggregates at least 10 days in advance of starting production. If a previously developed source is selected, submit test results with evidence that central plant hot-mix bituminous pavements constructed with the aggregates have had a satisfactory service record of at least 5 years under similar climatic conditions. Include in the service record a tabulation of aggregate gradation and quality test results, typical hot-mix asphalt mix design using the aggregate, and a list of representative paving projects using the aggregate. Make such tests and other investigations as necessary to determine whether or not aggregates meeting the requirements specified can be produced from the proposed sources. Sample aggregates in accordance with ASTM D75/D75M and test them at the start of production.

#### 1.4.5 Mineral Filler

Sample mineral filler in accordance with ASTM C183/C183M.

#### 1.4.6 Bituminous Materials

Select sources where bituminous materials are obtained in advance of time when materials will be required in the work. Sample bituminous materials in accordance with ASTM D140/D140M. Submit test results not less than 10 days before such material is required for use in the work.

### 1.5 ENVIRONMENTAL REQUIREMENTS

Do not construct bituminous courses when the underlying course contains free surface water, or when temperature of the surface of the underlying course is below 40 degrees F, unless otherwise directed.

### 1.6 ACCEPTANCE

#### 1.6.1 Tolerances

Acceptance of bituminous base course is based on compliance with the tolerances presented in Table 1. Remove and replace bituminous base course represented by the failing tests or submit repair plan for approval.

| TABLE 1                            |                             |
|------------------------------------|-----------------------------|
| Attribute                          | Measurement                 |
| Plant Mixture                      |                             |
| Delivery to Laydown Machine        | Minimum 250 deg F           |
| Laboratory Air Voids               | 3 to 5 percent              |
| Finished Mat                       |                             |
| Mat Density (avg of 4 cores/lot)   | Minimum 92 percent of TMD   |
| Joint Density (avg of 4 cores/lot) | Minimum 90.5 percent of TMD |
| Grade                              | plus/minus 0.05 foot        |
| Smoothness                         | plus/minus 3/8 inch         |
| Longitudinal Joint Offset          | Minimum 1 foot              |
| Transverse Joint Offset            | Minimum                     |

#### 1.6.2 Test Section

At the start of plant operation, prepare a quantity of the mixture sufficient to construct a test section at least 100 feet long and two spreader widths wide. Place, spread, and compact the mixture with equipment to be used in the project and in accordance with requirements specified herein. Construct a cold joint between spreader widths. Test and evaluate the test section and conform to all specified requirements. If tests indicate that the pavement does not conform to the tolerances of Table 1, remove and construct additional test sections and sample for conformance to specification requirements. Do not start production of the bituminous base course mixture without approval.

### PART 2 PRODUCTS

#### 2.1 AGGREGATES

Provide aggregates consisting of crushed stone, crushed slag, crushed gravel screenings, sand, and mineral filler, as required. The portion of these materials retained on the No. 4 sieve is classified as coarse aggregate; the portion passing the No. 4 sieve and retained on the No. 200 sieve, as fine aggregate; and the portion passing the No. 200 sieve, as mineral filler.

##### 2.1.1 Coarse Aggregates

Provide coarse aggregates consisting of clean, sound, durable fragments of crushed stone, crushed slag, or crushed gravel meeting the following requirements:

#### 2.1.1.1 Aggregate Wear

Percentage of wear not exceeding 40 after 500 revolutions, as determined in accordance with ASTM C131/C131M.

#### 2.1.1.2 Aggregate Loss

Percentage of loss not exceeding 18 after five cycles performed in accordance with ASTM C88, using magnesium sulfate.

#### 2.1.1.3 Fractured Faces

At least 75 percent by weight of coarse aggregate containing two or more fractured faces produced by crushing when tested in accordance with ASTM D5821.

#### 2.1.1.4 Flat and Elongated Pieces

Particle shape essentially cubical and containing not more than 20 percent, by weight, of flat particles and elongated particles (3:1 ratio of maximum to minimum) when tested in accordance with ASTM D4791.

#### 2.1.1.5 Dry Weight of Crushed Slag

Dry weight of crushed slag not less than 75 pcf as determined in accordance with ASTM C29/C29M.

#### 2.1.2 Fine Aggregates

Provide fine aggregates consisting of clean, durable natural sands; manufactured sands prepared by crushing stone, slag, or gravel, or any combination of natural and manufactured sands. Natural sands consist of grains of clean, hard, durable rock. Limit the quantity of uncrushed material to a maximum of 25 percent by weight of total aggregate.

#### 2.1.3 Mineral Filler

Mineral filler conforming to ASTM D242/D242M.

#### 2.1.4 Liquid Limit and Plasticity Index

Measure liquid limit and plasticity index on the portion of the aggregate passing the No. 40 sieve in accordance with ASTM D4318. Requirements apply to the individual aggregate fractions and the combined blend in the completed base course. Provide aggregates classified as either nonplastic or having a liquid limit not greater than 25 and a plasticity index not greater than 5.

### 2.2 BITUMINOUS MATERIALS

#### 2.2.1 Asphalt Cement

Provide asphalt cement binder conforming to ASTM D6373 Performance Grade (PG). As an alternate, provide ASTM D3381/D3381M Viscosity Grade asphalt cement.

### 2.3 AGGREGATE GRADATION

Provide mineral aggregate of such size that percentage composition by

weight, as determined by ASTM C136/C136M, conforms to the gradation specified in TABLE 2, and does not vary from the low limit on one sieve to the high limit on the adjacent sieve or vice versa, but grade uniformly from coarse to fine.

| TABLE 2. AGGREGATE GRADATION |             |             |             |
|------------------------------|-------------|-------------|-------------|
| Percent Passing              |             |             |             |
| Sieve Size                   | Gradation 1 | Gradation 2 | Gradation 3 |

## 2.4 COMPOSITION OF MIXTURE

### 2.4.1 Job-Mix Formula (JMF)

#### 2.4.1.1 Develop the JMF

Provide an asphalt mix composed of a mixture of well-graded aggregate, mineral filler if required, and asphalt binder. Size the aggregate fractions, handle in separate size groups, and combine in such proportions that the resulting mixture meets the grading requirements of Table 2. Submit proposed JMF; do not produce hot-mix asphalt for payment until a JMF has been approved. Design the hot-mix asphalt in accordance with Marshall or Superpave procedures and the criteria shown in Table 3. Use the hand-held hammer to compact the specimens for Marshall mix design. Design Superpave mixes with the number of gyrations specified in Table 3, unless the DOT option is chosen. If the Tensile Strength Ratio (TSR) of the composite mixture, as determined by ASTM D4867/D4867M, is less than 75, reject the aggregates or treat the asphalt mixture with an approved anti-stripping agent. Add the amount of anti-stripping agent sufficient to produce a TSR of not less than 75. Provide an antistrip agent, if required, at no additional cost. Provide sufficient materials to produce 200 pound of blended mixture for verification of mix design at least 14

days prior to construction of test section.

#### 2.4.1.2 Option

A currently used DOT Superpave hot mix may be used in lieu of developing a Marshall hot mix design as described herein. Design the Superpave volumetric mix in accordance with AI MS-2 and ASTM D6925. Provide a nominal maximum aggregate size (NMAS) of 3/4 inch. Other DOT hot mix design methods may be suitable, as approved.

#### 2.4.2 JMF Requirements

Submit in writing the job mix formula for approval at least 10 days prior to the start of the test section including as a minimum:

- a. Percent passing each sieve size.
- b. Percent of asphalt binder.
- c. Percent of each aggregate and mineral filler to be used.
- d. Asphalt performance grade viscosity grade.
- e. Number of blows of hand-held hammer per side of molded specimen. (NA for Superpave)
- f. Number of gyrations of Superpave gyratory compactor, (NA for Marshall mix design)
- g. Laboratory mixing temperature.
- h. Lab compaction temperature.
- i. Temperature-viscosity relationship of the asphalt cement.
- j. Plot of the combined gradation on the 0.45 power gradation chart, stating the nominal maximum size.
- k. Graphical plots of stability (NA for Superpave), flow (NA for Superpave), air voids, voids in the mineral aggregate, and unit weight versus asphalt content as shown in AI MS-2.
- l. Specific gravity and absorption of each aggregate.
- m. Percent natural sand.
- n. Percent particles with 2 or more fractured faces (in coarse aggregate).
- o. Fine aggregate angularity.
- p. Percent flat or elongated particles (in coarse aggregate).
- q. Tensile Strength Ratio(TSR).
- r. Antistrip agent (if required) and amount.
- s. List of all modifiers and amount.

- t. Correlation of hand-held hammer with mechanical hammer (NA for Superpave).
- u. Percentage and properties (asphalt content, binder properties, and aggregate properties) of reclaimed asphalt pavement (RAP) in accordance with paragraph RECYCLED HOT-MIX ASPHALT, if RAP is used.

| Table 3. Mix Design Criteria                                                                                           |                           |                           |
|------------------------------------------------------------------------------------------------------------------------|---------------------------|---------------------------|
| Test Property                                                                                                          | 50 Blows or Mix Gyrations | 75 Blows or Mix Gyrations |
| Stability, pounds, minimum (NA for Superpave)                                                                          | *1350                     | *1800                     |
| Flow, 0.01 inch, (NA for Superpave)                                                                                    | 8-18                      | 8-16                      |
| Air voids, percent                                                                                                     | 3-5                       | 3-5                       |
| Percent Voids in mineral aggregate (VMA), (minimum)                                                                    |                           |                           |
| Gradation 1                                                                                                            | 14.0                      | 14.0                      |
| Gradation 2                                                                                                            | 15.0                      | 15.0                      |
| Gradation 3                                                                                                            | 16.0                      | 16.0                      |
| TSR, minimum percent                                                                                                   | 75                        | 75                        |
| * This is a minimum requirement.                                                                                       |                           |                           |
| ** Calculate VMA in accordance with AI MS-2, based on ASTM C127 and ASTM C128 bulk specific gravity for the aggregate. |                           |                           |

#### 2.4.2.1 Adjustment to JMF

The JMF for each mixture is in effect until a new formula is approved in writing. Should a change in sources of any materials be made, perform a new mix design and obtain approval before the new material is used. Make minor adjustments within the specification limits to the JMF to optimize mix volumetric properties. Adjustments to the original JMF are limited to plus or minus 4 percent on the No. 4 and coarser sieves; plus or minus 3 percent on the No. 8 to No. 50 sieves; and plus or minus 1 percent on the No. 100 sieve. Adjustments to the JMF are limited to plus or minus 1.0 percent on the No. 200 sieve. Asphalt content adjustments are limited to plus or minus 0.40 from the original JMF. If adjustments are needed that exceed these limits, develop a new mix design.

#### 2.5 RECYCLED ASPHALT PAVEMENT

RAP is not permitted. 2.6 EQUIPMENT, TOOLS, AND MACHINES

#### 2.6.1 Bituminous Plant

Provide a bituminous plant of such capacity to produce the quantities of bituminous mixtures required for the project within the completion time of the contract. Provide hauling equipment, paving machines, rollers, miscellaneous equipment, and tools in sufficient numbers and capacity and in proper working condition to place the bituminous paving mixtures at a rate equal to the plant output. Provide a sufficient number of adequately trained personnel during paving operations to produce a pavement meeting the requirements in this specification.

#### 2.6.2 Mixing Plants

Provide mixing plants in accordance with AASHTO M 156 which are automatic or semiautomatic controlled, commercially manufactured units designed, coordinated, and operated to consistently produce a mixture within the job-mix formula (JMF). Prequalify drum or batch mixers at the production rate to be used during actual mix production. The prequalification tests include extraction in accordance with ASTM D2172/D2172M and recovery of the asphalt binder in accordance with ASTM D1856.

#### 2.6.3 Asphalt Paver

Provide asphalt pavers which are self-propelled, with an activated screed, heated as necessary, and capable of spreading and finishing courses of hot-mix asphalt which will meet the specified thickness, smoothness, and grade, with sufficient power to propel itself and the hauling equipment without adversely affecting the finished surface. Provide a receiving hopper of sufficient capacity to permit a uniform spreading operation and equipped with a distribution system to place the mixture uniformly in front of the screed without segregation and produce a finished surface of the required evenness and texture without tearing, shoving, or gouging the mixture. If screed extensions are used to increase the paving width, provide auger extensions to distribute the hot mix along the additional screed length. Equip the paver with a control system capable of automatically maintaining the specified screed elevation. Automatically actuate the control system from either a reference line and/or through a system of mechanical sensors or sensor-directed mechanisms or devices which will maintain the paver screed at a predetermined transverse slope and at the proper elevation to obtain the required surface.

#### 2.6.4 Hauling Equipment

Provide trucks for hauling hot-mix asphalt having tight, clean, and smooth metal beds. To prevent the mixture from adhering to them, lightly coat the truck beds with a release agent specifically designed for use with hot mix asphalt. Provide each truck with a suitable cover to protect the mixture from adverse weather. When necessary to maintain the mixture at the specified temperature, insulate or heat truck beds and securely fasten covers (tarps).

#### 2.6.5 Rollers

Provide the number, type, and weight of rollers sufficient to compact the mixture to the required density while it is still in a workable condition. Do not use equipment which causes excessive crushing of the aggregate or displacement of the asphalt mixture.

### 2.6.6 Straightedge

Furnish and maintain at the site, in good condition, one 12 foot straightedge for each bituminous paver for use in testing the finished surface. Construct straightedges of aluminum with blades of box or box-girder cross section and a flat bottom reinforced to insure rigidity and accuracy. Provide handles to facilitate movement on pavement.

## PART 3 EXECUTION

### 3.1 CONDITIONING OF UNDERLYING COURSE

Prior to placing the bituminous base course, clean the underlying surface of foreign or objectionable matter. Apply a prime coat in accordance with 32 12 13 BITUMINOUS TACK AND PRIME COATS.

### 3.2 MIXING

#### 3.2.1 Preparation of Mineral Aggregates

Place and maintain each aggregate stockpile in such a manner to prevent segregation. Regulate rates of feed of aggregates so that the moisture content and temperature of aggregates will be within tolerances specified herein. Provide dry storage for mineral filler.

#### 3.2.2 Preparation of Bituminous Mixtures

Convey aggregates, mineral filler, and bitumen into the mixer in proportionate quantities required to meet the JMF. Set the mixing time as required to obtain a uniform coating of the aggregate with the bituminous material. Limit the temperature of bitumen at time of mixing not to exceed 300 degrees F. Maintain the temperature of aggregate and mineral filler in the mixer within the range of 293 to 329 degrees F when bitumen is added. Overheated and carbonized mixtures or mixtures that foam will be rejected.

#### 3.2.3 Water Content of Aggregates

Perform drying operations to reduce the water content of mixture to less than 0.75 percent. Conduct the water content test in accordance with ASTM D2216. If the water content is determined on individual hot bin samples, calculate the water content as a weighted average based on composition of blend.

#### 3.2.4 Storage of Bituminous Paving Mixture

Store the mixture according to the requirements of AASHTO M 156. Empty uninsulated surge bins at the end of each working day. If excessive heat loss, segregation, or oxidation of the stored asphalt mixture is observed, discontinue the use of the surge bin.

### 3.3 TRANSPORTATION OF BITUMINOUS MIXTURE

Transport the bituminous mixture from the paving plant to the site in trucks having tight, clean, smooth beds lightly coated with an approved release agent to prevent adhesion of mixture to truck bodies. Drain excessive release agent prior to loading. Cover each load with canvas or other approved material of ample size to protect mixture from weather and

prevent loss of heat. Reject loads that have crusts of cold, unworkable material or have become wet by rain. Do not haul over freshly placed material.

### 3.4 PLACING

Do not place bituminous mixtures without ample time to complete placement and compaction during daylight hours, unless artificial lighting is provided.

#### 3.4.1 Tack Coat

Spray contact surfaces of previously constructed pavement, curbs, manholes, and similar structures with a tack coat conforming to the requirements of Section 32 12 13 BITUMINOUS TACK AND PRIME COATS.

#### 3.4.2 Offsetting Joints in Bituminous Base Course

Place the bituminous base course so that longitudinal joints are offset from joints in the underlying course by at least 1 foot. Offset transverse joints by at least 2 feet from transverse joints in the underlying course.

#### 3.4.3 Use of Laydown Machine

Reject mixtures having temperatures less than 250 degrees F when delivered to the laydown machine. Adjust the laydown machine and regulate the speed so that the surface of the course being laid will be smooth and continuous without tears and pulls, and of such depth that, when compacted, the surface conforms to the cross section, grade, and contour indicated. Begin placement of the mixture along the centerline of a crowned section or on the high side of areas with a one-way slope. Place the mixture as nearly continuous as possible, and adjust the speed of placing to permit proper compaction. When segregation occurs in the mixture during placing, suspend the laydown operation until the cause is determined and corrected. Correct irregularities in alignment of the course left by the laydown machine by trimming directly behind machine. Immediately after trimming, thoroughly compact the edges of the course by tamping laterally with a lute. Do not permit distortion of the course during tamping.

#### 3.4.4 Placing Strips Succeeding Initial Strips

In placing each succeeding strip after the initial strip has been spread and compacted as specified below, overlap the screed of the laydown machine 1/2 to 1 inch over the previously placed strip and sufficiently high so that compaction will produce a smooth, dense joint. Use a lute to push back the mixture placed on the edge of the previously placed strip to the edge of the strip being placed. Do not broadcast material onto the mat. Remove and waste excess mixture.

#### 3.4.5 Hand Spreading in Lieu of Machine Spreading

In areas where the use of machine spreading is impractical, spread the mixture by hand. Prevent segregation during spreading. Do not broadcast material onto the mat. Remove and waste excess mixture. Maintain grade and smoothness tolerances presented in Table 1.

### 3.5 COMPACTION OF MIXTURE

Begin compaction as soon after placing as the mixture will bear roller without undue displacement. Do not permit delays in compacting the freshly placed mixture. After the initial rolling, perform preliminary tests of the crown, grade, and smoothness. Correct deficiencies so that the finished course will conform to requirements for the grade and smoothness specified in subpart: ACCEPTANCE. After meeting crown, grade, and smoothness requirements, continue rolling until a mat density of at least 92 percent of the theoretical maximum density (TMD) determined in accordance with ASTM D2041/D2041M is obtained. Roll the joints until until a joint density of at least 90.5 percent of the theoretical maximum density (TMD) determined in accordance with ASTM D2041/D2041M is obtained. Thoroughly compact areas inaccessible to rollers with hot hand tampers.

#### 3.5.1 Correcting Deficient Areas

Remove mixtures that become contaminated or are defective. Do not permit skin patching of an area that has been rolled. Cut holes the full thickness of the base course so that the sides are perpendicular and parallel to the direction of traffic and the edges are vertical. Spray sides with tack coat conforming to requirements of Section 32 12 13 BITUMINOUS TACK AND PRIME COATS. Place hot mix asphalt in the holes in sufficient quantity so that the finished surface will conform to grade, smoothness, and density requirements.

### 3.6 JOINTS

#### 3.6.1 General

Carefully construct joints between old and new pavements or between successive day's work or joints that have become cold to establish a continuous bond between old and new sections of the course. Construct joints having the same texture, density, and smoothness as other sections of the course. Clean contact surfaces of previously constructed pavements that have become coated with dust, sand, or other objectionable material by brushing or cut back with approved power saw, as approved. Spray the surface against which new material is placed with a thin, uniform coat of tack coat conforming to requirements of Section 32 12 13 BITUMINOUS TACK AND PRIME COATS. Apply the material far enough in advance of placement of the fresh mixture to insure adequate curing. Take care to prevent damage or contamination of sprayed surface.

#### 3.6.2 Transverse Joints

Pass the roller over the unprotected end of freshly placed mixture only when placing of the course is discontinued or when delivery of the mixture is interrupted to the extent that the unrolled material may become cold. In all cases, cut back the edge of the previously placed course a minimum of 2 inches to expose an even, straight, vertical surface for the full thickness of the course. In continuing placement of the strip, position the mechanical spreader on the transverse joint so that sufficient hot mixture will be spread to obtain a joint after rolling that conforms to the required density and smoothness specified herein.

#### 3.6.3 Longitudinal Joints

Cut back edges of a previously placed strip that have cooled or are

irregular, honeycombed, poorly compacted, damaged, or otherwise defective. In all cases, cut back the edge of the previously placed course a minimum of 2 inches to expose an even, straight, vertical surface for the full thickness of the course.

### 3.7 EDGES OF PAVEMENT

Neatly trim outside edges adjacent to shoulders.

### 3.8 QUALITY CONTROL

Perform tests in sufficient numbers and at the locations and times directed to ensure that materials, mixtures and compaction meet specified requirements. Obtain samples of finished pavement, including samples that span the longitudinal joint. Sample bituminous materials during construction when shipments of bituminous materials are received or when necessary to assure that some condition of handling or storage has not been detrimental to the bituminous material.

#### 3.8.1 Sampling

Obtain plant mix and in-place samples on a lot and subplot basis. Each full day's production or a maximum of 1000 tons is considered a lot. Divide the lot into four (4) equal sublots and obtain random samples in accordance with ASTM D3665 within each subplot. Obtain plant mix samples from the haul truck or from behind the paver. Test for grade and smoothness on a total lot basis.

#### 3.8.2 In-Place Density

Take one random core (4 inches or larger in diameter) from the mat (interior of the lane) of each subplot, and one random core from the joint (immediately over joint) of each subplot, with each random core the full thickness of the layer being placed. When the random core is less than 1 inch thick, do not include in the analysis. In this case, take another random core. After air drying to a constant weight, determine the density of each core in accordance with ASTM D2726/D2726M. Determine percent compaction using the TMD. Evaluate for acceptance in accordance with subpart: ACCEPTANCE. Remove and replace unacceptable lots.

#### 3.8.3 Laboratory Air Voids and Theoretical Maximum Density

Calculate laboratory air voids by determining the bulk density of each lab compacted specimen using the laboratory-prepared, thoroughly dry method of ASTM D2726/D2726M and determining the theoretical maximum density of each subplot sample using ASTM D2041/D2041M. Use the latest theoretical maximum density value to calculate the laboratory air voids for each subplot. Evaluate for acceptance in accordance with subpart: ACCEPTANCE. Complete and report all laboratory air void tests within 24 hours after completion of construction of each lot.

#### 3.8.4 Plan Grade

Provide finished surfaces conforming, within tolerances specified, to the lines, grades, and cross sections indicated. Do not permit finished surfaces to vary more than the tolerances provided in subpart: ACCEPTANCE from the plan gradeline and elevation established and approved at the site. Maintain finished surfaces flush with finished surfaces of abutting pavements. Do not permit deviations from the plan gradeline and elevation

in areas of pavements where closer conformance with plan grade and elevation is required for the proper functioning of drainage and other appurtenant structures involved.

#### 3.8.5 Surface Smoothness

Provide finished surfaces not deviating from the testing edge of a straightedge more than the tolerances of subpart: ACCEPTANCE in any direction.

#### 3.8.6 Temperatures

Check temperatures at least four times per lot, at necessary locations, to determine the temperature at the dryer, the asphalt cement in the storage tank, the asphalt mixture at the plant, and the asphalt mixture at the job site.

#### 3.9 PROTECTION OF PAVEMENT

After final rolling of the pavement, do not permit vehicular traffic of any kind until the pavement has cooled to ambient temperature.

-- End of Section --

SECTION 32 12 13

BITUMINOUS TACK AND PRIME COATS  
05/17

PART 1 GENERAL

1.1 UNIT PRICES

1.1.1 Measurement

The bituminous material paid for will be the measured quantities of residual bituminous material used in the accepted work, provided that the measured quantities are not 10 percent over the specified quantities. Any amount of bituminous material more than 10 percent over the specified quantity will be deducted from the measured quantities. Express measured quantities in 2000 pound tons at 60 degrees F. Correct volumes measured at temperatures other than 60 degrees F in accordance with ASTM D1250 using a coefficient of expansion of 0.00025 per degree F for asphalt emulsion.

1.1.2 Payment

The quantities of bituminous material, determined as specified above, will be paid for at the respective contract unit prices. Payment will constitute full compensation for all operations necessary to complete the work as specified herein.

1.1.3 Waybills and Delivery Tickets

Submit waybills and delivery tickets, during progress of the work. Before the final statement is allowed, file with the Contracting Officer certified waybills and certified delivery tickets for all bituminous materials used in the construction of the pavement covered by the contract. These submittals are required for Unit Pricing bid only. Do not remove bituminous material from storage until the initial outage and temperature measurements have been taken. The delivery or storage units will not be released until the final outage has been taken.

### 1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval.. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Waybills and Delivery Tickets

Local/Regional Materials

SD-06 Test Reports

Sampling and Testing

### 1.4 QUALITY ASSURANCE

Certificates of compliance for asphalt materials delivered will be obtained and checked to ensure that specification requirements are met. Quantities of applied material will be determined. Payment will be for amount of residual asphalt applied. Tack coat materials will not be diluted. Prime coat materials when emulsions are used can be diluted on site with potable water up to 1 part emulsion to 1 part water.

### 1.5 DELIVERY, STORAGE, AND HANDLING

Inspect the materials delivered to the site for contamination and damage. Unload and store the materials with a minimum of handling.

### 1.6 EQUIPMENT, TOOLS AND MACHINES

#### 1.6.1 General Requirements

Equipment, tools and machines used in the work are subject to approval.

Maintain in a satisfactory working condition at all times. Calibrate equipment such as asphalt distributors, scales, batching equipment, spreaders and similar equipment within 12 months of their use. If the calibration expires during project, recalibrate the equipment before work can continue.

#### 1.6.2 Bituminous Distributor

Provide a self propelled distributor with pneumatic tires of such size and number to prevent rutting, shoving or otherwise damaging the surface being sprayed. Calibrate the distributor in accordance with ASTM D2995. Design and equip the distributor to spray the bituminous material in a uniform coverage at the specified temperature, at readily determined and controlled total liquid rates from 0.03 to 1.0 gallons per square yard, with a pressure range of 25 to 75 psi and with an allowable variation from the specified rate of not more than plus or minus 5 percent, and at variable widths. Include with the distributor equipment a separate power unit for the bitumen pump, full-circulation spray bars, tachometer, pressure gauges, volume-measuring devices, adequate heaters for heating of materials to the proper application temperature, a thermometer for reading the temperature of tank contents, and a hand hose attachment suitable for applying bituminous material manually to areas inaccessible to the distributor. The distributor will be capable of circulating and agitating the bituminous material during the heating process.

#### 1.6.3 Heating Equipment for Storage Tanks

Use steam, electric, or hot oil heaters for heating the bituminous material. Provide steam heaters consisting of steam coils and equipment for producing steam, so designed that the steam cannot come in contact with the bituminous material. Fix an armored thermometer to the tank with a temperature range from 40 to 400 degrees F so that the temperature of the bituminous material may be determined at all times.

#### 1.6.4 Power Brooms and Power Blowers

Use power brooms and power blowers suitable for cleaning the surfaces to which the bituminous coat is to be applied.

### 1.7 ENVIRONMENTAL REQUIREMENTS

Apply bituminous coat only when the surface to receive the bituminous coat is dry. A limited amount of moisture (approximately 0.03 gallon/square yard) can be sprayed on the surface of unbound material when prime coat is used to improve coverage and penetration of asphalt material. Apply bituminous coat only when the atmospheric temperature in the shade is 50 degrees F or above and when the temperature has not been below 35 degrees F for the 12 hours prior to application, unless otherwise directed.

## PART 2 PRODUCTS

### 2.1 PRIME COAT

Provide asphalt conforming to one of the following grades:

#### 2.1.1 Cutback Asphalt

Provide cutback asphalt conforming to ASTM D2026/D2026M, Grade SC-70  
ASTM D2027/D2027M, Grade MC-30.

### 2.1.2 Emulsified Asphalt

Provide emulsified asphalt conforming to ASTM D977, Type SS-1. Asphalt emulsion can be diluted up to 1 part water to 1 part emulsion for prime coat use. Do not dilute asphalt emulsion for tack coat use.

## 2.2 TACK COAT

### 2.2.1 Asphalt Cement

Provide asphalt cement conforming to ASTM D946/D946M.

### 2.2.2 Cutback Asphalt

Provide cutback asphalt conforming to ASTM D2028/D2028M.

### 2.2.3 Emulsified Asphalt

Provide emulsified asphalt conforming to ASTM D977, Type SS-1. For prime coats the emulsified asphalt can be diluted with up to 1 part emulsion to 1 part water. No dilution is allowed for tack coat applications. The base asphalt used to manufacture the emulsion is required to show a negative spot when tested in accordance with AASHTO T 102 using standard naphtha.

### 2.2.4 Local/Regional Materials

Use Local/Regional Materials or products extracted, harvested, or recovered, as well as manufactured, within a 500 mile radius from the project site, if available from a minimum of three sources.

## PART 3 EXECUTION

### 3.1 PREPARATION OF SURFACE

Immediately before applying the bituminous coat, remove all loose material, dirt, clay, or other objectionable material from the surface to be treated by means of a power broom or blower supplemented with hand brooms. Apply treatment only when the surface is dry and clean.

### 3.2 APPLICATION RATE

The exact quantities within the range specified, which may be varied to suit field conditions, will be determined by the Contracting Officer.

#### 3.2.1 Tack Coat

Apply bituminous material for the tack coat in quantities of not less than 0.03 gallons nor more than 0.10 gallons per square yard of residual asphalt onto the pavement surface as approved by the Contracting Officer. Do not dilute asphalt emulsion when used as a tack coat.

#### 3.2.2 Prime Coat

Apply bituminous material for the prime coat in quantities of not less than 0.05 gallons nor more than 0.12 gallons per square yard of residual asphalt for asphalt emulsion up to a 1 to 1 dilution rate or for residual asphalt for cutback asphalt.

### 3.3 APPLICATION TEMPERATURE

#### 3.3.1 Viscosity Relationship

Apply asphalt at a temperature that will provide a viscosity between 10 and 60 seconds, Saybolt Furol, or between 20 and 120 centistokes, kinematic. Furnish the temperature viscosity relation to the Contracting Officer.

#### 3.3.2 Temperature Ranges

The viscosity requirements determine the application temperature to be used. The following is a normal range of application temperatures:

| Cutback Asphalts          |                   |
|---------------------------|-------------------|
| MC-30                     | 85-190 degrees F  |
| SC-70, MC-70,<br>RC-70    | 120-225 degrees F |
| SC-250, MC-250,<br>RC-250 | 165-270 degrees F |
| Asphalt Emulsion          |                   |
| All Grades                | 70-160 degrees F  |
| Asphalt Cement            |                   |
| All Grades                | 275-350 degrees F |

Some of these temperatures for rapid cure cutbacks are above the flash point of the material and care should be taken in their heating.

### 3.4 APPLICATION

#### 3.4.1 General

Following preparation and subsequent inspection of the surface, apply the bituminous prime or tack coat with the bituminous distributor at the specified rate with uniform distribution over the surface to be treated. Properly treat all areas and spots, not capable of being sprayed with the distributor, with the hand spray. Until the succeeding layer of pavement is placed, maintain the surface by protecting the surface against damage and by repairing deficient areas at no additional cost to the Government. If required, spread clean dry sand to effectively blot up any excess bituminous material. No smoking, fires, or flames other than those from the heaters that are a part of the equipment are permitted within 25 feet of heating, distributing, and transferring operations of cutback materials. Prevent all traffic, except for paving equipment used in constructing the surfacing, from using the underlying material, whether primed or not, until the surfacing is completed. The bituminous coat requirements are described herein.

#### 3.4.2 Prime Coat

Apply a prime coat at locations shown on the Drawings. The prime coat is

required if it will be at least 7 days before the asphalt mixture is constructed on the underlying (base course, etc.) compacted material. The type of liquid asphalt and application rate will be as specified herein. Protect the underlying layer from any damage (water, traffic, etc.) until the surfacing is placed. If the Contractor places the surfacing within seven days, the choice of protection measures or actions to be taken is at the Contractor's option. Repair (recompact or replace) damage to the underlying material caused by lack of, or inadequate, protection by approved methods at no additional cost to the Government. If the Contractor opts to use the prime coat, apply as soon as possible after consolidation of the underlying material. Apply the bituminous material uniformly over the surface to be treated at a pressure range of 25 to 75 psi; the rate will be as specified above in paragraph APPLICATION RATE. To obtain uniform application of the prime coat on the surface treated at the junction of previous and subsequent applications, spread building paper on the surface for a sufficient distance back from the ends of each application to start and stop the prime coat on the paper and to ensure that all sprayers will operate at full force on the surface to be treated. Immediately after application remove and destroy the building paper.

#### 3.4.3 Tack Coat

Apply tack coat at the locations shown on the drawings. A tack coat should be applied to every bound surface (asphalt or concrete pavement) that is being overlaid with asphalt mixture and at transverse and longitudinal joints. Apply the tack coat when the surface to be treated is clean and dry. Immediately following the preparation of the surface for treatment, apply the bituminous material by means of the bituminous distributor, within the limits of temperature specified herein and at a rate as specified above in paragraph APPLICATION RATE. Apply the bituminous material so that uniform distribution is obtained over the entire surface to be treated. Treat lightly coated areas and spots missed by the distributor by spraying with a hand wand or using other approved method. Following the application of bituminous material, allow the surface to cure without being disturbed for period of time necessary to permit setting of the tack coat. Apply the bituminous tack coat only as far in advance of the placing of the overlying layer as required for that day's operation. Maintain and protect the treated surface from damage until the succeeding course of pavement is placed.

#### 3.5 CURING PERIOD

Following application of the bituminous material and prior to application of the succeeding layer of asphalt mixture allow the bituminous coat to cure and water or volatiles to evaporate prior to overlaying. Maintain the tacked surface in good condition until the succeeding layer of pavement is placed, by protecting the surface against damage and by repairing and recoating deficient areas. Allow the prime coat to cure without being disturbed for a period of at least 48 hours or longer, as may be necessary to attain penetration into the treated course. Furnish and spread enough sand to effectively blot up excess bituminous material.

#### 3.6 FIELD QUALITY CONTROL

Obtain certificates of compliance for all asphalt material delivered to the project. Obtain samples of the bituminous material under the supervision of the Contracting Officer. The sample may be retained and tested by the Government at no cost to the Contractor.

### 3.7 SAMPLING AND TESTING

Furnish certified copies of the manufacturer's test reports indicating temperature viscosity relationship for cutback asphalt or asphalt cement, compliance with applicable specified requirements, not less than 5 days before the material is required in the work.

#### 3.7.1 Sampling

Unless otherwise specified, sample bituminous material in accordance with ASTM D140/D140M.

#### 3.7.2 Calibration Test

Furnish all equipment, materials, and labor necessary to calibrate the bituminous distributor. Calibrate using the approved job material and prior to applying the bituminous coat material to the prepared surface. Calibrate the bituminous distributor in accordance with ASTM D2995.

#### 3.7.3 Trial Applications

Before applying the spray application of tack or prime coat, apply three lengths of at least 100 feet for the full width of the distributor bar to evaluate the amount of bituminous material that can be satisfactorily applied.

##### 3.7.3.1 Tack Coat Trial Application Rate

Unless otherwise authorized, apply the trial application rate of bituminous tack coat materials in the amount of 0.05 gallons per square yard. Make other trial applications using various amounts of material as may be deemed necessary.

##### 3.7.3.2 Prime Coat Trial Application Rate

Unless otherwise authorized, apply the trial application rate of bituminous materials in the amount of 0.15 gallon per square yard. Make other trial applications using various amounts of material as may be deemed necessary.

#### 3.7.4 Sampling and Testing During Construction

Perform quality control sampling and testing as required in paragraph FIELD QUALITY CONTROL.

### 3.8 TRAFFIC CONTROLS

Keep traffic off surfaces freshly treated with bituminous material. Provide sufficient warning signs and barricades so that traffic will not travel over freshly treated surfaces.

## 1.2 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

### SD-02 Shop Drawings

### 1.3 QUALITY CONTROL

#### 1.3.1 Certificates of Compliance

Submit certificates of compliance in accordance with the applicable reference standards and descriptions of this section for the following:

- a. Zinc coating
- b. Fabric
- c. Stretcher bars
- d. Gate hardware and accessories
- e. Concrete

#### 1.4 DELIVERY, STORAGE, AND HANDLING

Deliver materials to site in an undamaged condition. Store materials off the ground to provide protection against oxidation caused by ground contact.

## PART 2 PRODUCTS

### 2.1 SYSTEM DESCRIPTION

Submit reports of listing chain-link fencing and accessories regarding weight in ounces for zinc coating, and chemical composition and thickness of aluminum alloy coating.

Submit manufacturer's catalog data for complete fence assembly, gate assembly, hardware assembly and accessories.

## 2.2 FENCES

### 2.2.1 Fabric

FS RR-F-191/1; Type II, aluminum-coated steel, 9 gauge, conforming to ASTM A491, 9-gauge core wire size, conforming to ASTM F668. Color to be black complying with ASTM F934.I, zinc-coated steel, 9 gauge conforming to ASTM A392, with 2.0 ounces per square foot of coated surface. Provide selva ge knuckled at both selvages.

Height of fabric, as indicated.

Provide fabric consisting of wires woven into a 1-3/4 inch diamond mesh. Provide one-piece fabric widths for fence heights up to 12 feet.

#### 2.2.1.1 Top and Bottom Selvages

Provide knuckled selvages at top and bottom for fabric with 2 inch mesh and up to 60 inches high, and if over 60 inches high, provide twisted and barbed top selva ge and knuckled bottom selva ge.

Knuckle top and bottom selvages for 1-3/4 inch and 1 inch mesh fabric.

### 2.2.2 Posts

#### 2.2.2.1 Metal

##### 2.2.2.1.1 Line Posts

Provide line posts complying with FS RR-F-191/3. Provide Class 1, steel pipe, Grade A Class 3, formed steel sections, in minimum sizes listed in FS RR-F-191/3 for each class and grade.

##### 2.2.2.1.2 End, Corner and Pull Posts

Provide end, corner, and pull posts in minimum sizes listed in FS RR-F-191/3 for each class and grade. Provide Class 1, steel pipe, Grade A Regular Strength.

##### 2.2.2.1.3 Steel Pipe, Class 1, Grade B Test Requirements

Steel pipe, Class 1, Grade B meeting the following performance criteria when subjected to salt spray testing in accordance with ASTM B117:

- a. Exterior: 1,000 hours with maximum 5 percent red rust.
- b. Interior: 650 hours with maximum 5 percent red rust.

#### 2.2.2.2 Post Tops

Provide steel, wrought iron, or malleable ironaluminum tops with PVC coating of minimum thickness of 0.006 in and designed as a weathertight closure cap. Post top to have finish and coating matching rails and posts. Steel type to be pressed steel galvanized after fabrication having a minimum zinc coating of 1.20 ounces per square foot. Provide resin reinforced tops for resin reinforced posts. Provide one cap for each post, unless equal protection is provided by a combination post-cap and wire supporting arm. Provide caps with an opening to permit through passage of the top rail.

### 2.2.3 Braces and Rails

Class 1, steel pipe, Grade A Regular Strength, in minimum sizes listed in FS RR-F-191/3 for each class and grade.

#### 2.2.3.1 Top Rail

Provide top rail conforming to minimum sizes specified in FS RR-F-191/3 for each class and grade unless members are to be oversized. Provide expansion couplings 6 inches long at each joint in top rails.

#### 2.2.3.2 Center Rails Between Line Posts

Provide center rail conforming to minimum sizes specified in FS RR-F-191/3 for each class and grade unless members are to be oversized.

#### 2.2.3.3 Bottom Rail

Provide bottom rail conforming to minimum sizes specified in FS RR-F-191/3 for each class and grade unless members are to be oversized.

#### 2.2.3.4 Post-Brace Assembly

Provide bracing conforming to minimum sizes specified in FS RR-F-191/3 for each class and grade, and 3/8 inch adjustable truss rods and turnbuckles.

### 2.2.4 Wire Ties

Provide 9-gauge wire for tying fabric to line posts, spaced 12 inches on center. For tying fabric to rails and braces, space wire ties 24 inches on center. For tying fabric to tension wire, space 0.105-inch hog rings 24 inches on center. Manufacturer's standard procedure will be accepted if of equal strength and durability.

FS RR-F-191/4. Provide wire ties constructed of the same material and coating as the fencing fabric.

### 2.2.5 Sleeves

Provide sleeves for setting into concrete construction of the same material as post sections, sized 1 inch greater than the diameter or dimension of the post. Weld flat plates to each sleeve base to provide anchorage and prevent intrusion of concrete.

### 2.2.6 Stretcher Bars

Provide bars that have one-piece lengths equal to the full height of the fabric with a minimum cross section of 3/16 by 3/4 inch, in accordance with ASTM F626.

### 2.2.7 Stretcher Bar Bands

Provide bar bands for securing stretcher bars to posts that are steel, wrought iron, or malleable iron spaced not over 15 inches on center. Bands may also be used in conjunction with special fittings for securing rails to posts. Provide bands with projecting edges chamfered or eased.

#### 2.2.8 Tension Wire

Provide metallic coated steel marcelled tension wire, ( No. 7-gauge) complying with ASTM A824. Provide aluminum-coated (aluminized) steel wire with coating that weighs not less than 0.4 ounces per square foot. Provide zinc-coated steel wire with zinc coating that weighs not less than 1.2 ounces per square foot.

#### 2.2.9 Miscellaneous Hardware

Provide miscellaneous hot-dip galvanized hardware as required.

### 2.3 GATES

FS RR-F-191/2; Type I, single swing III, single cantilever sliding, wheel sliding gate. Shape and size of gate frame as shown on drawings. Framing and bracing members, round of steel alloy. Steel member finish, zinc-coated. Provide gate frames and braces of minimum sizes listed in FS RR-F-191/3 for each Class and Grade, except that steel pipe frames are a minimum of 1.90 inches o.d., 0.120 inches minimum wall thickness and aluminum pipe frames and intermediate braces are 1.869 inches o.d. minimum, 0.940 lb/ft of length. Provide intermediate members as necessary for gate leaves more than 8 feet wide, to provide rigid construction, free from sag or twist. Provide truss rods or intermediate braces for gate leaves less than 8 feet wide.

#### 2.3.1 Gate Posts

Provide gate posts for supporting each gate leaf in minimum sizes listed in FS RR-F-191/3 for each material class and grade. Gate post material class, grade and finish to match other fence posts.

#### 2.3.2 Gate Fabric

Gate fabric, is as specified for fencing fabric. Attach gate fabric to gate frame in accordance with manufacturer's standards, except that welding is not permitted.

#### 2.3.3 Gate Frame

Provide gate frame assembly that is welded or assembled with special malleable or pressed-steel fittings and rivets to provide rigid connections. Install fabric with stretcher bars at vertical edges; stretcher bars may also be used at top and bottom edges. Attach stretcher bars and fabric to gate frames on all sides at intervals not exceeding 15 inches. Attach hardware with rivets or by other means which provides equal security against breakage or removal.

#### 2.3.4 Gate Bracing

Provide diagonal cross-bracing, consisting of 3/8 inch diameter adjustable-length truss rods on welded gate frames, where necessary to obtain frame rigidity without sag or twist. Provide nonwelded gate frames with diagonal bracing.

#### 2.3.5 Padlocks

Provide padlocks conforming to ASTM F883, with chain.

### 2.3.6 Gate Hardware and Accessories

Provide gate hardware and accessories that conforms to ASTM A392 and ASTM F626, and as specified. Coating for steel latches, stops, hinges, keepers, and accessories, is galvanized

- a. Provide forged steel hinges to suit gate size, non-lift-off type, offset to permit 180-degree opening. Provide hinge with stainless steel pin.
- b. Provide latch that permits accessibility and operation from either side of the gate regardless of the latching arrangement, and with a padlock eye provided as an integral part of the latch. Provide fork type gate latches.
- c. Provide stops and holders of malleable iron for vehicular gates. Provide stops that automatically engage the gate and hold it in the open position until manually released.
- e. Provide double gates with a cane bolt and ground-set keeper, with latch or locking device and padlock eye designed as an integral part.
- f. Provide manufacturer's standard heavy-duty track ball bearing hanger sheaves, overhead framing and supports, guides, stays, bracing, and accessories as required for easy operation of manual sliding gates.

### 2.4 MATERIALS

#### 2.4.1 Zinc Coating

Provide zinc-coated ferrous metal components and accessories that are factory coated after fabrication, except as otherwise specified.

For galvanizing field repairs, provide material that is cold-applied zinc-rich coating conforming to ASTM A780/A780M.

#### 2.4.2 Concrete

Provide concrete conforming to ASTM C94/C94M, and obtaining a minimum 28-day compressive strength of 3,000 psi.

#### 2.4.3 Grout

Provide grout of proportions one part portland cement to three parts clean, well-graded sand and a minimum amount of water to produce a workable mix.

### PART 3 EXECUTION

Submit manufacturer's erection/installation drawings and instructions that detail proper assembly and materials in the design for fence, gate, hardware and accessories.

Provide complete installation conforming to ASTM F567.

### 3.1 PREPARATION

Ensure final grading and established elevations are complete prior to commencing fence installation.

### 3.2 INSTALLATION

#### 3.2.1 Security

Install new chain link fencing, remove existing fencing, and perform related work to provide continuous security for facility. Schedule and fully coordinate work with Contracting Officer and cognizant Security Officer.

#### 3.2.2 Fence Installation

Install fence on prepared surfaces to line and grade indicated. Secure fastening and hinge hardware in place to fence framework by peening or welding. Allow for proper operation of components. Coat peened or welded areas with a repair coating matching original coating. Install fence in accordance with fence manufacturer's written installation instructions except as modified herein.

##### 3.2.2.1 Post Spacing

Provide line posts spaced equidistantly apart, not exceeding 10 feet on center. Provide gate posts spaced as necessary for size of gate openings. Do not exceed 500 feet on straight runs between braced posts. Provide corner or pull posts, with bracing in both directions, for changes in direction of 15 degrees or more, or for abrupt changes in grade. Submit drawings showing location of gate, corner, end, and pull posts.

##### 3.2.2.2 Top and Bottom Tension Wire

Install tension wires before installing chain-link fabric, and pull wires taut. Place top and bottom tension wires within 8 inches of respective fabric line.

#### 3.2.3 Excavation

Provide excavations for post footings which are drilled holes in concrete slab as indicated. Space footings for line posts 10 feet on center maximum and at closer intervals when indicated, with bottoms of the holes approximately 3 inches below the bottoms of the posts.

#### 3.2.4 Setting Posts

Remove loose and foreign materials from holes and moisten the soil prior to placing concrete. Provide tops of footings that are trowel finished and sloped or domed to shed water away from posts. Set hold-open devices, sleeves, and other accessories in concrete.

Keep exposed concrete moist for at least 7 calendar days after placement or cured with a membrane curing material, as approved. Grout all posts set into sleeved holes in concrete with an approved grouting material. Maintain vertical alignment of posts in concrete construction until concrete has set.

#### 3.2.4.1 Earth and Bedrock

Provide concrete bases of dimensions indicated on the manufactures installation drawings. Compact concrete to eliminate voids, and finish to a dome shape.

#### 3.2.4.2 Concrete Slabs and Walls

Set posts into zinc-coated sleeves, set in concrete slab or wall, to a minimum depth of 12 inches. Fill sleeve joint with nonshrink grout or other approved material. Set posts for support of removable fence sections into sleeves that provide a tight sliding joint and hold posts aligned and plumb without use of setting material.

#### 3.2.4.3 Bracing

Brace gate, corner, end, and pull posts to nearest post with a horizontal brace used as a compression member, placed at least 12 inches below top of fence, and a diagonal tension rod.

#### 3.2.4.4 Tolerances

Provide posts that are straight and plumb within a vertical tolerance of 1/4 inch after the fabric has been stretched. Provide fencing and gates that are true to line with no more than 1/2 inch deviation from the established centerline between line posts. Repair defects as directed.

#### 3.2.5 Concrete Strength

Provide concrete that has attained at least 75 percent of its minimum 28-day compressive strength, but in no case sooner than 7 calendar days after placement, before rails, tension wire, or fabric are installed. Do not stretch fabric and wires or hang gates until the concrete has attained its full design strength.

#### 3.2.6 Top Rails

Provide top rails that run continuously through post caps or extension arms, bending to radius for curved runs. Provide expansion couplings as recommended by the fencing manufacturer.

#### 3.2.7 Center Rails

Provide single piece center rails between posts set flush with posts on the fabric side, using special offset fittings where necessary.

#### 3.2.8 Brace Assembly

Provide bracing assemblies at end and gate posts and at both sides of corner and pull posts, with the horizontal brace located at midheight of the fabric.

Install brace assemblies so posts are plumb when the diagonal rod is under proper tension. Provide two complete brace assemblies at corner and pull posts where required for stiffness and as indicated.

### 3.2.9 Tension Wire Installation

Install tension wire by weaving them through the fabric and tying them to each post with not less than 7-gauge galvanized wire or by securing the wire to the fabric with 10-gauge ties or clips spaced 24 inches on center.

### 3.2.10 Fabric Installation

Provide fabric in single lengths between stretch bars with bottom barbs placed approximately 1-1/2 inches above the ground line. Pull fabric taut and tied to posts, rails, and tension wire with wire ties and bands.

Install fabric on the security side of fence, unless otherwise directed. Ensure fabric remains under tension after the pulling force is released.

### 3.2.11 Stretcher Bar Installation

Thread stretcher bars through or clamped to fabric 4 inches on center and secured to posts with metal bands spaced 15 inches on center.

### 3.2.12 Gate Installation

Install gates plumb, level, and secure, with full opening without interference. Install ground set items in concrete for anchorage as recommended by the fence manufacturer. Adjust hardware for smooth operation and lubricated where necessary.

### 3.2.13 Tie Wires

Provide tie wires that are U-shaped to the pipe diameters to which attached. Twist ends of tie wires not less than two full turns and bent so as not to present a hazard.

### 3.2.14 Fasteners

Install nuts for tension bands and hardware on the side of the fence opposite the fabric side. Peen ends of bolts to prevent removal of nuts.

### 3.2.15 Zinc-Coating Repair

Clean and repair galvanized surfaces damaged by welding or abrasion, and cut ends of fabric, or other cut sections with specified galvanizing repair material applied in strict conformance with the manufacturer's printed instructions.

### 3.2.16 Accessories Installation

#### 3.2.16.1 Post Caps

Install post caps as recommended by the manufacturer.

#### 3.2.16.2 Padlocks

Provide padlocks for gate openings and provide chains that are securely attached to gate or gate posts. Provide padlocks keyed alike, and provide two keys for each padlock.

### 3.2.17 Grounding

Ground fencing as specified.

Ground all fences crossed by overhead power lines in excess of 600 volts, and all electrical equipment attached to the fence. Ground fences on each side of all gates, at each corner, at the closest approach to each building located within 50 feet of the fence, and where the fence alignment changes more than 15 degrees. Grounding locations can not exceed 650 feet. Bond each gate panel with a flexible bond strap to its gate post. Ground fences crossed by power lines of 600 volts or more at or near the point of crossing and at distances not exceeding 150 feet on each side of crossing. Provide ground conductor consisting of No. 6 AWG solid copper wire. Provide solid copper rod grounding electrodes 3/4 inch by 10 foot long. Drive electrodes into the earth so that the top of the electrode is at least 6 inches below the grade. Where driving is impracticable, bury electrodes a minimum of 12 inches deep and radially from the fence, with top of the electrode not less than 2 feet or more than 8 feet from the fence. Clamp ground conductor to the fence and electrodes with bronze grounding clamps to create electrical continuity between fence posts, fence fabric, and ground rods. Total resistance of the fence to ground cannot exceed 25 ohms.

### 3.3 CLOSEOUT ACTIVITIES

Remove waste fencing materials and other debris from the work site.

Submit manufacturer's data indicating percentage of recycled material content in protective fence materials, including chain link fence, fabric, and gates to verify affirmative procurement compliance.

-- End of Section --

SECTION 33 11 13.28

HIGH DENSITY POLYETHYLENE PIPE

07/24

PART 1 GENERAL

1.1 WORK INCLUDED

This Section covers furnishing, handling, laying, joining and installation of HDPE piping, fittings and appurtenances.

The Contractor shall furnish and install the various pipelines and appurtenant work as indicated on the Contract Drawings and as specified herein, or as reasonably required to produce a complete, proper, and functional installation in accordance with the intent of these Contract Documents.

1.2 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 QUALITY ASSURANCE

All pipe and fittings shall be inspected and tested at the factory as required by the standard specifications to which the material is manufactured. The Contractor shall furnish in duplicate to the Engineer sworn certificates providing evidence of such tests.

The Government reserves the right to have any or all pipe, fittings, and special castings inspected and/or tested by an independent service at either the manufacturer's plant or elsewhere. Such inspection and/or tests shall be at the Owner's expense.

Deflections in horizontal alignment will not be permitted at joints without written consent of the Engineer. If approved, deflections shall

not exceed one-half the manufacturer's recommendation.

When requested by the Engineer, the Contractor shall ensure that a qualified representative of the manufacturer shall be present at the jobsite for the first day of pipe laying, to assure that proper procedures are followed.

The Engineer shall be notified in advance when the location of an existing pipeline conflicts with the proposed location of the Work.

All piping shall be of the type and size shown on the drawings and described in this section of the Specifications.

1.4 SUBMITTALS: IN ACCORDANCE WITH REQUIREMENTS OF GENERAL SPECIFICATIONS, SUBMIT THE FOLLOWING:

Manufacturer's literature on the materials of this Section.

Manufacturer's certification that the product was manufactured, tested, and supplied in accordance with this specification.

1.5 DELIVERY, STORAGE, AND HANDLING

Pipe shall be packaged to withstand shipment without damage and handled carefully on the jobsite.

PART 2 PRODUCTS

2.1 HIGH DENSITY POLYETHYLENE (HDPE) PIPE AND FITTINGS:

2.1.1 Design Requirements

HDPE pipe and fittings shall be manufactured from PE 3408 resin meeting the cell classification of 345434C per ASTM 1248 and 3350.

All polyethylene fittings shall have a pressure rating equal to or higher than the pressure rating of the pipe.

HDPE pipe shall be furnished in standard lengths.

All HDPE connections shall have ANSI Class 150. Gaskets for flanged connections shall be full faced EPDM and hardware shall be 70/30 Copper / Nickel, Titanium or similar material rated for seawater.

All pipe and fittings shall be IDR 11 rated at 160 psi.

All piping and valves shall be supported by the size and style supports shown in the drawings, or an approved equal. The support shall be designed and stamped by a professional engineer. The cost shall be borne by the Contractor.

Pipe shall be homogeneous throughout; free from voids, cracks, and other defects; as uniform as commercially practicable in color, density, and other physical properties.

Pipe surfaces shall be free from nicks, scratches, and other blemishes. The joining surfaces of pipe shall be free from gouges and other imperfections that could cause leakage at joints.

For fused saddles, transition couplings for HDPE to PVC shall be submitted for approval. Pipe shall be blue for water irrigation or blue strip meeting NSF or AWWA.

## 2.2 MANUFACTURERS

Pipe and fittings shall be manufactured by Ipex, Inc.; Performance Pipe, Division of Chevron Chemical Co.; JM Eagle Pipe Co.; Pipeline Plastics, LLC; E.J. Prescott or approved equal.

## 2.3 COPPER NICKEL PIPE MATERIAL ALTERNATIVE

Copper Nickel Pipe may be used in place of HDPE, as approved by the Engineer. Copper nickel pipe material must be 70/30 copper nickel pipe ASTM B411 and ASME SB466, IPS Class 200 wall.

### 2.3.1 Copper Nick Flanges

70/30 copper nickel ASTM B466 and ASME SB466 Class 150.

## PART 3 EXECUTION

### 3.1 INSPECTION BEFORE INSTALLATION

Each length of pipe and each fitting shall be carefully inspected prior to being lowered into the pipe. All materials not meeting the requirements of these specifications, or otherwise found defective or unsatisfactory by the Engineer, shall be rejected and immediately marked and removed from the jobsite by the Contractor.

### 3.2 PIPE INSTALLATION

Except as modified herein, installation of HDPE pipe installation shall be in accordance with ASTM D2321 and manufacturer standards.

All pipe and fittings shall be installed according to the manufacturer's instructions. Pipe interiors, fitting interiors, and joint surfaces shall be thoroughly cleaned prior to installation. Pipes and fittings shall be maintained clean. For HDPE pipe, a clean cotton cloth shall be employed for cleaning; polyester-type materials shall not be used as they may melt during fusion procedures.

Branches and fittings shall be laid by the Contractor as indicated on the drawings, and/or as required by the Engineer. Open ends of pipe and branches shall be closed with PVC caps secured in place with premolded gasket joints or as required by the Engineer.

Care shall be taken to prevent earth and other materials from entering the pipe, and when pipe laying operations are suspended, the Contractor shall maintain a suitable stopper in the end of the pipe.

If any defective pipe is discovered after being placed, removal and replacement with sound pipe will be required at no additional cost to the Owner.

### 3.3 HDPE PIPE JOINING

HDPE pipe should be joined by butt-fusion methods, having a completely uniform and monolithic pipe interior according to the fusion joining

procedures as instructed by the manufacturer meeting standards of ASTM D3261.

Each individual performing fusion joining shall have had at least one year of experience in the use of the fusion procedure.

Inspection of joints shall be performed by a person qualified by training or experience to evaluate the acceptability of HDPE joints made under the applicable joining procedures.

The pipe sections shall be joined at ground level to a length recommended by the manufacturer, such that when pulling the pipe into position, maximum allowable stress is not exceeded. Use appropriate materials and equipment, as recommended by the HDPE pipe manufacturer, when pulling butt-fused pipe sections in the 48" RCP, to prevent pipe damage.

#### 3.4 LEAKAGE TESTING

On completion of a section of pipe is installed, the Contractor shall install suitable bulkheads as required, dewater and test the pipe for leakage.

Unless otherwise approved, the section shall be tested in accordance with manufacturer recommended procedure. Pressure testing shall use water as test media and not air.

#### 3.5 TESTING

Prior to the pressure and leakage tests, the piping shall be thoroughly flushed clean of all dirt, dust, oil, grease and other foreign material. This work shall be done with care to avoid damage to linings and coatings.

The installed pipe shall be pressure tested and leakage tested in accordance with AWWA Standard C600.

#### 3.6 PRESSURE AND LEAKAGE TESTS

Unless otherwise approved, all pipelines shall be given a combined pressure and leakage tests between line valves. The Contractor shall furnish and install suitable temporary testing plugs or caps; all necessary pressure pumps, pipe connections, meters, gates, and other necessary equipment; and all labor required. The Owner or Engineer shall have the privilege of using their own gages.

Subject to approval and provided that the tests are made within a reasonable time considering the progress of the project as a whole, and the need to put the section into service, the Contractor may make the tests when it desires.

Unless it has already been done, the section of pipe to be tested shall be filled with water of approved quality, and all air shall be expelled from the pipe. The Contractor shall follow established procedures for filling the pipe and expelling trapped air to avoid exposing the piping system to water hammer. If blowoffs are not available at high points for releasing air, the Contractor shall install the necessary taps. If the Contractor changes the grade of pipe installation, it will be responsible for locating the taps at the correct location in the system for testing. After completion of the test, if so, required by the Engineer, the Contractor shall remove corporations used for testing and plug the holes.

The section under test shall be maintained full of water for a period of 24 hours prior to the combined pressure and leakage test being applied.

The pressure test shall consist of first raising the water pressure (based on the elevation of the lowest point of the section under test corrected to the gage location) to a pressure in pounds per square inch numerically equal to the pressure rating of the pipe (160 psi, unless otherwise noted). If the Contractor cannot achieve the specified pressure and maintain it for a period of one hour, the section shall be considered as having failed to pass the pressure test.

If the pressure test fails, the Contractor shall make a leakage test by metering the flow of water into the pipe while maintaining in the section being tested a pressure equal to the pressure rating of the pipe. If the average leakage during a two hour period exceeds a rate of 11.6 gallons per inch of diameter per 24 hours per mile of pipeline, the section shall be considered as having failed the leakage test. For example, if 1,000 feet of 12 inch pipe is to be tested, the allowable leakage is 2.2 gallons over a 2-hour period, calculated as follows:

$$L = (11.6 \text{ gal}) \times (12") \times (2 \text{ hr.}) \times (1000') = 2.2 \text{ gal} \\ (1") \times (24 \text{ hr.}) \times (5280')$$

If the section fails to pass the pressure and leakage test, the Contractor shall do everything necessary to locate, uncover, and repair or replace the defective pipe, fitting, or joint, all at its own expense and without extension of time for completion of the work. Additional tests and repairs shall be made until the section passes the specified test.

-- End of Section --

SECTION 33 21 00.19

VERTICAL MULTI-STAGE CENTRIFUGAL PUMPS  
**11/24**

PART 1 GENERAL

1.1 WORK INCLUDED

This Section covers the furnishing and installation of vertical multi-stage centrifugal pumps, motors, and appurtenances complete for pumping BWRO permeate water.

1.2 RELATED WORK

- a. 03 30 00 CAST-IN-PLACE CONCRETE
- b. Division 40 - Instrumentation
- c. Division 26 - Electrical

1.3 PUMP SCHEDULE

- a. Adequate tolerances in the listed capacity, head and efficiency values have been included. No deviation below the listed parameters will be permitted.
- b. All listed parameters shall be considered design points.
- c. Pump Schedule

Table 1.3

| Pump                   | Description                             | Design Capacity (gpm) | Design Total Dynamic Head (feet) | Rated Motor HP | RPM                 | Voltage | Starter Type | Make / Model            |

#### 1.4 SUBMITTALS

Government approval is required for submittals with a "G" classification. Submittals not having a "G" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

##### SD-02 Shop Drawings

PUMP CONSTRUCTION; G, AE

Show complete details of construction and installation of all equipment, including appurtenances; include all dimensions.

Include all specifics of this installation.

Delete all references not applicable to this installation.

Outline specific areas where the proposed equipment differs from that specified.

Include complete wiring diagrams required for installation.

Prior to shipment, the certified pump curves shall be approved by the Engineer and shall show the actual performance of the pumps under factory testing. Pump certification shall include testing for head, capacity, efficiency and brake horsepower, at 50%, 65%, 85% and 100% for variable speed driven pumps, and at the rated speed for constant speed pumps.

Complete test results on each motor from the routine test as defined in the NEMA standard for a motor of its class and rating to determine that it is free from electrical and mechanical defects and to provide assurance that it meets the design specifications.

The manufacturer's complete initial test for each motor model design tested for efficiency by the following means: The full load Dynamometer test shall be based on IEEE 112 Method B, per NEMA MG1 12.53.

##### SD-06 Test Reports

FIELD AND ACCEPTANCE TESTS, G, AE

Upon completion of installation, the results of the acceptance tests as specified under this section of the specification shall be submitted to the Engineer.

##### SD-07 Certificates

Installation; G, AE

Furnish written certification from the manufacturer's representative of the proper installation of each component.

##### SD-09 Manufacturer's Field Reports

FIELD AND ACCEPTANCE TESTS; G

Upon completion of installation, the results of the field tests as specified under this section of the specification shall be submitted to the Engineer.

SD-10 Operation and Maintenance Data

Operations and Maintenance Manuals; G

Complete operation and maintenance information for this specific equipment.

The manuals will be reviewed by the Engineer for completeness; those that are deemed inadequate will be returned for correction.

Complete parts list including the manufacturer's reference and ordering numbers.

A complete list of the manufacturer's name, address and phone number, the local representative's name, address and phone number, and the model and serial numbers of all equipment supplied.

Spare Parts; G

1.5 QUALITY ASSURANCE

a. General

- (1) This specification directs special attention to certain features but does not purport to cover all details of the design, manufacture or installation of the pumping units. The final responsibility for supplying and installing pumping equipment which functions as specified herein rests with the Contractor.
- (2) Where more than one pump is being supplied, they should all be supplied by the same Pump Manufacturer.
- (3) Workmanship and the method and materials of construction shall conform to the best practice and highest standards applicable for the design use as specified.
- (4) Pumping units furnished shall be complete in all particulars and ready for final assembly, installation and operation.
- (5) Any structural, mechanical, civil, architectural, HVAC, plumbing or electrical changes required by the use of an approved equal product shall be the responsibility of the Contractor.

b. Manufacturers

- (1) Pump manufacturers shall certify proof of successful operating experience during the last 10 years of five installations of equipment comparable to that specified herein.
- (2) The electrical variable speed drive equipment specified in Division 26 (including a/c drive induction motor specified herein) shall be designed and sized by the pump supplier who

shall have successfully manufactured, installed and started up at least ten systems similar to this installation in the past five years. The pump and motor supplier shall assume responsibility for the correct operation of the entire a/c drive system.

- (3) Pumps shall be Goulds Xylem, or Engineer approved equal. See Table 1.3 in Section 1.3 for approved manufacturer and model numbers.

## 1.6 STORAGE

- a. Pump shafts and columns stored on site shall have covered and taped ends for protection. Pump equipment damaged or bent during shipping or storage shall be replaced at no cost to the Government.
- b. All pump motors shall be stored on site according to motor manufacturer's recommendations until pumps are operational and accepted by the Engineer. Pumps with motor space heaters shall be energized during storage; the Contractor shall be responsible for such arrangements.

## 1.7 WARRANTY

- a. The pump manufacturer and pump motor manufacturer shall each individually and separately warranty that the equipment they supplied under this Section fully meets the criteria specified herein and shall further warranty that the equipment is free from all defects in materials and workmanship.
- b. The manufacturer's warranties from defects shall contain a provision that the manufacturer shall repair or replace any defects, to the satisfaction of and at no additional cost to the Owner, for a period of twenty-four (24) months for the pump and motor from the date of Substantial Completion of the project.

## PART 2 PRODUCTS

### 2.1 PUMP CONSTRUCTION

#### 2.1.1 Pump Casing

- a. The pump casing shall be of deep drawn, laser welded AISI 304L or 316L stainless steel and shall be capable of withstanding maximum working pressures of 360 psi. Piping connections shall be in-line and shall be compatible with ANSI raised face flanges.
- b. Wear ring composed of PPS shall be provided with each stage. Wear rings must be self centering and easily replaceable.
- c. The interior of the pump head and base shall be smooth and free from surface defects.
- d. Pump casings shall be designed for 175 psi working pressure and shall be hydrostatically tested at 150 percent of working pressure.
- e. The seal housing shall be of concave design and shall hold the seal faces below the topmost part of the pump casing.

#### 2.1.2 Pump Impellers

- a. The impellers shall of enclosed design and constructed of AISI 316L or AISI 304L stainless steel. Impellers shall provide internal thrust balance in each stage.
- b. Each stage shall have a bowl with attached diffuser and be constructed of AISI 304L or 316L stainless steel.
- c. The mechanical seal shall have a carbon rotating face, silicon carbide graphite filled stationary face, viton elastomers, and 316 SS metal spring.

#### 2.1.3 Inverter Duty Motors

- a. The pumps shall be driven over the specified speed range by a/c motors sized to operate in conjunction with variable voltage/variable frequency rectified power and provide 100 percent motor torque and horsepower rating at 1.0 service factor.
- b. The motor base speed shall be selected so that the maximum operating speed of the centrifugal pump and motor are compatible.
- c. Motors shall not exceed 3,600 rpm.
- d. The a/c motors for variable frequency applications shall be 3 Phase, 60 Hertz, 460 Volts. They shall be rated for operation in 40NC ambient at 1.15 service factor for constant speed operation and 1.0 service factor for operation on variable frequency, variable voltage. The motor shall have a KVA per horsepower rating of NEMA code letter G or better.
- e. The motors shall be totally enclosed fan cooled enclosure, premium efficiency design, cast iron construction, mill and chemical duty, NEMA design B, Class B insulation with the following minimum features:
  - (1) The motor shall develop sufficient torque to start the pump and bring it up to full speed when the pump is full of water and operate the pump at any point of its characteristic curve without entering into the service factor.
- f. Each motor shall be designed for the highest efficiency standardly available in the marketplace.
- g. The motors shall be tested as specified in this section.

#### 2.2 PUMP TESTS

All pumps shall be tested in the shop of the manufacturer for head, capacity, efficiency, and brake horsepower at 50%, 65%, 85% and 100% of the rated speed. Six certified copies of the results in the form of pump characteristic curves shall be furnished to the Engineer for review prior to shipment.

### PART 3 EXECUTION

#### 3.1 INSTALLATION

All pumps shall be assembled and installed in accordance with the

manufacturer's recommendations and as approved by the Engineer.

Pump checkout and testing shall be as described in Section 01 75 13, EQUIPMENT CHECKOUT AND TESTING, and as described below.

### 3.2 FIELD AND ACCEPTANCE TESTS

- a. After all pumps have been installed and connected and after inspection, operation, and adjustment has been completed by the manufacturer's representative, the pumping equipment shall be field tested in the presence of the Engineer, for overall wire to water efficiency and for general performance and fitness for the service specified. Results of the tests shall be submitted to the Engineer.
- b. The quantity of water discharged by the pumps shall be measured by the equipment installed.
- c. Pumping heads shall be measured by pressure gauges, especially calibrated, and electrical input by using suitable instruments. Duration of the tests shall be as determined by the Engineer.
- d. If the capacity of a pumping unit under the design pumping heads fails to deliver the design capacity, or if the wire to water efficiency under the designed head fails to meet the efficiency stated in the specification, the Contractor shall, at its own expense, upon the written request of the Engineer, replace the motor, impeller, or other parts, or otherwise improve the unit until the specified capacity and efficiency are fulfilled.

### 3.3 TECHNICAL DIRECTION

- a. The service of a factory trained manufacturer's representative shall be provided as specified herein.
- b. Service to be provided:
  - (1) The service representative shall be responsible for complete component inspection on site after delivery.
  - (2) Start up services and supervision, including coordinating the tuning of the variable frequency drive system with instrumentation.
  - (3) Complete instruction of the Owner's operating personnel. The Owner reserves the right to videotape the instruction of the operating personnel.
- c. Service shall be provided for the following minimum periods of time:
  - (1) Pumps and motors Two (2) eight hour days.
- d. The minimum period of time herein specified does not relieve the manufacturer from providing sufficient time to satisfactorily complete the required service functions.
- e. A manufacturer's representative shall certify in writing that the pumps have been properly installed.

#### 3.4 SPARE PARTS

All other spare parts recommended in the manufacturer's standard operations and maintenance information.

#### 3.5 OPERATION AND MAINTENANCE MANUALS

Provide standard operation and maintenance manual for the pumps provided

1.2 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detail Drawings; G, AE

SD-03 Product Data

Support of the Equipment; G, AE

Piping and Fittings; G, AE

Valves; G, AE

Insulating Flanges; G, AE

Expansion Joints; G, AE

SD-04 Samples

Insulated Sections; G; G, AE

SD-10 Operation and Maintenance Data

Valve Manholes and Accessories; G; G, AE

Data Package 2; G; G, AE

1.3 QUALITY ASSURANCE

1.3.1 Detail Drawings

Submit detail drawings 30 days after notice to proceed for valve manholes and the piping and equipment in the valve manholes, such as steam traps, valves, sump pumps, pressure gauges, thermometers and insulation, including a complete list of equipment and materials, manufacturer's descriptive and technical literature, performance charts and curves, catalog cuts, installation instructions, and complete wiring and schematic diagrams. Show on the drawings pipe anchors and guides, and layout and anchorage of equipment and appurtenances in valve manholes, and equipment

relationship to other parts of the work including clearances for maintenance and operation.

#### 1.3.2 Insulated Sections

Submit sample sections, 30 days after notice to proceed, for insulation of pipe, elbow, tee, valve, support point, and terminating points. After approval of materials and prior to insulation of piping, prepare a display of insulated sections showing compliance with specifications and showing fastening, sealing, jacketing, straps, waterproofing, supports, hangers, anchors, and saddles. Display approved display sample sections at the jobsite during the construction period until no longer needed by Contracting Officer, then removed.

#### 1.4 DELIVERY, STORAGE, AND HANDLING

Protect all materials and equipment delivered and placed in storage from the weather, excessive humidity, and excessive temperature variation; dirt, dust, or other contaminants.

### PART 2 PRODUCTS

#### 2.1 STANDARD PRODUCTS

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening.

Equipment items must be supported by service organizations. Submit a certified list of qualified permanent service organizations for support of the equipment which includes their addresses and qualifications. These service organizations must be reasonably convenient to the equipment installation and able to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

**Products provided here must be compatible with seawater or deionized water. Material like titanium, copper-nickel, ASTM B62 Bronze, ASTM 148 Bronze, etc. shall be materials of construction when in contact with this water. Where materials are called for in the drawings and specifications that are not compatible with seawater, they shall be provided with sacrificial anodes.**

#### 2.2 NAMEPLATES

Supply each major item of equipment such as sump pump, motor, steam trap, and pressure reducing valve with the manufacturer's name, address, type or style, model or serial number, and catalog number on a plate secured to the item of equipment.

#### 2.3 ASBESTOS PROHIBITION

Asbestos and asbestos-containing products are not allowed.

#### 2.4 ELECTRICAL WORK

Provide motors, manual or automatic motor control equipment, and protective or signal devices required for the operation specified under this section in accordance with NFPA 70 and contract documents.

## 2.5 PIPING AND FITTINGS

### 2.5.1 General Requirements

Provide piping, fittings and piping accessories inside the valve manholes suitable for the working pressure and temperature requirements of the system conforming to ASME B31.1. To the greatest extent possible, match the piping and fittings inside the valve manholes to the piping and fittings located on the outside of the valve manhole. Provide steel piping in valve manholes with joints welded except that joints 3/4 inch and smaller may be threaded. When threaded joints are used on High Temperature Water Systems, seal weld (continuous fillet weld) the interface area where the pipe threads meet the threaded fittings to preclude any water leakage. Do not attach supports, anchors, or stays to any piping system in places where either the installation of or the movement of the pipe and its contents will cause damage to the construction.

### 2.5.2 Steel Pipe

Provide black steel, seamless or electric-resistance welded, conforming to the requirements of ASTM A53/A53M, Grade B or ASTM A106/A106M, Grade B. Provide schedule 40 type for pipe up to and including 10 inches in diameter. Provide 0.375 inch nominal wall thickness for pipe 12 inches in diameter and greater. Provide schedule 80 type for gauge piping and piping 3/4 inch in diameter and smaller.

#### 2.5.2.1 Nipples

Provide nipples that conform to ASTM A733 as required to match adjacent piping.

#### 2.5.2.2 Pipe Threads

Provide pipe threads that conform to ASME B1.20.1. Use pipe threads only on pipe 3/4 inch or smaller.

### 2.5.3 Fittings

Provide fittings, valves, flanges and unions with the manufacturer's trademark affixed in accordance with MSS SP-25 so as to permanently identify the manufacturer.

#### 2.5.3.1 Welded Fittings

Provide welded fittings to match connecting pipes with butt welded fittings, conforming to ASME B16.9, and socket welded fittings, conforming to ASME B16.11.

#### 2.5.3.2 Unions

Provide unions that conform to MSS SP-83 as required to match adjacent piping.

#### 2.5.3.3 Ball Valves

Provide ball valves having flanged or butt welded end connections conforming to MSS SP-72; provide ball valves having threaded end

connections conforming to MSS SP-110.

#### 2.5.4 Insulating Flanges and Dielectric Waterways

##### 2.5.4.1 Insulating Flanges

For systems in which cathodic protection is used, provide insulating flanges or flange gasket kits in the valve manhole at the pipe connection to or from the heat distribution system, at the interface of dissimilar metals, and when the carrier pipe and appurtenances are supported in such a way as to electrically ground or alter the cathodic protection system voltages or currents. Provide a kit that consists of flanges, a flange gasket, nuts and bolts, bolt sleeves, and one insulating washer and one steel washer for both ends of each bolt. Provide manufacturer certified gasket kits capable of electrically isolating the pipe at the 175 psig pressure and 100 degrees F temperature of the heating medium at the point of application. Submit evidence of satisfactory installations operating not less than 2 years, in accordance with paragraph SUBMITTALS, before materials are delivered. Ensure that these kits are provided and properly installed according to manufacturer's published instructions. Provide bolts torqued to the correct tightness and in the correct bolt pattern as recommended by the manufacturer's published instructions. Provide steel flanges that conform to ASME B16.5 Class 150 300 and that match valves or flanged fittings on which used. Provide flat faced steel flanges. Provide non-asbestos compressed material gaskets in accordance with ASME B16.21. Provide bolts that conform to the requirements of ASTM A193/A193M, Grade B7. Provide bolt heads marked to identify the manufacturer and the standard to which the bolt complies. Extend bolt lengths to no less than 2 full threads beyond the nut at the required tension with the washer seated. Provide nuts that conform to the requirements of ASTM A194/A194M, Grade 7.

##### 2.5.4.2 Dielectric Waterways

Provide dielectric waterways that have temperature and pressure rating equal to or greater than that specified for the connecting piping and used for joining dissimilar metals on 3/4 inch and smaller threaded pipe. Provide waterways that have metal connections on both ends suited to match connecting piping. Provide dielectric waterways that are internally lined with an insulator specifically designed to prevent current flow between dissimilar metals. Provide dielectric flanges that meet the performance requirements described herein for dielectric waterways.

##### 2.5.4.3 Gaskets Non-Insulating

Provide spiral wound, non-asbestos gasket with centering ring that conform to ASME B16.20.

#### 2.6 VALVES

Provide valves that conform to the material, fabrication, and operating requirements of ASME B31.1, unless otherwise specified. Provide valves suitable for the service temperatures and pressures utilized. Provide valves for that conform to ASME B31.1 Class 150, as suitable for service temperatures and pressures utilized. Valves 3/4 inch and smaller may be bronze where seal welding is not required. Provide valves 6 inches and larger with a 1 inch minimum gate or globe bypass valve sized in conformance with MSS SP-45.

### 2.6.1 Steel Valves

Provide steel globe, gate, angle, and check valves that conform to the requirements of ASME B16.34 and ASME B31.1 for the service temperatures and pressures utilized. Provide gate valves 2-1/2 inches and smaller with a rising stem. Provide gate valves 3 inches and larger with an outside screw and yoke.

### 2.6.2 Bronze Valves

#### 2.6.2.1 Globe, Gate, and Angle Valves

Provide bronze globe, gate, and angle valves that conform to MSS SP-80, union bonnet type.

#### 2.6.2.2 Check Valves

Provide bronze check valves that conform to MSS SP-80.

### 2.6.3 Packing

Provide asbestos free valve packing. Provide die-formed, ring type specifically designated valve stem packing suitable for service temperatures and pressures utilized. Provide polytetrafluoroethylene packing that has a with minimum 50 percent graphite filament. Provide valves 1-1/2 inches and smaller with four or five packing rings and provide valves 2 inches and larger with at least six packing rings. Spiral or continuous packing will not be acceptable. Provide a metal insert having proper clearance around the valve stem at the bottom of the stuffing box and acting as a base for the packing material. Provide one piece construction with provisions for not less than two bolts for packing adjustment, with a liner of noncorrosive material for packing glands.

## 2.7 STEAM TRAPS

Provide fail open traps with trap bodies suitable for a working pressure of not less than 1.5 times the steam supply pressure, but not less than 200 psi.

### 2.7.1 Bucket Traps

Provide inverted-bucket type bucket traps with automatic air discharge conforming to ASTM F1139.

### 2.7.2 Thermostatic Traps

Provide thermostatic traps that have a bimetallic element with automatic air discharge conforming to ASTM F1139.

## 2.8 PRESSURE GAUGES

Provide pressure gauges that conform to ASME B40.100 with a minimum dial size of 4-1/4 inches. Provide each gauge with a throttling type needle valve or a pulsation dampener and shut-off valve.

## 2.9 DIAL THERMOMETERS

Provide dial type thermometers 3-1/2 inches in diameter with stainless steel case, remote-type bulb or direct-type bulb as required. Provide

thermometers that have an accuracy of plus or minus 2 degrees F. Provide thermometer wells of the separable socket type for each thermometer with a direct-type bulb. Provide thermometer with a white face with black digits graduated in 2 degrees F increments.

## 2.10 COATINGS

Coat steel manhole piping with an organic zinc undercoat that conforms to SSPC Paint 29 Type II followed by a thermal barrier coating having a manufacturer's documented minimum thermal conductivity of 0.058 Btu/hr•ft•°F. Provide the undercoat and thermal barrier coating with a continuous use service temperature rating that exceeds the nominal system operating temperature by a minimum of 50 degrees F.

## 2.11 CONCRETE VALVE MANHOLES AND ACCESSORIES

### 2.11.1 Wall and Floor Construction

Provide manhole in accordance with Section 03 42 13.00 10 PLANT-PRECAST CONCRETE PRODUCTS FOR BELOW GRADE CONSTRUCTION. Construct walls and floors of reinforced concrete not less than 8 inches thick. Construct walls using one monolithic pour. Extend walls flush with finished grade. Provide floor with an internal sump; slope the floor in all directions to the sump to allow water collection. Provide construction joints with water stops. Waterproof manhole exterior in accordance with Section 07 13 53 ELASTOMERIC SHEET WATERPROOFING.

### 2.11.2 Manhole Supported Cover(s)

Provide an 5/16 inch thick checker pattern, aluminum solid plate cover that conforms to AA H35.1/35.1M cover that is supported by and is flush with the top of the manhole walls. Construct cover(s) to be removable and sectionalized as indicated. Provide hot-dipped galvanized structural steel supports, anchor bolts, nuts, and washers. Provide a cover and support system that can support a load up to 150 psf. Install an 5/16 inch thick checker pattern, aluminum solid plate cover that conforms to AA H35.1/35.1M on top of the open grating. Attach the checkered plate to the grating with removable, galvanized steel fasteners.

### 2.11.3 Raised Frame Cover(s)

Provide a raised support structure constructed out of hot-dipped galvanized steel that is designed to sit on top of the manhole walls. Provide an 5/16 inch thick checker pattern, aluminum solid plate cover that conforms to AA H35.1/35.1M. Construct cover(s) to be removable and sectionalized as indicated. Provide ventilation openings as indicated around the entire perimeter below the raised top. Provide hot-dipped galvanized steel lifting lugs on the cover.

### 2.11.4 Concrete Cover

Provide a 6 inches thick cast concrete cover designed to support loads up to 150 psf. Provide a 4 by 4 foot aluminum access door in the concrete top. Provide two 6 inch goosenecks; terminate one gooseneck inside the manhole within 2 feet of the manhole's floor; terminate the other gooseneck inside the manhole just below the manhole top.

#### 2.11.5 Ladders

Provide steel valve manhole ladders, with nonslip surfaces, and consisting of uprights with steps or rungs. fabricate ladders with two stringers a minimum 3/8 inch thick and 2-1/2 inches wide, and rungs not be less than 16 inches in width, 3/4 inch diameter, spaced 12 inches apart. Anchor the ladders to the wall by means of steel inserts spaced not more than 6 feet apart vertically, and install to provide at least 6 inches of space between the wall and rungs. Galvanize ladders and inserts after fabrication in conformance with ASTM A123/A123M.

#### 2.11.6 Pipe Sleeves

Provide zinc-coated steel pipe, conforming to ASTM A53/A53M, Schedule 40 or standard weight. Install so there is no electrical continuity between the pipe sleeve and the pipe casing.

##### 2.11.6.1 Pipe Sleeves Through Valve Manhole Cover

Provide insulation continuously through sleeves and provide aluminum jacket over the insulation. Provide smooth sheet 0.016 inch nominal thickness aluminum jacket conforming to ASTM B209. Where penetrations in valve manhole tops are required, insulate piping and seal with waterproof coating up to a point flush with the top of the flashing and the end of the insulation. Butt insulation exposed to the weather tightly against the flashing and valve manhole insulation, and extend the aluminum jacket required for piping exposed to the weather 2 inches beyond the insulation to form a counterflashing. Flash and counterflash valve manhole penetrations and apply waterproof coating conforming to ASTM D2822/D2822M, Type I.

##### 2.11.6.2 Pipe Sleeves for Conduit Penetrations

Provide a modular mechanical type sealing assembly between the valve manhole pipe sleeve and the conduit casing . The mechanical seal consists of interlocking elastomeric links shaped to continuously fill the annular space between the casing and sleeve. The link material is a synthetic elastomeric capable of withstanding long term exposure at 400 degrees F without deterioration. Attach the links to each other with corrosion resistant steel bolts, nuts and pressure plates. The link, bolts, nuts and pressure plates must be the product of single manufacturer and furnished as the product of single manufacturer as a package or kit.

#### 2.11.7 Pipe Supports

Provide pipe supports in accordance with MSS SP-58. Galvanize all pipe supports, including structural cross support members, Chains, straps, or single point supports are not allowed.

#### 2.12 EXPANSION JOINTS

Submit manufacturer's descriptive data and technical literature, performance charts, catalog cuts and installation instructions.

##### 2.12.1 Guided Slip Tube

Internally-externally guided type, injected semiplastic type packing, with service outlets. Construct joints for minimum working pressure of ASME Class 150. Provide single or double slip tube type as indicated. Provide

flanged or butt welding end connections as indicated.

#### 2.12.2 Flexible Ball

Provide chromium plated steel balls capable of 360-degree rotation plus 15-degree angular flex movement. Provide pressure molded composition gaskets designed for continuous operation temperature of 525 degrees F. Construct joints for minimum working pressure of ASME Class 150. Provide flanged or butt welding end connections as indicated.

#### 2.12.3 Bellows-Type

Type 304 stainless steel corrugated bellows, reinforced with rings, internal sleeves, and external protective covers, designed to withstand 10,000 cycles over a 20 year period and a minimum working pressure of ASME Class 150. Provide limit stops to limit total movement in both directions. Cold set the joints to compensate for temperature at time of installation. Provide single or double bellows expansion joint as indicated. Provide first pipe alignment guide no more than four pipe diameters from the expansion joint; provide second pipe alignment guide no more than 14 pipe diameters from the first guide. Provide flanged or butt welding end connections as indicated.

#### 2.13 MISCELLANEOUS METAL

Hot-dip galvanize miscellaneous metal bolted together, shop welded, or assembled in the field, and pipe supports, including structural cross support members and anchors

### PART 3 EXECUTION

#### 3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

#### 3.2 SITE WORK

##### 3.2.1 Excavation, Trenching, and Backfilling

Excavate, trench, and backfill the valve manholes as indicated and in accordance with Section 31 00 00.00 02 EARTHWORK.

##### 3.2.2 Painting

Clean the heat affected zone of field welded galvanized surfaces and other galvanized surfaces damaged during installation in compliance with SSPC SP 10/NACE No. 2, and paint in accordance with Section 09 90 00 PAINTS AND COATINGS. Clean steel and iron appurtenances, piping, and supports in compliance with SSPC SP 10/NACE No. 2, and paint in accordance with SSPC Paint 16.

#### 3.3 PIPING

##### 3.3.1 General

Use steel piping and insulate in valve manholes. Protect insulation with a galvanized steel jacket. Cut pipe to measurements established at the site and work into place without springing or forcing. Clear all openings and equipment, and avoid cutting or other weakening of structural members

to facilitate piping installation. Remove burrs from ends of pipe by reaming. Install to permit free expansion and contraction without damage to joints or hangers and in accordance with ASME B31.1. Do not attach supports, anchors, or stays where either expansion or the weight of the pipe could cause damage to permanent construction. The method of attaching supports must not interfere with the operation of the cathodic protection system.

### 3.3.2 Welded Joints

Weld all pipe joints for piping in valve manholes, except joints at traps, strainers, and at valves and piping 3/4 inch and smaller which may be threaded. Conform welding to the requirements specified in paragraph WELDING.

### 3.3.3 Flanged and Threaded Joints

#### 3.3.3.1 Flanged Joints

Flanged joints are permitted for dielectric isolation only. Construct flanged joints to be faced true, provided with gaskets, and made perfectly square and tight. Use flanged joints only for electrical isolation and in other special cases where connected equipment is available with only flanged joints, or when specifically indicated. Provide electrically isolated flange joints at all connections to or from the heat distribution system and between dissimilar metals.

#### 3.3.3.2 Threaded Joints

Apply graphite or inert filler and oil, graphite compound, or polytetrafluoroethylene tape to the male threads only. Provide unions at all screwed valves, strainers and connections to equipment 3/4 inch and smaller. Use dielectric unions at connections of dissimilar metals in 3/4 inch and smaller piping. When used on High Temperature Water Systems, seal weld threaded joints.

### 3.3.4 Reducing Fittings

#### 3.3.4.1 Horizontal Water Heating Lines

Provide eccentric reducers for all pipe size changes. Provide eccentric type reducing fittings to maintain the tops of adjoining pipes at the same level.

### 3.3.5 Branch Connections

Branch off top of mains as indicated providing unrestricted circulation, elimination of air pockets, and permitting the complete drainage of the system. Branch connections may be made with either welding tees or forged branch outlet fittings. If branch outlet fittings are used, provide forged fittings no larger than two nominal pipe sizes smaller than the main run. Reinforce branch outlet fittings to withstand external strains and designed to withstand full pipe bursting strength.

### 3.3.6 Pipe Supports in Valve Manholes

Securely support horizontal and vertical runs of pipe in valve manholes.

### 3.4 WELDING

Weld pipe in accordance with qualified procedures, using performance qualified welders and welding operators. Procedures and welders must be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. Notify the Contracting Officer 24 hours in advance of tests and perform the tests at the work site. The welder or welding operator must apply his assigned symbol near each weld he makes as a permanent record. Perform welding and nondestructive testing procedures for piping as specified in Section 40 17 26.00 20 WELDING PROCESS PIPING. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.

### 3.5 COATINGS

Prepare the steel piping surface by abrasive blasting to the near-white metal grade in conformance with SSPC SP 10/NACE No. 2. Within eight hours of blasting, or prior to any condensation of moisture or other surface deterioration whichever occurs first, coat all surfaces with an organic zinc primer conforming to SSPC Paint 29 Type II. Spray apply the primer to a minimum thickness at any point of 4 mils. Allow the primer to cure according to the manufacturer's recommendations prior to overcoating with the thermal barrier coating. Provide thermal barrier coating having film forming properties, an adhesion value of 5 when tested according to ASTM D3359 and a minimum thermal conductivity of 0.058 Btu/hr•ft•°F. Spray apply the thermal barrier coating in accordance with manufacturers recommendations to a minimum thickness at any point of 50 mils.

### 3.6 INSULATION

Install insulation so that it is not damaged by pipe expansion or contraction. Keep insulation dry before, during, and after installation. Groove insulation installed over welds to assure a snug fit. Hold insulation in place with stainless steel straps. Install a minimum of 2 bands on each individual length of insulation, with maximum spacing not exceeding 18 inch centers.

#### 3.6.1 Installation

Install material in accordance with published installation instructions of the manufacturer. Do not apply insulation materials until piping tests are complete. Prior to application, thoroughly clean surfaces of moisture, grease, dirt, rust, and scale; paint where required.

#### 3.6.2 Insulation on Pipes Passing Through Sleeves

Provide continuous insulation, as required by paragraph PIPE SLEEVES THROUGH VALVE MANHOLE COVER. Provide aluminum jackets over the insulation. When penetrating valve manhole walls, extend aluminum jacket not less than 2 inches beyond the sleeve on each side of the wall and secure with an aluminum band on each side of the wall. Where flashing is provided, secure the jacket with not less than one band located not more than 1 inch from the end of the jacket. When penetrating valve manhole tops, insulate pipe as required for valve manhole service.

#### 3.6.3 Covering of Insulation in Valve Manholes

Cover insulation for pipe, flanges, valves, and fittings with aluminum

jackets.

#### 3.6.4 Insulation of Piping Accessories in Valve Manholes

Insulate flanges, couplings, unions, valves, fittings, and other pipe accessories, unless otherwise indicated, with removable and reusable factory premolded, prefabricated, or field fabricated insulation. Provide aluminum sheet over insulation manholes and neatly terminate for accessories that are not to be insulated.

#### 3.6.5 Insulation Sealing for Chilled Water Systems

Seal the ends of insulation with vapor barrier, caulk penetrations and apply caulking to parting line between equipment and removable section insulation. Upon completion of installation of the insulation, including removable sections, apply two coats of vapor barrier coating with a layer of glass cloth embedded between the coats, providing a total dry thickness of the finish of 1/16 inch while maintaining removability of the sections as designed. Apply coating to flanges, unions, valves, anchors, fittings and accessories, all terminations, and all insulation not protected by factory vapor barrier jackets or PVC fitting covers. Overlap tape seams 1 inch. Extend the coating out onto the adjoining pipe insulation 2 inches. Taper insulation terminations to unions at a 45-degree angle.

#### 3.6.6 Insulation Thickness

Provide the minimum thickness of insulation for shall be 2 inches.

### 3.7 VALVE MANHOLES AND ACCESSORIES

#### 3.7.1 Piping and Equipment in Valve Manholes

Provide easy access in valve manholes without stepping on piping or equipment, and allow sufficient working area for maintenance work. Refer to drawings of piping and equipment in valve manholes for installation and support details. Install all globe, angle and gate valves with the stems horizontal or above.

Submit Data Package 2 as related to all equipment provided for the project in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Detail in the operation manuals the step-by-step procedures required for equipment startup, operation, and shutdown. Include in the operation manuals the manufacturer's name, model number, parts list, and brief description of all equipment and their basic operating features. List in the maintenance manuals routine maintenance procedures, possible breakdowns and repairs, and troubleshooting guides. Include in the maintenance manuals piping and equipment layout and simplified wiring and control diagrams indicating location of electrical components with terminals designated for wiring, as installed.

### 3.8 TESTS

Perform tests of piping in the valve manholes as part of the testing of the direct buried conduit system. Include the piping in the valve manhole in these tests and perform in accordance with the system supplier's Approved Brochure or the contract specifications.

## 1.2 RELATED REQUIREMENTS

Section 26 08 00 APPARATUS INSPECTION AND TESTING applies to this section, with the additions and modifications specified herein.

## 1.3 DEFINITIONS

- a. Unless otherwise specified or indicated, electrical and electronics terms used in these specifications, and on the drawings, are as defined in IEEE Stds Dictionary.
- b. In the text of this section, the words conduit and duct are used interchangeably and have the same meaning.
- c. In the text of this section, "medium voltage cable splices," and "medium voltage cable joints" are used interchangeably and have the same meaning.

## 1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Precast Underground Structures; G

SD-03 Product Data

Medium Voltage Cable; G

Medium Voltage Cable Joints; G

Medium Voltage Cable Terminations; G

Precast Concrete Structures; G

Sealing Material

Pulling-In Irons

Manhole Frames and Covers; G

Handhole Frames and Covers; G

Composite/Fiberglass Handholes; G

Cable Supports (racks, arms and insulators); G

SD-06 Test Reports

Medium Voltage Cable Qualification and Production Tests; G

Existing Cable Assessment Tests; G

Field Acceptance Checks and Tests; G

Arc-proofing Test for cable fireproofing tape; G

Cable Installation Plan and Procedure; G

Six copies of the information described below in 8-1/2 by 11 inch binders having a minimum of three rings from which material may readily be removed and replaced, including a separate section for each cable pull. Separate sections by heavy plastic dividers with tabs, with all data sheets signed and dated by the person supervising the pull.

- a. Site layout drawing with cable pulls numerically identified.
- b. A list of equipment used, with calibration certifications. The manufacturer and quantity of lubricant used on pull.
- c. The cable manufacturer and type of cable.
- d. The dates of cable pulls, time of day, and ambient temperature.
- e. The length of cable pull and calculated cable pulling tensions.

f. The actual cable pulling tensions encountered during pull.

#### SD-07 Certificates

Cable splicer/terminator; G

Cable Installer Qualifications; G

### 1.5 QUALITY ASSURANCE

#### 1.5.1 Precast Underground Structures

Submittal required for each type used. Provide calculations and drawings for precast manholes and handholes bearing the seal of a registered professional engineer including:

- a. Material description (i.e.,  $f'_c$  and  $F_y$ )
- b. Manufacturer's printed assembly and installation instructions
- c. Design calculations
- d. Reinforcing shop drawings in accordance with ACI SP-66
- e. Plans and elevations showing opening and pulling-in iron locations and details

#### 1.5.2 Certificate of Competency for Cable Splicer/Terminator

Submit certification of the qualification of the cable splicer/terminator for approval, 30 days before splices or terminations are to be made in medium voltage (5 kV to 35 kV) cables. Include the training, and experience of the individual on the specific type and classification of cable to be provided under this contract. Indicate that the individual has had three or more years recent experience splicing and terminating medium voltage cables. List a minimum of three splices/terminations that have been in operation for more than one year. In addition, the individual may be required to perform a dummy or practice splice/termination in the presence of the Contracting Officer, before being approved as a qualified cable splicer. If that additional requirement is imposed, the Contractor must provide short sections of the approved types of cables along with the approved type of splice/termination kit, and detailed manufacturer's instructions for the cable to be spliced. The Contracting Officer reserves the right to require additional proof of competency or to reject the individual and call for certification of an alternate cable splicer.

#### 1.5.3 Cable Installer Qualifications

Provide at least one onsite person in a supervisory position with a documentable level of competency and experience to supervise all cable pulling operations. Provide a resume showing the cable installers' experience in the last three years, including a list of references complete with points of contact, addresses and telephone numbers. Cable installer must demonstrate experience with a minimum of three medium voltage cable installations. The Contracting Officer reserves the right to require additional proof of competency or to reject the individual and call for an alternate qualified cable installer.

#### 1.5.4 Regulatory Requirements

In each of the publications referred to herein, consider the advisory provisions to be mandatory, as though the word, "must" had been substituted for "should" wherever it appears. Interpret references in these publications to the "authority having jurisdiction," or words of similar meaning, to mean the Contracting Officer. Equipment, materials, installation, and workmanship must be in accordance with the mandatory and advisory provisions of IEEE C2 and NFPA 70 unless more stringent requirements are specified or indicated.

#### 1.5.5 Standard Products

Provide materials and equipment that are products of manufacturers regularly engaged in the production of such products which are of equal material, design and workmanship. Products must have been in satisfactory commercial or industrial use for 2 years prior to bid opening. The 2-year period must include applications of equipment and materials under similar circumstances and of similar size. The product must have been for sale on the commercial market through advertisements, manufacturers' catalogs, or brochures during the 2-year period. Where two or more items of the same class of equipment are required, these items must be products of a single manufacturer; however, the component parts of the item need not be the products of the same manufacturer unless stated in this section.

##### 1.5.5.1 Alternative Qualifications

Products having less than a 2-year field service record will be acceptable if a certified record of satisfactory field operation for not less than 6000 hours, exclusive of the manufacturers' factory or laboratory tests, is furnished.

##### 1.5.5.2 Material and Equipment Manufacturing Date

Products manufactured more than 3 years prior to date of delivery to site are not acceptable, unless specified otherwise.

## PART 2 PRODUCTS

### 2.1 CONDUIT, DUCTS, AND FITTINGS

#### 2.1.1 Rigid Metal Conduit

UL 6.

##### 2.1.1.1 Rigid Metallic Conduit, PVC Coated

NEMA RN 1, Type A40, except that hardness must be nominal 85 Shore A durometer, dielectric strength must be minimum 400 volts per mil at 60 Hz, and tensile strength must be minimum 3500 psi.

#### 2.1.2 Intermediate Metal Conduit

UL 1242.

##### 2.1.2.1 Intermediate Metal Conduit, PVC Coated

NEMA RN 1, Type A40, except that hardness must be nominal 85 Shore A

durometer, dielectric strength must be minimum 400 volts per mil at 60 Hz, and tensile strength must be minimum 3500 psi.

#### 2.1.3 Plastic Conduit for Direct Burial and Riser Applications

UL 651 and NEMA TC 2, EPC-40 or as indicated.

#### 2.1.4 Plastic Duct for Concrete Encasement

Provide Type EPC-40 per UL 651 and NEMA TC 2, as indicated.

#### 2.1.5 Duct Sealant

UL 94, Class HBF. Provide high-expansion urethane foam duct sealant that expands and hardens to form a closed, chemically and water resistant, rigid structure. Sealant must be compatible with common cable and wire jackets and capable of adhering to metals, plastics and concrete. Sealant must be capable of curing in temperature ranges of 35 degrees F to 95 degrees F. Cured sealant must withstand temperature ranges of -20 degrees F to 200 degrees F without loss of function.

#### 2.1.6 Fittings

##### 2.1.6.1 Metal Fittings

UL 514B.

##### 2.1.6.2 PVC Conduit Fittings

UL 514B, UL 651, and NEMA TC 3.

##### 2.1.6.3 PVC Duct Fittings

NEMA TC 9.

##### 2.1.6.4 Outlet Boxes for Steel Conduit

Outlet boxes for use with rigid or flexible steel conduit must be cast-metal cadmium or zinc-coated if of ferrous metal with gasketed closures and must conform to UL 514A.

### 2.2 LOW VOLTAGE INSULATED CONDUCTORS AND CABLES

Insulated conductors must be rated 600 volts and conform to the requirements of NFPA 70, including listing requirements. Wires and cables manufactured more than 12 months prior to date of delivery to the site are not acceptable. Service entrance conductors must conform to UL 854, type USE.

#### 2.2.1 Conductor Types

Cable and duct sizes indicated are for copper conductors and THHN/THWN unless otherwise noted. Conductors No. 10 AWG and smaller must be solid. Conductors No. 8 AWG and larger must be stranded. All conductors must be copper.

#### 2.2.2 Conductor Material

Unless specified or indicated otherwise or required by NFPA 70, wires in

conduit, other than service entrance, must be 600-volt, Type XHHW conforming to UL 44. Copper conductors must be annealed copper complying with ASTM B3 and ASTM B8.

#### 2.2.3 Jackets

Provide cables with an overall PVC outer jacket.

#### 2.2.4 Cable Marking

Insulated conductors must have the date of manufacture and other identification imprinted on the outer surface of each cable at regular intervals throughout the cable length.

Identify each cable by means of a fiber, laminated plastic, or non-ferrous metal tags in each manhole, handhole, junction box, and each terminal. Each tag must contain the following information; cable type, conductor size, circuit number, circuit voltage, cable destination and phase identification.

Color code conductors. Provide conductor identification within each enclosure where a tap, splice, or termination is made. Conductor identification must be by color-coded insulated conductors, plastic-coated self-sticking printed markers, colored nylon cable ties and plates, heat shrink type sleeves, or colored electrical tape. Properly identify control circuit terminations. Color must be green for grounding conductors and white for neutrals; except where neutrals of more than one system are installed in same raceway or box, other neutrals may be white with a different colored (not green) stripe for each. Color of ungrounded conductors in different voltage systems are as follows:

- a. 208/120 volt, three-phase
  - (1) Phase A - black
  - (2) Phase B - red
  - (3) Phase C - blue
- b. 480/277 volt, three-phase
  - (1) Phase A - brown
  - (2) Phase B - orange
  - (3) Phase C - yellow
- c. 120/240 volt, single phase: Black and red

#### 2.3 LOW VOLTAGE WIRE CONNECTORS AND TERMINALS

Provide a uniform compression over the entire conductor contact surface. Use solderless terminal lugs on stranded conductors.

- a. For use with copper conductors: UL 486A-486B.

#### 2.4 LOW VOLTAGE SPLICES

Provide splices in conductors with a compression connector on the

conductor and by insulating and waterproofing using one of the following methods which are suitable for continuous submersion in water and comply with ANSI C119.1.

#### 2.4.1 Heat Shrinkable Splice

Provide heat shrinkable splice insulation by means of a thermoplastic adhesive sealant material applied in accordance with the manufacturer's written instructions.

#### 2.4.2 Cold Shrink Rubber Splice

Provide a cold-shrink rubber splice which consists of EPDM rubber tube which has been factory stretched onto a spiraled core which is removed during splice installation. The installation must not require heat or flame, or any additional materials such as covering or adhesive. It must be designed for use with inline compression type connectors, or indoor, outdoor, direct-burial or submerged locations.

### 2.5 MEDIUM VOLTAGE CABLE

Cable (conductor) sizes are designated by American Wire Gauge (AWG) and Thousand Circular Mils (Kcmil). Conductor and conduit sizes indicated are for copper conductors unless otherwise noted. Insulated conductors must have the date of manufacture and other identification imprinted on the outer surface of each cable at regular intervals throughout cable length. Wires and cables manufactured more than 12 months prior to date of delivery to the site are not acceptable. Provide single conductor type cables unless otherwise indicated.

#### 2.5.1 Cable Configuration

Provide Type MV cable, conforming to NEMA WC 74/ICEA S-93-639 and UL 1072. Provide cables manufactured for use in duct applications as indicated. Cable must be rated 15 kV or 35 kV as indicated with 133 percent insulation level.

#### 2.5.2 Conductor Material

Provide concentric-lay-stranded, Class B conductors. Provide soft drawn copper cables complying with ASTM B3 and ASTM B8 for regular concentric and compressed stranding or ASTM B496 for compact stranding.

#### 2.5.3 Insulation

Provide ethylene-propylene-rubber (EPR) insulation conforming to the requirements of ANSI/NEMA WC 74/ICEA S-93-639 and ICEA S-94-649.

#### 2.5.4 Shielding

Cables rated for 2 kV and above must have a semiconducting conductor shield, a semiconducting insulation shield, and an overall copper tape shield for each phase.

#### 2.5.5 Neutrals

Neutral conductors must be copper, employing the same insulation and jacket materials as phase conductors.

#### 2.5.6 Jackets

Provide PVC jackets with a separator that prevents contact with underlying semiconducting insulating shield.

### 2.6 MEDIUM VOLTAGE CABLE TERMINATIONS

IEEE 48 Class 1; of the molded elastomer, prestretched elastomer, or heat-shrinkable elastomer. Acceptable elastomers are track-resistant silicone rubber or track-resistant ethylene propylene compounds, such as ethylene propylene rubber or ethylene propylene diene monomer. Separable insulated connectors may be used for apparatus terminations, when such apparatus is provided with suitable bushings. Provide terminations, where required, with mounting brackets suitable for the intended installation and with grounding provisions for the cable shielding, metallic sheath, or armor. Provide terminations in a kit, including: skirts, stress control terminator, ground clamp, connectors, lugs, and complete instructions for assembly and installation. Terminations must be the product of one manufacturer, suitable for the type, diameter, insulation class and level, and materials of the cable terminated. Do not use separate parts of copper or copper alloy in contact with aluminum alloy parts in the construction or installation of the terminator.

#### 2.6.1 Cold-Shrink Type

Terminator must be a one-piece design, utilizing the manufacturer's latest technology, where high-dielectric constant (capacitive) stress control is integrated within a skirted insulator made of silicone rubber. Termination must not require heat or flame for installation. Termination kit must contain all necessary materials (except for the lugs). Design termination for installation in low or highly contaminated indoor and outdoor locations and must resist ultraviolet rays and oxidative decomposition.

#### 2.6.2 Heat Shrinkable Type

Terminator must consist of a uniform cross section heat shrinkable polymeric construction stress relief tubing and environmentally sealed outer covering that is nontracking, resists heavy atmospheric contaminants, ultra violet rays and oxidative decomposition. Provide heat shrinkable sheds or skirts of the same material. Design termination for installation in low or highly contaminated indoor or outdoor locations.

#### 2.6.3 Separable Insulated Connector Type

IEEE 386. Provide connector with steel reinforced hook-stick eye, grounding eye, test point, and arc-quenching contact material. Provide connectors of the loadbreak or deadbreak type as indicated, of suitable construction for the application and the type of cable connected, and that include cable shield adaptors. Provide external clamping points and test points. Do not use separable connectors in manholes/handholes.

- a. 200 Ampere loadbreak connector ratings: Voltage: 15 kV, 95 kV BIL. Short time rating: 10,000 rms symmetrical amperes.
- b. 600 Ampere deadbreak connector ratings: Voltage: 15 kV, 95 kV BIL. Short time rating: 25,000 rms symmetrical amperes.

## 2.7 MEDIUM VOLTAGE CABLE JOINTS

Provide joints (splices) in accordance with IEEE 404 suitable for the rated voltage, insulation level, insulation type, and construction of the cable. Joints must be certified by the manufacturer for waterproof, submersible applications. Upon request, supply manufacturer's design qualification test report in accordance with IEEE 404. Connectors for joint must be tin-plated electrolytic copper, having ends tapered and having center stops to equalize cable insertion.

### 2.7.1 Heat-Shrinkable Joint

Consists of a uniform cross-section heat-shrinkable polymeric construction with a linear stress relief system, a high dielectric strength insulating material, and an integrally bonded outer conductor layer for shielding. Replace original cable jacket with a heavy-wall heat-shrinkable sleeve with hot-melt adhesive coating.

### 2.7.2 Cold-Shrink Rubber-Type Joint

Joint must be of a cold shrink design that does not require any heat source for its installation. Splice insulation and jacket must be of a one-piece factory formed cold shrink sleeve made of black EPDM rubber. Splice should be packaged three splices per kit, including complete installation instructions.

## 2.8 TELECOMMUNICATIONS CABLING

Provide telecommunications cabling in accordance with Section 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP).

### 2.9 LIVE END CAPS

Provide live end caps using a "kit" including a heat-shrinkable tube and a high dielectric strength, polymeric plug overlapping the conductor. Conform to applicable portions of IEEE 48.

### 2.10 TAPE

#### 2.10.1 Insulating Tape

UL 510, plastic insulating tape, capable of performing in a continuous temperature environment of 80 degrees C.

#### 2.10.2 Buried Warning and Identification Tape

Provide detectable tape in accordance with Section 31 00 00 EARTHWORK.

#### 2.10.3 Fireproofing Tape

Provide tape composed of a flexible, conformable, unsupported intumescent elastomer. Tape must be not less than .030 inch thick, noncorrosive to cable sheath, self-extinguishing, noncombustible, adhesive-free, and must not deteriorate when subjected to oil, water, gases, salt water, sewage, and fungus.

### 2.11 PULL ROPE

Plastic or flat pull line (bull line) having a minimum tensile strength of

200 pounds.

## 2.12 GROUNDING AND BONDING

### 2.12.1 Driven Ground Rods

Provide copper-clad steel ground rods conforming to UL 467 not less than 3/4 inch in diameter by 10 feet in length. Sectional type rods may be used for rods 20 feet or longer.

### 2.12.2 Grounding Conductors

Stranded-bare copper conductors must conform to ASTM B8, Class B, soft-drawn unless otherwise indicated. Solid-bare copper conductors must conform to ASTM B1 for sizes No. 8 and smaller. Insulated conductors must be of the same material as phase conductors and green color-coded, except that conductors must be rated no more than 600 volts. Aluminum is not acceptable.

## 2.13 CAST-IN-PLACE CONCRETE

Provide concrete in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE. In addition, provide concrete for encasement of underground ducts with 3000 psi minimum 28-day compressive strength. Concrete associated with electrical work for other than encasement of underground ducts must be 4000 psi minimum 28-day compressive strength unless specified otherwise.

## 2.14 UNDERGROUND STRUCTURES

Provide precast concrete underground structures or standard type cast-in-place manhole types as indicated, conforming to ASTM C857 and ASTM C478. Top, walls, and bottom must consist of reinforced concrete. Walls and bottom must be of monolithic concrete construction. Locate duct entrances and windows near the corners of structures to facilitate cable racking. Covers must fit the frames without undue play. Form steel and iron to shape and size with sharp lines and angles. Castings must be free from warp and blow holes that may impair strength or appearance. Exposed metal must have a smooth finish and sharp lines and arises. Provide necessary lugs, rabbets, and brackets. Set pulling-in irons and other built-in items in place before depositing concrete. Install a pulling-in iron in the wall opposite each duct line entrance. Cable racks, including rack arms and insulators, must be adequate to accommodate the cable.

### 2.14.1 Cast-In-Place Concrete Structures

Concrete must conform to Section 03 30 00 CAST-IN-PLACE CONCRETE. Construct walls on a footing of cast-in-place concrete except that precast concrete base sections may be used for precast concrete manhole risers.

### 2.14.2 Precast Concrete Structures, Risers and Tops

Precast concrete underground structures shall be provided in lieu of cast-in-place where practical and subject to the requirements specified below. Precast units must be the product of a manufacturer regularly engaged in the manufacture of precast concrete products, including precast manholes.

#### 2.14.2.1 General

Precast concrete structures must have the same accessories and facilities as required for cast-in-place structures. Likewise, precast structures must have plan area and clear heights not less than those of cast-in-place structures. Concrete materials and methods of construction must be the same as for cast-in-place concrete construction, as modified herein. Slope in floor may be omitted provided precast sections are poured in reinforced steel forms. Concrete for precast work must have a 28-day compressive strength of not less than 4000 psi. Structures may be precast to the design and details indicated for cast-in-place construction, precast monolithically and placed as a unit, or structures may be assembled sections, designed and produced by the manufacturer in accordance with the requirements specified. Structures must be identified with the manufacturer's name embedded in or otherwise permanently attached to an interior wall face.

#### 2.14.2.2 Design for Precast Structures

ACI 318Mand as shown on manhole structural drawings. In the absence of detailed on-site soil information, design for the following soil parameters/site conditions:

- a. Angle of Internal Friction ( $\phi$ ) = 30 degrees
- b. Unit Weight of Soil (Dry) = 120 pcf, (Saturated) = 130 pcf
- c. Coefficient of Lateral Earth Pressure ( $K_a$ ) = 0.33
- d. Ground Water Level = at ground elevation
- e. Vertical design loads must include full dead, superimposed dead, and live loads including a 30 percent magnification factor for impact. Live loads must consider all types and magnitudes of vehicular (automotive, industrial, or aircraft) traffic to be encountered. The minimum design vertical load must be for H20 highway loading per AASHTO HB-17.
- f. Horizontal design loads must include full geostatic and hydrostatic pressures for the soil parameters, water table, and depth of installation to be encountered. Also, horizontal loads imposed by adjacent structure foundations, and horizontal load components of vertical design loads, including impact, must be considered, along with a pulling-in iron design load of 6000 pounds.
- g. Each structural component must be designed for the load combination and positioning resulting in the maximum shear and moment for that particular component.
- h. Design must also consider the live loads induced in the handling, installation, and backfilling of the manholes. Provide lifting devices to ensure structural integrity during handling and installation.

#### 2.14.2.3 Construction

Provide a uniform thickness for structure top, bottom, and wall not less than 6 inches. Thin-walled knock-out panels for designed or future duct

bank entrances are not permitted. Provide quantity, size, and location of duct bank entrance windows as directed, and cast completely open by the precaster. Size of windows must exceed the nominal duct bank envelope dimensions by at least 12 inches vertically and horizontally to preclude in-field window modifications made necessary by duct bank misalignment. However, the sides of precast windows must be a minimum of 6 inches from the inside surface of adjacent walls, floors, or ceilings. Form the perimeter of precast window openings to have a keyed or inward flared surface to provide a positive interlock with the mating duct bank envelope. Provide welded wire fabric reinforcing through window openings for in-field cutting and flaring into duct bank envelopes. Provide additional reinforcing steel comprised of at least two No. 4 bars around window openings. Provide drain sumps a minimum of 12 inches in diameter and 4 inches deep for precast structures.

#### 2.14.2.4 Joints

Provide tongue-and-groove joints on mating edges of precast components. Shiplap joints are not allowed. Design joints to firmly interlock adjoining components and to provide waterproof junctions and adequate shear transfer. Seal joints watertight using preformed plastic strip conforming to ASTM C990. Install sealing material in strict accordance with the sealant manufacturer's printed instructions. Provide waterproofing at conduit/duct entrances into structures, and where access frame meets the top slab, provide continuous grout seal.

#### 2.14.3 Manhole Frames and Covers

Provide cast iron frames and covers for manholes conforming to CID A-A-60005. Cast the words "ELECTRIC" or "TELECOMMUNICATIONS" in the top face of power and telecommunications manhole covers, respectively, and as required in drawings.

#### 2.14.4 Handhole Frames and Covers

Frames and covers of steel must be welded by qualified welders in accordance with standard commercial practice. Provide rolled-steel floor plate covers having an approved antislip surface. Hinges must be of stainless steel with bronze hinge pin, 5 by 5 inches by approximately 3/16 inch thick, without screw holes, and must be for full surface application by fillet welding. Hinges must have nonremovable pins and five knuckles. The surfaces of plates under hinges must be true after the removal of raised antislip surface, by grinding or other approved method.

#### 2.14.5 Manhole Riser and Collars

Provide precast reinforced concrete grade rings, precast concrete risers, and sewer and manhole brick conforming to ASTM C32, Grade MS as required on drawings

### 2.15 CABLE SUPPORTS (RACKS, ARMS, AND INSULATORS)

Anchors shall be sleeve type and constructed of stainless steel.

#### 2.15.1 Cable Rack Stanchions

The wall bracket or stanchion must be 4 inches by approximately 1 inch glass-reinforced nylon with recessed bolt mounting holes, 48 inches long (minimum) in manholes. Space slots for mounting cable rack arms at 8 inch

intervals.

#### 2.15.2 Rack Arms

Cable rack arms must be glass reinforced nylon and must be of the removable type. Rack arm length must be a minimum of 8 inches and a maximum of 21 inches.

#### 2.15.3 Insulators

Insulators are not required for nylon arms.

#### 2.16 CABLE TAGS IN MANHOLES

Provide polyethylene tags for each power cable located in manholes. Do not provide handwritten letters. The first position on the power cable tag denotes the voltage. The second through sixth positions on the tag identifies the circuit. The next to last position denotes the phase of the circuit and include the Greek "phi" symbol. The last position denotes the cable size. As an example, a tag could have the following designation: "11.5 NAS 1-8(Phase A)500," denoting that the tagged cable is on the 11.5kV system circuit number NAS 1-8, underground, Phase A, sized at 500 kcmil.

##### 2.16.1 Polyethylene Cable Tags

Provide tags of polyethylene having an average tensile strength of 3250 pounds per square inch; and that are 0.08 inch thick (minimum), non-corrosive non-conductive; resistive to acids, alkalis, organic solvents, and salt water; and distortion resistant to 170 degrees F. Provide 0.05 inch (minimum) thick black polyethylene tag holder. Provide a one-piece nylon, self-locking tie at each end of the cable tag, having a minimum loop tensile strength of 175 pounds and black block letters, numbers, and symbols one inch high on a yellow background. Letters, numbers, and symbols must not fall off or change positions regardless of the cable tags' orientation.

#### 2.17 MEDIUM VOLTAGE ABOVE GROUND CABLE TERMINATING CABINETS

Cable terminating cabinets must be hook-stick operable, deadfront construction conforming to the requirements of IEEE C37.20.3, Category A. Provide cabinets with 600 A. dead-break junctions and elbow-type separable dead-break connectors, cable parking stands, and grounding lugs. Provide cable terminating equipment in conformance with IEEE 386.

Ratings at 60 Hz must be:

|                                                      |              |
|------------------------------------------------------|--------------|
| Nominal voltage (kV)                                 | As indicated |
| Rated maximum voltage (kV)                           | 15 or 35     |
| Rated continuous current (A)                         | 600          |
| One-second short-time current-carrying capacity (kA) | As indicated |

|          |              |
|----------|--------------|
| BIL (kV) | As indicated |
|----------|--------------|

## 2.18 LOW VOLTAGE ABOVE GROUND TERMINATION PEDESTAL

Provide copolymer polypropylene, low voltage above ground termination pedestal manufactured through an injection molding process. Pedestals must resist fertilizers, salt air environments and ultra-violet radiation. Pedestal top must be imprinted with a "WARNING" and "ELECTRIC" identification. Pedestal must contain three lay-in six port connectors, NEMA C119.4, Class "A", dual rated for aluminum or copper, and capable of terminating conductors ranging from 10 AWG to 500 kcmil. Protect each connector with a clear, hard lexan (plastic) cover. Provide pedestal with rust-free material and stainless steel hardware that is lockable.

## 2.19 SOURCE QUALITY CONTROL

### 2.19.1 Arc-Proofing Test for Cable Fireproofing Tape

Manufacturer must test one sample assembly consisting of a straight lead tube 12 inches long with a 2 1/2 inch outside diameter, and a 1/8 inch thick wall, and covered with one-half lap layer of arc and fireproofing tape per manufacturer's instructions. The arc and fireproofing tape must withstand extreme temperature of a high-current fault arc 13,000 degrees K for 70 cycles as determined by using an argon directed plasma jet capable of constantly producing and maintaining an arc temperature of 13,000 degrees K. Temperature (13,000 degrees K) of the ignited arc between the cathode and anode must be obtained from a dc power source of 305 (plus or minus 5) amperes and 20 (plus or minus 1) volts. Direct the arc toward the sample assembly accurately positioned 5 (plus or minus 1) millimeters downstream in the plasma from the anode orifice by fixed flow rate of argon gas (0.18 g per second). Test each sample assembly at three unrelated points. Start time for tests must be taken from recorded peak current when the specimen is exposed to the full test temperature. Surface heat on the specimen prior to that time must be minimal. The end point is established when the plasma or conductive arc penetrates the protective tape and strikes the lead tube. Submittals for arc-proofing tape must indicate that the test has been performed and passed by the manufacturer.

### 2.19.2 Medium Voltage Cable Qualification and Production Tests

Results of AEIC CS8 qualification and production tests as applicable for each type of medium voltage cable.

## 2.20 INNERDUCT

Innerduct shall be constructed of corrugated high density polyethylene. Product shall come in 5-unit assembly, 1.25-inch diameter each unit, with each unit of varying color. Pull tape shall be provided in each innerduct.

## PART 3 EXECUTION

### 3.1 INSTALLATION

Install equipment and devices in accordance with the manufacturer's published instructions and with the requirements and recommendations of NFPA 70 and IEEE C2 as applicable. In addition to these requirements,

install telecommunications in accordance with TIA-758 and  
RUS Bull 1751F-644.

### 3.2 CABLE INSPECTION

Inspect each cable reel for correct storage positions, signs of physical damage, and broken end seals prior to installation. If end seal is broken, remove moisture from cable prior to installation in accordance with the cable manufacturer's recommendations.

### 3.3 CABLE INSTALLATION PLAN AND PROCEDURE

Obtain from the manufacturer an installation manual or set of instructions which addresses such aspects as cable construction, insulation type, cable diameter, bending radius, cable temperature limits for installation, lubricants, coefficient of friction, conduit cleaning, storage procedures, moisture seals, testing for and purging moisture, maximum allowable pulling tension, and maximum allowable sidewall bearing pressure. Perform pulling calculations and prepare a pulling plan and submit along with the manufacturer's instructions in accordance with SUBMITTALS. Install cable strictly in accordance with the cable manufacturer's recommendations and the approved installation plan.

Calculations and pulling plan must include:

- a. Site layout drawing with cable pulls identified in numeric order of expected pulling sequence and direction of cable pull.
- b. List of cable installation equipment.
- c. Lubricant manufacturer's application instructions.
- d. Procedure for resealing cable ends to prevent moisture from entering cable.
- e. Cable pulling tension calculations of all cable pulls.
- f. Cable percentage conduit fill.
- g. Cable sidewall bearing pressure.
- h. Cable minimum bend radius and minimum diameter of pulling wheels used.
- i. Cable jam ratio.
- j. Maximum allowable pulling tension on each different type and size of conductor.
- k. Maximum allowable pulling tension on pulling device.

### 3.4 UNDERGROUND STRUCTURE CONSTRUCTION

Provide standard type cast-in-place construction as specified herein and as indicated, or precast construction as specified herein. Horizontal concrete surfaces of floors must have a smooth trowel finish. Cure concrete by applying two coats of white pigmented membrane forming-curing compound in strict accordance with the manufacturer's printed instructions, except that precast concrete may be steam cured. Curing compound must conform to ASTM C309. Locate duct entrances and windows in

the center of end walls (shorter) and near the corners of sidewalls (longer) to facilitate cable racking and splicing. Covers for underground structures must fit the frames without undue play. Form steel and iron to shape and size with sharp lines and angles. Castings must be free from warp and blow holes that may impair strength or appearance. Exposed metal must have a smooth finish and sharp lines and arises. Provide necessary lugs, rabbets, and brackets. Set pulling-in irons and other built-in items in place before depositing concrete. Manhole locations, as indicated, are approximate. Coordinate exact manhole locations with other utilities and finished grading and paving.

#### 3.4.1 Cast-In-Place Concrete Structures

Construct walls on a footing of cast-in-place concrete except that precast concrete base sections may be used for precast concrete manhole risers.

#### 3.4.2 Precast Concrete Construction

Set commercial precast structures on 6 inches of level, 90 percent compacted granular fill, 3/4 inch to 1 inch size, extending 12 inches beyond the structure on each side. Compact granular fill by a minimum of four passes with a plate type vibrator. Installation must additionally conform to the manufacturer's instructions.

#### 3.4.3 Pulling-In Irons

Provide steel bars bent as indicated, and cast in the walls and floors. Alternatively, pipe sleeves may be precast into the walls and floors where required to accept U-bolts or other types of pulling-in devices possessing the strengths and clearances stated herein. The final installation of pulling-in devices must be made permanent. Cover and seal exterior projections of thru-wall type pulling-in devices with an appropriate protective coating. In the floor, locate the irons a minimum of 6 inches from the edge of the sump, and in the walls, locate the irons within 6 inches of the projected center of the duct bank pattern or precast window in the opposite wall. However, the pulling-in iron must not be located within 6 inches of an adjacent interior surface, or duct or precast window located within the same wall as the iron. If a pulling-in iron cannot be located directly opposite the corresponding duct bank or precast window due to this clearance limitation, locate the iron directly above or below the projected center of the duct bank pattern or precast window the minimum distance required to preserve the 6 inch clearance previously stated. In the case of directly opposing precast windows, pulling-in irons consisting of a 3 foot length of No. 5 reinforcing bar, formed into a hairpin, may be cast-in-place within the precast windows simultaneously with the end of the corresponding duct bank envelope. Irons installed in this manner must be positioned directly in line with, or when not possible, directly above or below the projected center of the duct bank pattern entering the opposite wall, while maintaining a minimum clear distance of 3 inches from any edge of the cast-in-place duct bank envelope or any individual duct. Pulling-in irons must have a clear projection into the structure of approximately 4 inches and must be designed to withstand a minimum pulling-in load of 6000 pounds. Hot-dip galvanize irons after fabrication.

#### 3.4.4 Cable Racks, Arms and Insulators

Cable racks, arms and insulators must be sufficient to accommodate the cables. Space racks in power manholes not more than 3 feet apart, and

provide each manhole wall with a minimum of two racks. Space racks in signal manholes not more than 16 1/2 inches apart with the end rack being no further than 12 inches from the adjacent wall. Methods of anchoring cable racks are as follows:

- a. Provide a 5/8 inch diameter by 5 inch long anchor bolt with 3 inch foot cast in structure wall with 2 inch protrusion of threaded portion of bolt into structure. Provide 5/8 inch steel square head nut on each anchor bolt. Coat threads of anchor bolts with suitable coating immediately prior to installing nuts.
- b. Provide concrete channel insert with a minimum load rating of 800 pounds per foot. Insert channel must be steel of the same length as "vertical rack channel;" and cast flush in structure wall. Provide 5/8 inch steel nuts in channel insert to receive 5/8 inch diameter by 3 inch long steel, square head anchor bolts.
- c. Provide concrete "spot insert" at each anchor bolt location, cast flush in structure wall. Each insert must have minimum 800 pound load rating. Provide 5/8 inch diameter by 3 inch long steel, square head anchor bolt at each anchor point. Coat threads of anchor bolts with suitable coating immediately prior to installing bolts.

#### 3.4.5 Field Painting

Clean cast-iron frames and covers not buried in concrete or masonry of mortar, rust, grease, dirt and other deleterious materials, and coat with bituminous paint.

### 3.5 UNDERGROUND CONDUIT AND DUCT SYSTEMS

#### 3.5.1 Requirements

Run conduit in straight lines except where a change of direction is necessary. Provide numbers and sizes of ducts as indicated. Provide a 4/0 AWG bare copper grounding conductor above medium-voltage distribution duct banks. Bond bare copper grounding conductor to ground rings (loops) in all manholes and to ground rings (loops) at all equipment slabs (pads). Route grounding conductor into manholes with the duct bank (sleeving is not required). Ducts must have a continuous slope downward toward underground structures and away from buildings, laid with a minimum slope of 3 inches per 100 feet. Depending on the contour of the finished grade, the high-point may be at a terminal, a manhole, a handhole, or between manholes or handholes. Terminate all PVC conduit end points in utility holes, switching cabinets, transform handholes and buildings with end bells. The bell end of the conduits that enter manholes and handholes must be flush with the wall.

Perform changes in ductbank direction as follows:

- a. Short-radius manufactured 90-degree duct bends may be used only for pole or equipment risers, unless specifically indicated as acceptable.
- b. The minimum manufactured bend radius must be 18 inches for ducts of less than 3 inch diameter, and 36 inches for ducts 3 inches or greater in diameter.
- c. As an exception to the bend radius required above, provide field manufactured longsweep bends having a minimum radius of 25 feet for a

change of direction of more than 5 degrees, either horizontally or vertically, using a combination of curved and straight sections. Maximum manufactured curved sections allowed for use in field manufactured longsweep bend: 30 degrees.

### 3.5.2 Treatment

Keep ducts clean of concrete, dirt, or foreign substances during construction. Make field cuts requiring tapers with proper tools and match factory tapers. Use a coupling recommended by the duct manufacturer whenever an existing duct is connected to a duct of different material or shape. Store ducts to avoid warping and deterioration with ends sufficiently plugged to prevent entry of any water or solid substances. Thoroughly clean ducts before being laid. Store plastic ducts on a flat surface and protected from the direct rays of the sun.

### 3.5.3 Conduit Cleaning

As each conduit run is completed, for conduit sizes 3 inches and larger, draw a flexible testing mandrel approximately 12 inches long with a diameter less than the inside diameter of the conduit through the conduit. After which, draw a stiff bristle brush through until conduit is clear of particles of earth, sand and gravel; then immediately install conduit plugs. For conduit sizes less than 3 inches, draw a stiff bristle brush through until conduit is clear of particles of earth, sand and gravel; then immediately install conduit plugs.

### 3.5.4 Multiple Conduits

Separate multiple conduits by a minimum distance of 3 inches, except that light and power conduits must be separated from control, signal, and telephone conduits by a minimum distance of 12 inches. Stagger the joints of the conduits by rows (horizontally) and layers (vertically) to strengthen the conduit assembly. Provide plastic duct spacers that interlock vertically and horizontally. Spacer assembly must consist of base spacers, intermediate spacers, ties, and locking device on top to provide a completely enclosed and locked-in conduit assembly. Install spacers per manufacturer's instructions, but provide a minimum of two spacer assemblies per 10 feet of conduit assembly.

### 3.5.5 Conduit Plugs and Pull Rope

Provide new conduit indicated as being unused or empty with plugs on each end. Plugs must contain a weephole or screen to allow water drainage. Provide a plastic pull rope having 3 feet of slack at each end of unused or empty conduits.

### 3.5.6 Conduit and Duct Without Concrete Encasement

Depths to top of the conduit must be not less than 24 inches below finished grade. Provide not less than 3 inches clearance from the conduit to each side of the trench. Grade bottom of trench smooth; where rock, soft spots, or sharp-edged materials are encountered, excavate the bottom for an additional 3 inches, fill and tamp level with original bottom with sand or earth free from particles, that would be retained on a 1/4 inch sieve. The first 6 inch layer of backfill cover must be sand compacted as previously specified. The rest of the excavation must be backfilled and compacted in 3 to 6 inch layers. Provide color, type and depth of warning tape as specified in Section 31 00 00 EARTHWORK.

#### 3.5.6.1 Encasement Under Roads and Structures

Under roads, paved areas, and railroad tracks, install conduits in concrete encasement of rectangular cross-section providing a minimum of 3 inch concrete cover around ducts. Extend concrete encasement at least 5 feet beyond the edges of paved areas and roads, and 12 feet beyond the rails on each side of railroad tracks. Depths to top of the concrete envelope must be not less than 24 inches below finished grade, and under railroad tracks not less than 50 inches below the top of the rails.

#### 3.5.7 Duct Encased in Concrete

Construct underground duct lines of individual conduits encased in concrete. Depths to top of the concrete envelope must be not less than 18 inches below finished grade, except under roads and pavement, concrete envelope must be not less than 24 inches below finished grade, and under railroad tracks not less than 50 inches below the top of the rails. Do not mix different kinds of conduit in any one duct bank. Concrete encasement surrounding the bank must be rectangular in cross-section and provide at least 3 inches of concrete cover for ducts. Separate conduits by a minimum concrete thickness of 3 inches. Before pouring concrete, anchor duct bank assemblies, prevent floating during concrete pouring by driving reinforcing rods adjacent to duct spacer assemblies and attaching the rods to the spacer assembly. Provide steel reinforcing in the concrete envelope as indicated. Provide color, type and depth of warning tape as specified in Section 31 00 00 EARTHWORK.

##### 3.5.7.1 Connections to Manholes

Duct bank envelopes connecting to underground structures must be flared to have enlarged cross-section at the manhole entrance to provide additional shear strength. Dimensions of the flared cross-section must be larger than the corresponding manhole opening dimensions by no less than 12 inches in each direction. Perimeter of the duct bank opening in the underground structure must be flared toward the inside or keyed to provide a positive interlock between the duct bank and the wall of the structure. Use vibrators when this portion of the encasement is poured to assure a seal between the envelope and the wall of the structure.

##### 3.5.7.2 Connections to Existing Underground Structures

For duct bank connections to existing structures, break the structure wall out to the dimensions required and preserve steel in the structure wall. Cut steel and bend out to tie into the reinforcing of the duct bank envelope. Chip the perimeter surface of the duct bank opening to form a key or flared surface, providing a positive connection with the duct bank envelope.

##### 3.5.7.3 Connections to Existing Concrete Pads

For duct bank connections to concrete pads, break an opening in the pad out to the dimensions required and preserve steel in pad. Cut the steel and bend out to tie into the reinforcing of the duct bank envelope. Chip out the opening in the pad to form a key for the duct bank envelope.

##### 3.5.7.4 Connections to Existing Ducts

Where connections to existing duct banks are indicated, excavate the banks

to the maximum depth necessary. Cut off the banks and remove loose concrete from the conduits before new concrete-encased ducts are installed. Provide a reinforced concrete collar, poured monolithically with the new duct bank, to take the shear at the joint of the duct banks. Abandon in place those no longer used ducts and cables which do not interfere with the work.

#### 3.5.7.5 Partially Completed Duct Banks

During construction wherever a construction joint is necessary in a duct bank, prevent debris such as mud, and, and dirt from entering ducts by providing suitable conduit plugs. Fit concrete envelope of a partially completed duct bank with reinforcing steel extending a minimum of 2 feet back into the envelope and a minimum of 2 feet beyond the end of the envelope. Provide one No. 4 bar in each corner, 3 inches from the edge of the envelope. Secure corner bars with two No. 3 ties, spaced approximately one foot apart. Restrain reinforcing assembly from moving during concrete pouring.

#### 3.5.8 Duct Sealing

Seal all electrical penetrations for radon mitigation, maintaining integrity of the vapor barrier, and to prevent infiltration of air, insects, and vermin.

### 3.6 CABLE PULLING

Test existing duct lines with a mandrel and thoroughly swab out to remove foreign material before pulling cables. Pull cables down grade with the feed-in point at the manhole or buildings of the highest elevation. Use flexible cable feeds to convey cables through manhole opening and into duct runs. Do not exceed the specified cable bending radii when installing cable under any conditions, including turnups into switches, transformers, switchgear, switchboards, and other enclosures. Cable with tape shield must have a bending radius not less than 12 times the overall diameter of the completed cable. If basket-grip type cable-pulling devices are used to pull cable in place, cut off the section of cable under the grip before splicing and terminating.

#### 3.6.1 Cable Lubricants

Use lubricants that are specifically recommended by the cable manufacturer for assisting in pulling jacketed cables.

### 3.7 CABLES IN UNDERGROUND STRUCTURES

Do not install cables utilizing the shortest path between penetrations, but route along those walls providing the longest route and the maximum spare cable lengths. Form cables to closely parallel walls, not to interfere with duct entrances, and support on brackets and cable insulators. Support cable splices in underground structures by racks on each side of the splice. Locate splices to prevent cyclic bending in the spliced sheath. Install cables at middle and bottom of cable racks, leaving top space open for future cables, except as otherwise indicated for existing installations. Provide one spare three-insulator rack arm for each cable rack in each underground structure.

### 3.7.1 Cable Tag Installation

Install cable tags in each manhole as specified, including each splice. Tag wire and cable provided by this contract. Install cable tags over the fireproofing, if any, and locate the tags so that they are clearly visible without disturbing any cabling or wiring in the manholes.

### 3.8 CONDUCTORS INSTALLED IN PARALLEL

Group conductors such that each conduit of a parallel run contains one Phase A conductor, one Phase B conductor, one Phase C conductor, and one neutral conductor.

### 3.9 LOW VOLTAGE CABLE SPLICING AND TERMINATING

Make terminations and splices with materials and methods as indicated or specified herein and as designated by the written instructions of the manufacturer. Do not allow the cables to be moved until after the splicing material has completely set. Make splices in underground distribution systems only in accessible locations such as basements, vaults, manholes, handholes, or aboveground termination pedestals.

### 3.10 MEDIUM VOLTAGE CABLE TERMINATIONS

Make terminations in accordance with the written instruction of the termination kit manufacturer.

### 3.11 MEDIUM VOLTAGE CABLE JOINTS

Provide power cable joints (splices) suitable for continuous immersion in water. Make joints only in accessible locations in manholes or handholes by using materials and methods in accordance with the written instructions of the joint kit manufacturer.

#### 3.11.1 Joints in Shielded Cables

Cover the joined area with metallic tape, or material like the original cable shield and connect it to the cable shield on each side of the splice. Provide a bare copper ground connection brought out in a watertight manner and grounded to the manhole grounding loop as part of the splice installation. Ground conductors, connections, and rods must be as specified elsewhere in this section. Wire must be trained to the sides of the enclosure to prevent interference with the working area.

### 3.12 CABLE END CAPS

Cable ends must be sealed at all times with coated heat shrinkable end caps. Cables ends must be sealed when the cable is delivered to the job site, while the cable is stored and during installation of the cable. The caps must remain in place until the cable is spliced or terminated. Sealing compounds and tape are not acceptable substitutes for heat shrinkable end caps. Cable which is not sealed in the specified manner at all times will be rejected.

### 3.13 LIVE END CAPS

Provide live end caps for single conductor medium voltage cables where indicated.

### 3.14 FIREPROOFING OF CABLES IN UNDERGROUND STRUCTURES

Fireproof (arc proof) wire and cables which will carry current at 2200 volts or more in underground structures.

#### 3.14.1 Fireproofing Tape

Tightly wrap strips of fireproofing tape around each cable spirally in half-lapped wrapping. Install tape in accordance with manufacturer's instructions.

#### 3.14.2 Tape-Wrap

Tape-wrap metallic-sheathed or metallic armored cables without a nonmetallic protective covering over the sheath or armor prior to application of fireproofing. Wrap must be in the form of two tightly applied half-lapped layers of a pressure-sensitive 10 mil thick plastic tape, and must extend not less than one inch into the duct. Even out irregularities of the cable, such as at splices, with insulation putty before applying tape.

### 3.15 GROUNDING SYSTEMS

NFPA 70 and IEEE C2, except provide grounding systems with a resistance to solid earth ground not exceeding 5 ohms.

#### 3.15.1 Grounding Electrodes

Provide cone pointed driven ground rods driven full depth plus 6 inches, installed to provide an earth ground of the appropriate value for the particular equipment being grounded.

If the specified ground resistance is not met, provide an additional ground rod in accordance with the requirements of NFPA 70 (placed not less than 6 feet from the first rod). Should the resultant (combined) resistance exceed the specified resistance, measured not less than 48 hours after rainfall, notify the Contracting Officer immediately.

#### 3.15.2 Grounding Connections

Make grounding connections which are buried or otherwise normally inaccessible, by exothermic weld or compression connector.

- a. Make exothermic welds strictly in accordance with the weld manufacturer's written recommendations. Welds which are "puffed up" or which show convex surfaces indicating improper cleaning are not acceptable. Mechanical connectors are not required at exothermic welds.
- b. Make compression connections using a hydraulic compression tool to provide the correct circumferential pressure. Tools and dies must be as recommended by the manufacturer. An embossing die code or other standard method must provide visible indication that a connector has been adequately compressed on the ground wire.

#### 3.15.3 Grounding Conductors

Provide bare grounding conductors, except where installed in conduit with associated phase conductors. Ground cable sheaths, cable shields, conduit, and equipment with No. 6 AWG. Ground other noncurrent-carrying

metal parts and equipment frames of metal-enclosed equipment. Ground metallic frames and covers of handholes and pull boxes with a braided, copper ground strap with equivalent ampacity of No. 6 AWG. Provide direct connections to the grounding conductor with 600 v insulated, full-size conductor for each grounded neutral of each feeder circuit, which is spliced within the manhole.

#### 3.15.4 Ground Cable Crossing Expansion Joints

Protect ground cables crossing expansion joints or similar separations in structures and pavements by use of approved devices or methods of installation which provide the necessary slack in the cable across the joint to permit movement. Use stranded or other approved flexible copper cable across such separations.

#### 3.15.5 Manhole Grounding

Loop a 4/0 AWG grounding conductor around the interior perimeter, approximately 12 inches above finished floor. Secure the conductor to the manhole walls at intervals not exceeding 36 inches. Connect the conductor to the manhole grounding electrode with 4/0 AWG conductor. Connect all incoming 4/0 grounding conductors to the ground loop adjacent to the point of entry into the manhole. Bond the ground loop to all cable shields, metal cable racks, and other metal equipment with a minimum 6 AWG conductor.

#### 3.15.6 Fence Grounding

Provide grounding for fences as indicated. Drive ground rods until the top is 12 inches below grade. Attach a No. 4 AWG copper conductor, by exothermic weld to the ground rods and extend underground to the immediate vicinity of fence post. Lase the conductor vertically into 12 inches of fence mesh and fasten by two approved bronze compression fittings, one to bond wire to post and the other to bond wire to fence. Bond each gate section to its gatepost by a 1/8 by one inch flexible braided copper strap and ground post clamps. Clamps must be of the anti-electrolysis type.

### 3.16 EXCAVATING, BACKFILLING, AND COMPACTING

Provide in accordance with NFPA 70 and Section 31 00 00 EARTHWORK.

#### 3.16.1 Reconditioning of Surfaces

##### 3.16.1.1 Unpaved Surfaces

Restore to their original elevation and condition unpaved surfaces disturbed during installation of duct. Preserve sod and topsoil removed during excavation and reinstall after backfilling is completed. Replace sod that is damaged by sod of quality equal to that removed. When the surface is disturbed in a newly seeded area, re-seed the restored surface with the same quantity and formula of seed as that used in the original seeding, and provide topsoiling, fertilizing, liming, seeding, sodding, sprigging, or mulching. Provide work in accordance with Section 32 92 19 SEEDING and Section 32 93 00 EXTERIOR PLANTS.

##### 3.16.1.2 Paving Repairs

Where trenches, pits, or other excavations are made in existing roadways and other areas of pavement where surface treatment of any kind exists ,

restore such surface treatment or pavement the same thickness and in the same kind as previously existed, except as otherwise specified or indicated in details, and to match and tie into the adjacent and surrounding existing surfaces. Make repairs as specified in Section 32 13 13.06 PORTLAND CEMENT CONCRETE PAVEMENT FOR ROADS AND SITE FACILITIES.

### 3.17 CAST-IN-PLACE CONCRETE

Provide concrete in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE.

#### 3.17.1 Concrete Slabs (Pads) for Equipment

Unless otherwise indicated, the slab must be at least 8 inches thick, reinforced with a 6 by 6 - W2.9 by W2.9 mesh, placed uniformly 4 inches from the top of the slab. Place slab on a 6 inch thick, well-compacted gravel base. Top of concrete slab must be approximately 4 inches above finished grade with gradual slope for drainage. Edges above grade must have 1/2 inch chamfer. Slab must be of adequate size to project at least 8 inches beyond the equipment.

Stub up conduits, with bushings, 2 inches into cable wells in the concrete pad. Coordinate dimensions of cable wells with transformer cable training areas.

#### 3.17.2 Sealing

When the installation is complete, seal all conduit and other entries into the equipment enclosure with an approved sealing compound. Seals must be of sufficient strength and durability to protect all energized live parts of the equipment from rodents, insects, or other foreign matter.

### 3.18 FIELD QUALITY CONTROL

#### 3.18.1 Performance of Field Acceptance Checks and Tests

Perform in accordance with the manufacturer's recommendations, and include the following visual and mechanical inspections and electrical tests, performed in accordance with NETA ATS.

##### 3.18.1.1 Medium Voltage Cables

Perform tests after installation of cable, splices, and terminators and before terminating to equipment or splicing to existing circuits.

##### a. Visual and Mechanical Inspection

- (1) Inspect exposed cable sections for physical damage.
- (2) Verify that cable is supplied and connected in accordance with contract plans and specifications.
- (3) Inspect for proper shield grounding, cable support, and cable termination.
- (4) Verify that cable bends are not less than ICEA or manufacturer's minimum allowable bending radius.
- (5) Inspect for proper fireproofing.

(6) Visually inspect jacket and insulation condition.

(7) Inspect for proper phase identification and arrangement.

b. Electrical Tests

(1) Perform a shield continuity test on each power cable by ohmmeter method. Record ohmic value, resistance values in excess of 10 ohms per 1000 feet of cable must be investigated and justified.

(2) Perform acceptance test on new cables before the new cables are connected to existing cables and placed into service, including terminations and joints. Submit results per submittals for Existing Cable Assessment Tests.

(3) Perform maintenance test on complete cable system after the new cables are new cables connected to existing cables and placed into service, including existing cable, terminations, and joints. Tests must be very low frequency (VLF) alternating voltage withstand tests in accordance with IEEE 400.2. VLF test frequency must be 0.05 Hz minimum for a duration of 60 minutes using a sinusoidal waveform. Test voltages must be as follows:

| CABLE RATING AC TEST VOLTAGE for<br>ACCEPTANCE TESTING |                |
|--------------------------------------------------------|----------------|
| 5 kV                                                   | 10kV rms(peak) |
| 8 kV                                                   | 13kV rms(peak) |
| 15 kV                                                  | 20kV rms(peak) |
| 25 kV                                                  | 31kV rms(peak) |
| 35 kV                                                  | 44kV rms(peak) |

| CABLE RATING AC TEST VOLTAGE for<br>MAINTENANCE TESTING |                |
|---------------------------------------------------------|----------------|
| 5 kV                                                    | 7kV rms(peak)  |
| 8 kV                                                    | 10kV rms(peak) |
| 15 kV                                                   | 16kV rms(peak) |
| 25 kV                                                   | 23kV rms(peak) |
| 35 kV                                                   | 33kV rms(peak) |

3.18.1.2 Low Voltage Cables, 600-Volt

Perform tests after installation of cable, splices and terminations and before terminating to equipment or splicing to existing circuits.

a. Visual and Mechanical Inspection

- (1) Inspect exposed cable sections for physical damage.
- (2) Verify that cable is supplied and connected in accordance with contract plans and specifications.
- (3) Verify tightness of accessible bolted electrical connections.
- (4) Inspect compression-applied connectors for correct cable match and indentation.
- (5) Visually inspect jacket and insulation condition.
- (6) Inspect for proper phase identification and arrangement.

b. Electrical Tests

- (1) Perform insulation resistance tests on wiring No. 6 AWG and larger diameter using instrument which applies voltage of approximately 1000 volts dc for one minute.
- (2) Perform continuity tests to ensure correct cable connection.

3.18.1.3 Grounding System

a. Visual and mechanical inspection

Inspect ground system for compliance with contract plans and specifications.

b. Electrical tests

Perform ground-impedance measurements utilizing the fall-of-potential method in accordance with IEEE 81. On systems consisting of interconnected ground rods, perform tests after interconnections are complete. On systems consisting of a single ground rod perform tests before any wire is connected. Take measurements in normally dry weather, not less than 48 hours after rainfall. Use a portable ground resistance tester in accordance with manufacturer's instructions to test each ground or group of grounds. The instrument must be equipped with a meter reading directly in ohms or fractions thereof to indicate the ground value of the ground rod or grounding systems under test. Provide site diagram indicating location of test probes with associated distances, and provide a plot of resistance vs. distance.

3.18.2 Follow-Up Verification

Upon completion of acceptance checks and tests, show by demonstration in service that circuits and devices are in good operating condition and properly performing the intended function. As an exception to requirements stated elsewhere in the contract, the Contracting Officer must be given 5 working days advance notice of the dates and times of checking and testing.

.... -- End of Section --

SECTION 35 45 01

VERTICAL PUMPS, MIXED-FLOW IMPELLER-TYPE  
**02/21, CHG 3: 08/23**

PART 1 GENERAL

1.1 PRICES

1.1.1 Vertical Pumps, Mixed-Flow Impeller-Type

1.1.1.1 Payment

Payment will be made for costs associated with furnishing and installing the vertical pumps, and mixed-flow impeller-type, as specified.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Contractor Selected Manufacturers; G, AE

SD-02 Shop Drawings

Detail Drawings; G, AE

SD-03 Product Data

Materials; G, AE

Shipping Bills

Pump Curves; G, AE

Installation and Erection Instructions Manual; G, AE

Field Tests; G, AE

In Water Bearing Lubrication; G, AE

Grout; G, AE

SD-04 Samples

Materials; G, AE

SD-05 Design Data

Stress-Relieving Procedure; G, AE

Baseplates and the Anchoring Bolts; G, AE

SD-06 Test Reports

Factory Test; G, AE

Balancing; G, AE

Field Test Results; G, AE

SD-07 Certificates

Qualified Welders; G

Examination Procedure And Qualification Of The Examiner; G

SD-10 Operation and Maintenance Data

Operation and Maintenance Instructions Manual; G, AE

1.4 QUALITY ASSURANCE

1.4.1 Detail Drawings

Submit drawings of sufficient size to be easily read, within 90 days of notice of award of contract. Submit information in the English language. Provide with English (IP) dimensions. Drawings must consist of complete designs of the pump, pump installation instructions, performance charts, brochures, and other information required to illustrate that the entire pumping system (including the pump, motor has been coordinated and will function as a unit.

- a. Outline drawings of the pump showing pertinent dimensions and weight of each component of the pump. Prepare drawings to scale.
- b. Drawing showing details and dimensions of pump mounting design or layout including any embedded items.
- c. Cross-sectional drawings of the pump showing each component. Show major or complicated sections of the pump in detail. Indicate on each drawing an itemized list of components showing type, grade, and class of material used and make and model number of standard component used.
- d. Detail and assembly drawings of entire pump. Include all dimensions required to manufacture pump.
- e. Drawings covering erection and installation, that are intended to be furnished to the erecting engineer.
- f. Drawings of the pump; base plate showing its dimensions.

1.4.2 Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, procedures and welders must be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1. Perform welder qualification tests for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests. Perform the qualification tests at the work site if practical. The welder or welding operator must apply their assigned symbol near each weld made as a permanent record.

The names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, and standards tested to.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Outfit major pump components with lifting lugs or eye bolts to facilitate handling. Design and arrange lugs or bolts to allow safe handling of pump

components singly or collectively as required during shipping, installation, and maintenance. Submit copies of certified shipping bills to the Contracting Officer or memorandums of all shipments of finished pieces or members to designated site, giving designation mark and weight of each piece, number of pieces, total weight, and if shipped by rail in carload lots, car initial and number.

#### 1.5.2 Processing for Storage

Prepare pumps and spare parts for storage indoors. Indoor storage consists of a permanent building that has a leak-proof roof, full walls to contain stored equipment, and a concrete floor or temporary trailers. A temporary structure may also be built at the job site for equipment storage that will contain features of the permanent building above except that provision for ventilation must be provided and floor may be crushed rock. Provide a vapor barrier below the crushed rock. Use cribbing below equipment stored on crushed rock so that equipment does not come in contact with crushed rock. Provide a plastic barrier between equipment and wood cribbing. Submit a list of equipment and materials requiring to the Contracting Officer no later than 30 days prior to shipment of pumping units. Store long term (greater than 6 months) in accordance with Contractor selected pump specifications.

### 1.6 PROJECT/SITE CONDITIONS

#### 1.6.1 Static Head

Static head is the difference, in feet, between water surface elevation in the immediately inside trash rack and water surface elevation of river. Total head includes static head, friction losses outside of equipment being furnished, plus velocity head loss.

### 1.7 MAINTENANCE

#### 1.7.1 Special Tools

Include one set of special tools required to completely assemble, disassemble, or maintain the pumps. Special tools refer to oversized or specially dimensioned tools, special attachments or fixtures, or any similar items. If required, provide a device for temporarily supporting the pump shaft and impeller during assembly, disassembly, and reassembly of the motor when the thrust bearing is not in place.

### 1.8 WARRANTY

Provide a warranty for all equipment included under this section against defective workmanship, materials, design, and performance for a period of 12 months from the date the equipment is accepted. If the equipment or part does not conform to these warranties, and the Government notifies the Contractor within a reasonable time after its discovery, the Contractor must promptly correct such nonconformity by repair or replacement. Coordinate the down time and repair for the equipment with the Contracting Officer. The Contractor is liable during the warranty period for the direct cost of removal of the equipment from the installed location, transportation for repair, and reinstallation on site. The expense of removing adjacent apparatus, installing spare equipment, costs of supplying temporary service, is not included in this warranty provision.

## PART 2 PRODUCTS

### 2.1 SYSTEM DESCRIPTION

Design and provide identical, vertical, mixed-flow, single stage impeller-type pumps, as indicated. The pumping systems include pumps and electric motor pump drives.

#### 2.1.1 Design Requirements

- a. Pumps are for the purpose of pumping seawater from B242 into to B72. Water pumped will not exceed 68 degrees F, will be relatively turbid, and may contain sand and silt capable of passing through the intake screen. An intake screen will have 0.0315 inch clear openings.
- b. Design pumps so that no major modifications, alterations, or additions will be required to the pumping station to accommodate them. Design pumps so that pump parts will fit within the limiting horizontal and vertical dimensions shown and that installation and maintenance can be accomplished by the interior; overhead traveling crane. Pumps must be capable of being lowered through floor openings shown with a minimum of 1 inch clearance around each side.
- c. Design documents must be signed and sealed by a professional engineer.

#### 2.1.2 Capacities

Each pump must:

- a. The guarantee point for the pump is 780 gal/min with a differential total dynamic head pressure of 64 feet with water surface in sump at Elevation -0.25 ft (NAV 88) feet. Note high water level is 4.18 ft and low water elevation is -4.71 ft. With both pumps in operation, the system shall achieve 1,550 gal/min with a differential total dynamic head pressure of 72 feet. 1

#### 2.1.3 Pump Curves

Indicate on the pump curves for the submitted pumps that the pumps are capable of operating over the entire total head corresponding to the static head range.

### 2.2 MATERIALS

Material selection not specified is guided by HI 9.1-9.5 for corrosion, erosion, and abrasion resistance. Submit copies of purchase orders, deviations from the specified materials, mill orders, shop orders for materials, and work orders, including orders placed or extended by each supplier. Furnish a list designating materials to be used for each item at time of submittal of drawings. Within 60 days of notice of award submit names of Contractor selected manufacturers of machinery and other equipment contemplated to be incorporated in the work, together with performance capacities and other relevant information pertaining to the equipment. Submit samples of materials as directed. Equipment, materials, and articles installed or used without the approval of the Contracting Officer are at risk of subsequent rejection.

- a. Identify each pump by means of a separate nameplate permanently affixed in a conspicuous location. The plate must bear the

manufacturer's name, model designation, serial number if applicable, and other pertinent information e.g. horsepower, speed, capacity, type, direction of rotation. Make the plate of corrosion-resisting metal with raised or depressed lettering and a contrasting background.

- b. Equip each pump with suitably located instruction plates, including any warnings and cautions, describing any special and important procedures to be followed in starting, operating, and servicing the equipment. Make the plates of corrosion-resisting metal with raised or depressed lettering and contrasting background.
- c. Provide safety guards and/or covers wherever necessary to protect the operators from accidental contact with moving parts. Make guards and covers of sheet steel, expanded metal, or another acceptable material and removable for disassembly of the pump.

## 2.3 METALWORK FABRICATION

### 2.3.1 Designated Materials

Designated materials must conform to the following specifications, grades, and classifications.

| MATERIALS                                           | SPECIFICATION   | GRADE, CLASS                                      |
|-----------------------------------------------------|-----------------|---------------------------------------------------|
| Aluminum-Bronze                                     | ASTM B148       | Alloy No. C95500 Castings                         |
| Cast Iron                                           | ASTM A48/A48M   | Class Nos. 150A 150B, and 150C; 30A, 30B, and 30C |
| Cast Steel                                          | ASTM A27/A27M   | Grade 65-35, annealed                             |
| Cast Stainless Steel                                | ASTM A743/A743M | CF8                                               |
| Coal Tar Protective Coatings                        | AWWA C203       |                                                   |
| Cold-Rolled Steel Bars                              | ASTM A108       | min, Wt. Strm 65,000 psi                          |
| Copper Alloy Castings                               | ASTM B584       | Alloy No. C93700                                  |
| Corrosion-Resistant Alloy Casting                   | ASTM A217/A217M | Grade CA15                                        |
|                                                     | ASTM A352/A352M | CA6NM                                             |
|                                                     | ASTM A351/A351M | CF8M                                              |
| Dimensions for Steel Water Piping Fittings          | AWWA C208       |                                                   |
| Hot-Rolled Stainless                                | ASTM A576       | Graded G10200 and G11410                          |
| Ring Flanges                                        | AWWA C207       | Class B                                           |
| Rubber Products in Automotive Applications          | ASTM D2000      |                                                   |
| Seamless and Welded Austenitic Stainless Steel Pipe | ASTM A312/A312M |                                                   |
| Stainless Bars and Shapes                           | ASTM A276/A276M | Grades S30400 and S41000                          |

| Surface Texture (Surface Roughness, Waviness, and Lay) | ASME B46.1      |              |

## 2.3.2 Bolted Connections

### 2.3.2.1 Bolts, Nuts, and Washers

Bolts, nuts, and washers must conform to requirements of paragraphs under METALWORK FABRICATION, and paragraphs under VERTICAL PUMPS for types required. Use beveled washers where bearing faces have a slope of more than 1:20 with respect to a plane normal to bolt axis.

### 2.3.2.2 Materials Not Specifically Described

Materials not specifically described must conform to latest ASTM specification or to other listed commercial specifications covering class or kinds of materials to be used.

## 2.3.3 Metalwork

### 2.3.3.1 Flame Cutting of Material

Flame cutting of material other than steel is subject to approval of the Contracting Officer. Shear accurately, and neatly finish all portions of work. Steel may be cut by mechanically guided or hand-guided torches, provided an accurate profile with a smooth surface free from cracks and notches is secured. Prepare surfaces and edges to be welded in accordance with AWS D1.1/D1.1M. Do not chip or grind except where specified and as necessary to remove slag and sharp edges of mechanically guided or hand-guided cuts not exposed to view. Visible or exposed hand-guided cuts must be chipped, ground, or machined to metal free of voids, discontinuities, and foreign materials.

### 2.3.3.2 Alignment of Wetted Surfaces

Exercise care to assure that correct alignment of wetted surfaces being joined by a flanged joint is being obtained. Where plates of the water passage change thickness, transition on the outer surface, leaving inner surface properly aligned. When welding has been completed and welds have been cleaned, but prior to stress relieving, carefully check joining of plates in the presence of the Contracting Officer for misalignment of adjoining parts. Localized misalignment between inside or wetted surfaces of an adjoining flange-connected section of pump cannot exceed the amount shown in Column 4 of Table 1 for the respective radius or normal distance from the theoretical flow centerline. Correct misalignments greater than the allowable amount by grinding away offending metal, providing the maximum depth to which metal is to be removed does not exceed amount shown in Column 5 of Table 1. Do not remove metal until assuring the Contracting Officer that no excessive stresses will occur in the remaining material and that excessive local vibration will not result from removal of the material. Where required correction is greater than the amount in Column 5 of Table 1, reject pipe for use. Proposed procedure for all corrective work, other than minor grinding, must be approved by the Contracting Officer prior to start of corrective work. Finish corrective work by grinding corrected surface to a smooth taper. Length of the taper along each flow line element must be 10 times the depth of the offset error at the flow line. Wetted surface irregularities that might have existed in an approved model cannot be reason for accepting comparable surface irregularities in the prototype pump.

| TABLE 1                |                                  |                         |                         |                              |
|------------------------|----------------------------------|-------------------------|-------------------------|------------------------------|
| (1)                    | (2)                              | (3)                     | (4)                     | (5)                          |
| Pipe Diameter (inches) | Pipe Radius or Distance (inches) | Pipe Thickness (inches) | Maximum Offset (inches) | Grind-Not More Than (inches) |
| 24                     | 12                               | 3/8                     | 1/16                    | 3/32                         |

### 2.3.3.3 Stress-Relieving Procedure

After all fabrication welding is completed, and prior to any machining, stress-relieve the bell and the impeller (if it is fabricated) by heat

treatment. Submit proposed stress-relieving procedure.

#### 2.3.4 Examination of Castings

Clean and carefully examine all castings for surface defects. Examine all discovered defects by nondestructive means. Examination personnel must be qualified/certified in accordance with applicable ASTM requirements. Submit the examination procedure and qualification of the examiner. Conduct examination tests in the presence of the Contracting Officer. Choose the examination procedure best suited for the application.

##### 2.3.4.1 Examination Procedures

###### 2.3.4.1.1 Vibration

The pump, motor, and base shall operate outside of the natural resonant frequencies.

###### 2.3.4.1.2 Liquid Penetrant

Conform inspection to the applicable provisions of ASTM E165/E165M.

#### 2.4 VERTICAL PUMPS

##### 2.4.1 Speed

Rotative speed of pump must be no greater than 1,800 rpm.

##### 2.4.2 Efficiency

Pump efficiency, as defined in HI ANSI/HI 14.6, must include losses from the suction bell to the discharge elbow outlet and must not be less than 76 percent at the head-capacity condition(s) specified in paragraph CAPACITIES.

##### 2.4.3 Suction Bell

Make each suction bell of stainless steel plate. Provide a flanged connection for mating with the impeller bowl with a rabbet fit or four equally spaced dowels installed in the vertical position for initial alignment purposes and to maintain concentric alignment of the pump. Support each suction bell entirely by the pump casing. Supports from sump floor will not be acceptable.

##### 2.4.4 Impeller Bowl

Make each impeller bowl of nickel aluminum bronze (ASTM B148 Alloy 958). Heat-treat and stress-relieve welds before final machining. Provide flanges for mating with the suction bell and the impeller bowl or two-piece construction of the impeller. Provide flanged connections with the suction bell and the diffuser or split construction with a rabbet fit or four equally spaced dowels installed in the vertical position for initial alignment purposes and to maintain concentric alignment of the pump. Machine finish the impeller-swept area in the impeller bowl to at least 125 microinch rms and concentric with the impeller axis. For mixed-flow impellers, the angle in the impeller bowl must equal the outside angle of the impeller blade tips. Tolerance for concentricity of the impeller with the impeller axis is not greater than 20 percent of the operating clearance between the impeller and the impeller bowl.

#### 2.4.5 Diffuser Bowl

Make each diffuser bowl of nickel aluminum bronze (ASTM B148 Alloy 958). The diffuser must contain support for the upper impeller shaft bearing and have vanes to guide the pumped flow. Equip the diffuser bowl with a bypass drain, if required, to outside of the pump from the diffuser cavity located between the enclosing tube connection and the impeller. Furnish throttle bushing located in the cavity immediately above the impeller. Design bypass drain and throttle bushing to reduce water pressure on the lower seal. Impeller back-wear rings can also be used to reduce water pressure on the lower seal.

#### 2.4.6 Pump Column and Discharge Elbow

##### 2.4.6.1 Column and Discharge Elbow

Make each discharge elbow of duplex stainless steel plate (ASTM A240), Pipe (ASTM A790), UNS S32205. If turning vanes made of welded steel plate are used, provide an access door in the discharge elbow to allow personnel to inspect turning vanes and remove trash if necessary. Design column and discharge elbow to withstand internal pressures and external loadings associated with various conditions of pump operation. Provide flanges for mating individual segments together and for mating the pump column to the diffuser bowl. Flanges must have rabbeted fits or four equally spaced dowels installed in flanges for initial alignment purposes and to maintain concentric alignment. Terminate the elbow in a plain-end circular section. . Provide diameter of discharge end of elbow as indicated and allow standard diameter flexible couplings to be used. Use adjustable thrust rods and thrust lugs to transfer the load by bridging the coupling between the pump discharge elbow and discharge piping. Determine the size and number of thrust rods needed for the expected loading. Use a minimum of four thrust rods. Maintain complete access to the discharge piping until the discharge pipe installation is complete, inspected, and approved.

##### 2.4.6.2 Column and Discharge Elbow Support

Make each pump pipe column of fiber glass (D2996 Gr.1) material and the column size shall be a minimum of 8-inches outside diameter to reduce friction losses and velocity through the column. Column pipe thickness shall be Schedule 40 and the flange bolt material shall be monel bolts (ASTM F467 N04400) and nuts (ASTM F46 N0440).

Design pump column and discharge elbow for suspension from a baseplate assembly specified in paragraph BASEPLATE AND SUPPORTS and located at operating floor level.

Design each pumping unit for installation as indicated. Install the baseplate for supporting the electric motor. Design the support system to maintain proper alignment of the pumping unit and propeller blade setting. Include the support system in the dynamic analysis.

##### 2.4.6.3 Flanges

Machine flanges and drill bolt holes concentric with pump shaft vertical centerline, having a tolerance of plus or minus one fourth of the clearance between the bolt and bolt hole. When fabricated from steel plate, flanges must not be less than 1 inch thick after machining. Flange thickness after machining cannot vary more than 10 percent of greatest

flange thickness. Provide external stiffeners, if needed. Construct fabricated flanges, as a minimum, to the dimensions of AWWA C207, Class B. Design flanges on major components of pump casing (suction bell, impeller bowl, diffuser bowl, and column and elbow piping) such that blind holes necessitating use of cap screws or stud bolts are not used. Design flanges for connection to column pipe by at least two continuous fillet welds. Connect the inside diameter of the flange to pump column with one weld, and connect the outside diameter of the pump column to the flange with the other weld. Final design of welds rests with the manufacturer, and specified welds are the minimum requirement. Parallel machine, when provided on each end of the same component, and mount parallel to a plane that is normal to pump shaft centerline. Flanges on each end of the same component must have parallel tolerance of 0.002 inch. Finish machine mating surface on flange to 125 microinch finish or better. Provide flanges with a minimum of three jacking bolts to aid in disassembly of the pump.

#### 2.4.6.4 Flanged Joints

Design flanged joints to be air-and water-tight, against positive and negative operating pressures that will be experienced. Provide mating flanges, unless of the male-female rabbet type, with not less than four tapered dowels equally spaced around each flange. If rabbeted fit is not used, then provide the method used to determine concentricity of connected pieces. Gaskets are permitted to be used between column sections, gasket material must be EPDM.

#### 2.4.6.5 Nuts and Bolts

Monel material shall be used for bolts used in assembling the pump and its supporting members, including anchor bolts and dowels. Use only monel nuts and hexagonal bolts and nuts. Also use monel washers.

#### 2.4.6.6 Harnessed Coupling

Provide a flexible mechanical coupling or split-sleeve type coupling that either conforms to ASTM F1476, Type II, Class 3, stainless steel or ASTM F1476, Type 1, to connect the pump discharge elbow to the discharge piping. Install a minimum of four harness bolts (sized by the pump manufacturer) at each coupling.

#### 2.4.7 Impeller

Make the impeller of nickel aluminum bronze.

##### 2.4.7.1 Removal and Prior To Finishing

After removal from mold, and prior to finishing of surface imperfections, the Contracting officer will inspect castings. Fill and grind minor surface imperfections as necessary to preserve correct contour and outline of impeller and to restore surface imperfections to the same degree of finish as surrounding surfaces. Correct surface pits, depressions, projections, or overlaps showing greater than 1/16 inch variation from the general contour for that section. Castings that exhibit surface imperfections (as defined above) covering an area of more than 10 percent of blade surface will be rejected.

#### 2.4.7.2 Balancing

Balance each impeller by the two-plane balancing technique. Balance each impeller at rated operating speed. Check the balance at 110 percent of balance speed, and make needed corrections. Amount of allowable unbalance is in accordance with grade G6.3 of ISO 1940-1. Securely fasten weights needed to obtain the required level of balance to the inside cavity of the impeller hub. In no case can portions of the impeller be removed or weights be added to the outside of the hub, vanes, or water passages. Provide documentation of completed balance test with certification statement.

#### 2.4.8 Shafting

##### 2.4.8.1 Shaft

Each impeller shaft must be Monel K-500 and intermediate shaft(s) must be same material as the impeller shaft without interfering with shaft alignment. Each impeller shaft shall be provided with tungsten carbide bearing journal hardfacing. Also provide for removal of the impeller from below without disassembly of the pump above the impeller bowl. If the pump is multi-staged, design to permit the lower bowls and impeller to be easily removed for in-place inspections of upper propeller and bowl. Design shafts for two different design cases. The first uses a factor of safety of 5 based on ultimate tensile strength of the shaft material and rated horsepower of the motor. The second uses 75 percent of the yield strength of the shaft material and the locked rotor torque of the motor .

##### 2.4.8.2 Couplings

Couple the pump and motor shafts together using rigid flanged coupling capable of transmitting the forces and torques involved. Bolt coupling halves together and maintain concentric with each other, by means of a rabbet fit, to within 0.002 inch. Retain a shaft coupling nut, if used, by fitted bolts, and comply with all tolerances specified for the coupling. Finish machine the flange and bore in one setup to insure that the flange of the coupling is true to the bore. Each flange must be perpendicular to the bore, and parallel to the opposite end and mating flanges to within 0.002 inch. Each flange must be concentric to the centerline of the shaft to within 0.002 inch. Join together pump shaft sections with sleeve-type couplings capable of taking rotation in either direction. Threads, except on fasteners, cannot be employed in construction of sleeve-type couplings. Construct couplings, including keys and fasteners, of Monel K-500 (ASTM B865 K-500 UNS N05500) materials. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The finished shaft assembly must be concentric about the shaft centerline to within 0.004 inch. Shop assemble couplings and the pump shaft, and inspect for compliance with contract requirements. After inspection, matchmark parts, including fitted bolts, to their mating pieces.

##### 2.4.8.3 Journals

Finish sleeves at all bearings and packing gland locations to at least 32 rms and finish sleeves at seal locations to 16 rms. Securely fasten sleeves to the shaft to prevent movement. Make keys and fasteners, if used, from corrosion resisting steel; fastening by adhesive or welding is not acceptable. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The surface hardness of the sleeves at the bearing and packing gland locations must be as recommended by the pump

manufacturer.

Finish the shaft journal at all guide bearing and packing gland locations to at least 32 rms and finish the shaft at seal journal locations to 16 rms. The option exists to install replaceable stainless steel one-piece sleeves at each bearing, packing gland, and seal locations with the finishes stated above. Securely fasten sleeves to the shaft to prevent movement. Make keys and fasteners, if used, from corrosion resisting steel; fastening by adhesive or welding is not acceptable. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The surface hardness at the seal locations must be as recommended by the seal manufacturer.

#### 2.4.8.4 Circumferential Line

Inscribe or etch a circumferential line on the shaft above the stuffing box and mount an adjustable pointer opposite this line in order to indicate a change in vertical position of shaft and to permit realignment after motor removal.

#### 2.4.9 Shaft Enclosure

Provide a shaft enclosure to cover the intermediate shaft and coupling. It must be rigid enough to be self-supporting. Design each enclosure to be watertight and for easy assembly and disassembly in the field. Split each enclosure longitudinally to permit easy removal without removing or disassembling the pump shaft. Construct enclosing tubes, constructed with screw type joints and using tension in the tube to hold alignment, to prohibit the tension tube from unscrewing when the packing gland adjustments are made.

#### 2.4.10 Guide Bearings and Seals

##### 2.4.10.1 Guide Bearings

All in water bearing lubrication must conform EPA 800-R-11-002 for environmental acceptability. Submit in water bearing lubrication product data to show bearings meet environmental, performance, and comparability requirements for the application.

Bearings shall be Thordon GM22401 composite materials. Ensure the bearings are submerged in water when the pump is in operation. Accomplish lubrication by pump discharge water (product water) free-flowing through perforations in the shaft enclosure tube.

Provide each pump with bearings that are grooved and continuous. Machine the bearings to marine clearances for strained water lubrication and of sufficient length and diameter to keep bearing pressure to the allowable design. Select bearing thicknesses and marine clearances to allow for material swell from water submergence. Shaft bearings may be located as the design dictates with the following exceptions. Provide no fewer than three bearings in the pump with a maximum bearing spacing of 5 feet. Locate bearings at the top of the diffuser section, above the impeller, and near the baseplate. Support the line shaft bearing by the diffuser inner cone fabricated assembly. Secure tubing for bearing lubrication water to and routed on the outside of the casing for each bearing. The tubing must be continuously welded to a diffuser vane or bearing support to cross from the outside of the casing to the bearing mounting assembly.

Bearings must be easily removable for servicing in the field.

#### 2.4.10.2 Product Lubricated Pump Bearings

Submerged pump bearing must be product lubricated and meet the following requirements:

- a. Fabricated from a Thordon GM2401 composite material and not require petroleum lubricants for operation.
- b. Operate in brackish water that may contain silt.
- c. Does not require service or replacement for 50,000 operating hours.

#### 2.4.11 Thrust Bearing

Provide a thrust bearing in the motor to carry total thrust load occurring across pump operation.

#### 2.4.12 Packing Gland

Provide water-lubricated packing gland split longitudinally to facilitate removal or renewal. Arrange it to permit inspection, repair, removal, or replacement of packing without entering pump from below operating room floor. Provide eye bolts and tapped holes in each half of the split gland if halves weigh over 30 pounds each.

#### 2.4.13 Siphon Breaker Valve

Provide a siphon breaker valve assembly for each of the vertical axial-flow pumps. Provide mechanical, self-actuating valves. Install each assembly at the top (summit) of the discharge pipe and must vent air from the discharge pipe when the pump is started. The assembly must also permit air to enter the discharge pipe through the siphon breaker valve to prevent reverse siphoning of water when the pump is stopped. Size the valves based on the pumping conditions (e.g. flow, head, discharge pipe diameter) of the specific system. If a mechanically-actuated valve is chosen, size the valve to allow air to relieve at a maximum of 300 feet per second. Provide a means to operate the valve manually to stop back-siphoning through the pump in case the normal operator of the siphon breaker valve fails.

### 2.5 LUBRICATION SYSTEM

All in water bearing lubrication must conform EPA 800-R-11-002 for environmental acceptability. Submit in water bearing lubrication product data to show bearings meet environmental, performance, and comparability requirements for the application.

Provide lubrication for the bearings from the water being pumped (i.e., product water) by means of perforations in the shaft enclosure. Design the perforations such that the shaft tube is constantly filled with water during pump operation, thereby continually covering the contact surfaces of the bearings. If upper bearings will not receive sufficient pumped water for lubrication, use another means to provide sufficient water to these bearings using either product water or water from the intake canal. Provide a means to indicate visually that the upper bearing(s) and packing gland are obtaining sufficient lubrication water.

### 2.5.1 Supplemental Lubrication Water

If it is determined that the pumped product water cannot be lifted sufficiently to lubricate the upper bearing(s), it is the Contractor's responsibility to design and provide a complete water lubrication system. Provide a separate water lubrication system for each pump. The water cannot come from the potable/well water system. This water lubrication system must include a means for providing sufficient lubrication water to the upper bearing(s). The supplemental lubrication water system must include an alarm and shutdown in case of low-flow or no-flow to the upper bearing(s), along with electrical input to the engine control panel and SCADA/PLC systems as needed. Provide any necessary filtering, flow switches, time delays, to ensure that the upper bearings are satisfactorily lubricated. Coordinate any additional electrical power and controls requirements with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and other electrical sections. The supplemental lubrication water system must be fully maintainable. If the supplemental lubrication water system is needed, provide shop drawings, operations and maintenance data, and as-built drawings as required.

### 2.6 PAINTING

Perform painting in accordance with Section 09 90 00 PAINTING.

### 2.7 FACTORY ASSEMBLY

The pump must be assembled at the Contractor's selected manufacturer's plant to assure proper fitting and alignment of all parts. Tolerances cannot exceed those specified or shown on the the manufacturing drawings. Check rotating elements for binding. The suction bell, impeller housing, diffuser, and the discharge elbow must be properly match marked and have their centerlines clearly marked on the outside of all flanges to facilitate erection and alignment in the field. Notify the Contracting Officer sufficiently in advance to permit a representative of the Contracting Officer to inspect and witness the pump assembly. Matchmark all parts disassembled for shipment.

### 2.8 BASEPLATE AND SUPPORTS

Design and proportion the soleplate and baseplate to support the entire pump assembly, the motor and the loads (including the results of the dynamic analysis) to which it may be subjected during operation. Furnish lifting lugs or eye bolts, special slings, strongbacks, or other devices necessary to handle the pump during loading, unloading, erection, installation, and subsequent disassembly and assembly. Provide a sole plate under the baseplate. Install, level and grout the sole plate in accordance with API RP 686, Chapter 5 - Mounting Plate Grouting. Provide leveling nuts for leveling the baseplate assembly. Provide an anchor bolt layout to aid in placement of anchor bolts. The pedestal supporting the motor must contain a 1-inch lip to contain water leakage from the shaft packing. Provide a sole plate under the baseplate. Provide the calculations used in the design of the baseplates and the anchoring bolts to ensure that the proper forces (e.g. shear, torsion, bending) have been considered. Submit product data for grout used as pump supports. The baseplates must be structural steel plate of adequate thickness to support the weight of the pump plus the maximum hydraulic thrust of the pump. Provide plates of the length, width, and thickness as determined by the Contractor.

## 2.9 TESTS, INSPECTIONS, AND VERIFICATIONS

### 2.9.1 Pump Testing

Test specified pumps in accordance with HI ANSI/HI 14.6. For all pumps include Performance, hydrostatic, NPSH, and mechanical testing as described in HI ANSI/HI 14.6.

### 2.9.2 Critical Speeds

The assembled pumping unit, consisting of the motor and pump must be free from critical speeds or harmful torsional vibrations at all speeds encountered within the operating range.

Before the pump and motor are released for manufacture, the pump/motor structure must be analyzed by the Contractor for harmful natural frequencies in the lateral and torsional directions. A natural frequency that occurs within 25 percent above or below normal operating speed is unacceptable. Construct a dynamic analysis model using a commercially available program such as Ansys, Cosmos/M, or equivalent, which utilize finite element methods. Incorporate effects of column pipes, cover pipes, shafts, bearings, mass concentrations, and other such features as necessary to accurately model the pump structure. Analyze the structure in the run (wet) condition and consider the effect of water mass in the column and damping effect of water in the sump (vertical units only) at highest and lowest sump water levels. Incorporate Reed critical frequency and mass elastic diagram information for the Contractor's selected motors. If the Contractor cannot demonstrate to the satisfaction of the Contracting Officer (based on impact tests of similar units) that the Reed critical frequency value is accurate, the Contractor must conduct a dynamic analysis using finite element methods as described to determine motor Reed critical frequency for use with the Contractor selected pumps. Submit the complete detailed dynamic analysis report including the following information:

- a. Computer program used.
- b. Schematic diagram of the model depicting nodes and elements.
- c. Input data consisting of node coordinates, element types, material properties, element characteristics, element connectivities, and specified displacements.
- d. Motor mass elastic and Reed critical information (or dynamic analysis, if required).
- e. Analysis results, including significant natural frequencies.
- f. Interpretation of results.

Impact the test motor provided before shipment to determine actual Reed critical frequency of motor. Include results of impact tests included in motor test data to be submitted. The Contractor must address any discrepancy between calculated and actual motor Reed critical frequency values to determine whether design changes are required to prevent harmful natural frequencies in the pump/motor structure. Incorporate any design changes which are required to correct these discrepancies.

#### 2.9.2.1 Torsional Analysis

Before the pump, gear drive, and engine are released for manufacture, the Contractor must analyze the system for harmful torsional natural frequencies using mass elastic information for the selected pump(s) and gear drive(s). A natural frequency that occurs within 25 percent above or below normal operating speed is considered to be unacceptable.

#### 2.9.3 Lubricating System Tests

Test the complete lubricating system for each pumping unit, as deemed necessary by the Contracting Officer, to determine that the system meets the operational requirements specified. Test at least one valve of each size furnished with the lubrication line removed from its bearing and fitted with a pressure relief valve and pressure gage. Adjust the pressure relief valve to discharge it at the operating pressure specified and operate the system through one or more cycles as required to obtain an accurate measurement of the quantity of lubricant delivered. This must be within plus or minus 20 percent of the theoretical delivery of the respective valve. Replace, reinstall, and retest any component parts that are damaged as the result of these tests or that fail to meet the requirements of the specification.

#### 2.9.4 Factory Test

##### 2.9.4.1 General

Performance of the pump to be furnished will be accepted on the basis of the factory test. The factory test shall be performed in accordance with Standard Performance Test per ANSI/HI 14.6 Grade 1U. Conduct this test using the first pump produced for this contract.

##### 2.9.4.2 Instrumentation and Procedures

In the test report describe each instrument to be used in the tests in detail, giving all data applicable, such as manufacturer's name, type, model number, certified accuracy, coefficient, ratios, specific gravity of manometer fluid to be used, and smallest scale division. Provide calibration data on each of the instruments used. When necessary for clarity, include a sketch of the instrument or instrument arrangement. Include fully detailed narrative description of each proposed method of instrumentation, procedures to be used, and a sample set of computations. State the lowest equivalent static head that is obtainable with the testing when operating along the head-capacity curve of the proposed pump. Perform test procedures, except as specified, in accordance with applicable provisions of HI ANSI/HI 14.6.

##### 2.9.4.2.1 Head Measurements

Make head measurements using either a direct reading water column, mercury-air, mercury-water, a Meriam fluid manometer, or a pressure transducer. Measure vacuums with either a mercury-air manometer, a mercury-water manometer, or a pressure transducer. Dampen fluctuations sufficiently to permit column gages or a differential pressure transducer to be read to either closest 0.01 foot of water or Meriam fluid or 0.1 inch of mercury. Use manometers as indicated by ISA RP2.1. When pressure transducers are used, check their accuracy with a manometer.

#### 2.9.4.2.2 Capacity

Determine capacity by a calibrated flowmeter or long-radius ASME flow nozzle. Do not use orifice plates. Connect the flowmeter or nozzle taps to the column gages equipped with dampening devices that permits differential head to be determined to either the closest 0.01 foot of water or Meriam fluid or 0.1 inch of mercury. Magnetic flowmeters and flowmeters utilizing ultrasonic flow measurements will be acceptable if calibration of flowmeter has been completed within the last 6 months.

#### 2.9.4.2.3 Rotational Speed of Pump

Measure the rotational speed of the pump in accordance with "Method of Rotary Speed Movement" in HI ANSI/HI 14.6, except that revolution counters cannot be used. Non-contacting hand-held electronic tachometers are acceptable. The device used must permit the speed to be determined to 1 rpm.

#### 2.9.4.2.4 Power Input

Measure power input to the pump in accordance with "Power Measurements" in HI ANSI/HI 14.6. Use a method to permit pump brake horsepower to be determined to the closest 0.5 horsepower.

#### 2.9.4.2.5 Mechanical Tests

Take vibration measurements of the assembled pumping units per HI ANSI/HI 14.6.

#### 2.9.4.3 Pump Test

Demonstrate that the proposed pump complies with the specified performance. The pump must be capable of operation without instability over the entire range of heads specified in paragraph CAPACITIES. Tolerances must be in accordance with HI requirements. Instability is defined, for this specification, as when one or more of the following conditions occur:

- a. the pump has two or more flow rates at the same total head;
- b. The head-capacity curve has a dip (region on curve where change in flow rate produces an abnormally low head);
- c. When any point in the usable range of head-capacity curve cannot be repeated within 3 percent.

Rerun the test if this occurs. Compliance with specifications will be determined from curves required by paragraph TEST RESULTS. Test procedures, except as specified, must be in accordance with applicable provisions of HI ANSI/HI 14.6. The acceptance grade is 1U as described in HI ANSI/HI 14.6. Pumps are acceptable if they achieve the guarantee point requirements stated in paragraph CAPACITIES. Use water at approximately the same temperature for all tests run and record the temperature during test runs.

#### 2.9.4.4 Motor, Cables, and Controller Test

Test the pump motor per NETA ATS. For induction motors use NETA ATS 7.15.1.

#### 2.9.4.5 Test Procedure

##### 2.9.4.5.1 Performance of The Pump

Determine the performance of the pump by a series of test points sufficient in number to develop a constant-speed curve over the range of total heads corresponding to the static heads in paragraph CAPACITIES. The performance/test range must include additional testing at total heads 2 feet higher than the total head determined in paragraph CAPACITIES. The lowest total head for testing must be, as a minimum, the total head determined from paragraph CAPACITIES. If the test setup permits testing at lower total heads, extend the range of total heads 2 feet lower. Conduct tests using prototype total heads. Head differentials between adjacent test points cannot exceed 3 feet, but in no case may fewer than 10 points be plotted in the pumping range. If the plot of the data indicates a possibility of instability or dip in the head-versus-capacity curve, a sufficient number of additional points on either side of instability must be made to clearly define the head-capacity characteristics.

##### 2.9.4.5.2 Sump Elevations

Conduct tests at two different sump elevations (approximately a 5 foot differential) to determine the effect of test sump geometry on the performance of the pump. Should the test results indicate that the performance is not the same in all respects for both sump conditions, take whatever corrective action is necessary to produce congruent results. Use the sump elevations specified in paragraph CAPACITIES. The test results with this sump elevation must meet all specified conditions of capacity, head, and brake horsepower. Submit curves indicating test results.

##### 2.9.4.5.3 Tests Results

Plot results of tests to show total head, static , brake horsepower and efficiency as ordinates; all plotted against pump discharge as the abscissa. Plot curves showing prototype performance to a scale that will permit reading head directly to 0.5 foot, capacity to 100 gpm, , efficiency to 1 percent, and power input to 10 horsepower.

##### 2.9.4.5.4 Demonstration

Demonstrate to the Contracting Officer that the blade templates fit the tested pump. Perform the demonstration immediately after testing is completed. Retain all templates for the tested pump, and provide them to the Government upon request of the Contracting Officer, to permit the Government to verify geometric similarity with the Contractor's pump. In addition to providing templates, submit dimensioned drawings of the impeller that contain all dimensions needed to manufacture it. Stamp the tested impeller with identification marks. Provide necessary facilities and instruments needed to permit the Government to verify that pumps are in complete geometric similarity with the tested pump.

#### 2.10 PUMP DRAINAGE

Provide drain holes for all parts of the pump to eliminate trapped water. These drain provisions must be self-draining without any requirement to enter the sump.

## 2.11 CERTIFIED TEST REPORT

Submit Contractor's pump manufacturer certified completed test report stating the specified pumps meet HI ANSI/HI 14.6 after testing is complete.

## 2.12 TEST REPORT

Submit, in accordance with HI ANSI/HI 14.6, and within 30 days of receipt of approval of the witness test, to Government digital copies of a report covering completely the test setup and performance and cavitation tests. Include, as a minimum, the following in each test report:

- a. Provide a statement of the purpose of the test, the name of the project, contract number, and design conditions. Also provide where guaranteed values differ from specified values.
- b. A resume of preliminary studies, if such studies were made.
- c. A description of the test pump and motor, including serial numbers, if available. Information required under "b" may be included here.
- d. A description of the test procedure used, including dates, test personnel, any retest events, and witness test data.
- e. A list of all test instruments with model numbers and serial numbers.
- f. Sample computations (complete).
- g. A discussion of test results.
- h. Conclusions.
- i. Copies of instrument calibration.
- j. Copies of all recorded test data.
- k. Curves required by paragraph TESTS RESULTS.
- l. Curves showing the performance of the test pump.
- m. Drawings of the test setup showing all pertinent dimensions and elevations and a detailed dimensioned cross section of the pump.
- n. Drawings including cross sections of water passages that must be incorporated in the construction contract.

## PART 3 EXECUTION

### 3.1 INSTALLATION

Install the soleplate and baseplate in accordance with API RP 686. Provide leveling nuts for leveling the baseplate assembly. Provide an anchor bolt layout to aid in placement of anchor bolts. The pedestal supporting the motor must contain a 1-inch lip to contain water leakage from the shaft packing. Provide a threaded drain to the sump.

### 3.1.1 Equipment

- a. Install the equipment specified under this section and related drive machinery specified under other sections of this specification in accordance with the approved Installation and Erection Instructions Manual; no later than time of pump delivery, submit digital manual describing procedures to be followed by the erecting engineer in erecting, assembling, installing, and dry-and wet-testing the pump. To the extent necessary or desirable, coordinate and consolidate description of the pump with similar descriptions specified for the gear reducer and diesel enginemotor.
  - (1) The description must be a complete, orderly, step-by-step explanation of operations required, and also include such things as alignment procedures, bolt torque values, permissible blade/bowl clearances; permissible bowl out-of-roundness; permissible shaft misalignment; recommended instrument setups; recommended gages and instruments; bearing clearances; and similar details.
  - (2) Complement and supplement the description with drawings, sketches, photos, and similar materials to whatever extent necessary or desirable, resulting in a description that may be comprehended by an engineer or mechanic without extensive experience in erecting or installing pumps of this type.
- b. The Contractor's erection engineer(s), familiar with the equipment to be installed, must supervise the handling, installation, start-up and testing of the equipment as required by paragraph QUALITY ASSURANCE.
- c. Submit digital copies of Operation and Maintenance Instructions Manual containing complete information on operation, lubrication, adjustment, routine and special maintenance, disassembly, repair, reassembly, and trouble diagnostics for the pump and auxiliary units. Provide the operation and maintenance manual and both parts lists on flash drive, formatted to print on ANSI size A 8-1/2 by 11-inch paper. Drawings incorporated in manual or parts lists, may be reduced to page size provided they are clear and legible. Photographs or catalog cuts of components may be included for identification. Submit operation and maintenance data in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

### 3.1.2 Pipes and Joints

Install pipes and joints in accordance with AWWA M11.

### 3.2 FIELD TESTS

After the pumping unit is installed and prior to start-up, completely clean the sump area of any accumulated construction debris. Once final cleaning of the sump area is completed, the area will be area reviewed by a representative of the Government. Correct any damage to the pumping units or related equipment during initial start-up due to foreign objects left in the sump areas.

Prior to proceeding with construction of the model, but not later than 90 days after the date of notice to proceed, submit a description of the proposed model and test procedure. Include dimensioned drawings and cross-sectional views of the model pump showing with the location of all

instruments and the point of their connection to the model.

#### 3.2.1 Wet Tests

Test each pump unit under load, at or near normal operating conditions, for at least 2 hours or as directed by the Contracting Officer; the test will be witnessed by the Government. Provide all supplies and equipment required to conduct the test. During the test observe, measure and record the operation of the pumps during the test for vibration and bearing temperatures in accordance with HI 9.6.4ISO 10816-3. Submit field test results. Without additional costs to the Government, make all changes and correct any errors. The Contracting Officer may waive or postpone the test if sufficient water is not available.

-- End of Section --

SECTION 40 05 13

PIPELINES, LIQUID PROCESS PIPING  
10/07, CHG 2: 02/20

PART 1 GENERAL

1.1 UNIT PRICES

Measurement and payment will be based on completed work performed in accordance with the drawings, specifications and the contract payment schedules. No payment will be made under this section for excavation, trenching, or backfilling. Payment for such work will be made under Section 31 00 00.00 22 EARTHWORK.

1.1.1 Measurement

Determine the length of pipelines, for which payment will be made, by measuring along the centerlines of the various piping systems and sizes as furnished and installed. Measure pipe from the center of fitting to center of fitting and from center of main header to end of pipe. Make no deduction for the space occupied by valves or fittings.

1.1.2 Payment

Payment will be made at the price per linear foot listed in the bid form for the various types and sizes of piping, and will be full compensation for all pipes, joints, fittings and specialties, complete in place. Payment for valves and other appurtenances will be made at the respective contract unit price for each item complete in place. Payment will include the furnishing of all testing, plant, labor, and material and incidentals necessary to complete the work, as specified and as shown in contract documents.

1.1.2.1 Connections to Existing Piping

Connections to existing piping systems where new fittings in the existing line are required will be paid for according to the contract prices for such connection. The price will be considered as full compensation for material and labor required for the removal and replacement of the existing pipe as necessary.

1.1.2.2 Connections to Existing Equipment

Connections to existing equipment where new fittings for the existing equipment are required will be paid for according to the contract prices for such connection. The price will be considered as full compensation for material and labor required for the installation of new fittings or the removal and replacement of existing fittings, as necessary.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" classification. Submittals not having a "G" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings; G, AE

Materials and Equipment

SD-03 Product Data

Qualifications; G, AE

Welders; G, AE

Waste Water Disposal; G, AE

Manufacturer's Field Services; G, AE

Delivery, Storage and Handling; G, AE

Materials and Equipment; G, AE

Installation; G, AE

Valve Schedule; G, AE

Operator Schedule; G, AE

SD-06 Test Reports

Double Containment Piping Leak Detection System; G, AE

Pipe Leakage Tests; G, AE

Hydrostatic Tests; G, AE

Pneumatic Tests; G, AE

Valve Testing; G, AE

Disinfection; G, AE

SD-07 Certificates

Plastic Piping System; G, AE

Plastic Pipe Installation; G, AE

SD-10 Operation and Maintenance Data

Piping and Appurtenances; G, AE

#### 1.4 QUALIFICATIONS

##### 1.4.1 Experience

Submit a statement certifying that the Contractor has the specified experience. Ensure Contractor has successfully completed at least three projects of the same scope and size or larger within the last six years. Demonstrate specific experience in regard to the system installation to be performed.

##### 1.4.2 Double Containment Piping System Manufacturer

The double containment piping system manufacturer will have at least ten years of installation experience with leak detection/location sensor cable technology.

##### 1.4.3 Welders

Submit the names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, standards tested to, etc. Weld pressure piping systems in accordance with qualifying procedures using performance qualified welders and operators. Use procedures and welders in accordance with 40 17 26.00 20 WELDING PRESSURE PIPING. Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

Materials delivered and placed in storage must be stored with protection from the weather, excessive humidity variation, excessive temperature variation, dirt, dust and/or other contaminants. Proper protection and care of material before, during and after installation is the Contractor's responsibility. Any material found to be damaged must be replaced at the Contractor's expense. During installation, piping must be capped to keep out dirt and other foreign matter. A Safety Data Sheet in conformance with 29 CFR 1910 Section 1200(g) must accompany each chemical delivered for use in pipe installation. At a minimum, this includes all solvents, solvent cements, glues and other materials that may contain hazardous compounds. Handling must be in accordance with ASTM F402. Storage facilities must be classified and marked in accordance with NFPA 704. Materials must be stored with protection from puncture, dirt, grease, moisture, mechanical abrasions, excessive heat, ultraviolet (UV) radiation damage, or other damage. Pipe and fittings must be handled and stored in accordance with the manufacturer's recommendation. Plastic pipe must be packed, packaged and marked in accordance with ASTM D3892.

#### 1.6 PROJECT/SITE CONDITIONS

##### 1.6.1 Environmental Requirements

**The project is handling salt water and dionized water. Material of construction shall be compatable with liquid it is carrying or environment placed in. Where materials are called out in the drawings that may not be compatable with the environment, cathodic protection shall be provided.** Should the drawings miss calling out this proction, the general contract should assume this protection shall be provided. .

##### 1.6.2 Existing Conditions

Verify existing piping and penetrations. Prior to ordering materials,

expose all existing pipes which are to be connected to new pipelines. Verify the size, material, joint types, elevation, horizontal location, and pipe service of existing pipes, and inspect size and location of structure penetrations to verify adequacy of wall sleeves, and other openings before installing connecting pipes.

## 1.7 SEQUENCING AND SCHEDULING

For slab, floor, wall, and roof penetrations, keep on site pertinent wall pipes and sleeves before they are required for placement in concrete forms. Verify and coordinate the size and location of building and structure pipe penetrations before forming and placing concrete.

## 1.8 MAINTENANCE

### 1.8.1 Service

Provide services for automatic valvedouble containment leak detection monitoring systemdouble containment leak sensor cable, systems by a manufacturer's representative who is experienced in the installation, adjustment and operation of the equipment specified. Inspect the installation, and supervise the adjustment and testing of the equipment.

### 1.8.2 Extra Materials

Submit the manufacturer's installation recommendations or instructions for each material or procedure to be utilized, including materials preparation. Concurrent with delivery and Installation of the specified piping systems and appurtenances, furnish spare parts for each different item of material and equipment specified that is recommended by the manufacturer to be replaced any time up to 3 years of service. For each type and size of valve, provide the following extra materials: lubricator, lubricant (with appropriate temperature rating), lubricator/isolating valve; galvanized operating wrench, 4.1 feet long, for T-handled operators; galvanized operating key for cross handled valves. Extra materials include 2 of the following spare parts for each type and size of valve: gaskets; all elastomer parts; stem packing; seat rings.

## PART 2 PRODUCTS

### 2.1 SYSTEM REQUIREMENTS

This specification covers the requirements for above and below grade liquid process pipe, pipe supports, fittings, equipment and accessories located both inside and outside of treatment plants.

#### 2.1.1 Design Requirements

Select and design support systems in accordance with MSS SP-58 within the specified spans and component requirements. The absence of pipe supports and details on the contract drawings does not relieve the Contractor of responsibility for sizing and providing supports throughout facility. The structural design, selection, fabrication and erection of piping support system components must satisfy the seismic requirements in accordance with UFC 3-301-01 a

#### 2.1.2 Performance Requirements

The pressure ratings and materials specified represent minimum acceptable

standards for piping systems. Provide piping systems suitable for the services specified and intended. Coordinate each piping system to function as a unit. Provide flanges, valves, fittings and appurtenances with a pressure rating no less than that required for the system in which they are installed.

#### 2.1.2.1 Above Grade Piping Systems

Provide piping systems suitable for design conditions, considering the piping both with and without internal pressure, and installation factors such as insulation, support spans, and ambient temperatures. Give consideration to all operating and service conditions both internal and external to the piping systems.

### 2.2 MATERIALS AND EQUIPMENT

Submit manufacturer's descriptive and technical literature for each piping system, including design recommendations; pressure and temperature ratings; dimensions, type, grade and strength of pipe and fittings; thermal characteristics (coefficient of expansion and thermal conductivity); and chemical resistance to each chemical and chemical mixture in the liquid stream. Provide piping materials and appurtenances as specified and as shown on the drawings, and suitable for the service intended. Ensure piping materials, appurtenances, and equipment supplied as part of this contract are of equal material and ratings as the connecting pipe, new and unused except for testing equipment. Ensure components that serve the same function and are the same size are identical products of the same manufacturer. Provide general materials to be used for the piping systems in accordance with TABLE I and indicate by service in the contract drawings. Submit a list of piping systems, pressure ratings and source of supply for each piping system broken out by material, size and application as indicated on the contract drawings. A list of any special tools necessary for each piping system and appurtenances furnished for adjustment, operation, maintenance and disassembly of the system. Provide pipe fittings compatible with the applicable pipe materials.

#### 2.2.1 Standard Products

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacturing of the products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Submit the following: Equipment shop drawings and support system detail drawings showing piping systems and appurtenances, such as mechanical joints, valves, local indicators and hangers, including a complete list of equipment and materials. As-built drawings showing pipe anchors and guides, and layout of piping systems relative to other parts of the work including clearances for maintenance and operation. As-built piping and instrumentation diagrams (P&IDs) identifying and labeling equipment, instrumentation, valves, vents, drains, and all other inline devices; if the contract drawings contained P&IDs, revise the P&IDs found in the contract drawings to reflect the constructed process system, as directed by the Contracting Officer. Use nominal sizes for standardized products. Provide pipe, valves, fittings and appurtenances supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

### 2.2.2 Identification and Tagging

Each piece of pipe must bear the ASTM designation and all other markings required for that designation. Mark valves in accordance with MSS SP-25 and securely attach an identification tag using stainless steel wire. Identification tags must be 1.375 inch minimum diameter, made of engraved laminated plastic engraved anodized aluminum stamped stainless steel. Display service, valve identification number shown on the contract drawings, the manufacturer's name, and the valve model number.

## 2.3 DUCTILE IRON PIPING SYSTEM

### 2.3.1 Ductile Iron Pipe

Provide ductile iron pipe for pressure service with a design and wall thickness conforming to AWWA C115/A21.15. Provide ductile iron pipe with a double thickness cement lining conforming to AWWA C104/A21.4. The ductile iron shall be glass lined and class 52 thickness when not in a buried condition and class 53 when buried.

### 2.3.2 Ductile Iron Joints

Provide joints with a working pressure rating for liquids equal to the pressure rating of the connected pipe. Provide dielectric fittings or isolation joints between all dissimilar metals.

#### 2.3.2.1 Restrained Joints

Provide restrained joints conforming to the requirements of AWWA C111/A21.11, and designed for a working pressure equal to connected pipe rating. When using ductile iron pipe with restrained joints, supply field cuts with a lock ring complete with retainer, retainer lock and roll-pin, as required by manufacturer's recommendations, procedures and/or installation instructions.

#### 2.3.2.2 Flanged Joints

Provide flanged joints conforming to AWWA C110/A21.10. Provide gaskets, bolts and nuts with flanged joints in sufficient quantity for the complete assembly of each joint. Gaskets must be vulcanized synthetic rubber, reclaimed rubber is not acceptable.

### 2.3.3 Ductile Iron Fittings

Fittings must be ductile iron AWWA C153/A21.53. Up to 12 inches inclusive, the fittings must be 250 psig rated. Pipe and fittings must be glass lined. Provide flanges and flanged fittings conforming to ASME B16.1 and rated for 150 psig service. Provide ductile iron materials. For tie-in to existing flanges, field check existing flanges for nonstandard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolts and nuts must be carbon steel conforming to ASTM A307, Grade B. Provide bolts with washers of the same material as the bolts. Gaskets must be rubber full face, maximum 0.125 inch thick. Sacrificial zinc anode bolts from Mars Company shall be provided for each bolt or studs (both sides).

### 2.3.4 Corrosion Control

Ductile iron piping must be hot-dipped galvanized in accordance with

ASTM A153/A153M. Coat and wrap buried pipe per manufacturer standards.,  
2.4 CARBON STEEL PIPING SYSTEM

#### 2.4.1 Carbon Steel Pipe

##### 2.4.1.1 General Service

Provide carbon steel pipe meeting the requirements of ASTM A53/A53M seamless , Grade A, Schedule 80 and , hot-dipped galvanized. Provide Schedule 80 buried carbon steel piping and fittings.

##### 2.4.1.2 High Temperature Service

Seamless carbon steel pipe for high temperature service must conform to ASTM A106/A106M Grade A , , Schedule 80 with dimensions conforming to ASME B36.10M.

#### 2.4.2 Carbon Steel Tubing

Provide tubing meeting the requirements of ASTM A334/A334M, seamless Grade 1 carbon steel or ASTM A423/A423M, seamless , Grade 1 low-alloy carbon steel with nominal size and wall thickness in accordance with Pipe Schedule.

#### 2.4.3 Carbon Steel Joints

Join carbon steel piping by flanges or mechanical joints for grooved ends meeting the requirements of AWWA C606. Provide dielectric fittings or isolation joints between all dissimilar metals.

#### 2.4.4 Carbon Steel Fittings

Fittings must be heat-treated low-carbon steel. Where cast fittings are not available, fabricate segmental welded steel fittings, ASTM A53/A53M, Grade B, meeting the requirements of manufacturer's recommended wall thicknesses.

##### 2.4.4.1 Threaded Fittings

Threaded fittings must be Class 150 300, low carbon steel, ASTM A858/A858M, conforming to ASME B16.11, and threaded in accordance with ASME B1.20.1. Threaded, rigid couplings must be seamless, Type I hot-dipped galvanized Type II electrogalvanized carbon steel in accordance with ASTM A865/A865M and threaded in accordance with ASME B1.20.1. Use polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308 for lubricant/sealant.

##### 2.4.4.2 Welding Fittings

Provide butt-welding or socket-welding welding fittings. Provide welding fittings consisting of forged steel, ASTM A105/A105M Class 150 .

##### 2.4.4.3 Flanged Fittings

Ensure the internal diameter bores of flanges and flanged fittings are the same as that of the associated pipe. The flanges must be welding neck or threaded type. Flanges and flanged fittings must be forged steel, ASTM A105/A105M or ASTM A727/A727M , faced and drilled to ASME B16.5 Class 150 with a flat face. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as

required to assure new pipe and flange mate properly. Provide bolting consisting of alloy-steel ASTM A193/A193M Grade B5 hex head bolts and ASTM A194/A194M Grade 5 hex head nuts . When mating flange on valves or equipment is cast iron, use ASTM A193/A193M Grade B8 Class 1 bolts and ASTM A194/A194M Grade 8 heavy hex head nuts . Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. Provide nonmetallic gaskets conforming to ASME B16.21 that are a maximum 0.125inch thick chloroprene rubber, durometer hardness No.80, 1,500 psi minimum tensile strength, 125 percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.

#### 2.4.4.4 Compression Fittings for Tubing

Provide compression fittings consisting of carbon steel ASTM A108 or ASTM A576 nuts, ferrules and bodies rated for pressure of application. Provide straight threads conforming to ASME B1.1.

#### 2.4.5 Carbon Steel Coatings

Coat carbon steel piping components with corrosion resistant materials. Ensure coatings and finishes are 100 percent holiday free.

##### 2.4.5.1 Silicone Coating

Prepare carbon steel piping surfaces in accordance with SSPC SP 6/NACE No.3. Provide surfaces with an alkyd primer of 2.5 mils dry film thickness followed by two alkyd modified silicone final coats.

##### 2.4.5.2 Zinc Coating

Galvanizing must be hot-dip applied and meet the requirements of ASTM A153/A153M; electroplated zinc or cadmium plating is unacceptable. Stainless steel components may be substituted where galvanizing is specified.

##### 2.4.5.3 Thermoplastic Resin Coating System

Carbon steel piping surfaces must have a minimum of 4 coats of phenolic type coatings applied at a minimum dry film thickness of 1.6 mils per coat. Bake each coat at 300 degrees F for 10 minutes. Cure the full coating system in an oven at 375 degrees F for 30 minutes.

#### 2.4.6 Carbon Steel Cathodic Protection

Buried ferrous piping must have cathodic protection.

### 2.5 STAINLESS STEEL PIPING SYSTEM

#### 2.5.1 Austenitic Piping

##### 2.5.1.1 Stainless Steel Pipe

Stainless steel pipe intended for general corrosive service must meet the requirements of ASTM A312/A312M, seamless ASTM A813/A813M for fit-up and alignment quality, ASTM A814/A814M for flanged and cold-bending quality, C, Grade TP316L , Schedule in accordance with Pipe Schedule with dimensions conforming to ASME B36.19M.

#### 2.5.1.2 Stainless Steel Tubing

Provide stainless steel tubing meeting the requirements of ASTM A269/A269M or ASTM A632, seamless, Grade TP316L with nominal size and wall thickness in accordance with Pipe Schedule.

#### 2.5.1.3 Stainless Steel Joints

Join stainless steel piping by welded fittings or flanges. Provide dielectric fittings or isolation joints between all dissimilar metals.

#### 2.5.1.4 Stainless Steel Welding Fittings

Provide butt-welding or socket-welding welding fittings. Provide welding fittings consisting of forged austenitic stainless steel, ASTM A403/A403M Grade TP316L, .

#### 2.5.1.5 Stainless Steel Flanged Fittings

Provide internal diameter bores of flanges and flanged fittings that are the same as that of the associated pipe. Ensure flanges are welding neck slip-on or threaded type. Provide flanges and flanged fittings consisting of forged austenitic stainless steel, ASTM A182/A182M Grade TP316L, Class 150300, drilled to ASME B16.5 with a flat face. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting must be alloy-steel ASTM A193/A193M Grade B8 hex head bolts and ASTM A194/A194M Grade 8 8C hex head nuts. When mating flange on valves or equipment is cast iron, use ASTM A193/A193M Grade B8 Class 1 bolts and ASTM A194/A194M Grade 8 heavy hex head nuts. Provide bolts with washers of the same material as the bolts. Provide gaskets meeting the requirements of ASME B16.5. Provide nonmetallic gaskets conforming to ASME B16.21 and that are a maximum 1/8 inch thick chloroprene rubber, durometer hardness No.80, 1,500 psi minimum tensile strength, 125 percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.

#### 2.5.1.6 Stainless Steel Crimping Fittings

Crimping fittings must be cold drawn, TP316L austenitic stainless steel. O-ring seals must be fluoro-elastomeric.

#### 2.5.1.7 Compression Fittings for Tubing

Provide compression fittings consisting of ASTM A479/A479M stainless steel, Grade TP316, nuts, ferrules and bodies rated to pressure of the application. Provide straight threads conforming to ASME B1.1.

### 2.6 COPPER PIPING SYSTEM

#### 2.6.1 Copper Pipe

Seamless C12200 copper alloy pipe, must be a 061 annealed Temper with extra strong standard dimensions conforming to ASTM B42

#### 2.6.2 Copper Tubing

Provide seamless copper alloy tubing conforming to ASTM B88 alloy C12200, Type K, with a 060 (annealed) . .

### 2.6.3 Copper Joints

Join pipe using threaded soldered or brazed fittings and flanged connections to equipment. Join tubing using solder flared or compression fittings. Provide dielectric fittings or isolation joints between all dissimilar metals.

### 2.6.4 Copper Fittings

Provide component castings of flanges and fittings consisting of copper alloy C83600 (also known as alloy 85-5-5-5), Temper in accordance with ASTM B62. Provide solder joint fittings conforming to ASME B16.22 and ASME B16.18. Provide fittings for flared copper tube conforming to ASME B16.26. Provide cast bronze threaded fittings conforming to ASME B16.15 and are threaded in accordance with ASME B1.20.1. Ensure flanges and flanged fittings are faced and drilled Class 150 in accordance with ASME B16.26. Provide copper and bronze press fittings conforming to material requirements of ASME B16.18 or ASME B16.22 and performance criteria of IAPMO PS 117. Sealing elements must be of EPDM and factory installed or an alternative supplied by fitting manufacturer. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Tubing compression fittings must be forged brass alloy C37700, conforming to ASTM B124/B124M, nuts, ferrules and bodies rated for pressure of the application with straight threads conforming to ASME B1.1.

#### 2.6.4.1 Bolting For Copper Piping

Provide bolting materials that meet the requirements of ASME B31.1 and consist of ASTM B98/B98M alloy C65100 or C66100 materials. Provide bolts with washers of the same material as the bolts.

#### 2.6.4.2 Gaskets For Copper Piping

Gaskets listed in ASME B16.5, Annex E, Group 1a may be used with any flange rating class and bolting. Provide nonmetallic, full faced gaskets used with low strength or non-ferrous bolting with a seating pressure less than 1,600 psi. Ensure gasket dimensions conform to ASME B16.21.

### 2.6.5 Solder For Copper Piping

Use solder and flux conforming to ASTM B32 and AWS A5.8/A5.8M. .

### 2.6.6 Copper Piping Supports

Support piping system using padded steel piping supports that conform to MSS SP-58. Do not use conventional steel and galvanized pipe hangers for copper piping systems. Ensure all valves, instruments and other equipment attached to the piping system are individually supported.

## 2.7 PLASTIC PIPING SYSTEM

Submit documentation certifying that the manufacturer of each thermoplastic piping system is listed with the Plastic Pipe Institute as meeting the recipe and mixing requirements of the resin manufacturer for the resin used to manufacture each of the respective thermoplastic pipe systems.

#### 2.7.1 PVC Pipe

PVC, ASTM D1784, minimum cell classification 12545-C, pipe must be Schedule 80 conforming to ASTM D1785 .

#### 2.7.2 PVC Tubing

Provide flexible and clear tubing with nominal size and wall thickness in accordance with Pipe Schedule and reinforcement.

#### 2.7.3 PVC Joints

Join piping system by socket-weld or flanged connections except where connecting to unions, valves, and equipment with threaded connections that may require future disassembly. Ensure connections at those points are threaded and back-welded. Tubing connections must use compression fittings.

#### 2.7.4 PVC Fittings

Ensure the schedule rating for the fittings is not less than that for the associated pipe. Fittings must be ASTM D1784, , PVC conforming to the requirements of ASTM D2464, threaded in accordance with ASME B1.20.1 or ASTM D2466, socket type or ASTM D2467, socket type.

##### 2.7.4.1 Flanged Fittings

Provide flanges and flanged fittings that are Class 125, one piece, molded hub type, flat faced, and conform to ASME B16.1 drilling. Provide flanges complete with one-piece, molded PVC stub ends. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade B8 hex head bolts and ASTM A194/A194M, Grade 8 hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum 1/8 inch thick, fabricated from polytetrafluoroethylene (PTFE) in accordance with ASME B16.21. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the PVC flange from bolting moment.

##### 2.7.4.2 Tubing Fittings

Provide compression type fittings comprised of polyvinylidene fluoride (PVDF) nuts and bodies, with elastomeric O-ring seals , rated to pressure of application with straight threads conforming to ASME B1.1.

#### 2.7.5 PVC Solvent Cement

Join socket connections with PVC solvent cement conforming to ASTM D2564. Ensure manufacture and viscosity is as recommended by the pipe and fitting manufacturer to assure compatibility. Prepare joints with primers conforming to ASTM F656 prior to cementing and assembly.

### 2.8 CHLORINATED POLYVINYL CHLORIDE (CPVC)

#### 2.8.1 CPVC Pipe

CPVC, ASTM D1784, minimum cell classification 23447, pipe must be Schedule

80 conforming to ASTM F441/F441M .

#### 2.8.2 CPVC Joints

Join piping system by socket-weld or flanged connections except where connecting to unions, valves, and equipment with threaded connections that may require future disassembly. Ensure connections at those points are threaded and back-welded.

#### 2.8.3 CPVC Fittings

Ensure the schedule rating for the fittings is not less than that for the associated pipe. Fittings must be ASTM D1784, cell classification 23447 , CPVC conforming to the requirements of ASTM F437, threaded in accordance with ASME B1.20.1 , ASTM F438, socket type or ASTM F439, socket type.

##### 2.8.3.1 Flanged Fittings

Provide flanges and flanged fittings that are Class 125, one piece, molded hub type, flat faced, and conforming to ASME B16.1 drilling. Provide flanges complete with one-piece, molded CPVC stub ends. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade B8 B8M hex head bolts and ASTM A194/A194M, Grade 8 hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum 0.125 inch thick, fabricated from polytetrafluoroethylene (PTFE) in accordance with ASME B16.21. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the CPVC flange from the bolting moment.

#### 2.8.4 Solvent Cement

Join socket connections with PVC solvent cement conforming to ASTM F493. Ensure manufacture and viscosity is as recommended by the pipe and fitting manufacturer to assure compatibility. For sodium hypochlorite, use Weld On 724 CPVC cement or equal.

### 2.9 POLYVINYLIDENE FLUORIDE (PVDF)

#### 2.9.1 PVDF Pipe

PVDF, conforming to ASTM D3222, pipe must be 80.

#### 2.9.2 PVDF Tubing

Provide flexible tubing with nominal size and wall thickness in accordance with Pipe Schedule.

#### 2.9.3 PVDF Joints

Join PVDF pipe by thermal butt-fusion , except where connecting to valves and equipment that may require future disassembly, provide flanged joints. Tubing connections must use compression fittings.

#### 2.9.4 PVDF Fittings

Provide molded PVDF fittings. Provide fittings with the same or higher pressure rating as the pipe when installed in accordance with the latest

technical specifications. Provide flanges and flanged fittings that are Class 125, one piece, molded hub type, flat faced, and conforming to ASME B16.1 drilling. Provide flanges complete with one-piece, molded PVDF stub ends. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade B8 B8M hex head bolts and ASTM A194/A194M, Grade 8 hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum 1/8 inch thick, fabricated from polytetrafluoroethylene (PTFE) in accordance with ASME B16.21. When the mating flange has a raised face, use a flat ring gasket and provide a filler gasket between outer diameter of the raised face and the flange outer diameter to protect the PVDF flange from bolting moment. Provide compression type tubing fittings comprised of polyvinylidene fluoride (PVDF) nuts and bodies, with elastomeric O-ring seals, rated for the pressure of the application with straight threads conforming to ASME B1.1.

2.10 POLYETHYLENE (PE)

#### 2.10.1 PE Pipe

Ensure pipe is extruded from PE, ASTM D3350 with a minimum cell classification of 324433-C. The PE pipe must be Schedule 80.

#### 2.10.2 PE Tubing

Tubing must be flexible crosslinked PE conforming to ASTM D3350, minimum cell classification 35400, and dimensioned in accordance with ASTM F876 with nominal size in accordance with Pipe Schedule.

#### 2.10.3 PE Joints

Join PE pipe by thermal butt-fusion socket heat fusion and/or socket electrofusion, except where connecting to valves and equipment that may require future disassembly, use flanged joints.

#### 2.10.4 PE Fittings

Provide PE fittings with the same or higher pressure rating as the pipe when installed in accordance with the latest technical specifications. Provide molded PE fittings. Provide butt-fusion fittings conforming to ASTM D3261. Provide socket-fusion fittings conforming to ASTM D2683 with tools meeting the requirements of ASTM F1056. Provide insert fittings conforming to ASTM D2609.

##### 2.10.4.1 Couplings

Join couplings and saddle joints by electrofusion in accordance with ASTM F1055.

##### 2.10.4.2 Flanged Fittings

Provide flanges and flanged fittings that are Class 125, ASME B16.1 ASME B16.5 drilling. Provide flanges complete with one-piece, molded PE stub ends. Ensure flanged connections have the same pressure rating as the pipe or greater. Bolting must be stainless steel, ASTM A193/A193M, Grade B8 hex head bolts and ASTM A194/A194M, Grade 8 hex head nuts. Provide bolts with washers of the same material as the bolts. Gaskets must be full-faced, maximum 1/8 inch thick, fabricated from polytetrafluoroethylene (PTFE) in accordance with ASME B16.21.

#### 2.10.4.3 Tubing Fittings

Provide compression type fittings comprised of forged brass alloy C37700, conforming to ASTM B124/B124M, nuts, polyvinylidene fluoride (PVDF) nuts and bodies, with elastomeric O-ring seals rated for pressure of application with straight threads conforming to ASME B1.1.

### 2.11 ISOLATION JOINTS AND COUPLINGS

#### 2.11.1 Metallic Piping Couplings

Provide thrust ties where shown on the contract drawings and where required to restrain the force developed by 1.5 times the maximum allowable operating pressures specified. For metallic pipe other than ductile iron, attach thrust ties with fabricated lugs. For ductile iron pipe, attach thrust ties with socket clamps against a grooved joint coupling or flange. For exposed installations, use zinc-plated nuts and bolts. However, high-strength, low-alloy steel, in accordance with AWWA C111/A21.11, may be substituted for use on cast iron and ductile iron couplings. For buried and submerged installations, provide 316 stainless steel bolts and nuts. Use steel middle rings and followers that are fusion bonded epoxy-lined and coated in accordance with Section 09 90 00 PAINTS AND COATINGS and pressure tested beyond yield point.

##### 2.11.1.1 Sleeve-Type Couplings

Use sleeve-type couplings for joining plain end pipe sections in a flexible manner with a diameter to properly fit the pipe. A coupling consists of one stainless steel or ductile iron middle ring, two stainless steel or ductile iron followers, two elastomeric wedge section gaskets and elliptic-neck, track-head steel bolts designed to properly compress the gaskets. For pipe sizes between 0.5 through 1.5 inch, ensure the followers are ductile iron, and the middle ring is in accordance with ASTM A513/A513M or ASTM A395/A395M with AWWA C111/A21.11 bolting. For pipe sizes 2 inch and larger, ensure the followers are ASTM A395/A395M, and the middle ring is ASTM A513/A513M or ASTM A395/A395M with AWWA C111/A21.11 bolting. Gaskets must be fluoro-elastomeric. Split sleeve-type couplings may be used in aboveground installations under special situations and when approved in advance by the Contracting Officer.

##### 2.11.1.2 Transition Couplings

Transitional couplings may be used to connect two pipes of the same material that have small differences in outside diameter. Size a fully assembled transitional coupling to properly fit pipe diameters. The coupling must consist of one stainless steel or ductile iron middle ring, two stainless steel or ductile iron followers, two elastomeric wedge section gaskets and elliptic-neck, track-head steel bolts designed to properly compress the gaskets. The coupling must use fluoro-elastomeric, wedge gaskets. Size the coupling to match the associated piping.

##### 2.11.1.3 Flanged Coupling Adapters

Provide flanged coupling adapters consisting of fully assembled units manufactured to meet ASTM A126 Class B, cast iron. The flanges must mate with ASME B16.1 ASME B16.5 Class 150 flanges of the same nominal size. Apply a factory applied corrosion resistant coating. The coupling must use fluoro-elastomeric, wedge gaskets. Where pipe movement out of the adaptor may occur, provide proper anchorage of the pipe and furnish

couplings with lock pins. Size the coupling to match the associated piping.

## 2.11.2 Couplings for Nonmetallic Piping

### 2.11.2.1 Bellows Coupling

Provide a bellows coupling with a minimum of two polytetrafluoroethylene (PTFE) convolutions unless otherwise shown, with ductile iron flanged, faced and drilled to ASME B16.1/ASME B16.5 Class 150 end connections, and metal reinforcing bands. The maximum allowable working pressure is rate for the application. Limit bolting to restrain the force developed by 1.5 times the specified maximum allowable operating pressure. Size the coupling to match the associated piping.

### 2.11.2.2 Compression Coupling

A compression coupling consists of one stainless steel middle section, two stainless steel mechanical nuts, two elastomeric gaskets and two machined steel lock rings. The coupling must use fluoro-elastomeric, wedge gaskets. The rated pressure must work with application.  
B. Size the coupling to match the associated piping.

## 2.12 VALVE BOXES SERVICE BOXES, VALVE MANHOLES AND VALVE PITS

The box length must adapt to the depth of cover required over the pipe at the valve location without full extension. Boxes must be cast iron or concrete, except that concrete boxes may be installed only in locations not subjected to vehicular traffic. Provide boxes with housings of sufficient size to completely cover the valve or service stop and complete with covers.

### 2.12.1 Valve Boxes

Provide cast-iron valve boxes with minimum metal thickness of 3/16 inch and of the extension type with slide-type adjustment and flared base. Provide concrete boxes that are the standard product of a manufacturer of precast concrete equipment.

### 2.12.2 Service Boxes

Provide extension service boxes with either screw or slide-type adjustment.

### 2.12.3 Valve Manholes or Pits

Construct valve manholes or pits for automatic valves and meters installed below grade in accordance with Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES.

## 2.13 VALVES

### 2.13.1 General Requirements For Valves

Valves include operator, actuator, handwheel, chain wheel, extension stem, floor stand, worm and gear operator, operating nut, chain, wrench, and all other accessories required for a complete operation. Ensure valves are suitable for the intended service. Renewable parts are not to be of a lower quality than those specified. Ensure valve ends are compatible with adjacent piping system. Size an operator to operate the associated

valve for the full range of pressures and velocities. Valves will open by turning counterclockwise. Provide factory mounted operators, actuators, and accessories.

#### 2.13.2 Valve Schedule

Submit a list of valve materials, pressure ratings, valve operator's materials, air supply pressure, electrical service, location, source of supply, and reference identification as indicated in the contract drawings. Provide a list of any special tools necessary for each valve type and appurtenances furnished for adjustment, operation, maintenance and disassembly. Requirements relative to this paragraph are shown on the located in the contract drawings .

#### 2.13.3 Factory Finishing

Provide valves with an epoxy lining and coating in accordance with AWWA C550 unless otherwise specified. Ensure the epoxy is either a two-part liquid material or a heat-activated fusion material except that only a heat-activated material applies if a valve coating is specified as "fusion" or "fusion bonded" epoxy. Provide epoxy lining and coating with a minimum 7.0 mils dry film thickness except where it is limited by valve operating tolerances. Finish exposed valves in accordance with Section 09 90 00 PAINTS AND COATINGS.

#### 2.13.4 Check Valves

##### 2.13.4.1 Thermoplastic Check Valve

Provide thermoplastic check valves, 0.25 inch through 16 inch, of a ball-check design, manufactured of chlorinated polyvinyl chloride (CPVC) with flanged end connections. Use valves that are rated for 150 psig service. Provide valves with fluoro-elastomeric O-ring seals and seats.

##### 2.13.4.2 Double Disc Swing Check Valve

Double disc swing check valves, 2 inch through 52 inch, must be wafer style, spring loaded swing check valve, with a Duplex Stainless Steel or Marine Bronze body, a Duplex Stainless Steel or marine grade bronze disc, resilient seats, stainless steel hinge pin, and a stainless steel stop pin spring. Ensure valves 2 inch through 12 inch are rated for 200 psig service at 140 degrees F and valves 14 inch through 52 inch are rated for 150 psig service at 140 degrees F.

##### 2.13.4.3 Silent Check Valve

Provide silent check valves conforming to the following:

- a. Silent check valves, 2 through 10 inch, center guided valve with a bronze body, bronzetrim, bronze springs. Ensure valves are rated for 200 psig service at 140 degrees F.
- b. Silent check valves, 2.5 through 42 inch, must be globe style, center guided valve with ASME B16.1 Class 125 flanged end connections, a bronze body, bronze trim, butadiene acrylonitrile seat, and bronze spring. Ensure valves are rated for 150 psig service.

## 2.13.5 Ball Valves

### 2.13.5.1 General Purpose Ball Valves

Provide general purpose ball valves conforming to the following:

- a. Ball valves, 2 inch and smaller, must be end entry type with bronze bodies and threaded, in accordance with ASME B1.20.1, regular ports. Provide valves with polytetrafluoroethylene (PTFE) seats and packing, brassballs and hand lever or pneumatically actuated, orelectrically actuated operators as shown in the drawings. Ensure valves are rated for 400 psig psig service at 150 degrees F and conform to ASME B16.34 . Install a union adjacent to the valves to provide access to the seat.
- b. Ball valves, 2.5 inch and larger, must be end entry type with bronze bodies and ASME B16.1 flanged ends. Provide valves with polytetrafluoroethylene (PTFE)packing and seats, a brass ball, full bore ports, and hand wheel,pneumatically actuated, or electrically actuated operators as shown in the contract drawings. Ensure valves are rated for 400 psig psig service at 150 degrees F and conform to ASME B16.34 Class.
- c. Provide ball valves, 2 to 12 inch, conforming to ASME B16.34, and with a bronzebody, stainless steel ball and stem, polytetrafluoroethylene (PTFE) packing and gasket, and flangedends, full port. Ensure valves are rated for 200 psig service, and have hand lever, pneumatically actuatedor electrically actuatedoperators as shown in contract drawings..

### 2.13.5.2 Multiple Piece Body Ball Valves

Provide multiple piece body ball valves, 1.5 to 6 inch, with three piece bodies constructed of cast steel ASTM A351/A351M Grade CF8Mstainless steel. Valves must have a TP316 stainless steel ball, and ASME B16.5 flangedend connections. Ensure valves are rated for 1000 psig service and conform to ASME B16.34 . Provide valves with reinforced polytetrafluoroethylene (PTFE) seats and stem packing, that are fullbore, and equipped with hand lever, , pneumatically actuated, or electrically actuated operators as shown on the contract drawings.

### 2.13.5.3 Thermoplastic Ball Valve

Provide thermoplastic ball valves, 6 inch and smaller, rated for 150 psig service at 120 degrees F, and have ASTM D1784, chlorinated polyvinyl chloride (CPVC) bodies, balls, and stems. Provide valves of end entry, double union design, with flangedends connections, a polytetrafluoroethylene (PTFE) O-ring stem seals. Provide valves with operator as shown in the contract drawings.

## 2.13.6 Gate Valves

### 2.13.6.1 General Service Gate Valves

Provide general service gate valves conforming to the following:

- a. Provide gate valves, 2 inch and smaller, with bronze bodies and stems, screwed or bolted bronze bonnets, single solid wedge bronze discs, and non-rising stems. Provide valves rated for 175 psig service and conforming to ASME B16.34 Class 150 . End connections

must be ASME B16.1 flanged. Equip valves operators as specified in the contract documents.

- b. Provide gate valves, 2.5 inch and larger, with marine grade bronze bodies with bronze trim. Provide valves that have Class 125 flanged or mechanical joint (buried only end connections. Provide a NRS Bolted type bonnet. Discs must be wedge type of bronze construction, and have nonrising stems . Include a by-pass of the same materials as the gate valve for each gate valve, 16 inch and larger. Provide bypass meeting the requirements of AWWA C500. Use valves rated for 200 psig service. Equip valves with operators as required in the contract documents.

#### 2.13.6.2 Thermoplastic Gate Valve

Provide thermoplastic gate valves, 1/2 inch and larger, with ASTM D1784 chlorinated polyvinyl chloride (CPVC), , bolted bonnets, single polypropylene wedge discs, non-rising stems, and flanged end connections. Provide valves rated for 150 psig psig service at 140 degrees F. Equip valves with operators as called out in contract drawings.

#### 2.13.7 Globe Valves

##### 2.13.7.1 General Requirements For Globe Valves

Provide globe valves, 3 inch and smaller, that are globe style valve with bronzebodies, with bronze trim, and bronzebonnets. Provide valves conforming to ASME B16.34 Class 150, and with ASME B16.11 threaded or ASME B16.5 flanged or ASME B16.1 flanged end connections. Include threaded bonnets, inside screws, rising stems, plug discs constructed of bronze, and bronze rings. Ensure valves are rated for 200 psig service. Equip valves with operators as required in contract documents.

##### 2.13.7.2 Needle Valve

Needle valves, 1 inch and smaller, must be of a straightpattern and must have TP316 stainless steel bodies and trim. Provide valves conforming to ASME B16.34 Class 150 with ASME B16.11 threaded, in accordance with ASME B1.20.1, or if used on tubing, have tubing compression fittings, that match associated tubing fittings, end connections. Ensure valves include integral bonnets, TP316 stainless steel stems, plug stem tips constructed of polytetrafluoroethylene (PTFE)bronze, fluoro-elastomer packing and O-ring stem seals. Ensure valves are rated for 300 psig service. Equip valves with operators as required in contract documents.

##### 2.13.7.3 Hose Valve

Hose valves, 0.75 through 3 inch, must be globe style angle pattern hose valves with cast iron ductile iron carbon steel bronzebodies, bronze trim, inside screws, rising stems, and polytetrafluoroethylene (PTFE)disc. The outlet ports must be cast brass in accordance with ASME B1.20.1 pipe threads, male by male, nipple adapter with hexagonal wrench feature and brass cap with chain. Provide valves rated for 125 psig service.

#### 2.13.8 Plug Valves

##### 2.13.8.1 Eccentric Valve

Provide nonlubricated type eccentric valves, 3 inch and smaller, rated

for 175 psig service at 140 degrees F. Valves must have drip-tight shutoff with pressure from either direction, and bronze bodies, in accordance with ASME B16.5 flanged or ASME B16.1 flanged or ASME B16.11 threaded end connections as applicable for application, all metal, matching body plugs with round ports, stainless steel seats, Monel stem bearings, and fluoro-elastomer filled polytetrafluoroethylene (PTFE) seals. Provide valves conforming to ASME B16.34 Class 150. Equip valves with operators as defined in contract documents.

#### 2.13.8.2 Lined Eccentric Valve

Provide nonlubricated type eccentric valves, 3 through 54 inch, rated for 175 psig service at 140 degrees F. Provide valves with drip-tight shutoff with pressure from either direction, and bronze bodies in accordance with ASME B16.1 flanged end connections. Provide cast iron plugs with round or rectangular ports of no less than 80 percent of the connecting pipe area and coated with fluoro-elastomer. Provide valves with stainless steel seats, self-lubricating reinforced polytetrafluoroethylene (PTFE) stem bearings, and nitrile rubber grit seals on the stems. Equip valves with operators as required in contract drawings. Ensure valves conform to ASME B16.34 Class 150.

#### 2.13.9 Butterfly Valves

##### 2.13.9.1 Standard Service Butterfly Valve

Provide butterfly valves, 2 inch and larger, with marine rated bronze or super duplex stainless steel bodies, with ASME B16.5 flanged or ASME B16.1 flanged end connections. Provide valves conforming to Class 150 or ASME B16.34 Class 150 as required for application. Discs must be contoured duplex stainless steel. Provide duplex stainless steel valve shafts with self-lubricating, corrosion-resistant sleeve type bearings. Provide valve seats, constructed of chloroprene, for 24 inch and smaller valves and attach to either the valve body or the disc. Provide valves with operators as required in the contract documents.

##### 2.13.9.2 Thermoplastic Butterfly Valves

Provide thermoplastic butterfly valves, 1.5 inch and larger, with lugged style bodies constructed of polyvinyl chloride (PVC) coated ductile iron. Provide valves with polyvinyl chloride (PVC) discs, fluoro-elastomeric seats, polytetrafluoroethylene (PTFE) seals, and operators per the contract documents. Ensure valves are rated for 150 psig service at 140 degrees F.

#### 2.13.10 Diaphragm Valves

##### 2.13.10.1 Standard Service Diaphragm Valve

Provide diaphragm valves, 1/2 inch and larger, with marine grade bronze or super duplex stainless steel bodies, ASME B16.1 or ASME B16.5 Class 150 flanged end connections and fluoro-elastomeric seals, and are actuated as indicated on contract drawings. Provide position indicators to indicate diaphragm position. Valves must be rated for 150 psig service at 140 degrees F.

##### 2.13.10.2 Thermoplastic Diaphragm Valve

Provide thermoplastic diaphragm valves, 1/2 inch and larger, with polyvinyl chloride (PVC), ASME B16.1 or ASME B16.5 Class 150 flanged end

connections and polytetrafluoroethylene (PTFE) seals, and that are actuated per the contract drawings. Pneumatically operated valves must be fail-closed. Provide position indicators to indicate diaphragm position. Valves must be rated for 150 psig service at 68 degrees F.

#### 2.13.11 Self-Contained Automatic Valves

##### 2.13.11.1 Pressure-Reducing Valve

Pressure-reducing valves, 1/2 inch and larger, must be direct operated, diaphragm actuated, spring controlled globe valves with bronze bodies. End connections must be ASME B16.1 or ASME B16.5 Class 150 flanged as for application. Provide stainless steel trim and stem. Valves must have externally mounted strainers with cocks. Use valve sizes and ratings as shown in the Valve Schedule on the contract drawings.

Pressure-reducing valves, for the R.O. membrane system and ABW system shall be constructed of duplex stainless steel rated for seawater application. The purpose of these valves is to shut when there is no flow (e.g. act like a check valve when pump stops) as well as control the pressure such that common pressure in the discharge line to the outfall does not exceed 25 psig.

The controls shall consist of an electric actuator including the electric motor, reduction gearing, valve stem drive nut/bushing, position limit switches, mechanical overload torque switches, and automatic declutch-able handwheel. In addition, the valve will close upon power failure.

These valves shall be supplied with a non-intrusive electric actuator capable of being controlled based on a 4-20mA analog signal for valve position.

The electric actuator shall be powered from a 230/460 VAC, 3 Phase, 60 Hz. Power source and are to incorporate motor, integral reversing starter, local control facilities and terminals for remote control and indication connections housed within a self-contained, sealed enclosure.

All programming shall be done digitally. Mechanical dials used to program limits is not acceptable.

Actuators shall be suitable for indoor and outdoor use. The actuator shall be capable of functioning in an ambient temperature ranging from °F(-10 °C) to °F(110 °C).

##### Motor

1. The electric motor shall be Class F insulated, with a time rating of at least 15 minutes at 104°F(40°C) or twice the valve stroking time, whichever is the longer, at an average load of at least 33% of maximum valve torque.

2. Electrical and mechanical disconnection of the motor should be possible without draining the lubricant from the actuator gearcase.

##### Hand operation

1. A handwheel shall be provided for emergency operation, engaged when the motor is declutched by a lever or similar means, the drive being restored to power automatically by starting the motor. The handwheel or selection lever shall not move on restoration of motor drive.

2. Provision shall be made for the hand/auto selection lever to be

locked in both hand and auto positions. It should be possible to select hand operation while the actuator is running or start the actuator motor while the hand/auto selection lever is locked in hand without damage to the drive train.

3. The handwheel drive must be mechanically independent of the motor drive and any handwheel gearing should be such as to permit emergency manual operation in a reasonable time.

4. Clockwise operation of the handwheel shall give closing movement of the valve unless otherwise stated in the job specification.

Remote valve position/actuator status indication.

1. Four contacts shall be provided which can be selected to indicate any position of the valve; Provision shall be made for the selection of a normally closed or open contact form.

2. Contacts shall maintain and update position indication during handwheel operation when all external power to the actuator is isolated.

3. The contacts shall be rated at 5A, 250V AC, 30V DC.

Local position indication

1. The actuator shall include a digital position indicator with a display from fully open to fully closed in 1% increments. Red, green and yellow lights corresponding to Open, Closed and Intermediate position shall be included on the indicator.

2. End of travel indication colors shall be reversible.

Integral starter and transformer

1. The reversing starter, control transformer and local controls shall be integral with the valve actuator suitably housed to prevent breathing and condensation.

2. The starter shall be suitable for 60 starts per hour and of rating appropriate to motor size.

3. The controls supply transformer shall be fed from two of the incoming three phases and incorporate overload protection.

Local Controls

1. The actuator shall incorporate local controls for Open, Close and Stop and a Local/Stop/Remote mode selector switch lockable in any one of the following three positions: local control only, stop (no electrical operation), remote control plus local stop only. It shall be possible to select maintained or non-maintained local control.

2. The local controls shall be arranged so that the direction of valve travel can be reversed without the necessity of stopping the actuator. Provision shall be made to orientate the local controls through increments of 90°.

The actuator shall be factory installed on the valve prior to shipment to the job site.

Pump Control Electrical Panel

A. The valve shall be supplied with an electrical control panel, designed to control the valve.

B. The control panel shall be NEMA 4X Rated. The panel shall not exceed 16" Wide x 16" Tall x 6" Deep.

C. The control panel shall house the following components required to perform the necessary logic functions.

1. Relays

2. Timers
3. Dry Contact (Input) for "Pump Start" command
4. Dry Contact (Output) for "Valve Fail" annunciation

D. The following components shall be mounted on the door of the control panel. All lights, switches, and pushbuttons shall be supplied with independent labels.

1. HAND-OFF-AUTOMATIC selector switch
2. PUMP RUNNING indicating light
3. VALVE FAIL indicating light
4. ALARM RESET pushbutton

E. All wiring within the control panel shall be neat and tidy. Each wire shall be numbered on both ends and should collate with the wire numbers indicated on the electrical schematic provided.

These PRVs will be manufactured by Ross, Cal-Val or equal.

#### 2.13.12 Operators

##### 2.13.12.1 Operator Schedule

Requirements relative to this paragraph are shown on the Operator Schedule located in the contract drawings.

##### 2.13.12.2 Manual Operator

The force in a manual operator is not allowed to exceed 39.3 pound under any operating condition, including initial breakaway. Equip the operator with gear reduction when force exceeds 39.3 pound. Provide a self-locking type manual operator or equip with a self-locking device. Supply a position indicator on quarter-turn valves. Provide worm and gear operators consisting of a one-piece design with worm-gears of gear bronze material. Worm must be hardened alloy steel with the thread ground and polished. Provide traveling nut type operators with threader steel reach rods with an internally threaded bronze or ductile iron nut.

##### 2.13.12.2.1 Exposed Operators

Provide exposed operators with galvanized and painted handwheels. Lever operators are allowed on quarter-turn valves 8 inch and smaller. Supply cranks on gear type operators. If located off of the operator floor, provide chain wheel operator with tiebacks, extension stem, floor stands, and other accessories to permit operation from normal operation level. Ensure valve handles are capable of padlocking, and provide wheels that are lockable with a chain and padlock.

##### 2.13.12.2.2 Underground Operators

Buried service operators on valves larger than 2.5 inch must have a 2 inch operating nut. Buried operators on valves 2 inch and smaller must have a cross handle for operation by a forked key. Enclose the moving parts of valve and operator in housing to prevent contact with the soil. Design buried service operators for quarter-turn valves to withstand an input

torque of 450 foot-pound of input torque at the fully open or fully closed positions, and grease pack and gasket to withstand a submersion in water to 10.2 psig. Provide buried valves with extension stems, bonnets, and valve boxes.

#### 2.13.12.3 Pneumatic Operator

Provide pneumatic operators complete with actuators, air sets, exhaust mufflers, speed controls, pilot solenoids, safety vented isolation valves, and accessories. Ensure pneumatic operators are suitable for full operation range of valve at air supply pressure indicated. Use actuators to return the valve to the closed position upon loss of signal unless otherwise indicated. Use springs to return valve to this failed position. Furnish pneumatic operators with features noted on the valve Schedule in the contract drawings. Provide limit switches on all actuators.

##### 2.13.12.3.1 Cylinder Actuators

Provide cylinder actuators conforming to ANSI/AWWA C541 and ANSI/AWWA C542, and operate with an air supply pressure of 80 psig. Totally enclose the nonswivel type with travel stops and position indicator, and factory lubricate and seal, requiring no additional lubrication. The double acting type must be nonmetallic for operation on nonlubricated air and must have a manual handwheel override independent of the cylinder. Locate the manual override locally next to valve.

##### 2.13.12.3.2 Diaphragm Actuators

Provide diaphragm actuators with a spring return with a aluminum diaphragm case and spring barrel, steel spring and actuator stem, and fabric-reinforced chloroprene diaphragm. Use actuators on quarter-turn valves which include a totally enclosed valve actuating mechanism with adjustable travel stops and valve position indicator with manual override if indicated. The actuating mechanism must factory lubricated and sealed. Size and configure diaphragm actuators for the service indicated and an air supply pressure of 35 psig.

##### 2.13.12.3.3 Air Sets

Include a pressure regulator with internal relief, filter, outlet pressure gauge, and adjustable reduced pressure range as required by the valve actuator. The air set must have an aluminum body and handwheel, safety vented lockout isolation valve, and gauge range 1.33 to 2 times maximum operating pressure.

##### 2.13.12.3.4 Limit Switches

Provide single-pole, double-throw (SPDT) type limit switches, rated 10 amps at 120 volts ac, housed in a NEMA 250 Type 4 X enclosure, and adjustable for open and closed valve positions.

##### 2.13.12.3.5 Positioners

The positioners for modulating actuators must be pneumatic force balance instruments to control valve positions as a function of the input signals. The positioners must accomplish positive positioning of valve by a mechanical feedback connection from the valve actuating mechanism. Provide position feedback through a characterized linear cam to allow adjustment of valve positioning and input signal. Provide positioner

suitable for either a double acting or spring return actuator. Provide positioner with zero and span adjustment and field reversible for direct or reverse action. Include gauges for supply and output pressure and for input signal pressure. Operate modulating valve positioners on a 3 to 15 psig pneumatic 4 to 20 mA or 1 to 5 v dc electric input signal unless otherwise indicated. A positioner for dc input signal with transducers must convert the electrical signal to the appropriate pneumatic signal. Ensure transducer is integral with the positioner or a separate component. If separate, factory mount the transducer on the pneumatic operator. Line electric power is not required for transducer operation. Corrosion-resistant enclosures for positioners and transducers must be splash- and moisture-proof with gasketed covers.

#### 2.13.12.3.6 Solenoid Valve

Use a solenoid valve to pilot the control actuator in the appropriate configuration for the type of actuator being controlled. Provide a pilot operated diaphragm type solenoid valve consisting of a brass body and resilient seat and operate with minimum operating pressure differential no greater than 10.2 psi and maximum operating pressure differential no less than 150 psi . Provide corrosion-resistant internal parts. Provide solenoid valve with Class F molded coils for operation on 120 volts, 60-Hz, ac, unless otherwise indicated. Provide solenoid enclosure conforming to NEMA 250 Type 4X. Solenoids on double acting cylinders for open-close and throttling valves must be four-way with dual coils. Solenoids on spring return cylinders for open-close and throttling valves must be three-way, spring return. Furnish an air exhaust muffler in the exhaust port of all actuator pilot solenoid valves.

#### 2.13.12.4 Electric Operator

Provide electric operators complete with actuators, speed controls and accessories. Operate actuators on 120 VAC, 60 Hz with a 75 percent duty cycle and equip with an AC thermal overload protector with automatic rest, reversing (bi-directional) operation for use with quarter-turn valves, or rotating equipment to full rotation. Gearing must be a two-stage planetary, permanently lubricated self-locking gear train with self-lubricating bearings; connections via male output shaft. Use start-up torque of 120 foot-pound. Use stall torque of 150 foot-pound. Mount two travel stop limit switches with cams, internal, independent, adjustable, and actuated by cams, on the drive shaft. Provide a side mounted hand turn wheel for a manual override. Ensure actuators have a NEMA 250 Type 4 X enclosure with a corrosion resistant, baked epoxy finish as standard. Operate actuator in a temperature range of -40 to plus 150 degrees F. Actuators must fail in last position unless otherwise indicated. Furnish electric operators with features noted on the Valve Schedule in the contract drawings. Provide limit switches on all actuators.

##### 2.13.12.4.1 Limit Switches

Limit switches must be single-pole, double-throw (SPDT) type, rated 10 amps at 120 volts ac, housed in a NEMA 250 Type 4 X enclosure, and adjustable for open and closed valve positions.

##### 2.13.12.4.2 Positioners

Provide positioners for modulating actuators to control valve positions as a function of the input signals. Operate positioner on 120 VAC, 60 Hz.

voltage. The mode of operation must be direct acting reverse acting. Operate modulating valve positioners on a either 4 to 20 mA or 1 to 5 v DC input signal as indicate in the contract drawings unless otherwise indicated. Provide splash-and moisture-proof corrosion-resistant enclosures with gasketed covers for positioners.

#### 2.13.13 Valve Accessories

##### 2.13.13.1 Extension Bonnet for Valve Operator

Provide all extension bonnets as necessary, complete with stem and accessories applicable to the specific valve and operator.

##### 2.13.13.2 Floor Stand and Extension Stem

Provide the nonrising, indicating type floor stand and extension stem, complete with stem, coupling, handwheel, stem guide brackets, and yoke attachment. Space stem guide such that stem L/R ratio does not exceed 200. Supply anchors as required.

##### 2.13.13.3 Floor Box and Stem

Provide the plain type floor box and stem for support of nonrising type stem; complete with stem, operating nut, and stem guide brackets. Space stem guide such that stem L/R ratio does not exceed 200. Supply anchors as required.

##### 2.13.13.4 Chain Wheel and Guide

Provide the handwheel direct-mount type chain wheel and guide, complete with galvanized or cadmium-plated chain.

#### 2.14 DRAINS

Valved drains may not be shown on the detailed drawings for individual pipelines; their absence will not relieve the Contractor of the responsibility for providing and installing them as indicated in the piping and instrumentation diagrams to complete the piping system for the use intended.

##### 2.14.1 Locations

Locate drains as indicated on the contract drawings. Drain all pipeline low points.

##### 2.14.2 Sizes

For pipelines 2.5 inch and larger, provide 0.75 inch drains equipped with ball valves. For pipelines 2 inch and smaller, provide 1/2 inch drains equipped with ball valves.

#### 2.15 SAMPLE PORTS

Sample ports, shown on the flow diagrams and piping and instrument diagrams of the contract drawings, may not be shown on the detailed drawings of the individual pipelines; their absence does not relieve the Contractor of the responsibility for providing them. Provide sample ports as indicated in the piping and instrument diagrams to complete the piping systems for the use intended. Locate sample ports in easily accessible

locations, and avoid potential stagnant points and/or areas where material could collect. S Provide valve body consisting of stainless steel Class 150 with a male ASME B1.20.1 pipe threads inlet connection and female ASME B1.20.1 pipe threads outlet connection. Provide sampling ports comprised of pipe fittings, pipe, and ball valves which comply with material, temperature, and pressure requirements of the associated piping system as specified elsewhere in this Section.

## 2.16 MISCELLANEOUS PIPING COMPONENTS

### 2.16.1 Air Release and Vacuum Breakers

Locate air release vents, and vent such that a hazardous atmosphere will not be created upon operation.

#### 2.16.1.1 Locations

Locate vacuum breakers as indicated on the contract drawings. Ensure all pipeline high points have vacuum breakers. Provide vacuum breakers on all tanks and process equipment.

#### 2.16.1.2 Vacuum Breakers

Provide vacuum breakers 2 inch and smaller of an angle type with all bronze bodies and bonnets, and install at least 6 inch above the flood line of associated equipment and conforming to ASSE 1001 for pipe applied units.

#### 2.16.1.3 Air and Vacuum Valve Suitable for Corrosive Service

Provide air and vacuum valve conforming to ASSE 1001, and automatically exhaust air during the filling of a system while allowing air to re-enter during draining or when vacuum occurs. Ensure valve is rated for 150 psig working pressure and built with a standard elongated body. Provide valve consisting of a bronze body and cover, with duplex stainless steel float and trim. Provide end connections as follows: for 1/2 through 3 inch ASME B1.20.1 pipe threaded inlet and outlet, for 4 inch and larger ASME B16.5 or ASME B16.1 Class 150 flanged inlet with outlet as required to be compatible with application. Fit air and vacuum valve with blowoff valve, quick disconnect couplings, and a minimum 6.6 feet of hose in order to permit back flushing after installation without dismantling the valve.

#### 2.16.1.4 Air Release Valve Suitable for Corrosive Service

Use air release valve to automatically exhaust entrained air that accumulates in a system. Ensure valve is rated for 150 psig working pressure and built with a standard elongated body. Provide valve consisting of a bronze body and cover, with duplex stainless steel float and trim. Ensure valve end connections are ASME B16.5 or ASME B16.1 Class 150 flanged a compatible for application used. Fit air and vacuum valve with blowoff valve, quick disconnect couplings, and a minimum 6.6 feet of hose in order to permit back flushing after installation without dismantling the valve.

#### 2.16.1.5 Combination Air Valve Suitable for Corrosive Service

The valve combines the operating functions of both an air and vacuum valve and an air release valve. The air and vacuum portion must automatically exhaust air during filling of a piping system and allow air to re-enter during draining or when a vacuum occurs. Air release portion must

automatically exhaust entrained air that accumulates in the piping system. Provide valve consisting of a an individual air and vacuum valve and an air relief valve mounted on a common header. Ensure valve is rated for 150psig working pressure and built with a standard elongated body. Provide valve with a bronze body and cover, with duplex stainless steel float and trim. Ensure valve end connections are ASME B16.5or ASME B16.1 Class 150 flangedsuitable for application. he air and vacuum valve to be fitted with a blowoff valve, quick disconnect couplings, and a minimum 6.6 feet of hose in order to permit back flushing after installation without dismantling the valve.

#### 2.16.2 Backflow Preventer

The backflow preventer must be identical in size to pipe. Do not allow total head loss through the complete backflow assembly to exceed 10.1 psi at rated flow.

##### 2.16.2.1 Double Check Valve Assembly

Provide backflow preventer consisting of two independently operating, spring loaded, "Y" check valves rated for 175 psig service at 140 degrees F, with one isolation gate valve, one differential relief valve, and testing cocks. Use port size of 1inch and ASME B1.20.1 threaded . Ensure check valve assembly is rated for 150 psig working pressure at 150 degrees F. Provide assembly meeting the requirements of AWWA C510.

##### 2.16.2.2 Reduced Pressure Backflow Preventer

Provide assembly body consisting of two independent bronze body check valves rated at 150 psig at 140 degrees F, with an intermediate relief valve, and isolation gate valve, as testing cocks. Ensure all internal parts are serviceable in-line. Use port sizes of 1 inch and ASME B1.20.1 threaded. Ensure reduced pressure backflow prevention assembly is rated for 150 working pressure at 150 degrees F. Provide assembly body in accordance with AWWA C511.

##### 2.16.2.3 Backflow Preventer with Intermediate Vent

Provide assembly body consisting of two independent bronze body check valves rated at 175psig at 140 degrees F, with an intermediate atmospheric vent, and isolation gate valve, as testing cocks. Use port sizes of 1 inch and ASME B1.20.1 threaded . Ensure backflow prevention assembly is rated for 150 psig working pressure at 150 degrees F. Provide assembly body in accordance with AWWA C511.

#### 2.16.3 Strainers

Provide simplex strainers with a Y-pattern body. Use port sizes of 1inch and ASME B1.20.1 threaded. Ensure strainers are rated for 150psig working pressure at 150 degrees F and conform to ASTM F1199or ASTM F1200. Provide body consisting of cast bronze with a screwed bronze cap. The screen must be heavy-gauge Monel, 30 mesh and equipped with a ASME B1.20.1 pipe threaded blowoff hole.

#### 2.16.4 Indicating Devices

##### 2.16.4.1 Pressure and Vacuum Gauges

Pressure and vacuum gauges must be stem orpanel mounted, with brass cases

equipped with safety pressure blowout backs aglycerine -filled dials. If stem mounted, the thickness of pipe must be sufficient size and thickness to support the gauge. The gauge sensors must be diaphragm actuated and constructed of Monel or Inconel or beryllium-copper. Equip gauges with Monel or TP316L stainless steel threaded connections that supports the weight of the gauge. The dials of the gauges must be 4.5 inch in diameter or larger with scale readings in psig and inches of mercury ranging from zero to approximately twice the anticipated process operating or equipment pressure. Provide a slotted adjustable pointer . Provide a lever handled gauge cock and filter type snubber. Install snubber between the pipeline and the gauge. Isolate the gauges from the process fluids using remote corrosion resistant diaphragm seals. Construct the housing of the corrosion resistant seals of Monel polytetrafluoroethylene (PTFE) or compatible material for application. Compose seals of Monel, Hastelloy polytetrafluoroethylene (PTFE) or compatible material for application .

#### 2.16.4.2 Thermometers

Provide bi-metal actuated thermometers, with 5 inch dished anti-parallax dials that have external calibration adjustment and stainless steel cases. Do not use mercury in thermometers. Use thermometers with stainless steel stems, adjustable angle type for the correct viewing angle. Include union connections with associated thermowells. Scale must be 25 to 125 degrees F with accuracy within one scale division.

#### 2.16.4.3 Thermowells

Provide P316 stainless steel thermowells with a diameter of 1 inch. Use length as shown on the contract drawings and coordinate with the associated temperature element. Construct process connections of stainless steel with flanges, faced and drilled to ASME B16.5 Class 150 . Use thermowells, equipped with terminal connection heads rated NEMA 250 Type 4 X, with thermocouples or RTDs.

#### 2.16.5 Static Mixer

Design static mixer to disperse the design flow, as shown in the hydraulic profile of added chemicals in a process flow stream . The maximum allowable pressure drop for the static mixer is 5 feet of water column in accordance with the requirements of the process stream pumping system. Size diameter of the mixer housing identical to the process piping. Use length in accordance with the number of mixing elements required. Provide housing materials compatible with chemicals being injected, providing chemical resistance to both the chemical additives and process stream. Ensure coatings on coated components are factory spark-tested to verify that the coating is free from pinholes. Ensure end configurations are , flanged faced and drilled to ASME B16.5 or ASME B16.1 Class 150 and compatible with the piping system. Provide injection ports of the same materials as the mixer housing in the number, dimensions, and positions shown on drawings, and with connections compatible with the chemical feed piping system. Supply each housing with a name plate which at a minimum provides the manufacturer's name and address, part model number, and direction of flow. Construct mixing elements providing resistance to both the chemical additives and process stream. Install elements consecutively, with the number required designed to provide mixing with a homogeneity of the final mix of less than or equal to 0.05 by the end of the static mixer or within 10 pipe diameters downstream.

#### 2.16.6 Expansion Joints

Provide all structural work and equipment required to control expansion and contraction of piping. Verify that the anchors, guides, and expansion joints provided, adequately protect the piping systems.

##### 2.16.6.1 Expansion Joint for Metallic Pipe

The expansion joint must be a bellows type with 316L stainless steel wetted materials of construction. Size expansion joint to match the associated piping. The maximum allowable working pressure is 150 psig at 120 degrees F. Size expansion joint for a maximum axial compressing and expanding for a temperature range of and an angular rotation of 15 degrees. End connections must be ASME B16.5 or ASME B16.1 Class 150 flanged. Provide required accessories for a complete assembly including: limit stops, internal flow liners, and control rods, .

##### 2.16.6.2 Expansion Joint for Nonmetallic Piping

Provide a bellows expansion joint with a minimum convolutions to accommodate an axial deflection for a temperature range of 0°F to 120°F flanged, faced and drilled to ASME B16.1 or ASME B16.5 Class 150 end connections, and metal reinforcing bands. The maximum allowable working pressure is 140 psig at 120 degrees F. Limit bolting to restrain the force developed by 1.5 times the specified maximum allowable operating pressure. Size expansion joint to match the associated piping. Provide required accessories for a complete assembly including: limit stops, internal flow liners, and control rods.

#### 2.16.7 Pressure Relief Devices

Provide pressure relief devices conforming to the requirements of ASME B31.3.

##### 2.16.7.1 Pressure-Relief Valve

Provide pressure-relief valves conforming to the following:

- a. Pressure-relief valves, 2 inch and smaller, must be a direct diaphragm, spring controlled type with bronze bodies and spring cases. Trim must be bronze and seats, nitrile. Diaphragms must be elastomeric, chloroprene. Ensure miscellaneous parts such as the valve stems, nuts, and springs are stainless steel. Ensure end connections are flanged, faced and drilled to ASME B16.1 or ASME B16.5 Class 15. The valves must open when the upstream pressure reaches a maximum set point. Sizes and ratings as shown in the Valve Schedule in the contract drawings.
- b. Pressure relief valves, 2.5 inch and larger, must be hydraulically operated, diaphragm actuated, pilot controlled globe or angle valves with externally mounted strainers and test cocks. Provide bodies consisting of bronze and trim consisting of bronze. Stem must be stainless steel. Ensure end connections are flanged, faced and drilled to ASME B16.1 or ASME B16.5 Class 150. The valves must open when the upstream pressure reaches a maximum set point. Sizes and ratings as shown in the Valve Schedule in the contract drawings..

## 2.17 PIPE SUPPORTS AND PENETRATIONS

Provide auxiliary steel where the support of piping systems and equipment is required between building structural elements. Provide light gauge and structural steel shapes conforming to the requirements of ASTM A36/A36M. The Contractor has the option to use pre-engineered support systems of electrogalvanized steel products. However, a mixture of support system manufacturers products is not permitted. Where auxiliary steel is indicated as stainless steel, provide stainless steel conforming to ASTM A167, No. 1 Finish or as noted on the contract drawings.

### 2.17.1 Pipe Supports

Provide pipe supports conforming to the requirements of MSS SP-58. Where pipe supports contact bare piping or in-line devices, provide supports of compatible material so that neither has a deteriorating action on the other.

#### 2.17.1.1 Beam Clamps

For upper attachments on structural steel, provide beam clamps of ASTM A36/A36M carbon steel and MSS SP-58 Types 19 through 23, 25 or 27 through 30. Holes drilled in structural steel for hanger support rods will not be permitted. Provide clamps with hardened steel cup-point set screws and lock-nuts for anchoring in place. Base clamp size selection only on the support of the required load.

#### 2.17.1.2 Riser Clamps

Support vertical runs of piping at each floor, or closer where required, with ASTM A36/A36M carbon steel clamps bolted around pipes and attach to the building construction. Provide copper plated clamps for copper tubing support. Use two bolt-type clamps designed for installation under insulation on insulated pipe runs.

#### 2.17.1.3 Brackets

Where piping is run adjacent to walls or steel columns, provide welded ASTM A36/A36M steel brackets, pre-punched with a minimum of two fastener holes.

#### 2.17.1.4 Offset Pipe Clamp

Where pipes are indicated as offset from wall surfaces, supply a double-leg design two-piece pipe clamp.

#### 2.17.1.5 Racks

Fabricate multiple pipe racks or trapeze hangers from ASTM A36/A36M steel, and design to suit the conditions at the points of installation. Keep pipes in their relative positions to each other by the use of clamps or clips. Pipelines subject to thermal expansion must be free to slide or roll.

#### 2.17.1.6 Hangers

Fabricate hangers of malleable iron, ASTM A47/A47M or ASTM A36/A36M carbon steel. Ensure all hangers are of a uniform type and material for a given pipe run and application. Use coated or plated hangers to isolate steel

hangers from dissimilar metal tube or pipe. Ensure hangers for pipe sizes 2.5 inch or larger incorporate a means of vertical adjustment after erection while supporting the load. For piping systems with operating temperatures from 122 to 446 degrees F, use the following: MSS SP-58 Type 1 or 3 through 12 hangers with overhead support and appropriate saddle of MSS SP-58 Type 40 for insulated pipe; MSS SP-58 Types 41 or 43 through 46 hangers or supports with roller support and appropriate saddle of MSS SP-58 Type 39 on insulated pipe; MSS SP-58 Types 35 through 38 for sliding support. For piping systems with liquid temperatures up to 122 degrees F, use the following: MSS SP-58 Types 1, 3 through 12, Types 24 and 26 with overhead support, or Types 35 through 38 with support from below.

#### 2.17.1.7 Hanger Rods

Provide carbon steel hanger rods conforming to ASTM A576. The diameter of the rods for piping system support must conform to ASME B31.1.

#### 2.17.2 Pipe Guides

##### 2.17.2.1 Intermediate Guides

For piping 6 inch and smaller, provide a pipe clamp with an oversize pipe sleeve for a minimum 0.16 inch clearance. For piping 8 inch and larger, use U-bolts with double nuts that are manufactured for the purpose to provide a minimum 0.28 inch clearance around pipe. The stock sizes for the U-bolts are as follows: for a 8 inch pipe use a 0.625 inch U-bolt; for a 10 inch pipe, use a 3/4 inch U-bolt; for a 12 inch to 16 inch pipe, use a 0.875 inch U-bolt; and for 18 inch to 30 inch pipes use 1 inch U-bolts.

##### 2.17.2.2 Alignment Guides

For piping, 8 inch and smaller, ensure alignment guides are galvanized steel, spider or sleeve type. For piping, 10 inch and larger, ensure alignment guides are galvanized steel, roller type guides unless shown otherwise in contract drawings.

#### 2.17.3 Flashing Sleeves

Install galvanized steel flashing sleeves wherever piping passes through concrete roof structures. Where piping penetrates roofs, provide 4 lb. lead flashing. Extend flashing 8 inches from the pipe in all directions, extend up the pipe, and fit with double-threaded flashing for pipes 3 inches and smaller. Turn down flashing inside the pipe for 4 inch and larger pipes.

#### 2.17.4 Wall Penetrations

##### 2.17.4.1 Above Grade Wall Penetrations

Provide piping which passes through fire-rated or smoke-rated walls, floors, or ceilings with insulated and encased pipe sleeves. Seal penetrations through an existing fire or fire barrier wall with a fire stop system that has an "F" rating no less than the required fire resistance rating of the penetrated wall. The fire stopping sealant for metal piping systems must be vibration resistant, polysiloxane (also known as silicone) based, nonslumping, premixed sealant with intumescent properties, that is rated for 3 hours pursuant to ASTM E814 and UL requirements. The fire stopping sealant for plastic and insulated piping

systems must be a polysiloxane (also known as silicone) based, nonslumping, premixed sealant with intumescent properties , that is vibration and moisture resistant, and is rated for 3 hours pursuant to ASTM E814 and UL requirements with metal collars. Fit vented plastic pipe penetrations with galvanized steel collars that have intumescent inlays.

#### 2.17.4.2 Below Grade Wall Penetrations

Provide below-grade wall penetrations with hydrostatic seals designed to seal opening between pipe or conduit and a through-structure opening. The seals must be modular mechanical type consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe and wall opening .

#### 2.17.4.3 Galvanizing

Galvanizing must be zinc or cadmium plating. Stainless steel components may be substituted where galvanizing is specified.

### 2.18 MISCELLANEOUS MATERIALS

#### 2.18.1 Pipe Insulation Material

Provide insulation for pipes, valves, instrumentation and controls, and other equipment in accordance with Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS consisting of one inch ASTM C552 cellular glass and integral moisture barriers.

#### 2.18.2 Heat Trace

Heat trace must be electrical with materials selected for compatibility with transported liquids and ambient environment. The heat trace must be capable of maintaining the liquid process design temperature at 50 degrees F maximum when subjected to an exterior temperature of -20 degrees F. Ensure electrical work is in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM, and UL listed, and includes all terminations, junction boxes, and automatic controls. Perform work in conformance to hazard classifications indicated on the drawings.

- a. Provide UL listed parallel conduction type heat tape, with adjustable thermostat for outdoor aboveground winterized piping. Ensure tape is not affected by direct sunlight, ambient temperature, operating temperature, rain, or salt laden atmosphere. Provide flexible, parallel circuit construction consisting of a continuous self-limiting resistance, conductive inner core material between two parallel copper bus wires, designed for cut-to-length at the job site and for wrapping around valves and complex fittings. Self-regulation must prevent overheating and burnouts even where the cable overlaps itself.
- b. Provide end seals for ends of circuits. Wire at the ends of circuits are not to be tied together.
- c. Provide sufficient cable, as recommended by the manufacturer, to keep the pipe surface at 34 degrees F minimum during winter outdoor design temperature as indicated, but not less than the following: 3 inch pipe and smaller with one inch thick insulation, 4 watts/feet; and 4 inch pipe and larger 1.5 inch thick insulation, 8 watts/feet of pipe.

## PART 3 EXECUTION

### 3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

### 3.2 PREPARATION

#### 3.2.1 Protection

Close pipe and equipment openings with caps or plugs during installation. Protect equipment from dirt, water, and chemical or mechanical damage.

#### 3.2.2 System Preparation

##### 3.2.2.1 Pipe and Fittings

Inspect pipe and fittings before exposed piping is installed or buried piping is lowered into the trench. Clean the ends of pipes thoroughly, remove foreign matter and dirt from inside of pipes, and keep piping clean during and after laying.

##### 3.2.2.2 Damaged Coatings

Repair damaged coating areas in the field with material equal to the original coating, except promptly remove damaged glass-lined pipe from the site. Do not install damaged piping materials. Field repair damaged and uncoated areas of galvanized piping conforming to ASTM A780/A780M.

##### 3.2.2.3 Field Fabrication

Notify the Contracting Officer at least 2 weeks prior to the field fabrication of pipe or fittings and at least 3 days prior to the start of any surface preparation or coating application work. Perform field welding in accordance with Section 40 17 26.00 20 WELDING PRESSURE PIPING. Provide welding electrodes in accordance with Table 3.1 of AWS D1.1/D1.1M as required for the applicable base metals and welding process. Fabricate fittings in accordance with the manufacturer's instructions.

### 3.3 EXPOSED PIPING INSTALLATION

Run exposed piping as straight as practical along the alignment shown on the contract drawings and with a minimum of joints. Install piping and appurtenances in conformance with reviewed shop drawings, manufacturer's instructions and ASME B31.3. Install piping without springing or forcing the pipe.

#### 3.3.1 Anchors and Fasteners

Impact expansion (hammer and explosive charge drive-type) anchors and fastener systems are not acceptable. Lead shields, plastic or fiber inserts, and drilled-in plastic sleeve/nail drive systems are also not acceptable.

##### 3.3.1.1 Drilled-In Expansion Anchors and Fasteners

Design anchors to accept both machine bolts and/or threaded rods. Such

anchors must consist of an expansion shield and expander nut contained inside the shield. Fabricate and design the expander nut to climb the bolt or rod thread and simultaneously expand the shield as soon as the threaded item, while being tightened, reaches, and bears against the shield bottom. Provide shield body consisting of four legs, taper the inside of each toward shield bottom (or nut end). Elongate the end of one leg and turn across shield bottom. Rib the outer surface of shield body for grip-action. The expander nut must be of square design with sides tapered inward from bottom to top. The anchor materials of construction must be zinc plated steel of 43,541 psi minimum tensile strength (unless shown otherwise in contract drawings). Provide fasteners consisting of machine bolts for use with above anchors; provide nuts and washers conforming to ASTM A194/A194M. Ensure the anchor length, diameter, and embedment depth meet the manufacturer's requirements for the maximum allowable working load of the application.

#### 3.3.1.2 Drilled-In Adhesive Anchors

Compose anchors of an anchor rod assembly and an anchor rod adhesive cartridge. Provide anchor rod assembly composed of a chamfered and threaded stud rod of zinc plated ASTM A36/A36M steel with a nut and washer of ASTM A194/A194M alloy-steel. Use anchor length, diameter, and embedment depth meeting the manufacturer's requirements for the maximum allowable working load of the application. Ensure the adhesive cartridge is a sealed capsule containing premeasured amounts of resin, quartz sand aggregate, and a hardener contained in a separate vial within the capsule. Activate the capsule ingredients by the insertion procedure of the anchor rod assembly.

#### 3.3.2 Piping Expansion and Contraction Provisions

Install piping to allow for thermal expansion and contraction resulting from the difference between installation and operating temperatures. Design for installation of plastic pipe exposed to ambient conditions or in which the temperature variation of the contents is substantial must have provisions for movement due to thermal expansion and contraction documented to be in accordance with PPI TR-21. Install anchors as shown in the contract drawings to withstand expansion thrust loads and to direct and control thermal expansion. Install an intermediate pipe guide for every pipe at each metal channel framing support not carrying an anchor or alignment guide. Where pipe expansion joints are required, install pipe alignment guides adjacent to the expansion device and within four pipe diameters. Install expansion devices in accordance with the manufacturer's instructions and at the locations shown in the contract drawings.

#### 3.3.3 Piping Flexibility Provisions

Provide thrust protection as required. Install flexible couplings and expansion joints at connections to equipment, and where shown on the contract drawings. Provide additional pipe anchors and flexible couplings, beyond those shown on the contract drawings, to facilitate piping installation, in accordance with reviewed shop drawings.

#### 3.3.4 Couplings, Adapters and Service Saddles

Thoroughly clean pipes of oil, scale, rust, and dirt in order to provide a clean seat for gaskets. Wipe gaskets clean prior to installation. Lubricate flexible couplings and flanged coupling adapter gaskets with

soapy water or the manufacturer's standard lubricant before installation on the pipe ends. Install couplings, service saddles, and anchor studs in accordance with manufacturer's instructions. Tighten bolts progressively, drawing up bolts on opposite sides a little at a time until all bolts have a uniform tightness. Use torque-limiting wrenches to tighten bolts.

### 3.3.5 Piping Equipment/Component Installation

Install piping components and indicators in accordance with manufacturer's instructions. Provide required upstream and downstream clearances, isolation valves, and miscellaneous devices for an operable installation.

Use upstream and downstream lengths of undisturbed piping in accordance with flow indicator manufacturer's recommendations.

#### 3.3.5.1 Backflow Preventers

Install backflow preventers with nameplate and test cocks accessible from front of unit, and with a minimum clearance of 12.2 inches between the port and grade. Install assemblies in accordance with local codes and discharge to an open drain with an air gap; vertical installation is prohibited.

#### 3.3.5.2 Local Indicators

Install all direct-reading indicator devices, thermometers, and pressure gauges so that they can be easily read from floor level, and are readily accessible for maintenance and service. Coat all temperature sensing bulbs with a silver base heat transfer grease prior to insertion into the thermowell. Install pressure gauges and thermometers where indicated in the contract drawings. Field calibrate all indicators at time of installation to ensure measuring and reading accuracy. Install differential pressure gauges across the process equipment indicated in the contract drawings, in accordance with the manufacturer's recommendations, and arranged for easy observation.

#### 3.3.6 Pipe Flanges

Pipe flanges must be set level, plumb, and aligned. Install flanged fittings true and perpendicular to the axis of the pipe. Ensure bolt holes are concentric to the centerline of the pipe and straddle the vertical centerline of the pipe.

#### 3.3.7 Valve Locations

Locate valves in accordance with the contract drawings where actuators are shown. Where actuators are not shown, locate and orient valves to permit easy access to the valve operator, and to avoid interferences.

#### 3.3.8 Pipe Tap Connections

Taps to pipe barrels are unacceptable. Make taps to ductile iron piping only with a service saddle or at a tapping boss of a fitting, valve body, or equipment casting. Make taps to steel piping only with a welded threadolet connection.

#### 3.3.9 Plastic Pipe Installation

Submit a statement signed by the plastic pipe manufacturer's representative certifying that the Contractor's personnel are capable of

properly installing the piping system on the project. Cut, make up, and install all plastic pipe in accordance with the pipe manufacturer's recommendations.

- a. Perform heat joining in accordance with ASTM D2657. Perform electrofusion joining in accordance with ASTM F1290. Do not thread Schedule 40 pipe. Use Schedule 80 threaded nipples where necessary to connect to threaded valves or fittings. Use strap wrenches for tightening threaded plastic joints, and do not over tighten these fittings.
- b. Do not lay pipe when the temperature is below 40.1 degrees F, nor above 90 degrees F when exposed to direct sunlight. Ensure any plastic pipe installed above grade and outdoors is ultraviolet (UV) protected or UV resistant.
- c. Shield pipe ends that are to be joined from direct sunlight prior to and during the laying operation. Provide adequate ventilation when working with pipe joint solvent cement and handle solvent cements, primers and cleaners in accordance with ASTM F402.
- d. Provide and install supports and hangers in accordance with the manufacturer's recommendations and which indicated as specified and indicated. Where plastic pipe is subjected to severe temperature fluctuations, provisions for expansion and contraction must be provided. Accomplish this with the use of expansion joints and offset piping arrangements. Hydrostatically test all lines at 1.5 times the pressures listed in the Pipe Schedule shown on the contract drawings or maximum operating pressure, whichever is smaller.

Submit 6 copies each of operation and maintenance manuals in indexed booklet form. Detail in the Operation Manuals the step-by-step procedures required for specialized startup, operation and shutdown of piping systems, and include the manufacturer's name, model number, parts list and brief description of piping equipment such as valves and other appurtenances and their basic operating features. List in the Maintenance Manuals routine maintenance procedures and troubleshooting guides for the equipment, and include piping layout and valve locations.

#### 3.3.9.1 PVC Piping

Construct solvent-cemented joints in accordance with ASTM D2855.

#### 3.3.10 Double Containment Piping Installation

Factory trained field representatives of the piping supplier must provide technical field support during critical periods of piping and leak detection system installation including final check out of the leak detection/location system, and end user training.

#### 3.3.11 Insulation

Install insulation on piping as indicated in the contract drawings in accordance with the provisions of Section 23 07 00 THERMAL INSULATION FOR MECHANICAL SYSTEMS.

### 3.4 BURIED PIPE PLACEMENT

Install thermoplastic piping systems underground in accordance with ASTM D2774.

#### 3.4.1 Excavation and Backfilling

Perform earthwork as specified in Section 31 00 00.00 22 EARTHWORK. Accomplish backfilling after inspection by the Contracting Officer. Exercise care when lowering pipe into the trench to prevent damage or twisting of the pipe.

#### 3.4.2 Fittings

Make press connections in accordance with manufacturer's installation instructions using tools approved by the manufacturer. Insert tubing fully into the fitting and then mark at the shoulder of the fitting. Check fitting alignment against the mark on the tubing to ensure the tubing is fully inserted before the joint is pressed. At valves and connections, dig out the trench bottom with sufficient length, width, and depth to ensure clearance between the undisturbed trench bottom and the valves and such connections.

#### 3.4.3 Thrust Restraint

Thrust restraint devices are generally not shown in the contract drawings; their absence will not relieve Contractor of the responsibility for providing them as required to provide complete systems for the use intended. Provide thrust blocks and ties where required, whether or not shown on the contract drawings. At a minimum, provide thrust restraint at pipeline tees, plugs, caps, bends, and other locations where unbalanced forces exist.

##### 3.4.3.1 Thrust Blocks

Thrust blocking must be concrete of a mix not leaner than 1 cement, 2.5 sand and 5 gravel, and have a compressive strength of not less than 2000 psi after 28days. Place blocking between solid ground and the fitting to be anchored. Unless otherwise indicated or directed, pour the base and thrust bearing sides of the thrust blocks against undisturbed earth. The sides of thrust blocks not subject to thrusts may be poured against forms. Provide area of bearing as shown or directed. Place blocking so that fitting joints are accessible for repair. Use steel rods and clamps, protected by galvanizing or a coating of bituminous paint, to anchor vertical down bends into gravity thrust blocks.

##### 3.4.3.2 Restrained Joints

The restrained pipe according to manufacturer recommendations. For ductile iron pipe, design restrained joints in accordance with DIPRA TRD.

#### 3.4.4 Marking Tape

Provide and install pipe marking tape in accordance with the requirements of Section 31 00 00.00 22 EARTHWORK.

#### 3.4.5 Plastic Pipe Installation

Cut, fabricate, and install plastic pipe in strict conformance with the

pipe manufacturer's recommendations. Provide offset loops from the trench centerline as recommended by the manufacturer for the maximum temperature variation between the pipe temperature at the time of solvent welding and operating temperature. Design for installation of plastic pipe exposed to ambient conditions or in which the temperature variation of the contents is substantial must have provisions for movement due to thermal expansion and contraction documented to be in accordance with PPI TR-21. Support flexible plastic pipe connected to heavy fittings, manholes, and rigid structures in such a manner that no subsequent relative movement between the plastic pipe at the flanged joint and the rigid structures is possible. Do not use thrust blocking for flexible plastic piping. Design and install piping to withstand the compression and expansion forces imposed by the trench conditions. .

### 3.5 CONNECTING DISSIMILAR PIPE

Install flexible transition couplings, dielectric fittings and isolation joints in accordance with the manufacturer's instructions.

### 3.6 EXTERNAL CORROSION PROTECTION

Protect all pipe and piping accessories from corrosion and adverse environmental conditions.

#### 3.6.1 Underground Metallic Piping

Protect buried metallic piping from corrosion using protective coatings and cathodic protection. Where dissimilar metals are joined underground, use gas-tight isolation joints. Provide insulating joint material where shown to control galvanic or electrical action.

#### 3.6.2 Above Grade Metallic Piping

Do not paint nonferrous and stainless steel piping except for aluminum alloy piping. Where dissimilar metals are joined, use isolation joints.

##### 3.6.2.1 Ferrous Piping

Touch up shop primed surfaces with ferrous metal primer. Solvent clean surfaces that have not been shop primed. Clean surfaces that contain loose rust, mill scale or other foreign substances mechanically by power wire brushing or where requested by Owner/Engineer commercial sand blasting conforming to SSPC SP 6/NACE No.3 and prime with a ferrous metal primer. Finish primed surfaces with two coats of exterior vinyl paint in accordance with Section 09 90 00 PAINTS AND COATINGS.

### 3.7 DOUBLE CONTAINMENT PIPING LEAK DETECTION SYSTEM

- a. Install the system in accordance with the manufacturer's recommended installation procedures. Follow all local, state and federal codes and requirements. Install system by properly trained personnel. Provide a location map with the system by the Contractor indicating the "as built" system configuration and sensing string layout. Provide markings along the cable length as references to locate leaks. Base markings upon calibration points. Take and record calibration points along the sensing string in accordance with the manufacturer's recommended procedures. Provide cable not in containment piping with cable tags every 49.2 feet.

- b. Perform tests to demonstrate the ability of the system to detect and locate breaks, shorts and probes on the sensor string. Perform leak testing pursuant to the following procedure in order to verify operation and the ability to work with condensation pools or other static moisture. The double containment piping system leak detection field test procedures are as follows:

- (1) Wet the sensor cable near the start of the sensor string and acknowledge the detection/location alarm and remap the system.
- (2) Wet the sensor cable near the end of the sensor string with the first location still wetted and acknowledge the detection/location alarm and remap the system.
- (3) Wet the sensor cable in three additional locations between the first and second leak locations with each detection/location alarm being acknowledged and with all prior leak locations still wetted.
- (4) Prepare and submit a report verifying each leak location and detection accuracy. Furnish a hard copy report of the test results.

### 3.8 FLEXIBLE JOINTS AT CONCRETE STRUCTURES

Provide flexible joints at the face of all structures, whether or not shown on the contract drawings. Rubber ring joints, mechanical joints, flexible couplings, and proprietary restrained ductile iron pipe joints are considered flexible joints; welded pipe joints are not. Joints may be flush with the structure face or may be located up to 1 pipe diameter away from face, but not further than 17.7 inches away from face. For pipelines larger than 18 inch in diameter the first joint must be within 1 pipe diameter.

### 3.9 CLOSURES

Install closure pieces as necessary to end pipe runs and conforming to ASME B16.9 or ASME B16.11. Elastomer sleeves bonded to pipe ends are not acceptable. Provide pressure piping with closures of butt-welded caps blind flanges, threaded plugs, plain end pieces as required matching existing piping system, with thickness matching the nominal wall thickness of the associated pipe, mounted on double flexible couplings, unless otherwise shown on contract drawings or approved by the Contracting Officer. Ensure pipes with restrained joints have pipe closures installed with thrust tie-rod assemblies.

### 3.10 PENETRATIONS

Steel pipe sleeves must be hot-dipped galvanized after fabrication for above grade applications in nonsubmerged areas. For below grade, or in submerged and damp environments, line and coat steel pipe sleeves as specified in Section 09 90 00 PAINTS AND COATINGS. Isolate embedded metallic piping from concrete reinforcement using coated pipe penetrations. Coatings must be as specified in Section 09 90 00 PAINTS AND COATINGS. Support wall pipes securely by form work to prevent contact with reinforcing steel and tie-wires. Ensure joints are sealed with a wall penetration seal. For existing concrete walls, rotary drilled holes may be provided in lieu of sleeves.

### 3.11 VALVE INSTALLATION

Install flanged valve bolt holes so as to straddle the vertical centerline of pipe. Clean flanged faces prior to inserting the gasket and bolts, and then tighten the nuts progressively and uniformly. Clean threads of threaded ends by wire brushing or swabbing prior to installation.

#### 3.11.1 Valve Orientation

Install operating stem of a manual valve in a vertical position when the valve is installed in horizontal runs of pipe having centerline elevations 4.5 feet or less above finished floor, unless otherwise shown on contract drawings. Install operating stem of a manual valve in a horizontal position in horizontal runs of pipe having centerline elevations between 4.5 feet and 6.75 feet above finish floor, unless otherwise shown on contract drawings. Install automatic valves in accordance with the manufacturer's instructions and approved drawings.

##### 3.11.1.1 Butterfly Valves

Orientation of butterfly valves must take into account changes in pipe direction. Orient valve shafts so that unbalanced flows caused by pipe direction changes or other disturbances are equally divided to each half of the disc.

##### 3.11.1.2 Plug Valves

If a plug valve seat position is not shown in the contract drawings, locate the seat position as follows: for horizontal flow, the flow must produce an "unseating" pressure, and the plug must open into the top half of valve; and for vertical flow, install the seat in the highest portion of the valve.

#### 3.11.2 Line Size Ball Valves

Install a line size ball valve and union upstream of each solenoid valve, in-line flow switch, or other in-line electrical device, excluding magnetic flowmeters, for isolation during maintenance.

#### 3.11.3 Isolation Valve

Install safety isolation valves on compressed air supplies. Locate valve to provide accessibility for control and maintenance. If necessary, install access doors in finished walls and plaster ceilings for valve access.

#### 3.11.4 Operator Extension Stems

Where the depth of the valve is such that its centerline is more than 3 feet below grade, furnish an operator extension stem with a 2 inch operating nut to bring the operating nut to a point 5.9 inches below the surface of the ground and/or box cover. Locate operating nut in a floor box.

#### 3.11.5 Torque Tube

Where the operator for quarter-turn valve is located on a floor stand, furnish an extension stem torque tube, properly sized for the maximum torque capacity of the valve.

### 3.11.6 Chain Wheel and Guide

Install chain wheel and guide assemblies or chain lever assemblies on manually operated valves located over 6.73 feet above finished floor elevation. Where chains hang in normally traveled areas, use appropriate "L" type tie-back anchors.

### 3.12 AIR RELEASE, DRAINS AND SAMPLE PORTS

Provide sample ports where indicated on the contract drawings. Install specified vents at piping high points for entrapped air release and install drains in the low points of pipelines regardless of whether shown on contract drawings.

### 3.13 PIPING SUPPORT SYSTEMS INSTALLATION

The absence of pipe supports and details on the contract drawings does not relieve the Contractor of responsibility for sizing and providing supports throughout plant.

#### 3.13.1 General Support Requirements

Provide pipe support systems meeting the requirements of MSS SP-58. Install Contractor-designed and selected support systems in accordance with MSS SP-58, and as specified herein. Support piping connections to equipment by pipe supports and not off the equipment. Support large or heavy valves, fittings, and/or equipment independently of associated piping. Do not support pipes off other pipes. Provide supports at piping changes in direction or in elevation, adjacent to flexible joints and couplings, and where otherwise shown on the contract drawings. Do not install pipe supports and hangers in equipment access areas or bridge crane runs. Brace hanging pipes against horizontal movement by both longitudinal and lateral sway bracing. At each channel type support, provide every pipe with an intermediate pipe guide, except where pipe anchors are required. Existing support systems may be used to support additional new piping only if the Contractor can demonstrate that the existing support systems are adequate for the additional loads, or if the existing systems are strengthened to support the additional loads. Provide pedestal type pipe supports under base flanges adjacent to rotating equipment and where required to isolate vibration. Brace piping 2.5 inch in diameter and larger for seismic forces. Install lateral supports for seismic loads at all changes in direction.

#### 3.13.2 Support of Insulated Piping

Install oversized supports to fit the insulation inserts. Provide supports with galvanized or stainless steel protection shields and oversized rollers.

#### 3.13.3 Dielectric Barriers

Install dielectric barriers between supports and copper or stainless steel piping, and between stainless steel supports and non-stainless steel ferrous piping.

#### 3.13.4 Support Spacing

Provide a support and associated designed by a professional engineer.

### 3.13.5 Support Methods

Provide piping support as specified and as shown in the contract drawings. Support single horizontal suspended piping by adjustable swivel-ring, split-ring, or clevis hangers. Support multiple horizontal suspended piping by trapeze hangers with channel type supports. Provide horizontal pedestal mounted piping with saddle type supports. Provide horizontal wall mounted piping with wall brackets. Support vertical piping by wall brackets, base elbows, or riser clamps on floor penetrations.

### 3.13.6 Supports and Hangers for Stainless Steel Piping

Provide all hanger-pipe contact surfaces with a dielectric barrier consisting of chloroprene rubber wrapping or plastic coated hangers. The load rating of universal concrete inserts is not allowed to be less than that of the hanger rods they support.

### 3.14 PIPE IDENTIFICATION, PAINTING AND COLOR CODING

Ensure color, coating, and lettering requirements for exposed piping are in accordance with Section 09 90 00 PAINTS AND COATINGS. Except where piping is required to be completely painted in its code color, piping or its insulation covering may be banded either with plastic adhesive tapes or painted stripes around pipe designating piping contents in accordance with following options and requirements. Provide a single individual band, of plastic adhesive tape or paint, designating pipe contents with sufficient length to permit the stenciling of pipe contents in letters. Provide identification at branch connections, inlets and outlets of equipment, every 19.7 feet of straight run, upstream of valves, and within 3.3 feet of entrance to or exit from wall curtains, or other similar type barrier.

### 3.15 FIELD QUALITY CONTROL

#### 3.15.1 Hydrostatic Tests

Where any section of a pipeline is provided with concrete thrust blocking for fitting, do not make the hydrostatic tests until at least 5 days after the installation of the concrete thrust blocking, unless otherwise approved by the Contracting Officer.

##### 3.15.1.1 Buried Piping

After the pipe is laid, the joints completed and the trench partially backfilled leaving the joints exposed for examination, subject the newly laid piping or any valved section of piping, unless otherwise specified, for 1 hour to a hydrostatic test pressure as listed in the Pipe Schedule in the contract drawings. Open and close each valve several times during the test. Carefully examine exposed pipe, joints, fittings, and valves during the partially open trench test. Replace joints showing visible leakage as necessary. Remove defective pipe, joints, fittings, and valves found during the pressure test and replace with new material, and repeat the test until the test results are satisfactory. The requirement for the joints to remain exposed for the hydrostatic tests may be waived by the Contracting Officer when one or more of the following conditions are encountered: (1) wet or unstable soil conditions in the trench; (2) compliance would require maintaining barricades and walkways around and across an open trench in a heavily used area that would require continuous surveillance to assure safe conditions; or (3) maintaining the trench in

an open condition would delay completion of the Contract. The Contractor may request a waiver, setting forth in writing the reasons for the request and stating the alternative procedure proposed to comply with the hydrostatic tests. Place backfill placed prior to the tests in accordance with the requirements of Section 31 00 00.00 22 EARTHWORK.

#### 3.15.1.2 Exposed Piping

Conduct hydrostatic testing in accordance with ASME B31.3. Test piping systems under normal service conditions (as indicated in the Pipe Schedule in the contract drawings) to demonstrate compliance. Test pressure less than 1.5 times the design pressure is prohibited. Use water as the hydrostatic test fluid. Provide clean test water of such quality to prevent corrosion of the piping system materials. Open air release vents at all high points of the piping system in order to purge air pockets while the piping system is filling.

##### 3.15.1.2.1 Rigid Piping

For rigid piping hydrostatic testing, calculate the maximum test pressure according to ASME B31.3, but do not exceed the yield strength of the piping system. The maximum velocity during filling is 0.25 fps applied over full area of pipe. Venting during filling may also be provided by loosening flanges with a minimum of four bolts or by the use of equipment vents. Test all parts of the piping system. Maintain hydrostatic test pressure continuously for 30 minutes minimum and for such additional time as necessary to conduct examinations for leakage. Examine all joints and connections for leakage. Ensure piping system, exclusive of possible localized instances at pump or valve packing, shows no visual evidence of leaking. Correct visible leakage and retest. Unless otherwise directed by the Contracting Officer, leave the piping system full of water after leaks are repaired.

##### 3.15.1.2.2 Non-Rigid, Non-Metallic Piping

For non-rigid, non-metallic piping hydrostatic testing, calculate the maximum test pressure according to ASME B31.3, but do not exceed 1.5 times the maximum pressure rating of the lowest rated component in the piping system. The maximum velocity during filling is 0.25 fps applied over full area of pipe. Pressurize the system initially to 50 percent of the normal service conditions and inspect. Repair any leaks. Then pressurize the system to the test pressure. Add small amounts of water as required on a hourly basis for a maximum of 3 hours in order to maintain the test pressure. After 4 hours, lower the test pressure by 10.2 psi. If the hydrostatic pressure remains steady for 1 hour, then no leakage is indicated. Inspect for leaks, repair and retest if necessary. Allow piping system to relax for 8 hours before retesting.

##### 3.15.1.3 Double Containment

Test the primary piping of a double containment piping system in accordance with Subparagraph Exposed Piping of this paragraph. Pneumatically pressure test secondary containment piping of a double containment piping system in accordance with Subparagraph Double Containment Secondary Piping. Pressure test at the maximum test pressure of 5 psi or manufacturer's recommended maximum, 1 times the maximum pressure rating of the lowest rated component in the piping system. The maximum velocity during filling is 0.25 fps applied over full area of pipe. Pressurize the system initially to 50 percent of the normal service

conditions and inspect. Repair any leaks. Then pressurize the system to the test pressure. Add small amounts of water as required on a hourly basis for a maximum of 3 hours in order to maintain the test pressure. After 4 hours, lower the test pressure by 10.2 psi. If the hydrostatic pressure remains steady for 1 hour, then no leakage is indicated. Inspect for leaks, repair and retest if necessary. Allow piping system to relax for 8 hours before retesting.

#### 3.15.1.4 Time for Making Test

Except for joint material setting or where concrete thrust blocks necessitate a delay, underground piping jointed with rubber gaskets, mechanical or push-on joints, or couplings may be subjected to hydrostatic pressure, inspected, and tested for leakage at any time after partial completion of backfill. Conduct tests for above ground pressure piping after the piping has been completely installed, including all supports, hangers, and anchors, and inspected for proper installation but prior to installation of insulation.

#### 3.15.2 Pneumatic Tests

Prepare for and conduct pneumatic testing in accordance with the requirements of ASME B31.3. Care must be taken to minimize the chance of a brittle fracture or failure during a pneumatic leak test. Use only non-toxic, nonflammable, inert gases or air.

##### 3.15.2.1 Pressure Relief Device

During pneumatic testing, provide a pressure relief device for each piping section being tested. The device must have a set pressure no higher than the test pressure plus the lesser of 10 percent of the test pressure or 50.8 psi.

##### 3.15.2.2 Pneumatic Testing Procedures

The test fluid must be air and the test pressure must be 110 percent of the design pressure. Increase test pressure incrementally until the gage pressure reaches the lesser of 50 percent of the test pressure or 25 psig. Examine piping joints for leakage. If no leakage is occurring, continue to increase the pressure incrementally, while maintaining each incremental increase long enough to equalize pipe strains, until the test pressure is reached. Then reduce the test pressure to the design pressure and maintain for 10 minutes without additional energy expenditure. If the pneumatic pressure remains steady, then no leakage is indicated. Inspect for and repair leaks, and retest if necessary.

#### 3.15.3 Pipe Leakage Tests

Unless approved by the Contracting Officer, conduct leakage testing after the pressure tests have been satisfactorily completed. The duration of each leakage test is at least 2 hours, and during the test, subject the piping to no less than 200 psig pressure. Leakage is defined as the quantity of the test liquid, water, that is supplied to the piping system, or any valved or approved section thereof, in order to maintain pressure within 5 psi of the specified leakage test pressure after the piping has been filled with the test liquid and all air is expelled. No piping installation will be accepted if leakage exceeds the allowable leakage determined by the following formula:

|                                            |                                                 |                  |
|--------------------------------------------|-------------------------------------------------|------------------|
| $L = C_f \times N \times D \times P^{0.5}$ |                                                 |                  |
| Cf                                         | conversion factor                               | 0.0001351        |
| L                                          | allowable leakage                               | gallons per hour |
| N                                          | number of joints in the length of piping tested |                  |
| D                                          | nominal pipe diameter                           | inches           |
| P                                          | average test pressure during the test           | psig             |

Should any test disclose leakage greater than that allowed, locate the leaks and repair until the leakage is within the specified allowance, without additional cost.

#### 3.15.4 Testing New to Existing Connections

Test new piping connected to existing pipe, existing equipment, existing treatment systems, or tanks and treatment systems furnished under other Sections. Isolate the new piping with pipe caps, spectacle blinds, or blind flanges. Test the joint between new piping and existing piping by methods that do not place the entire existing system under the test load. Proceed. then, with the testing of new piping systems as specified herein.

#### 3.15.5 Valve Testing

Submit copies of all field test reports within 24 hours of the completion of the test. Valves may either be tested while testing pipelines, or as a separate step. Demonstrate that valves open and close smoothly with operating pressure on one side and atmospheric pressure on the other, and in both directions for two-way valve applications. Count and record the number of turns required to open and close each valve, and account for any discrepancies with manufacturer's data. Examine air and vacuum relief valves as the associated pipe is being filled to verify venting and seating is fully functional. Set, verify, and record set pressures for all relief and regulating valves. Test self-contained automatic valves at both maximum and minimum operating ranges, and reset upon completion of test to the design value.

#### 3.16 FINAL CLEANING

##### 3.16.1 Interim Cleaning

Prevent the accumulation of weld rod, weld spatter, pipe cuttings and filings, gravel, cleaning rags, and other foreign material within piping sections during fabrication. Examine the piping to assure removal of these and other foreign objects prior to assembly and installation.

##### 3.16.2 Flushing

Following assembly and testing, and prior to final acceptance, flush piping systems with water to remove accumulated construction debris and other foreign matter. Flush piping until all foreign matter is removed from the pipeline. Provide all hoses, temporary pipes, ditches, and other items as required to properly dispose of flushing water without damage to adjacent properties. The minimum flushing velocity is 2.5 fps . For

large diameter pipe where it is impractical to flush the pipe at the minimum flushing velocity, clean the pipeline in-place from the inside by brushing and sweeping, then flushing the pipeline at a lower velocity. Install cone strainers in the flushing connections of attached equipment and leave in place until cleaning is completed. Remove accumulated debris through drains, or by removing spools or valves.

### 3.16.3 Disinfection

. Before acceptance of (water) piping system operation, disinfect each section of completed pipeline in accordance with AWWA C651. After pressure tests have been made, thoroughly flush the piping section to be disinfected with water until all entrained dirt and mud have been removed before introducing the chlorinating material. The chlorinating material must be liquid chlorine, calcium hypochlorite, or sodium hypochlorite. Ensure the chlorinating material provides a dosage of no less than 50 ppm and introduce into the piping in an approved manner. Chlorinate PVC pipe lines using only the above specified chlorinating material in solution. Do not introduce the agent into the line in a dry solid state. Retain the treated water in the pipe long enough to destroy all non-spore-forming bacteria. Except where a shorter period is approved, the retention time is at least 24 hours and produce no less than 25 ppm of free chlorine residual throughout the line at the end of the retention period. Open and close all valves on the lines being disinfected several times during the contact period. Then flush the line with clean water until the residual chlorine is reduced to less than 1.0 ppm. During the flushing period, open and close each outlet on the line several times. From several points in the pipeline section, the Contracting Officer will take samples of water in sterilized containers for bacterial examination. Repeat the disinfection until the piping system passes the bacterial examination for 2 consecutive days. The piping system will not be accepted until satisfactory bacteriological results have been obtained.

### 3.17 WASTE WATER DISPOSAL

Submit the method proposed for disposal of waste water from hydrostatic tests and disinfection, and all required permits, prior to performing hydrostatic tests. Dispose of water used for testing, cleaning, flushing and/or disinfection in accordance with all applicable regulations. Disposal is solely the responsibility of the Contractor. Provide the method proposed for disposal of waste water to the Contracting Officer for approval prior to performing any testing, cleaning, flushing and disinfection activities.

### 3.18 MANUFACTURER'S FIELD SERVICES

Submit a signed statement certifying that the installation is satisfactory and in accordance with the contract drawings and specifications and the manufacturer's prescribed procedures and techniques, upon completion of the project and before final acceptance. Obtain manufacturer's technical assistance for Contractor training, installation inspection, start up, and owner operating and maintenance training. Follow manufacturer's instructions for installation.

1.2 DEFINITIONS AND SYMBOLS

Definitions are in accordance with AWS A3.0M/A3.0. Symbols are in accordance with AWS A2.4.

1.3 PERFORMANCE REQUIREMENTS

Quality of all joint preparation, welding, and examination is the Contractor's responsibility for. Clearly identify and record all materials used in the welding operations. The inspection and testing defined in this specification are minimum requirements. Additional inspection and testing is the responsibility of the Contractor when it is deemed necessary to achieve the quality required.

1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Pressure Piping; G

SD-03 Product Data

Welding Operations

SD-07 Certificates

Qualifications

1.5 QUALIFICATIONS

Welding procedures, welders, and welding operators previously qualified by test may be accepted for the work without requalification, provided that all of the following conditions are fulfilled:

- a. Copies of the welding procedures, the procedure qualification test records, and the welder and welding operator performance qualification test records are submitted and approved in accordance with paragraph SUBMITTALS.
- b. Testing was performed by an approved testing laboratory or technical consultant or by the Contractor's approved quality assurance organization.
- c. The welding procedures, welders, and welding operators were qualified in accordance with ASME BPVC SEC IX, or AWS B2.1/B2.1M, AR-2 level; and base materials, filler materials, electrodes, equipment, and processes conformed to the applicable requirements of this specification.
- d. The requirements of paragraph "Renewal of Qualification" below are met and records showing name of employer and period of employment using the process for which qualified are submitted as evidence of conformance.

#### 1.5.1 Welding Procedures Qualification

Record in detail and qualify the Welding Procedure Specifications for every proposed welding procedure. Qualification for each welding procedure must conform to the requirements of ASME B31.1, ASME B31.3, ASME B31.5, ASME B31.8, and to this specification. Specify end preparation for butt welds including cleaning, alignment, and root openings. Provide preheat, interpass temperature control, and postheat treatment of welds as required by approved welding procedures, unless otherwise indicated or specified. Describe the type of backing rings or consumable inserts, if used, and if they are to be removed, describe the removal process. Submit copies of the welding procedure specifications and procedure qualification test results for each type of welding required in accordance with paragraph SUBMITTALS. Approval of any procedure does not relieve the Contractor of the sole responsibility for producing acceptable welds. Identify welding procedures individually and reference on the detail drawings or key to the contract drawings.

#### 1.5.2 Welder and Welding Operator Performance

Provide qualified welder and welding operator assigned to work in accordance with ASME B31.1, ASME B31.3, ASME B31.5, ASME B31.8.

##### 1.5.2.1 Certification

Before assigning welders or welding operators to the work, provide the Contracting Officer with their names together with certification that each individual is performance-qualified as specified. State the type of welding and positions for which each is qualified, the code and procedure under which each is qualified, date qualified, and the firm and individual certifying the qualification tests.

##### 1.5.2.2 Identification

Identify each particular weld with the personal number, letter, or symbol assigned to each welder or welding operator. To identify welds, submit written records indicating the location of welds made by each welder or welding operator, and each welder or welding operator must apply the personal mark adjacent to the welds using a rubber stamp or felt-tipped

marker with permanent, weatherproof ink or other methods approved by the Contracting Officer that do not deform the metal. For seam welds, place identification marks adjacent to the welds at 3 foot intervals. Identification by die stamps or electric etchers will not be allowed.

#### 1.5.2.3 Renewal of Qualification

Requalification of a welder or welding operator is required under any of the following conditions:

- a. When a welder or welding operator has not used the specific welding process for a period of 3 months; the period may be extended to 6 months if the welder or welding operator has been employed on some other welding process.
- b. When a welder or welding operator has not welded with any process during a period of 3 months, all the personal qualifications are considered expired, including any extended by virtue of a., above.
- c. There is specific reason to question the person's ability to make welds that will meet the requirements of the specifications.
- d. The welder or welding operator was qualified by an employer, other than those firms performing work under this contract, and a qualification test has not been taken within the preceding 12 months.
- e. Renewal of qualification for a specific welding process under conditions a., b., and d., above, needs to be made on only a single test joint or pipe of any thickness, position, or material to reestablish the welder's or welding operator's qualification for any thickness, position, or material covered under previous qualification.

#### 1.5.3 Inspection and NDE Personnel

All inspection and NDE personnel must be qualified in accordance with the following requirements.

##### 1.5.3.1 Inspector Certification

Welding inspectors must be qualified in accordance with AWS QC1.

##### 1.5.3.2 NDE Personnel

Furnish certified NDE personnel, and establish a written procedure for the control and administration of NDE personnel training, examination, and certification. Base the procedures on appropriate specific and general guidelines of training and experience recommended by ASNT SNT-TC-1A, ASNT SNT-TC-1A Q&A Bk A, ASNT SNT-TC-1A Q&A Bk B, ASNT SNT-TC-1A Q&A Bk C and ASNT SNT-TC-1A Q&A Bk D.

#### 1.6 REGULATORY REQUIREMENTS

This section covers the welding of pressure piping systems. Submit detail drawings showing location, length, and type of welds; and indicating postweld heat treatment and NDE as required. Deviations from applicable codes, approved procedures, and approved detail drawings will not be permitted without prior written approval. Materials or components with welds made offsite will not be accepted if the welding does not conform to the requirements of this specification, unless otherwise specified.

Develop procedures for welding all metals included in the work. Do not start welding until welding procedures, welders, and welding operators have been qualified. Perform qualification testing by an approved testing laboratory, or by the Contractor if approved by the Contracting Officer. Notify the Contracting Officer at least 24 hours in advance of the time and place of the tests. When practicable, perform the qualification tests at or near the worksite. Maintain current records of the test results obtained in the welding procedure, welding operator, welder performance qualifications, and nondestructive examination (NDE) procedures readily available at the site for examination by the Contracting Officer. Qualify the procedures for making transition welds between different materials or between plates or pipes of different wall thicknesses. ASME B31.1, ASME B31.3, ASME B31.5, ASME B31.8 requirements for branch connections may be used in lieu of detailed designs. Unless otherwise specified, the choice of welding process is the responsibility of the Contractor. Safety precautions must conform to AWS Z49.1.

## 1.7 DELIVERY, STORAGE, AND HANDLING

Deliver all filler metals, electrodes, fluxes, and other welding materials to the site in manufacturers' original packages and stored in a dry space until used. Properly label and design packages to give maximum protection from moisture and to insure safe handling.

### 1.7.1 Material Control

Store materials in a controlled access and clean, dry area that is weathertight and maintained at a temperature recommended by the manufacturer. The materials must not be in contact with the floor and store on wooden pallets or cribbing.

#### 1.7.1.1 Damaged Containers

Store low-hydrogen steel electrodes in their sealed shipping container. If the seal is damaged during shipment or storage, and the damage is not immediately detected, rebake the covered electrodes in that container in accordance with the manufacturer's instructions prior to issuance or discard. If a container is damaged in storage and the damage is witnessed, immediately place the electrodes from that container in a storage oven. Provide storage oven temperature as recommended by the manufacturer or the welding material specification.

#### 1.7.1.2 Partial Issues

When a container of covered electrodes is opened and only a portion of the content is issued, place the remaining portion, within 1/2 hour, in a storage oven.

### 1.7.2 Damaged Materials

Discard damaged materials. Discard covered electrodes which are oil or water-soaked, dirty, or on which the flux has separated from the wire.

## PART 2 PRODUCTS

### 2.1 MATERIALS

Provide welding materials which comply with ASME BPVC SEC II-C. Provide welding equipment, electrodes, welding wire, and fluxes capable of

producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

## PART 3 EXECUTION

### 3.1 WELDING OPERATIONS

Perform welding in accordance with qualified procedures using qualified welders and welding operators. Submit detailed procedures which define methods of compliance to contract drawings and specifications. Inspection and material procurement records. System and material testing and certification records. Written records and drawings indicating location of welds made by each welder or welding operator.

Do not perform welding when the quality of the completed weld could be impaired by the prevailing working or weather conditions. The Contracting Officer will determine when weather or working conditions are unsuitable for welding. Welding of hangers, supports, and plates to structural members must conform to Section 05 05 23.16 STRUCTURAL WELDING.

#### 3.1.1 Base Metal Preparation

Do not use oxy-fuel cutting on austenitic stainless steel or nonferrous materials.

#### 3.1.2 Weld Joint Fit-Up

Fit, align, and retain parts that are to be joined by welding in position during the welding operation by the use of bars, jacks, clamps, or other mechanical fixtures. Do not use welded temporary attachments except when it is impractical to use mechanical fixtures. When temporary attachments are used, they must be the same material as the base metal. Completely remove by grinding or thermal cutting after the welding operation is completed. If thermal cutting is used, cut the attachment no less than 1/4 inch from the member and remove the balance by grinding. After the temporary attachment has been removed, visually examine the area.

#### 3.1.3 Preheat and Interpass Temperatures

Provide preheat temperatures meeting the requirements specified by ASME B31.1, ASME B31.3, ASME B31.5, ASME B31.8. However, preheat below 50 degrees F for ferritic steel or austenitic stainless steel, or 32 degrees F for nonferrous alloys is not acceptable. Do not exceed maximum interpass temperatures of 300 degrees F for austenitic stainless steels, nickel alloys, and copper alloys; and 500 degrees F for carbon steels. Use preheat techniques to ensure that the full thickness of the weld joint preparation and/or adjacent base material, at least 3 inches in all directions, is at the specified temperature. Preheating by induction or resistance methods is preferred. When flame heating is used, employ only a neutral flame. Do not use oxy-fuel heating on austenitic stainless steel or nickel-alloy materials; however, air-fuel heating is acceptable if controlled to insure that the surface temperature does not exceed 150 degrees F. Check interpass temperatures on the surface of the component within 1 inch of the weld groove and at the starting location of the next weld pass, and for a distance of about 6 inches ahead of the weld, but not on the area to be welded.

#### 3.1.4 Production Welding Instructions

- a. Do not perform welding when the ambient temperature is lower than 0 degree F.
- b. Welding is not permitted on surfaces that are wet or covered with ice, when snow or rain is falling on the surfaces to be welded, or during periods of high winds, unless the welders and the work are properly protected.
- c. Provide welding grade gases for purging and shielding with a dew point of minus 40 degrees F or lower.
- d. Back purges are required for austenitic stainless steels and nonferrous alloys welded from one side and set up such that the flow of gas from the inlet to the outlet orifice passes across the area to be welded. The oxygen content of the gas exiting from the purge vent must be less than 2 percent prior to welding.
- e. Maintain the purge on groove welds for at least three layers or 3/16 inch.
- f. Furnish removable purge dam materials made of expandable or flexible plugs, such as plexiglass, plywood (which must be dry when used), etc. Provide wood dams of kiln-dried quality. Provide nonremovable purge dams and purge dam adhesives made of water soluble materials. Purge dams made of polyvinyl alcohol are not permitted.
- g. Do not perform any welding process which requires the use of external gas shielding in a draft or wind unless the weld area is protected by a shelter. This shelter must be of material and shape appropriate to reduce wind velocity in the vicinity of the weld to a maximum of 5 mph (440 fpm).
- h. Welding of low-alloy and hardenable high-alloy steels may be interrupted provided a minimum of at least 3/8 inch thickness of weld deposit or 25 percent of the weld groove is filled, whichever is greater, and the preheat temperature is maintained during the time that welding is interrupted. If the temperature falls below the minimum preheat temperature before all welding has been completed on a joint, or, where required, before post weld heat treatment, perform a liquid penetrant or magnetic particle examination to insure sound deposited metal before reheating. Welding of other materials may be interrupted without restriction provided a visual inspection is performed before welding is resumed.
- i. Taper the ends of tack welds to be incorporated in the final welds by grinding or welding technique. Remove tack welds that are cracked or defective and retack the groove prior to welding. Remove temporary tack welds, ground the surface smooth, and visually inspect. For low-alloy and hardenable high-alloy steels, the area must be magnetic particle examination inspected.
- j. When joining ferritic steel pressure piping components to austenitic stainless steel pressure piping components and postweld heat treatment is required, the following requirements apply:
  - (1) Butter the weld-end preps of ferritic steel components, which are to be welded to austenitic stainless steel, with one of the

following weld filler metals conforming to the specified requirements: ASME BPVC SEC II-C, SFA 5.14, Classification ERNiCr-3; or ASME BPVC SEC II-C, SFA 5.11, Classification ENiCrFe-2.

- (2) Butter the ferritic steel weld-end prep, apply a postweld heat treatment as required by ASME B31.1, ASME B31.3, ASME B31.5, ASME B31.8 and then machine with the applicable weld-end preparation. After machining, the buttered layer must be a minimum of 1/4 inch thick.
- (3) Complete pressure piping transition joints using ERNiCr-3 or ENiCrFe-2 weld filler metals. Do not perform further postweld heat treatment.

- k. When joining ferritic steel pressure piping components to austenitic stainless steel pressure piping components and postweld heat treatment is not required, prepare and weld the joint using either ERNiCr-3 or ENiCrFe-2 filler metals. For service temperatures of 200 degrees F or less, stainless filler metal 309 ASME BPVC SEC II-C, SFA 5.4 or 5.9 is permissible in lieu of the nickel-based alloys.
- l. Grinding of completed welds is to be performed only to the extent required for NDE, including any inservice examination, and to provide weld reinforcement within the requirements of ASME B31.1, ASME B31.3, ASME B31.5, ASME B31.8. If the surface of the weld requires grinding, avoid reducing the weld or base material below the minimum required thickness. Provide minimum weld external reinforcement flush between external surfaces.

### 3.1.5 Postweld Heat Treatment

- a. Perform postweld heat treatment in accordance with ASME B31.1, ASME B31.3, ASME B31.5, ASME B31.8. Measure temperatures for local postweld heat treatment continuously by thermocouples in contact with the weldment.
- b. Perform postweld heat treatment of low-alloy steels, when required, immediately upon completion of welding and prior to the temperature of the weld falling below the preheat temperature. However, postweld heat treatment may be postponed after the completion of the weld, if, immediately after the weld is completed, it is maintained at a minimum temperature of 300 degrees F or the preheat temperature, whichever is greater, for 2 hours per inch of weld thickness.
- c. For low-alloy steels, use cooling rates that avoid temper embrittlement.

### 3.2 EXAMINATIONS, INSPECTIONS, AND TESTS

Visual and NDE must be performed by the Contractor to detect surface and internal discontinuities in completed welds. Employ the services of a qualified commercial inspection or testing laboratory or technical consultant approved by the Contracting Officer. Visually inspect all tack welds, weld passes, and completed welds. In addition, perform magnetic particle or liquid penetrant examination on root passes. Radiographic, Liquid penetrant, Magnetic particle or Ultrasonic examination is required as indicated in TABLE I. When inspection and testing indicates defects in a weld joint, repair the weld by a qualified welder in accordance with

paragraph CORRECTIONS AND REPAIRS.

| TABLE I. MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS                                                                 |                                                             |                                                                                                              |                                      |
|------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|--------------------------------------|
| Type Weld                                                                                                              | Piping Service Conditions and Nondestructive Test           |                                                                                                              |                                      |
|                                                                                                                        | Temperatures over 750 degrees F and at all pressures        | Temperatures between 350 degrees F and 750 degrees F inclusive and at pressures above 1025 psig              | All others                           |
| Butt Welds (Girth and Longitudinal)                                                                                    | RT for NPS over 2 inches MT or PT for NPS 2 inches and less | RT for over 2 inches NPS with thickness over 3/4 inch. | NOTES TO TABLE I                                                                                                       |                                                             |                                                                                                              |                                      |
| (1) All welds must be given a visual examination in addition to type of specific nondestructive examination specified. |                                                             |                                                                                                              |                                      |
| (2) NPS - nominal pipe size.                                                                                           |                                                             |                                                                                                              |                                      |
| (3) RT - Radiographic examination; MT - magnetic particle examination; PT - liquid penetrant examination.              |                                                             |                                                                                                              |                                      |
| (4) RT of branch welds must be performed before any nonintegral reinforcing material is applied.                       |                                                             |                                                                                                              |                                      |
| (5) The thickness of butt welds is defined as the thicker of the two abutting ends after end preparation.              |                                                             |                                                                                                              |                                      |
| (6) Temperatures and pressures shown are design.                                                                       |                                                             |                                                                                                              |                                      |

| TABLE I. MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS                                                                                                                                                                                                                                                    |                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| Type Weld                                                                                                                                                                                                                                                                                                 | Piping Service Conditions and Nondestructive Test |
| (7) In lieu of radiography of welded branch connections when required above, liquid penetrant or magnetic particle examination is acceptable and, when used, must be performed at the lesser of one half of the weld thickness or each 1/2 inch of weld thickness and all accessible final weld surfaces. |                                                   |
| (8) For nondestructive examination of the pressure retaining component, refer to the standards listed in applicable code or the manufacturing specifications.                                                                                                                                             |                                                   |
| (9) Fillet welds not exceeding 1/4 inch throat thickness which are used for the permanent attachment of nonpressure retaining parts are exempt from the PT or MT requirements of the above table.                                                                                                         |                                                   |

### 3.2.1 Random NDE Testing

When random radiographic, liquid penetrant, magnetic particle or ultrasonic examination is required, test a minimum of 10 percent of the total length or number of piping welds. Randomly select welds for inspection, but include an examination of welds made by each welding operator or welder in the selection. If the random testing reveals that any welds fail to meet minimum quality requirements, inspect an additional 10 percent of the welds in that same group. If all of the additional welds inspected meet the quality requirements, accept the entire group of welds represented and repair the defective welds. If any of the additional welds inspected also fail to meet the quality requirements, reject that entire group of welds. Remove and reweld the rejected welds, or 100 percent inspect the rejected welds and remove and reweld all defective weld areas.

### 3.2.2 Visual Inspection

Visually inspect weld joints as follows:

#### 3.2.2.1 Before Welding

For compliance with requirements for joint preparation, placement of backing rings or consumable inserts, alignment and fit-up, and cleanliness.

#### 3.2.2.2 During Welding

For cracks and conformance to the qualified welding procedure.

#### 3.2.2.3 After Welding

For cracks, contour and finish, bead reinforcement, undercutting, overlap, and size of fillet welds.

### 3.2.3 NDE Testing

Perform NDE in accordance with written procedures. Procedures for radiographic, liquid penetrant, magnetic particle or ultrasonic tests and methods must conform to ASME BPVC SEC V. Demonstrate the approved procedure to the satisfaction of the Contracting Officer. In addition to the information required in ASME BPVC SEC V, include the timing of the NDE in relation to the welding operations and safety precautions.

### 3.2.4 Inspection and Tests by the Government

The Government will perform inspection and supplemental nondestructive or destructive tests as deemed necessary. The cost of supplemental NDE will be borne by the Government. Correct and repair defects and reexamine weld repairs at no additional cost to the Government. Inspection and tests will be performed as required for visual inspection and NDE, except that destructive tests may be required also. When destructive tests are ordered by the Contracting Officer and performed by the Contractor, and the specimens or other supplemental examinations indicate that the materials and workmanship do not conform to the contract requirements, the cost of the tests, corrections, and repairs are borne by the Contractor. When the specimens or other supplemental examinations of destructive tests indicate that materials or workmanship do conform to the specification requirements, the cost of the tests and repairs will be borne by the Government. When destructive tests are made, repairs must be made by qualified welders or welding operators using welding procedures which will develop the full strength of the members cut. Welding is subject to inspection and tests in the mill, shop, and field. When materials or workmanship do not conform to the specification requirements, the work may be rejected at any time before final acceptance of the system containing the weldment.

### 3.3 ACCEPTANCE STANDARDS

#### 3.3.1 Visual

The following indications are unacceptable:

- a. Cracks.
- b. Undercut on surface which is greater than 1/32 inch deep.
- c. Weld reinforcement greater than 3/16 inch.
- d. Lack of fusion on surface.
- e. Incomplete penetration (applies only when inside surface is readily accessible).
- f. Convexity of fillet weld surface greater than 10 percent of longest leg plus 0.03 inch.
- g. Concavity in groove welds.
- h. Concavity in fillet welds greater than 1/16 inch.
- i. Fillet weld size less than indicated or greater than 1.25 times the minimum indicated fillet leg length.

#### 3.3.2 Magnetic Particle Examination

The following relevant indications are unacceptable:

- a. Any cracks and linear indications.
- b. Rounded indications with dimensions greater than 3/16 inch.

- c. Four or more rounded indications in a line separated by 1/16 inch or less edge-to-edge.
- d. Ten or more rounded indications in any 6 square inches of surface with the major dimension of this area not to exceed 6 inches with the area taken in the most unfavorable location relative to the indications being evaluated.

### 3.3.3 Liquid Penetrant Examination

Indications with major dimensions greater than 1/16 of an inch are considered relevant. The following relevant indications are unacceptable:

- a. Any cracks or linear indications.
- b. Rounded indications with dimensions greater than 3/16 inch.
- c. Four or more rounded indications in a line separated by 1/16 inch or less edge-to-edge.
- d. Ten or more rounded indications in any 6 square inches of surface with the major dimension of this area not to exceed 6 inches with the area taken in the most unfavorable location relative to the indications being evaluated.

### 3.3.4 Radiography

Welds that are shown by radiography to have any of the following discontinuities are unacceptable:

- a. Porosity in excess of that shown as acceptable in ASME BPVC SEC I, Appendix A-250.
- b. Any type of crack or zone of incomplete fusion or penetration.
- c. Any other elongated indication which has a length greater than:
  - (1) 1/4 inch for "t" up to 3/4 inch inclusive. Where "t", here and below, pertains to the thickness of the weld being examined; if a weld joins two members having different thickness at the weld, "t" is the thinner of these two thicknesses.
  - (2) 1/3 "t" for "t" from 3/4 inch to 2-1/4 inch, inclusive.
  - (3) 3/4 inch for "t" over 2-1/4 inch.
- d. Any group of indications in line that have an aggregate length greater than "t" in a length of "12t", except where the distance between the successive indications exceeds 6L where L is the longest indication in the group.

### 3.3.5 Ultrasonic Examination

Where discontinuities are interpreted to be cracks, lack of fusion, and incomplete penetration, they are unacceptable regardless of length. Linear-type discontinuities are unacceptable if the amplitude exceeds the reference level and discontinuities have lengths which exceed the following:

- a. 1/4 inch for "t" up to 3/4 inch. Where "t", here and below, is the thickness of the weld being examined; if the weld joins two members having different thicknesses at the weld, "t" is the thinner of these two thicknesses.
- b. 1/3 inch for "t" from 3/4 to 2-1/4 inch.
- c. 3/4 inch for "t" over 2-1/4 inch.

#### 3.4 CORRECTIONS AND REPAIRS

Remove and repair defects as specified in ASME B31.1, ASME B31.3, ASME B31.5, ASME B31.8 unless otherwise specified. Repair disqualifying defects discovered between weld passes before additional weld material is deposited. Wherever a defect is removed, and repair by welding is not required, blend the affected area into the surrounding surface eliminating sharp notches, crevices, or corners. After defect removal is complete and before rewelding, examine the area by the same test method which first revealed the defect to ensure that the defect has been eliminated. After rewelding, reexamine the repaired area by the same test method originally used for that area. Regard any indication of a defect as a defect unless reevaluation by NDE or by surface conditioning shows that no disqualifying defects are present. The use of any foreign material to mask, fill in, seal, or disguise welding defects will not be permitted.

1.2 RELATED REQUIREMENTS

Section 23 03 00.00 20 BASIC MECHANICAL MATERIALS AND METHODS applies to this section with the additions and modifications specified herein.

1.3 DEFINITIONS

AWS A3.0M/A3.0 and applicable ANSI piping documents.

1.4 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Welding Pressure Piping

SD-07 Certificates

Welding Procedures Qualification

Nondestructive Examination (NDE) Procedures

NDE personnel Certification Procedures

Inspector Certification

Submit inspector certification and NDE personnel certification for record.

SD-11 Closeout Submittals

Weld Identifications

## 1.5 QUALITY ASSURANCE

### 1.5.1 Welding Pressure Piping

Show location, length, and type of welds, and indicate postweld heat treatment and nondestructive testing as required.

### 1.5.2 Procedures

Develop and qualify procedures for welding metals included in the work. Do not start welding until welding procedures, welders, and welding operators have been qualified. Perform qualification testing by an approved testing laboratory, or by the Contractor if approved by the Contracting Officer in accordance with the qualified procedures. Notify the Contracting Officer at least 24 hours in advance of the time and place of the tests. When practicable, perform the qualification tests at or near the work site. Maintain current records of the test results obtained in welding procedure, welding operator/welder performance qualifications, and nondestructive examination (NDE) procedures. These records must be readily available at the site for examination by the Contracting Officer. Qualify the procedures for making transition welds between different materials or between plates or pipes of different wall thicknesses. ANSI Piping requirements for branch connections may be used in lieu of detailed designs. Unless otherwise specified, the choice of welding process must be the responsibility of the Contractor.

#### 1.5.2.1 Previous Qualifications

Welding procedures, welders, and welding operators previously qualified by test may be accepted for the work without requalification provided that the following conditions are fulfilled:

- a. Copies of welding procedures, procedure qualification test records, and welder and welding operator performance qualification test records are submitted and approved in accordance with the paragraph SUBMITTALS.
- b. Testing was performed by an approved testing laboratory or technical consultant or by the Contractor's approved quality control organization.
- c. The welding procedures, welders, and welding operators were qualified in accordance with ASME BPVC SEC IX or AWS B2.1/B2.1M, AR-2 level; and base materials, filler materials, electrodes, equipment, and processes conformed to the applicable requirements of this specification.
- d. The requirements of paragraph WELDER AND WELDING OPERATOR PERFORMANCE QUALIFICATION for renewal of qualification were met, and records showing name of employer and period of employment using the process for which qualified are submitted as evidence of conformance.

#### 1.5.2.2 Performance

The Contractor must be responsible for the quality of joint preparation, welding, and examination. Clearly identify and record materials used in the welding operations. The examination and testing defined in this specification are minimum requirements. Provide additional examination and testing as necessary to achieve the quality required.

### 1.5.3 Welding Procedures Qualification

Qualification of the welding procedures for each group of materials to be welded is required as indicated in ASME BPVC SEC IX. Record in detail and qualify the "Welding Procedure Specifications" for every welding procedure proposed. Qualification for each welding procedure must conform to the requirements of ANSI Standards and to this specification. The welding procedures must specify end preparation for welds, including cleaning, alignments, and root openings. Preheat, interpass temperature control, and postheat treatment of welds must be as required by ANSI Piping documents, unless otherwise indicated or specified. Describe the type of backing rings or consumable inserts, if used, and, if they are to be removed, the removal process. Welding procedure qualifications must be identified individually and referenced on the shop drawings or suitably keyed to the contract drawings.

### 1.5.4 Welder and Welding Operator Performance Qualification

Qualify each welder and welding operator assigned to work covered by this specification by performance tests using equipment, positions, procedures, base metals, and electrodes or bare filler wires from the same specification, classification, or group number that will be encountered on his assignment. Welders or welding operators who make acceptable procedure qualification tests will be considered performance-qualified for the welding procedure used. Determine performance qualification in accordance with ASME BPVC SEC IX, ANSI Piping Standards and as specified.

### 1.5.5 Renewal of Qualification

Requalification of a welder or welding operator must be required under one or any combination of the following conditions:

- a. When a welder or welding operator has not used the specific welding process for a period of 3 months. The period may be extended to 6 months if the welder has been employed on another welding process.
- b. There is specific reason to question the welder's ability to make welds that will meet the requirements of the specifications.
- c. The welder or welding operator was qualified by an employer other than those firms performing work under this contract and a qualification test has not been taken within the preceding 12 months. Renewal of qualification under this condition need be made on only a single test joint or pipe of any thickness, position, or material to reestablish qualification for any thickness, position, or material for which the welder or welding operator had qualified previously.

### 1.5.6 Qualification of Inspection and (NDE) Personnel

Qualification of Inspection and Nondestructive Examination (NDE) Personnel: Qualify inspection and nondestructive examination personnel in accordance with the following requirements:

#### 1.5.6.1 Inspector Certification

Qualify welding inspectors in accordance with AWS QC1.

#### 1.5.6.2 NDE Personnel Certification Procedures

Certify NDE personnel and establish a written procedure for the control and administration of NDE personnel training, examination, and certification. Base procedures on appropriate specific and general guidelines of training and experience recommended by ASNT SNT-TC-1A, Supplement A-Radiographic, Supplement B-Magnetic particle, Supplement C-Ultrasonic and Supplement D-Liquid Penetrant.

#### 1.5.6.3 Welding Procedures and Qualifications

- a. Specifications and Test Results: Submit copies of the welding procedure specifications and procedure qualification test results for each type of welding required. Approval of any procedure does not relieve the Contractor of the responsibility for producing acceptable welds. Submit this information on the forms printed in ASME BPVC SEC IX or their equivalent.
- b. Certification: Before assigning welders or welding operators to the work, submit their names, together with certification that each individual is performance qualified as specified. Do not start welding work prior to procedure qualification. The certification must state the type of welding and positions for which each is qualified, the code and procedure under which each is qualified, date qualified, and the firm and individual certifying the qualification tests.

#### 1.5.7 Symbols

Conform to AWS A2.4.

##### 1.5.7.1 Weld Identifications

Submit a list of the welders' names and symbol for each welder. To identify welds, submit written records indicating the location of welds made by each welder or welding operator.

#### 1.5.8 Safety

Conform to AWS Z49.1, 29 CFR 1910-SUBPART Q, "Welding, Cutting, and Brazing," 29 CFR 1926-SUBPART J, "Welding and Cutting."

#### 1.6 ENVIRONMENTAL

Do not perform welding when the quality of the completed weld could be impaired by the prevailing working or weather conditions. The Contracting Officer will determine when weather or working conditions are unsuitable for welding.

#### 1.7 DELIVERY AND STORAGE

Deliver filler metals, electrodes, fluxes and other welding materials to the site in manufacturers' original packages and store in a dry space until used. Label and design packages properly to give maximum protection from moisture and to assure safe handling.

## PART 2 PRODUCTS

### 2.1 WELDING MATERIALS

Comply with ASME BPVC SEC II-C. Welding equipment, electrodes, welding wire, and fluxes must be capable of producing satisfactory welds when used by a qualified welder or welding operator using qualified welding procedures.

## PART 3 EXECUTION

### 3.1 WELDING

Do not deviate from applicable codes, approved procedures and approved shop drawings without prior written approval from the Contracting Officer. Materials or components with welds made off the site will not be accepted if the welding does not conform to the requirements of this specification unless otherwise specified. Assign each welder or welding operator an identifying number, letter, or symbol that must be used to identify his welds. Each welder or welding operator must apply his mark adjacent to his weld using an approved rubber stamp or felt-tipped marker with permanent, weatherproof ink or other approved methods that do not deform the metal. For seam welds, place identification marks adjacent to the welds at 3 foot intervals. Confine identification by die stamps or electric etchers to the weld reinforcing crown, preferably in the finished crater.

### 3.2 WELDING OPERATORS

Perform welding in accordance with qualified procedures using qualified welders and welding operators.

### 3.3 SUPPORTS

Welding of hangers, supports, and plates to structural members must conform to AWS D1.1/D1.1M.

### 3.4 EXAMINATIONS AND TESTS

Visual and nondestructive examinations must be performed by the Contractor to detect surface and internal discontinuities in completed welds. Employ the services of a qualified commercial inspection or testing laboratory or technical consultant approved by the Contracting Officer. Visually examine welds Radiographic, Liquid penetrant, Magnetic particle, or Ultrasonic examination must be required as indicated in Tables IV and V attached to this section. Random NDE testing applies to ASME B31.3 and ASME B31.4 piping unless specified otherwise. When examination and testing indicates defects in a weld joint, a qualified welder must repair the weld in accordance with the paragraph CORRECTIONS AND REPAIRS of this section.

#### 3.4.1 Random NDE Testing

When radiographic, liquid penetrant, magnetic particle, or ultrasonic examination is required, test a minimum of 10 percent of the total length or number of piping welds. Randomly select the welds examined, but include an examination of welds made by each welding operator or welder. If random testing reveals that a weld fails to meet minimum quality requirements, examine an additional 10 percent of the welds in that same

group. If the additional welds examined meet the quality requirements, the entire group of welds represented must be accepted and the defective welds must be repaired. If any of the additional welds examined also fail to meet the quality requirements, that entire group of welds must be rejected. Remove and reweld rejected welds or examine rejected welds 100 percent and remove and reweld defects.

#### 3.4.2 Visual Examination

Visually examine welds as follows:

- a. Before welding -- for compliance with requirements for joint preparation, placement of backing rings or consumable inserts, alignment and fit-up, and cleanliness.
- b. During welding -- for conformance to the qualified welding procedure.
- c. After welding -- for cracks, contour and finish, bead reinforcement, undercutting, overlap, and size of fillet welds.

#### 3.4.3 Nondestructive Examination

NDE must be in accordance with written procedures. Procedures for radiographic, liquid penetrant, magnetic particle, or ultrasonic tests and methods must conform to ASME BPVC SEC V. The approved procedure must be demonstrated to the satisfaction of the Contracting Officer's QA personnel.

In addition to the information required in ASME BPVC SEC V, the written procedures must include:

- a. Timing of the nondestructive examination in relation to the welding operations.
- b. Safety precautions.

#### 3.4.4 Examinations and Tests by the Government

Examinations and tests will conform to paragraphs "Visual Examination" and "Nondestructive Examination" of this section, except that destructive tests may be required also. When destructive tests are made, qualified welders or welding operators must make repairs using welding procedures which will develop the full strength of the members cut. Welding must be subject to examination and tests in the mill, shop, and field.

#### 3.4.5 Piping Subject to 100 Percent NDE

ASME B31.4 and ASME B31.3 Piping Subject to 100 Percent NDE: 100 percent of each day's girth welds installed in the following locations must be nondestructively examined 100 percent by radiographic, magnetic particle, or liquid penetrant examination unless impracticable, in which case at least 90 percent must be examined. Nondestructive examination must be impracticable for each girth weld not examined.

- a. At onshore locations where a loss of hazardous liquid (petroleum, petroleum products, or anhydrous ammonia) could reasonably be expected to pollute stream, river, lake, reservoir, or other body of water, and any offshore area;
- b. Within railroad or public road rights-of-way;

- c. At overhead road crossings and within tunnels;
- d. Within the limits of any incorporated subdivision of a State government; and
- e. Within populated areas, including, but not limited to, residential subdivisions, shopping centers, schools, designated commercial areas, industrial facilities, public institutions, and places of public assembly.

### 3.5 ACCEPTANCE STANDARDS

#### 3.5.1 Visual

The following indications are unacceptable:

- a. Cracks--external surface.
- b. Undercut on surface which is greater than 1/32 inch deep or 25 percent for ASME B31.3 and 12.5 percent for ASME B31.4 and ASME B31.9 of the wall thickness, whichever is less, provided that the remaining wall thickness is not less than the minimum design thickness. For ASME B31.4 and in accordance with API Std 1104, undercuts over 1/64 inch through 1/32 inch or over 6 to 12.5 percent of the pipe wall thickness, whichever is smaller, must not exceed 2 inches in a continuous weld length of 12 inches or 1/6 the length of the weld, whichever is smaller; and undercuts 1/64 inch or 6 percent of the wall thickness, whichever is smaller, are acceptable regardless of length.
- c. Weld reinforcement:
  - (1) ASME B31.1, conform to Table I.

| TABLE I REINFORCEMENT OF GIRTH AND LONGITUDINAL BUTT WELDS |                                                           |                               |                         |

| Thickness of Base Metal, inches                                                                                                                        | Greater than 750 degrees F                                | 350 degrees F - 750 degrees F                                         | Less than 350 degrees C |
|                                                                                                                                                        | inch                                                      | inch                                                                  | inch                    |
| Over 1 to 2, incl.                                                                                                                                     | 1/8                                                       | 1/4                                                                   | 1/4                     |
| Over 2                                                                                                                                                 | 5/32                                                      | The greater of 1/4 inch or 1/8 times the width of the weld in inches. |                         |
| NOTES:                                                                                                                                                 |                                                           |                                                                       |                         |
| 1. For double welded butt joints, this limitation on reinforcement given above must apply separately to both inside and outside surfaces of the joint. |                                                           |                                                                       |                         |
| 2. For single welded butt joints, the reinforcement limits given above must apply to the outside surface of the joint only.                            |                                                           |                                                                       |                         |
| 3. The thickness of weld reinforcement must be based on the thickness of the thinner of the materials being joined.                                    |                                                           |                                                                       |                         |
| 4. The weld reinforcement thicknesses must be determined from the higher of the abutting surfaces involved.                                            |                                                           |                                                                       |                         |
| 5. Weld reinforcement may be removed if so desired.                                                                                                    |                                                           |                                                                       |                         |

(2) ASME B31.3, conform to Table II.

| TABLE II                                       |                            |
|------------------------------------------------|----------------------------|
| Wall Thickness, inches                         | Height, inches             |
| Less than or equal to 1/4                      | Less than or equal to 1/16 |
| Greater than 1/4, is less than or equal to 1/2 | Less than or equal to 1/8  |
| Greater than 1/2, is less than or equal to 1   | Less than or equal to 5/32 |
| Greater than 1                                 | Less than or equal to 3/16 |
| NOTES:                                         |                            |

| TABLE II                                                                                                                                                                                                                                                                                                                                                                  |                |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| Wall Thickness, inches                                                                                                                                                                                                                                                                                                                                                    | Height, inches |
| 1. Wall thickness is the nominal wall thickness of the thinner of components joined by butt weld.                                                                                                                                                                                                                                                                         |                |
| 2. Height: For "Normal Service" and "Severe Cyclic" conditions, use the listed value. For "Category D Fluid Service," use twice the listed value. Measure from surfaces of adjacent components. The lesser of the two measurements, in any plane through the weld, must not exceed the applicable value at right. Weld metal must merge smoothly into component surfaces. |                |

(3) ASME B31.4, conform to Table I for under 350 degrees F.

(4) ASME B31.5, conform to Table III.

| TABLE III                   |                                 |
|-----------------------------|---------------------------------|
| Pipe Wall Thickness, inches | Reinforcement Thickness, inches |
| 1/4 and under               | 1/16                            |
| Over 1/4 through 1/2        | 3/32                            |
| Over 1/2, through 1         | 1/8                             |
| Over 1                      | 3/16                            |

(5) ASME B31.9: Thickness of weld reinforcement must not exceed 3/16 inch.

- d. Lack of fusion on surface.
- e. Incomplete penetration (applies only when inside surface is readily accessible).
- f. Convexity of fillet weld surface greater than 10 percent of longest leg plus 0.03 inch.
- g. Concavity in groove welds.
- h. Concavity in fillet welds greater than 1/16 inch.
- i. Fillet weld size less than indicated or greater than 1 1/4 times the minimum specified fillet leg length.

### 3.5.2 Magnetic Particle Examination

The following relevant indications are unacceptable:

- a. Any cracks and linear indications.

- b. Rounded indications with dimensions greater than 3/16 inch.
- c. Four or more rounded indications in a line separated by 1/16 inch or less edge-to-edge.
- d. Ten or more rounded indications in any 6 square inches of surface, with the major dimension of this area not to exceed 6 inches, with the area taken in the most unfavorable location relative to the indications being evaluated.

#### 3.5.3 Liquid Penetrant Examination

Indications whose major dimensions are greater than 1/16 inch must be considered relevant. The following relevant indications are unacceptable:

- a. Any cracks or linear indications.
- b. Rounded indications with dimensions greater than 3/16 inch.
- c. Four or more rounded indications in a line separated by 1/16 inch or less edge-to-edge.
- d. Ten or more rounded indications in any 6 square inches of surface, with the major dimension of this area not to exceed 6 inches, with the area taken in the most unfavorable location relative to the indications being evaluated.

#### 3.5.4 Radiography

Welds that are shown by radiography to have any of the following discontinuities are unacceptable:

- a. Any type of crack or zone of incomplete fusion or penetration.
  - b. Any other elongated indication which has a length greater than:
    - (1) 1/4 inch for t up to 3/4 inch, inclusive;
    - (2) 1/3 t for t from 3/4 inch to 2 1/4 inches, inclusive;
    - (3) 3/4 inch for t over 2 1/4 inches where t is the thickness of the thinner portion of the weld.
- ("t" pertains to the thickness of the weld being examined. If a weld joins two members having different thickness at the weld, "t" is the thinner of these two thicknesses.)
- c. Any group of indications in line that have an aggregate length greater than t in a length of 12t, except where the distance between the successive indications exceeds 6L where L is the longest indication in the group.
  - d. Porosity in excess of that shown acceptable in Appendix A-250, Acceptance Standard for Radiographically Determined Rounded Indications in Welds, ASME BPVC SEC I.

#### 3.5.5 Ultrasonic Examination

Permitted for ASME B31.3 and ASME B31.4 piping only. Linear type

discontinuities are unacceptable if the amplitude exceeds the reference level and discontinuities have lengths which exceed the following:

- a.  $1/4$  inch for  $t$  up to  $3/4$  inch
- b.  $1/3 t$  for  $t$  from  $3/4$  inch to  $2\ 1/4$  inches
- c.  $3/4$  inch for  $t$  over  $2\ 1/4$  inches

("t" is the thickness of the weld being examined. If the weld joins two members having different thickness at the weld, "t" is the thinner of these two thicknesses. Discontinuities are interpreted to be cracks, lack of fusion, and incomplete penetration are unacceptable regardless of length.)

### 3.6 CORRECTIONS AND REPAIRS

Remove defects and replace welds as specified in ANSI Piping Standards, unless otherwise specified. Repair defects discovered between weld passes before additional weld material is deposited. Wherever a defect is removed, and repair by welding is not required, the affected area must be blended into the surrounding surface eliminating sharp notches, crevices, or corners. After defect removal is complete and before rewelding, reexamine the area by the same test methods which first revealed the defect to ensure that the defect has been eliminated. After rewelding, reexamine the repaired area by the same test methods originally used for that area. For repairs to base material, the minimum examination must be the same as required for butt welds. Indication of a defect must be regarded as a defect unless reevaluation by NDE or by surface conditioning shows that no unacceptable indications are present. The use of foreign material to mask, fill in, seal, or disguise welding defects will not be permitted.

| TABLE V - MANDATORY MINIMUM NONDESTRUCTIVE EXAMINATIONS FOR ASME B31.1 PIPING                                                                                                                                                                                                                            |                                                       |                                                                                                         |            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------|------------|
|                                                                                                                                                                                                                                                                                                          | Temperatures over 750 degrees F and at all pressures. | Temperatures between 350 degrees F and 750 degrees F inclusive and at all pressures over 1052 psig gage | All others |
| 5. RT of branch welds must be performed before any nonintegral reinforcing material is applied.                                                                                                                                                                                                          |                                                       |                                                                                                         |            |
| 6. The thickness of butt welds is defined as the thicker of the two abutting ends after end preparation.                                                                                                                                                                                                 |                                                       |                                                                                                         |            |
| 7. Temperatures and pressures shown are design.                                                                                                                                                                                                                                                          |                                                       |                                                                                                         |            |
| 8. In lieu of radiography of welded branch connections when required above, liquid penetrant or magnetic particle examination is acceptable and, when used, must be performed at the lesser of one-half of the weld thickness or each 1/2 inch of weld thickness and all accessible final weld surfaces. |                                                       |                                                                                                         |            |
| 9. For nondestructive examination of the pressure retaining component, refer to the standards listed in applicable code or the manufacturing specifications.                                                                                                                                             |                                                       |                                                                                                         |            |

## 1.2 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

### SD-02 Shop Drawings

Contractor Design Drawings; G, AE

Draft As-Built Drawings; G, AE

### SD-03 Product Data

Control Drawings; G

Sensors; G

Performance Verification Test (PVT); G

Factory Test Procedure; G

### SD-06 Test Reports

Factory Test Report

Testing, Adjusting and Commissioning

Performance Verification Test(PVT)

Endurance Test

#### SD-07 Certificates

Control and Sensor Wiring

Ground Rods

Wiring

Installation

#### SD-10 Operation and Maintenance Data

Training Manual; G, AE

Control System; G, AE

#### SD-11 Closeout Submittals

Final As-Built Drawings; G, AE

### 1.3 SITE ENVIRONMENTAL CONDITIONS

The expected site environmental conditions are a minimum of 14 degrees F and a maximum of 81 degrees F.

### 1.4 SEQUENCING

TABLE I: PROJECT SEQUENCING specifies the sequencing of submittals as specified in paragraph SUBMITTALS (denoted by an 'S' in the 'TYPE' column) and activities as specified in PART 3 EXECUTION (denoted by an 'E' in the 'TYPE' column).

#### 1.5.1 Sequencing for Submittals

The sequencing specified for submittals is the deadline by which the submittal must be initially submitted to the Government. Following submission there will be a Government review period as specified in Section 01 33 00 SUBMITTAL PROCEDURES. If the submittal is not accepted by the Government, revise the submittal and resubmit it to the Government within 14 days of notification that the submittal has been rejected. Upon re-submittal there will be an additional Government review period. If the submittal is not accepted the process repeats until the submittal is accepted by the Government.

#### 1.5.2 Sequencing for Activities

The sequencing specified for activities indicates the earliest the activity may begin.

#### 1.5.3 Abbreviations

In TABLE I the abbreviation AA0 is used for 'after approval of' and 'AC0' is used for 'after completion of'.

## PART 2 PRODUCTS

### 2.1 SYSTEM DESCRIPTION

The process control system must be used to monitor and control the operation of process equipment as specified and in accordance with the sequence of operation and control schematics shown on the drawings. The process control system must provide for operator interaction, overall process control system supervision, and process equipment control and monitoring. The system must adhere to Section 25 05 11 . Provide hardware configured and sized to support expansion as specified and shown on the drawings.

The process control system must be complete including sensors, field preamplifiers, signal conditioners, offset and span adjustments, amplifiers, transducers, transmitters, control devices, engineering units conversions and algorithms for the applications; and must maintain the specified end-to-end process control loop accuracy from the sensor to display and final control element. Connecting conductors must be suitable for installed controls. Enclosures must be rated for NEMA 4X.

#### 2.1.1 Operation

The process control system provided under this specification must operate using a combination of sequential function charts, function block diagrams, structured text, instruction, and ladder logic type as defined in IEC 61131-3 and supervisory control to provide the required sequences of operation. Input data to the controller must be obtained by using instruments and controls interfaced to mechanical, electrical, utility systems and other systems as shown and specified. All required setpoints, settings, alarm limits, and sequences of operation must be as identified in the database/ settings tables .

#### 2.1.2 Points

Provide inputs to and outputs from the process control system in accordance with the Input/Output (I/O) Summary Table indicated. Each connected analog output (AO), analog input (AI), binary output (BO), binary input (BI), pulse accumulator (PA) input and other input or output device connected to the control system must represent a "point" where referred to in this specification.

#### 2.1.3 Building Telecommunications Cabling (BTC)

Provide data transmission systems for communication between PLCs and between PLCs and the central station and server as shown on the drawings and as indicated.

#### 2.1.4 System Reliability

The system must be designed for maximum reliability, safety and integrity while maintaining an availability of 99% or better.

### 2.2 MATERIALS AND EQUIPMENT

#### 2.2.1 Product Certifications

Computing devices, as defined in FCC Part 15, supplied as part of the

process control system must be certified to comply with the requirements of Class B computing devices.

#### 2.2.2 Standard Products

Materials and equipment must be standard unmodified products of a manufacturer regularly engaged in the manufacturing of such products. Units of the same type of equipment must be products of a single manufacturer. Items of the same type and purpose must be identical and supplied by the same manufacturer, unless replaced by a new version approved by the Government.

#### 2.2.3 Nameplates

Each major component of equipment must have the manufacturer's name and address, and the model and serial number in a conspicuous place. Laminated plastic nameplates must be provided for equipment devices and panels furnished. Each nameplate must identify the device, such as pump "P-1" or valve "VLV-402". Labels must be coordinated with the schedules and the process and instrumentation drawings. Laminated plastic must be 1/8 inch thick, white with black center core. Nameplates must be a minimum of 1 by 3 inches with minimum 1/4 inch high engraved block lettering. Nameplates for devices smaller than 1 by 3 inches must be attached by a nonferrous metal chain. All other nameplates must be attached to the device.

### 2.3 GENERAL REQUIREMENTS

Equipment located outdoors, not provided with climate controlled enclosure, must be capable of operating in the ambient temperature range. Electrical equipment will conform to Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Equipment and wiring must be in accordance with NFPA 70, with proper consideration given to environmental conditions such as moisture, dirt, corrosive agents, and hazardous area classification.

### 2.4 SENSORS

#### 2.4.1 Transmitter

Unless indicated otherwise, each sensor must be provided with a transmitter, selected to match the sensor. Except where specifically indicated otherwise on the drawings, the transmitter must be provided with a four digit or analog visual display of the measured parameter and with a 4 to 20 mAdc output signal proportional to the level of the measured parameter. Accuracy must be plus or minus 2 percent of full scale reading with output error not exceeding plus or minus 0.5 percent of full scale. Transmitter must be located where indicated, mounted integrally with the sensor, pipe mounted, wall mounted or installed in the control panel. The distance between the sensor and transmitter must not exceed the manufacturer's recommendation. Field preamplifiers and signal conditioners must be included when necessary to maintain the accuracy from sensor to the programmable logic controller or recorder.

#### 2.4.2 Liquid Service

Sensors and meters in liquid service must be rated for continuous duty service at fluid approach velocities from 2.5 ft/s to 33 ft/s with correspondingly higher constriction velocities over a fluid temperature range from 32 degrees F to 105 degrees F at pressures up to 150 psi gage.

### 2.4.3 Flow Rate Sensors and Meters

Liquid flow indication must be provided in gpm. Vapor flow indication must be provided in cubic feet per minute. Pressure taps must incorporate appropriate snubbers. Unless indicated otherwise, the flow transmitter must produce a signal that is proportional to the volumetric flow rate, compensated for fluid temperature, and must have an accuracy of plus or minus 1 percent of full flow. Flow transmitter must be located within 15 feet of the flow element. The flow transmitter must include a digital readout of the volumetric flow rate to 3 significant figures. The controller must be provided with a minimum of three sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input.

The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a 4-20 mA<sub>dc</sub> output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost. Flow rate must be controlled to within plus or minus 5 percent of the design flow.

#### 2.4.3.1 Magnetic Flowmeter

Magnetic flowmeter must be non-intrusive, DC pulse type and must measure fluid flow through the use of a self generated magnetic field. The meter must have automatic zeroing circuitry. The magnetic flow element must be encapsulated in anodized aluminum. Flowmeter must be capable of measuring up to a maximum flow velocity of 33 fps. The metering tube must be constructed of anodized aluminum. The meter must be rated for a process temperature range of 32 to 212 F and 0 to 149F ambient. The maximum pressure drop across the meter and appurtenances must be 5 psi at the maximum flow rate.

#### 2.4.4 Level Instrumentation

Pressure taps must incorporate appropriate snubbers. Relays and housing must be intrinsically safe or explosion proof as required by the NFPA hazard rating for compatibility with the contents of the tank or sump. The controller must be provided with a minimum of three sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input.

The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a 4-20 mA<sub>dc</sub> output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost.

#### 2.4.4.1 Non-Contact Ultrasonic Level Sensor

The sensor must be microprocessor based and must provide continuous, non-contact level measurement of liquids and solids utilizing microwave pulsed time of flight measurement method. Sensor must have pushbutton calibration and LCD display. The sensor must operate in a frequency band approved for industrial use. The sensor must be capable of measuring in a range of 0 to 20 feet with an accuracy of plus or minus .25 percent of full scale and repeatability  $\pm 0.125$ ". The sensor must be capable of distinguishing between real echoes, reflections and background noise. The sensor must automatically compensate for temperature changes. The sensor must be capable of operating in a temperature range from minus 15 degrees F to 120 degrees F. Assembly must be flange mounted of sufficient size to eliminate echoing and suitable for the installed environment indicated. Mounting assembly must be suitable for service without requiring entry or drainage of the vessel where level is being measured.

#### 2.4.4.2 Leak Detection

Double walled containment system leak detectors must use electrodes mounted in the interstices of double walled containment systems with a minimum time delay of 0.5 seconds. Leak detectors for open systems must be mounted at slab or floor level with either a minimum time delay of 0.5 seconds or a minimum built-in-vertical adjustment of 1/8 inch to prevent activation due to high humidity. Detector must have a contact rating of 1.0 amps resistive or 200 mA inductive at 28 VDC. Leak detector panel must indicate the location and detector causing the alarmed state. The indicator must be manual reset type. A framed, non-fading half-size as-built location map in laminated plastic must be provided for the cable leak detection system in double containment piping systems indicating the as installed system configuration; sensing string layout must be furnished. Marks in meters feet along the length of pipeline interstitial cable must be provided as references to locate leaks.

#### 2.4.5 Pressure Instrumentation

Pressure taps must incorporate appropriate snubbers.

##### 2.4.5.1 Pressure Sensor and Transducer

The sensing element must be either diaphragm type. The pressure transducer must withstand up to 150 percent of rated pressure, with an accuracy of plus or minus 1.0 percent of full scale selected to put the design range of the measured pressure in the middle third of the transducer's range. Pressure must be measured in psi gage with a range, plus or minus 10 percent of design range and must be furnished with display to the nearest 0.145 psi. The transmitter output error must not exceed 0.1 percent of calibrated span.

##### 2.4.5.2 Pressure Switch

Sensors must be diaphragm and must be constructed of brass. Pressure switch must have a repetitive accuracy of plus or minus 5.0 percent of the operating range and must withstand up to 150 percent of rated pressure.

Switch actuation set point must be adjustable over the operating pressure range with a differential adjustment span of 20 to 40 percent of the range of the switch. The switch must have Form C snap-action contacts rated in

accordance with NEMA ICS 1.

#### 2.4.6 Process Analytical Instrumentation

Probes must be easily removable without interrupting service. Sampling pumps must be included where necessary or applicable to the sensing device. For sensors integral to the electronic controller the sample may be drawn directly into the sensor or may be drawn through a sample tube. For sensors remotely located the sample may be drawn through a sample tube. Outdoor sample tubes must be heat traced. Sensor and controller construction must be suitable for operation in the monitored medium. Systems requiring automated zero and calibration gas or reagents must be provided with 7 days supply of calibration gas or reagent. The controller must be provided with a minimum of three sets of dry contacts rated in accordance with NEMA ICS 1. The first set of contacts must close when the lower (warning) detection level has been exceeded. The second set of contacts must close when the upper (alarm) detection level has been exceeded. The third set of contacts must close when a controller malfunction has occurred, including loss of power or loss of sensor input. The alarm levels must be individually adjustable. The controller must be provided with an audible warning horn that sounds when the upper detection level has been exceeded, and a warning horn silence button. The controller must provide a 4-20 mA<sub>dc</sub> output signal to the programmable logic controller, proportional to the measured parameter. The controller must be provided with an internal battery to maintain operation for a minimum of 12 hours if power is lost.

##### 2.4.6.1 Chlorine in Liquid

All parts of the chlorine measurement system, including the sensors, transmitters, controllers and peripheral devices, that may come in contact with chlorine or a chlorine-filled environment must be constructed of materials suitable for this application. Residual chlorine sensor must continuously monitor the chlorine residual. The sensor must be capable of detecting chlorine in the range of 0 to 10 mg/L with an accuracy of plus or minus 1 percent of full scale reading. The sensor response time must be 90 percent in a maximum of 60 seconds.

##### 2.4.6.2 pH Monitoring

The sensor must be flow-through type. Sensor must be a differential type. Sensor must have a range of 1 . pH units to 14 . pH units and must have an accuracy of plus or minus 0.1 . pH unit. The sensor must automatically compensate for temperature over the temperature range. The sensor body must be PVC, CPVC or epoxy.

##### 2.4.6.3 Total Dissolved Solids (TDS)

The TDS sensor must measure the specific conductance using a conductivity sensor, displaying the total dissolved solids value in microohms (microSiemens) per centimeter (uS/cm) and transmitting an analog signal for remote processing. System must be industrial grade, torodial and suitable for measurement of conductivity in a solution by insertion of the sensing element into the pipeline, using a hot tap assembly . Sensor assembly must be suitable for periodic removal for adjustment and cleaning without requiring shut down of the process. Sensor must be suitable for range of 0 to 10,000 . Range must be field verified for the application and adjusted as required. Sensing element must be constructed of 316 stainless steel and glass, including temperature element, and be capable

of continuous operation. Sensing element must be unaffected by color in the fluid, pressure, and rate of flow. Sensor must have automatic temperature compensation and must require no normal maintenance or periodic recalibration.

#### 2.4.6.4 Water Turbidity

System must be complete and include indicating meter, sensing element and a transmitter. System must be industrial grade and suitable for measurement of turbidity by insertion of the sensing element into the pipeline, using a hot tap assembly. Sensor assembly must be suitable for periodic removal for adjustment and cleaning without requiring shutdown of the process. Sensor must be suitable for range from 0 to 200 Nephelometric turbidity units (NTU). The accuracy must be plus or minus 2 percent of full scale reading. Range must be field verified for the application and adjusted as required. Sensing element must be constructed of 316 stainless steel and glass. Sensing element must be unaffected by color in the fluid, pressure, temperature and rate of flow. Sensor must have automatic zeroing and must require no normal maintenance or periodic recalibration. Sensor must have active and passive anti-fouling mechanisms.

#### 2.4.7 Limit Switch

Limit switch must be rotary/lever type, contacts must be heavy duty and rated A600 or N600. Enclosure must be metal. The actuating head must vary based upon the application.

#### 2.4.8 Emergency Stop

Emergency stop pushbutton must have red mushroom actuator and yellow background. Actuator must be self-latching and manually reset. Provide contacts that are NEMA ICS A600 and directly opened. Pushbutton must meet NFPA 79 SECTION 10.7.

### 2.5 PROGRAMMABLE LOGIC CONTROLLER (PLC)

#### 2.5.1 PLC General Requirements

PLCs must be micro-processor based, capable of receiving binary and analog inputs and, through programming, must be able to control binary and analog output functions, perform data handling operations and communicate with external devices. PLCs must meet the requirements of Class A computing devices, and must be labeled as set forth in 47 CFR 15 and must be able to withstand conducted susceptibility test as outlined in NEMA ICS 1, NEMA ICS 2, NEMA ICS 3, or IEEE C37.90.1. PLCs must function properly at temperatures between 32 and 122 degrees F at 5 to 95 percent relative humidity non-condensing and must tolerate storage temperatures between minus 40 and plus 140 degrees F at 5 to 95 percent relative humidity non-condensing.

#### 2.5.2 Modular PLC

PLCs must be based on a modular, field expandable design allowing the system to be tailored to the process control application. The system must be expandable through the use of additional hardware and/or user software. As a minimum, the PLC must include a mounting backplane, power supply module, central processing unit (CPU) module, communications module, and input/output (I/O) module. The modules must be grouped

together in a mounting rack or cabinet. The mounting rack backplane must provide the communications mechanism to fully integrate the individual modules located within the rack. Modules other than I/O modules must plug directly into the backplane. The use of wire connectors between modules will not be allowed except for expansion of the system to include multiple backplanes. The rack size must be as needed to hold the equipment necessary while performing the required control functions.

#### 2.5.2.1 Central Processing Unit (CPU) Module

The CPU module must be a self contained, microprocessor based unit that provides time of day, scanning, application program execution, storage of application programs, storage of numerical values related to the application process and logic, I/O bus traffic control, peripheral and external device communications and self diagnostics. The scan time must be 250 milliseconds or better including spare I/O channels.

#### 2.5.2.2 Communications Module

The communications module must allow peer-to-peer communication with other PLCs and must allow the PLC to communicate with the central station, or workstation. The communication module must utilize the manufacturer's standard communication architecture and protocol, ethernet architecture and protocol or a combination of these. The communication module must allow programming of the PLC to be done locally through the use of a laptop computer or from the central station or remote workstation.

#### 2.5.2.3 Power Supply Module

One or more power supply modules must be provided as necessary to power other modules installed in the same cabinet. Power supply modules must plug directly into the backplane. Auxiliary power supplies may be used to supply power to remote cabinets or modules.

- a. Power supply modules must use AC power with a nominal voltage of 120 VAC plus or minus 5 percent. The power supply module must monitor the incoming line voltage level and must provide over current and over voltage protection. If the voltage level is detected as being out of range the power supply module must continue to provide power for an adequate amount of time to allow for a safe and orderly shutdown. Power supply modules must be capable of withstanding a power loss for a minimum of 20 milliseconds while still remaining in operation and providing adequate power to all connected modules.
- b. Each power supply module must be provided with an on-off switch integral to the module. If the manufacturer's standard power supply module is not provided with an on-off switch, a miniature toggle type switch must be installed near the PLC and must be clearly labeled as to its function..
- c. Provide power supply modules with an indicating light which must be lit when the module is operating properly.

#### 2.5.2.4 Input/Output (I/O) Modules

Modules must be self contained, microprocessor based units that provide an interface to field devices. The modules must be located in the same cabinet as the other PLC components. Each module must contain visual indication to display the on-off status of individual inputs or outputs. Each I/O

must be protected against reversal of polarity of the signal. Analog inputs and analog outputs must have 'open, short and out of range circuit' detection. It must be configurable per channel.

### 2.5.3 Program Storage/Memory Requirements

The CPU must utilize the manufacturer's standard non-volatile memory for the operating system. The controller must have electronically battery backup volatile memory. Must be possible to change battery with power on for storage of user programs. The user programs must be loaded through the controller keypad, central station or through the use of a laptop computer. The CPU memory capacity must be based on the system's control requirements. The memory capacity must be sized such that, when the system is completely programmed and functional, no more than 50 percent of the memory allocated for these purposes is used.

### 2.5.4 Input/Output Characteristics

Each controller must allow for analog input, analog output, binary input and binary output. The number and type of inputs and outputs for the system must be as shown on the drawings and must comply with the sequence of control. The system capacity must include a minimum of 20 percent spare input and output points (no less than two points) for each point type provided. During normal operation, a malfunction in any input/output channel must affect the operation of that channel only and must not affect the operation of the CPU or any other channel. All input circuits must have a minimum optical isolation of 1500 VRMS and must be filtered to guard against high voltage transients from the externally connected devices. All output circuits must have a minimum optical isolation of 1500 VRMS and must be filtered to guard against high voltage transients from the externally connected devices.

#### 2.5.4.1 Analog Inputs

Analog input circuits must be available in 4-20 mA.

#### 2.5.4.2 Binary Inputs

Binary input circuits must be available in  
79-132 VAC.

#### 2.5.4.3 Analog Outputs

Analog output circuits must be available in 4-20 mA.

#### 2.5.4.4 Binary Outputs

Binary output circuits must be available in 79-132 VAC.

#### 2.5.4.5 Pulse Inputs

Pulse inputs must be able to detect a pulse of 100 milliseconds or less.

### 2.5.5 Wiring Connections

Wiring connections must be heavy duty, self lifting, pressure type screw terminals to provide easy wire insertion and secure connections. The terminals must accept two #14 AWG wires. A hinged protective cover must be provided over the wiring connections. The cover must have write-on

areas for identification of the external circuits.

#### 2.5.6 On-Off Switch

Each controller must be provided with an integral on-off power switch. If the controller is not provided with a manufacturer's standard on-off switch, a miniature toggle type switch must be installed in the control panel near the controller and must be clearly labeled as to its function.

#### 2.5.7 Diagnostics

Each PLC must have diagnostic routines implemented in firmware. The CPU must continuously perform self-diagnostic routines that will provide information on the configuration and status of the CPU, memory, communications and input/output. The diagnostic routines must be regularly performed during normal system operation. A portion of the scan time of the controller must be dedicated to performing these housekeeping functions. In addition, a more extensive diagnostic routine must be performed at power up and during normal system shutdown. The CPU must log input/output and system faults in fault tables which must be accessible for display. When a fault affects input/output or communications modules the CPU must shut down only the hardware affected and continue operation by utilizing the healthy system components. All faults must be annunciated at the PLC and the central station. Diagnostic software must be useable in conjunction with the portable tester. The following diagnostics must be performed:

- a. Analog Inputs: Sensor out of range, open or shorted loop, analog-to-digital converter check
- b. Analog Outputs: Open or shorted loop
- c. Configuration: Check compatibility and availability of selected I/O hardware and software
- d. Memory: Checksum, parity check End-to End CPU memory

#### 2.5.8 Accuracy

Provide controllers with an accuracy of plus or minus 0.25 percent of input span.

### 2.6 PLC SOFTWARE

Furnish all PLC software described in this specification as part of the complete control system.

#### 2.6.1 Operating System

Each PLC must be provided with the manufacturer's standard operating system software package. The PLC must maintain a point database in its memory that includes all parameters, constraints and the latest value or status of all points connected to the PLC. Execution of the PLC application programs must use the data in memory resident files. The operating system must support a full compliment of process control functions. It must be possible to define these functions using a mix of ladder logic diagrams, function blocks, sequential function charts and text programming. Programming methods and interactions must be based on IEC 61131-3. A combination of the programming methods must be possible

within a single controller. The operating system must allow loading of control logic locally or from the central station in which case it must require a password to do so and data files from the portable tester. It must also support data entry and diagnostics using an operator interface panel attached directly to the PLC. Each PLC must be capable of operating in stand alone mode.

#### 2.6.1.1 Startup

The PLC must have startup software that causes automatic commencement of operation without human intervention, including startup of all connected I/O functions. A PLC restart program based on detection of power failure at the PLC must be included in the PLC software. The restart program must include start time delays between successive commands to prevent demand surges or overload trips.

#### 2.6.1.2 Failure Mode

Upon failure for any reason, each PLC must perform an orderly shutdown. Systems which are not Primary/Secondary must force all PLC outputs to a predetermined (failure mode) state, consistent with the failure modes shown and the associated control device. Primary/Secondary systems must transfer I/O scan and control to the PLC not currently failed.

#### 2.6.2 Functions

The controller operating system must be able to scan inputs, control outputs, and read and write to its internal memory in order to perform the required control as indicated in the sequence of control on the drawings. The controller must periodically perform self diagnostics to verify that it is functioning properly. If the system is set up as a Primary/Secondary system the system must attempt to switch to the other PLC upon sensing a fault in the currently controlling PLC.

##### 2.6.2.1 Analog Monitoring

Measure and transmit all analog values including calculated analog points.

##### 2.6.2.2 Logic (Virtual)

Logic (virtual) points must be software points entered in the point database which are not directly associated with a physical I/O function. Logic (virtual) points must be analog or binary points created by calculation from any combination of binary and analog points, or other data having all the properties of real points, including alarms, without the associated hardware. Logic (virtual) points must be defined or calculated and entered into the database. The calculated analog point must have point identification in the same format as any other analog point.

##### 2.6.2.3 State Variables

If an analog point represents more than two (up to 8) specific states, each state must be nameable. For example, a level sensor must be displayed at its measured engineering units plus a state variable with named states usable in programs or for display such as low alarm/low/normal/high/high alarm.

#### 2.6.2.4 Analog Totalization

Any analog point must be operator assignable to the totalization program. Up to eight analog values must be totalized within a selectable time period.

#### 2.6.3 Alarm Processing

Each PLC must have alarm processing software for AI, DI, and PA alarms for all real and virtual points connected to that PLC.

##### 2.6.3.1 Binary Alarms

Binary alarms are those abnormal conditions indicated by BIs as specified and shown. The system must automatically suppress analog alarm reporting associated with a binary point when that point is turned off.

##### 2.6.3.2 Analog Alarms

Analog alarms are those conditions higher or lower than a defined value, as measured by an AI. Analog readings must be compared to predefined high and low limits, and alarmed each time a value enters or returns from a limit condition. Unique high and low limits must be assigned to each analog point in the system. In control point adjustment (CPA) applications, key the limit to a finite deviation traveling with the setpoint. The system must automatically suppress analog alarm reporting associated with an analog point when that analog point is turned off.

##### 2.6.3.3 Pulse Accumulator (PA) Alarms

Pulse accumulator alarms are those conditions calculated from totalized values of accumulator inputs or PA input rates that are outside defined limits as specified and shown. PA totalized values must be compared to predefined limits and alarmed each time a value enters a limit condition. Unique limits must be assigned to each PA point in the system.

#### 2.6.4 Constraints

##### 2.6.4.1 Equipment Constraints Definitions

Each control point in the database must have PLC resident constraints defined and entered by the Contractor, including as applicable: maximum starts (cycles) per hour; minimum off time; minimum on time; high limit (value in engineering units); and low limit (value in engineering units).

##### 2.6.4.2 Constraints Checks

All control devices connected to the system must have the PLC constraints checked and passed before each command is issued. Each command point must have unique constraints assigned. High and low "reasonableness" values or one differential "rate-of-change" value must be assigned to each AI. Each individual point must be capable of being selectively disabled by the operator from the central station.

#### 2.6.5 Control Sequences and Control Loops

Specific functions to be implemented are defined in individual system control sequences and database tables shown on the drawings, and must include, as applicable, the following functions: PI control must provide

proportional control and proportional plus integral control; two position control must provide control for a two state device by comparing a set point against a process variable and an established dead band; floating point control must exercise control when an error signal exceeds a selected dead band, and must maintain control until the error is within the dead band limits; signal selection must allow the selection of the highest or lowest analog value from a group of analog values as the basis of control and must include the ability to cascade analog values so that large numbers of inputs can be reduced to one or two outputs; signal averaging must allow the mathematical calculation of the average analog value from a group of analog values as the basis of control and must include the ability to "weight" the individual analog values so that the function output can be biased as necessary to achieve proper control; reset function must develop an AO based on up to two AIs and one operator specified reset schedule.

#### 2.6.6 Command Priorities

A scheme of priority levels must be provided to prevent interaction of a command of low priority with a command of higher priority. Override commands entered by the operator must have higher priority than those emanating from applications programs.

#### 2.6.7 Resident Application Software

Provide resident applications programs developed in accordance with paragraph GRAPHICAL PROGRAMMING to achieve the sequences of operation, parameters, constraints, and interlocks necessary to provide control of the process systems connected to the process control system. All application programs must be resident in the PLC and must execute in the PLC, and must coordinate with each other, to ensure that no conflicts or contentions remain unresolved.

##### 2.6.7.1 Program Inputs and Outputs

Use program inputs listed for each application program to calculate the required program outputs. Where specific program inputs are not available, a "default" value or virtual point appropriate for the equipment being controlled and the proposed sequence of operation must be provided to replace the missing input, thus allowing the application program to operate.

##### 2.6.7.2 Failure Mode

In the event of a PLC failure, the controlled equipment must continue to function in the failure mode shown on the drawings. Systems that are Primary/Secondary must transfer control to the non-failed system.

### 2.7 CONTROL PANELS

#### 2.7.1 Components

##### 2.7.1.1 Enclosures

The enclosure for each control panel must conform to the requirements of NEMA 250 for the types specified. Finish color must be the manufacturer's standard, unless otherwise indicated. Enclosures for installation in mechanical equipment rooms must be Type 4 ; those for installation in clean, dry indoor occupied space may be Type 1; other locations must be as

otherwise specified or shown. Enclosures for equipment installed outdoors must be Type 4 or as shown. Enclosures for installation in a corrosive environment must be Type 4X and must be constructed of stainless steel . Painted steel must not be allowed for use in a corrosive environment. Enclosure must be provided with a single, continuously hinged exterior door with print pocket, 3-point latching mechanism and key lock and a single, continuously hinged interior door.

#### 2.7.1.2 Controllers

Provide controllers in accordance with paragraph Programmable Logic Controller (PLC).

#### 2.7.1.3 Standard Indicator Light

Indicator lights showing on, off, stand-by, automatic, manual depending on the application must comply with NEMA ICS 1, NEMA ICS 2 and UL 508A. Lights must be heavy duty, round and must mount in a 0.875 inch mounting hole. Indicator lights must be LED type and must operate at 120 VAC or 24 VDC. Long life bulbs must be used. Indicator light must be provided with a legend plate labeled as shown on the drawings. Lens color must be as indicated on the drawings. Lights must be push to test (lamp) type.

#### 2.7.1.4 Selector Switches

Selector switches must comply with NEMA ICS 1, NEMA ICS 2 and UL 508A. Selector switches must be heavy duty, round and must mount in a 0.875 inch mounting hole. The number of positions must be as indicated on the drawings. Switches must be illuminated . Switches must be rated for 600 volts, 10 amperes continuous. Selector switches must be provided with a legend plate labeled as shown on the drawings. Where indicated or required, dual auxiliary contacts must be provided for the automatic position to provide position sensing at the central station or workstation. Auxiliary contacts must be rated for 120 VAC, 1A as a minimum. Where indicated on the drawings, switches must be key operated. All keys must be identical.

#### 2.7.1.5 Push Buttons

Push buttons must comply with NEMA ICS 1, NEMA ICS 2 and UL 508A. Push buttons must be heavy duty, round and must mount in a 22.5 mm 0.875 inch mounting hole. The number and type of contacts must be as indicated on the drawings or required by the Sequence of Control. Push buttons must be rated for 600 volts, 10 amperes continuous. Push buttons must be provided with a legend plate labeled as shown on the drawings.

#### 2.7.1.6 Relays

Relays must comply with NEMA ICS 5 and derated for altitude above 1,500 m. Relays must be as required by the Sequence of Control. Relay coil must be 120 VAC and must be provided with matching mounting socket. Power consumption must not be greater than 3 watts. Coils must have a minimum current rating of 10 amps and minimum voltage rating of 120 volts. Contacts must have a minimum current rating of 10 amps and minimum voltage rating of 240 volts.

#### 2.7.1.7 Terminal Blocks

Terminal blocks must comply with NEMA ICS 4 and UL 1059. Terminal blocks

for conductors exiting control panels must be two-way type with double terminals, one for internal wiring connections and the other for external wiring connections. Terminal blocks must be made of bakelite or other suitable insulating material with full deep barriers between each pair of terminals. A terminal identification strip must form part of the terminal block and each terminal must be identified by a number in accordance with the numbering scheme on the approved wiring diagrams.

#### 2.7.1.8 Alarm Horns

Alarm horns must be provided where indicated on the drawings. Horns must be vibrating type and must comply with UL 508A. Horns must provide 100 dB at 10 feet. Exterior mounted horns must be weather proof by design or must be mounted in a weather proof enclosure that does not reduce the effectiveness of the horn.

#### 2.7.2 Panel Assembly

Control panels must be factory assembled and shipped to the jobsite as a single unit. Panels must be fabricated as indicated and devices must be mounted as shown or required. Each panel must be fabricated as a bottom-entry connection point for process control system electrical power, process control system main air source, process control system wiring, communications system wiring to other control panels and operators workstation.

#### 2.7.3 Electrical Requirements

Each panel must be powered by a dedicated 120 volts ac circuit, with a fuse, sized as recommended by the equipment manufacturer, and a disconnect switch located inside the panel. Wiring must terminate inside the panel on terminal blocks. Electrical work must be as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and as shown on the drawings.

#### 2.7.4 Power Line Conditioner

Each control panel must be provided with a power line conditioner to provide both voltage regulation and noise rejection. The power line conditioner must be of the ferro-resonant design, with no moving parts and no tap switching, while electrically isolating the secondary from the power line side. The power line conditioner must be sized for 125 percent of the actual connected kva load. Characteristics of the power line conditioner must be as follows:

##### 2.7.4.1 85 Percent Load

At 85 percent load, the output voltage must not deviate by more than plus or minus 1 percent of nominal voltage when the input voltage fluctuates between minus 20 percent to plus 10 percent of nominal voltage.

##### 2.7.4.2 Load Changes

During load changes of zero to full load, the output voltage must not deviate by more than plus or minus 3 percent of nominal voltage. Full correction of load switching disturbances must be accomplished within 5 cycles, and 95 percent correction must be accomplished within 2 cycles of the onset of the disturbance.

#### 2.7.5 Grounding

Control panel enclosures must be equipped with a solid copper ground bus or equivalent. The ground bus must be securely anchored to the enclosure so as to effectively ground the entire structure. Clamp-type terminals sized large enough to carry the maximum expected current must be provided on the ground bus for grounding cables. Where a definite circuit ground is required, a single wire not less than #10 AWG must run independently to the panel ground bus and must be fastened to the ground bus with a bolted terminal lug. Cases of instruments, relays and other devices must be effectively grounded through the enclosures steel structure unless otherwise indicated. Insulated wiring having a continuous rated current of not less than the circuit fuse rating must be used for grounding. Grounding terminals of power receptacles must be solidly grounded to the panel enclosure.

#### 2.7.6 Convenience Outlet

A 120 volt ac, 20 amp, ground fault interruption (GFI) type duplex convenience outlet must be provided inside the panel. The outlet circuit must be separate from the panel power circuit.

#### 2.7.7 Panel Interior Light

Each control panel must be provided with a 15 watt LED light. The light must be operated by a manual on-off switch mounted on the interior door of the enclosure. The light must be powered by the same circuit as the convenience outlet.

#### 2.7.8 Ventilation System

Each control panel must be provided with two single phase, 120 volt ac ventilation fans. Each fan must supply a minimum of 100 cfm of ventilation air through the enclosure. Each fan must be provided with a line voltage thermostat. Thermostat setpoints must be adjustable in a range of 70 to 140 degrees F as a minimum. Each supply and exhaust grille must contain a filter that is easily removed for cleaning or replacement.

#### 2.7.9 Heating System

Each control panel(s) must be provided with a thermostatically controlled electric heater capable of maintaining an enclosure temperature of 35 degrees F when continuously exposed to an ambient temperature of 0 degrees F.

#### 2.7.10 Uninterruptible Power Supply

Each control panel must be provided with an Uninterruptible Power Supply in accordance with Computer Hardware, UPS specification.

#### 2.7.11 Air Conditioning System

Where indicated, control panel must be provided with a mechanical refrigeration air conditioning system. The system must be capable of maintaining a temperature of 100 degrees F inside the enclosure with all equipment in the panel operating and while continuously exposed to full sunlight and an ambient air temperature of 95 degrees F. The compressor and condenser must be located outside the control panel enclosure. Provisions must be made to remove condensate from the control panel and to

protect all devices within the enclosure from condensate.

## 2.8 COMPUTER HARDWARE

For computer hardware furnished under this specification provide standard products of a single manufacturer which advertises service in all 48 contiguous states, and provide only model currently in production. Except for PCI-E cards installed into expansion slots provided in a desktop or server computer in order to meet the requirements of this specification, do not modify computer hardware from the manufacturer configuration.

### 2.8.1 Server Hardware

Computer Server Hardware (server) must be an industrial panel PC or small form factor PC meeting the following minimum requirements::

#### 2.8.1.1 Processor

Quad-core processor designed for server applications. Processor speed must be at least 50 percent of the speed of the fastest Intel server processor commercially available.

#### 2.8.1.2 Random Access Memory (RAM)

300 percent of the recommended requirements of the software to be installed on the server.

#### 2.8.1.3 Communications Ports

Four USB 3.0 3.1 ports.

#### 2.8.1.4 Hard Drives

##### 2.8.1.4.1 Internal Hard Drives

Solid State Hard drives with SATA-3 Controller providing at least 2TB usable disk space. Hard drives must use RAID (Redundant Array of Inexpensive Disks) at levels 1 or 5 (RAID-1 or RAID-5).

#### 2.8.1.5 Optical Drive

Not required.

#### 2.8.1.6 Video Output

32-bit color at a minimum resolution of 1920 by 1080 at a minimum refresh rate of 70 Hz and a DVI or display port output.

#### 2.8.1.7 Network Interface

One integrated 1000Base-T Ethernet with RJ45 connector.

#### 2.8.1.8 Monitor

Must be an Industrial panel or monitor suitable for use in a NEMA4 environment, mounted in the control panel. The monitor may be a combined Panel PC if the server requirements are met.

#### 2.8.1.9 Keyboard

Provide a 101 key wired USB keyboard having a minimum 64 character standard ASCII character set based on ANSI INCITS 154. Primary key input must be by touchscreen.

#### 2.8.1.10 Mouse

Provide a 2-button wired USB optical scroll mouse with a minimum resolution of 400 dots per inch. Primary input must be by touchscreen.

#### 2.8.1.11 Power Supplies

Power supply must be provided by the control panel the server is mounted within. Provide in accordance with Control Panel Components specification.

#### 2.8.2 Uninterruptible Power Supply (UPS)

A self contained UPS suitable for installation and operation at the Server and Workstation must be provided. The units must be sized to provide a minimum of 10 minutes of operation of the central station computer. The UPS must incorporate surge suppression, noise filtering (normal and common mode) short circuit protection and voltage regulation (brownout and overvoltage protection). UPS must be complete with all necessary power supplies, transformers, batteries, and accessories and must include visual indication of normal power operation, UPS operation, abnormal operation and visual and audible indication of low battery power. The UPS must comply with the Federal Communications Commission Standard 15J part A for radio noise emissions.

#### 2.9 TOUCHSCREEN HMI

Human Machine Interface (HMI) display screens must be supplied to provide an interface to the PLC. The touch screens must be compatible with the specific PLC being furnished. Locate touch screens in the cabinets as shown in the Contract Drawings. The touch screens must provide maintenance information and indication of the systems. The touch screens must be 19" panel mount with a minimum resolution of 1024x768. Provide operator interface as shown on the Contract Drawings or approved equal. If a panel PC is provided, no additional HMI is required.

##### 2.9.1 TOUCHSCREEN HMI Display Layout

Develop HMI control and supervision display layouts complying with the minimum requirements of the Control Narrative in the Contract Drawings. Submit for approval prior to implementation.

#### 2.10 MONITORING AND CONTROL SOFTWARE

Provide a single software package which implements the Scheduling, Alarming, Trending, Graphical System Display, and System Display Editor functionality. Other specified M&C functionality may be implemented in the same software package or in additional software packages. The monitoring and control software must provide the communication, programming and control capabilities necessary to support all specified points and functions, plus a minimum expansion of 50 percent of the current number of points, complete with their point database. The monitoring and control station must be online at all times and must perform all required functions as specified. Where multiple modules are

used the modules must be capable of sharing data and operating together seamlessly. Software must be a client-server software package with a graphical user interface (GUI) using web-browser based clients. The system must support multiple user operation with multiple tasks for each user and must support operation and management of all peripheral devices.

#### 2.10.1 M&C Software Update Licensing

In addition to all other licensing requirements, provide M&C Software licensing which includes licensing of the following software updates for a period of no less than 5 years:

- a. Security and bug-fix patches issued by the M&C Software manufacturer.
- b. Security patches to address any vulnerability identified in the National Vulnerability Database at <http://nvd.nist.gov> with a Common Vulnerability Scoring System (CVSS) severity rating of MEDIUM or higher.

#### 2.10.2 Graphical Operations

##### 2.10.2.1 Graphical User Interface

The central station must be provided with a mouse driven, graphical user interface.

##### 2.10.2.2 Display Information

The central station must display information necessary to support all requirements specified, including: operator commands; alarm notification; reports; system graphics as specified and as shown, incorporating dynamic data; and curve plotting.

##### 2.10.2.3 System Graphics Implementation

System graphics displays must be hierarchical displays which integrate dynamic data into the display. System graphics must reflect actual system configuration. Each system schematic must be included as a separate display. Different colors, textures, and use of inverted video must be used for various components and dynamic data. The displays must include standard and/or custom symbols. A library of callable display symbols containing symbols for all necessary equipment and control devices must be furnished. Symbols must conform to ISA 101.01 where applicable. Data associated with a display must be updated within 5 seconds of the binary status change or the analog change in excess of the analog change differential. Any dynamic data which is not current, due to PLC communications failure, PLC failure, or point out of service, must be highlighted or flagged.

##### 2.10.2.4 Display Editor

The display editor must enable the user to create, modify, save and delete displays and symbols. Within the display there must be dynamic fields with the function of linking the dynamic fields with the database and must be executed automatically as the last step of the database generation and modification procedure.

#### 2.10.2.5 Graphical Programming

The system must include a graphical programming function which must be used to create all control sequences utilized in the control panels. This function must reside in the central station to create, modify, and test software for control panel resident programs. The graphical programming function must provide programming elements to be connected together to create a logic diagram. The diagram must be compilable to produce executable code for the control panel. The graphical programming function must include elements necessary to create logic diagrams that represent sequences of operation. Program elements must be able to be combined into a custom template which can then be used as a standard function. Program checkout and debug facilities must include display of dynamic and/or simulated system variables and points on the programming screens. The user must be able to fix or force values of variables to enable program checkout during debugging. The programming must allow for the use of the portable tester for loading files directly into the control panel, uploading of existing control panel programming and database information and downloading of control panel programming and database information.

#### 2.10.2.6 System Menus and Displays

The user must be able to call up the following displays by dedicated function key, pull down menu or by icon and must be able to page forward and backward on linked multiple page displays. The system menu and index displays must also contain icons which can be used to call up subsequent displays.

- a. System Menu (list of all graphics and menus).
- b. Index (list of all PLCs).
- c. Alarm Summary (list of all uncleared alarms).
- d. Abnormal Summary (list of all devices not in normal state; keeps track of alarm conditions which have been cleared).
- e. Data Communications Summary (listing of availability for each communication channel, by statistically processing the number of transmission errors, outages, and other abnormal conditions for each channel).

#### 2.10.2.7 Hard-Copy Screen Request

The central station must be able to obtain a hard copy of the monitor display being viewed. This must be an exact "snapshot" of the data and device symbols shown on the selected monitor.

#### 2.10.3 Command Software

The software must provide for defining and selecting points, parameters, graphics, report generation, and all other functions associated with operation. The operator commands must be usable from central station computer and workstation keyboards with individual operator passwords as specified.

##### 2.10.3.1 Command Input

Command menus must utilize full words and acronyms selected to allow

operators to use the system without extensive training or data processing backgrounds. The system must prompt the operator.

#### 2.10.3.2 Command Input Errors

The system must supervise operator inputs to ensure they are correct for proper execution. Provide operator input assistance whenever a command cannot be executed because of operator input errors.

#### 2.10.3.3 Special Functions

The system must support the following special functions by using a mouse, in addition to all other commands specified:

##### 2.10.3.3.1 Help

Produce a display of all commands available to the operator. The help command, followed by a specific command, must produce context sensitive listing with a short explanation of the purpose, use, and system reaction to that command.

##### 2.10.3.3.2 Start/Enable

Manually start equipment and enable monitoring and control of points.

##### 2.10.3.3.3 Stop/Disable

Manually stop equipment and disable monitoring and control components.

##### 2.10.3.3.4 Display Diagram

Display diagrams of specific utility systems or other systems.

##### 2.10.3.3.5 Diagram Development

Facilitate development of diagrams of specific utility systems or other systems.

##### 2.10.3.3.6 Auto/Override

Override automatic operation of a point or return a point to automatic operation.

##### 2.10.3.3.7 Print Report

Allow the operator to print reports.

##### 2.10.3.3.8 Confirm Action

Allow the operator to confirm that the desired command sequence has been correctly entered and is to be executed.

##### 2.10.3.3.9 Cancel Action

Perform the opposite function of the confirm action, at any time prior to executing confirm action.

#### 2.10.3.3.10 Memo Pad

Allow the operator to create, store and retrieve pop-up notes.

#### 2.10.3.4 Operator's Commands

The operator's commands must provide the means for entry of control and monitoring commands, and for retrieval of information. The operator's commands must perform such tasks as requesting a display of any binary, analog, or accumulator point, or any group of related points, startup and shutdown selected systems or devices, modifying

#### 2.10.3.5 Level of Addressing

Provide four levels of addressing for identification as follows:

##### 2.10.3.5.1 Point

The individual sensor or control device within a unit.

##### 2.10.3.5.2 Unit

The unit that a point is associated with, such as a blower.

##### 2.10.3.5.3 Sub-System

The sub-system that a point is located in or near.

##### 2.10.3.5.4 System

The system that a sub-system is located in or near.

#### 2.10.3.6 System Access Control

A minimum of 5 passwords must be usable with the process control system software. The system must maintain an ASCII disk file logging all operators logged onto the system, alarm acknowledgments, commands issued and all database modifications for each password. Each password must be definable as to the functions that the operator can perform.

#### 2.10.4 Alarms

Provide M&C Software meeting the following minimum requirements for alarms:

- a. The M&C software must be capable of generating alarms by comparing the value of any point from any connected system to user-configurable limits and must notify an operator of the occurrence of an alarm condition. The process control system alarm history must be stored and must be recallable by the operator using the report generator. Alarm messages must take precedence over other functions. A minimum of the most recent 25 system alarms must be directly available at the central station computer. Operator acknowledgment of one alarm must not be considered as acknowledgment of any other alarm nor must it inhibit reporting of subsequent alarms. Alarm data to be displayed and stored must include: identification of the alarm; date and time to the nearest second of occurrence; device or sensor type; limit exceeded (if analog); engineering units; current value or status; alarm class; and alarm messages. All alarms recorded by the M&C system must be recommunicated to the existing control system as described in

contract documents.

- b. The M&C software must support at least two alarm priority levels: critical and informational. Critical alarms must remain in alarm until acknowledged by an operator and the alarm condition no longer exists; informational alarms must remain in alarm until the alarm condition no longer exists or until the alarm is acknowledged.
- c. The creation, modification, and handling (routing) of alarms must be fully accessible and fully adjustable from the graphical user interface.
- d. Alarm Data. Alarm data to be displayed and stored must include:
  - 1) Identification of alarm including building, system (or sub-system), and device name.
  - 2) Date and time to the nearest second of occurrence.
  - 3) Alarm type:
  - 4) Unreliable: Indicates that the source device has failed due to the sensing device or alarm parameter being out-of-range or bad data.
  - 5) High Alarm.
  - 6) Low Alarm.
  - 7) Current value or status of the alarm point, including engineering units
  - 8) Alarm limits, including engineering units.
  - 9) Alarm priority.
  - 10) Alarm Message: A unique message with a field of at least 60 characters. Assignment of messages to an alarm must be an operator editable function.
  - 11) Acknowledgement status of the alarm including the time, date and user of acknowledgement.

#### 2.10.4.1 Binary Alarms

Binary alarms must be subject to immediate reporting, within the alarm response time, at the central station.

#### 2.10.4.2 Analog Alarms

These alarms must be subject to immediate reporting, within the alarm response time, at the central station. The control panel analog readings must be compared to predefined high and low limits, and alarmed to the central station each time a value enters or returns from a limit condition. The program must automatically change the high or low limits, or both, of any analog point, based on time scheduled operations as specified, allowing for a time interval before the new alarm limit becomes effective. For those applications where setpoint adjustments are made, the alarm limit must be keyed to a finite deviation traveling with the setpoint.

#### 2.10.4.3 Alarm Messages

A unique message with a field of 60 characters must be provided for each alarm. Assignment of messages to a point must be an operator editable function. Secondary messages must be assignable by the operator for printing to provide further information, such as telephone lists or maintenance functions, and must be editable by the operator.

#### 2.10.4.4 Alarm Classes

Classes of alarms, which will be identified for each item, include class 1 and class 2 alarm conditions. Class 1 (Critical) must include display, print, and audible alarm at occurrence and at return-to-normal. Acknowledgment of class 1 alarms by the operator must be required at occurrence and at return-to-normal. Class 2 (Informational) must include display, print, and audible alarm at occurrence and at return-to-normal. No acknowledgment of class 2 alarms is required unless otherwise shown.

#### 2.10.5 Pop-up Note Function

A pop-up note function must be included with the workstation, providing the operator a capability of noting any data which may be associated with alarms or with any other event. A note created by an operator must be automatically called up when any other workstation calls up the associated point, alarm, or alarm summary. The pop-up note function must also support free form entry of data which can be used by any workstation operators as general reminders or instructions.

#### 2.10.6 Real Time Clock Synchronization

The system must synchronize each central station computer, real time clock, within one second and at least once per day automatically, without operator intervention and without requiring system shutdown. The central station computer must automatically initiate a call once per day to the NIST clock to obtain the correct time and date and update the real time clock. The central station computer must generate a report showing the time difference.

#### 2.10.7 System Reaction

Under system normal heavy load, no more than 10 seconds must lapse from the time a binary status alarm or analog alarm occurs at a PLC until the change is displayed at the central station and operator's workstation. The total system response time from initiation of a control action command to display of the resulting status change must not exceed 20 seconds under system normal heavy load conditions, assuming a zero response time for operation of the PLC's control device. The alarm printer must continue to print out all occurrences, including time of occurrence, to the nearest second. All system normal heavy load conditions must be introduced to the system via AIs and DIs.

##### 2.10.7.1 Occurrence

System normal heavy load conditions are defined as the occurrence throughout the system of a total of three status changes, three binary alarms, three analog high or low limit alarms, and three analog quantity changes within the high and low limits during a single 1-second interval. This number of similar occurrences must repeat on a continuous basis during successive 1-second intervals for a period of 2 minutes.

#### 2.10.7.2 Location

System normal heavy load conditions, as specified, must have 50 percent of the changes and alarms, including no less than one of each type, occurring at a single PLC with the remaining changes and alarms distributed among the remaining PLCs.

#### 2.10.8 Report Generator

Software must be provided to generate and format standard and custom reports for displaying, printing, and storing on disk. Reports must use database values and parameters, values calculated using the real time static database or historical data base; with the reports subsequently stored on hard disk or zip drive. Dynamic operation of the system must not be interrupted to generate a report. The report must contain the time and date when the sample was taken, and the time and date when the report was printed. The software must allow for automatic and manual generation of reports. For automatic reports an operator must be able to specify the time the initial report is to be generated, the time interval between reports, end of period, and the output format for the report. Manual report generation must allow for the operator to request at any time the output of any report.

##### 2.10.8.1 Periodic Automatic Report

The system must allow for specifying, modifying, or inhibiting the report to be generated, the time the initial report is to be generated, the time interval between reports, end of period, and the output peripheral.

##### 2.10.8.2 Request Report Mode

The system must allow for the operator to request, at any time, an immediate printout of any report.

#### 2.10.9 Data Interchange

Software must be provided to format and store on a government approved removable hard drive the data, trends, profiles, reports and logs as specified in a defined, standard format such as ASCII text or DIF for export and further processing by other software and/or computer systems.

#### 2.10.10 Control Panel and DTS Circuit Alarms

The system must supervise each control panel, I/O function and DTS circuit for alarm reporting, including: control panel not responding; control panel responding (return to normal); control panel to central station DTS circuit high error rate; control panel to control panel DTS circuit high error rate; control panel/central station real time clock error more than 15 seconds (adjustable); control panel intrusion alarm; control panel offline; control panel online (return to normal); control panel failure (self-diagnostics); point not responding to command; and point change of state without command.

#### 2.10.11 Central Station Database

The central station database must be stored on disk and in memory. The static database must be downloadable as required to control panels in the system.

#### 2.10.11.1 Database Definition Process

Software must be provided to define and modify each point in the database using operator commands. The definition must include all physical parameters and constraints associated with each point. Each database item must be callable for display or printing, including EEPROM, ROM and RAM resident data. Each point must be defined and entered into central station database.

#### 2.10.11.2 Dynamic Database

The dynamic database includes those variables which change with time or conditions including all DIIs, AIs, PAs, and virtual (logic) points.

#### 2.10.11.3 Dynamic Database Update

Update the dynamic database from the field, allowing the operator to select update times from 0.1 seconds to 2.0 seconds.

#### 2.10.11.4 Static Database

The static database includes those fixed parameters and constraints from all PLCs which define the characteristics of the system and I/O functions such as alarm limits, start/stop times, point names, PLC channel addresses, and sensor spans.

#### 2.10.11.5 Central Station Static Database Update

A copy of each control panels static database must be updated automatically once per day, each time an authorized change is submitted or upon demand from the central station database.

#### 2.10.11.6 Workstation Access to Dynamic Data

Any workstation with proper access password and connected to the central station via the BTS must have access to the central station's dynamic data. Display of data must commence within 5 seconds.

#### 2.10.12 Historical Data Storage and Retrieval

A historical data storage and retrieval function must be provided at the central station to collect and store dynamic data. This function must be in addition to other data storage requirements. The function must have the capability to collect and store alarm status changes, point values, events and operator commands, and system responses. The storage function must also have the capability to collect and store multiple sets of analog data at pre-specified sampling rates. This function must have the capability to retain historical data on hard disk for pre-specified time periods, up to forty five days using last day roll over, for short-term analysis, and then output the data to a solid state drive in a SQL database for long-term retention. The operator must also be able to selectively recall short-term data stored on hard disk. Retrieval and printing of the contents of any selected historical data file must be available using the data retrieval and report generation program. The output of the report generation program must be capable of being viewed on the screen, printed in a report, or stored.

#### 2.10.13 Trending

Provide M&C software capable of creating, modifying, uploading and archiving Point properties and performing real-time display of point properties with a minimum trending rate of 100 points per second.

- a. The M&C Software must include a graphical display for trend configuration, creation and deletion accessible through the graphical user interface. Each trend must be user-configurable for:
  - (1) Point to trend.
  - (2) Sampling interval: adjustable between 1 second and 1 hour.
  - (3) Start and Stop Time of Trend: Start and stop times determined by one or more of the following methods:
    - (a) Start time and stop time
    - (b) Start time and duration
    - (c) Start time and number of samples
- b. The M&C software must be capable of displaying and printing a graphical representation of each trend, and of multiple trended points on the same graph. The software must be capable of saving trend logs to a file. If the file format is not plain ASCII text in a Comma-Separated-Value (CSV) format, provide a means to export or convert the file to plain ASCII text in a CSV format.

#### 2.10.14 Analog Monitoring

The system must measure, transmit, and display analog values, including calculated analog points. Differential measurements must be displayed as positive or negative values with respect to their reference points shown. An analog change in value is defined as a change exceeding a preset differential value as specified. Each analog change in value must be operator selectable and settable to provide for a minimum reporting change in value of one-half the specified end-to-end accuracy of the measured variable. Displays and reports must express analog values in proper engineering units with sign. Provide 128 different sets of engineering unit conversions. Each engineering conversion unit must include range, span, and conversion equation.

#### 2.10.15 Analog Totalization

Any analog or calculated point must be operator assignable to the totalization program. The analog totalization time period must be defined uniquely for each point. At the end of the period, totals must be stored on disk for future reference. Totalization must then restart from zero for the next time period. The program must keep track of the peak and total value measured during the current period and for the previous period. The operator must be able to initiate a summary of totalization information on a point, unit, sub-system or system. The operator must be able to set or reset each totalized value individually. The operator must be able to define, modify, or delete the time period online.

#### 2.10.16 LAN Software

A network operating system must be supplied as part of the LAN software. The network operating system must support network device access to the central station. The system must provide workstation access to the central station as a virtual terminal. The network must provide network access to shared peripherals. The LAN software must provide for transparent communication with any node on the system. The LAN software must support the following:

##### 2.10.16.1 Access Control

Access control to the central station computer and workstations. Operators must be able to perform all specified functions, given the proper passwords, including database definition/modification, graphic creation/modification, and trending.

##### 2.10.16.2 Other Functions and Configurations

#### 2.10.17 Virus Protection Software

Virus Protection Software will be furnished by the Government.

#### 2.10.18 Disk Imaging (Backup) Software

Provide Disk imaging (backup) software consisting of the project site's standard disk imaging software.

### 2.11 DATA COMMUNICATION REQUIREMENTS

Process control system data communications must support the specified functions and process control system configuration shown on the drawings.

#### 2.11.1 Central Station/Workstation

Each workstation must be able to communicate with the central station as a virtual terminal. The workstation must be able to initiate uploads or downloads of programs and resident data, including parameters of connected systems PLCs and devices, constraints and programs in the central station.

#### 2.11.2 Central Station/PLC

The central station must be able to initiate an upload or download of PLC data programs.

#### 2.11.3 Communication

Communication with other computer systems must be accomplished using an Ethernet communications port. The central station or workstation must be able to initiate upload or download of data files.

#### 2.11.4 Error Detection and Retransmission

Error detection and retransmission must comply with current Ethernet standards.

### 2.12 FACTORY TEST

The process control system must be tested at the factory prior to

shipment. Written notification of planned testing must be given to the Government at least 21 days prior to testing, and in no case must notice be given until after the Contractor has received written Government approval of the test procedures.

#### 2.12.1 Factory Test Setup

Assemble and integrate the factory test setup as specified to prove that performance of the system satisfies all requirements of this project, including system communications requirements in accordance with the approved test procedures. The factory test must take place during regular daytime working hours on weekdays. Equipment used must be the same equipment that is to be delivered to the site. The factory test setup must include the following:

| Factory Test               |                                                                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| central station equipment  | one each of the components                                                                                                               |
| workstation                | one of each type                                                                                                                         |
| control panel              | not less than two control panels: at least one of each type used in the system plus at least one per DTS type                            |
| test set                   | one of each type                                                                                                                         |
| portable tester            | one of each type                                                                                                                         |
| communications circuits    | one of each type and speed to be utilized in the proposed system including bridges, modems, encoder/decoders, transceivers and repeaters |
| surge protection equipment | for power, communications, I/O functions and networks                                                                                    |
| I/O functions              | sufficient to demonstrate the I/O capability and system normal operation                                                                 |
| software                   | software required for proper operation of the proposed system including application programs and sequences of operation                  |

#### 2.12.2 Factory Test Procedure

Test procedures must define the tests required to ensure that the system meets technical, operational, and performance requirements. The test procedures must define location of tests, milestones for the tests, and identify simulation programs, equipment, personnel, facilities, and supplies required. Provide for testing all process control system capabilities and functions specified and shown. Cover actual equipment and sequences to be used for the specified project and include detailed instructions for test setup, execution, and evaluation of test results. The test reports must document results of the tests. Surge testing need not be conducted acceptable documented proof can be provided that such

testing has been satisfactorily demonstrated to the Government with identical surge protection applied. The procedures must include the following:

|                                                                                                              |                                                                                                                                        |
|--------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                              | Test Procedure                                                                                                                         |
| equipment                                                                                                    | block diagram                                                                                                                          |
| hardware and software                                                                                        | descriptions                                                                                                                           |
| commands                                                                                                     | operator commands                                                                                                                      |
| I/O functions                                                                                                | test database points with failure modes                                                                                                |
| passwords                                                                                                    | required for each operator access level                                                                                                |
| each type of digital and analog point in the test database                                                   | description                                                                                                                            |
| test equipment                                                                                               | list                                                                                                                                   |
| surge protection                                                                                             | circuit diagrams                                                                                                                       |
| inputs required (I/O point values and status) and corresponding expected results of each set of input values | for each application program                                                                                                           |
| default values                                                                                               | for the application program inputs not implemented or provided for in the contract documents for the application programs to be tested |

### 2.12.3 Factory Test Report

Submit original copies of data produced during the factory test, including results of each demonstration procedure within 7 days after completion of each test. Arrange the report so that commands, responses, and data acquired are correlated to allow logical interpretation of the data.

## PART 3 EXECUTION

### 3.1 FACTORY TEST

Perform factory testing of the System as specified. The Contractor is responsible for providing personnel, equipment, instrumentation, and supplies necessary to perform required testing. Provide written notification of planned testing to the Government at least 21 days prior to testing, and do not give this notice until after receiving written Government approval of the specific Factory Test Procedures. Provide Factory Test Procedures which define the tests required to ensure that the system meets technical, operational, and performance specifications. Within the Procedures define location of tests, milestones for the tests, and identify simulation programs, equipment, personnel, facilities, and supplies required. Provide procedures which test all capabilities and functions specified and indicated. Perform the Factory Test using equipment and software of the same manufacturer, model and revision as

will be used for the specified project. Include detailed instructions for test setup, execution, and evaluation of test results in the Procedures. Upon completion of the test, prepare a Factory Test Report, documenting the results of the Test, and submit it as specified. This report must be approved before any equipment is shipped.

Perform the Factory Test and provide Factory Test Submittals as shown in TABLE II. FACTORY TEST SEQUENCING.

TABLE II FACTORY TEST SEQUENCING

| ITEM # | DESCRIPTION                      | SEQUENCING                                    |
|--------|----------------------------------|-----------------------------------------------|
|        |                                  | (START of ACTIVITY or DEADLINE FOR SUBMITTAL) |
| 1      | Submit Factory Test Procedure to | 7 days after notice Proceed                   |
| 2      | Perform Factory Test             | After Approval of #1                          |
| 3      | Submit Factory Test Report       | 5 days After Completion of #2                 |

### 3.2 EQUIPMENT INSTALLATION REQUIREMENTS

#### 3.2.1 Installation

Install system components and appurtenances in accordance with the manufacturer's instructions and provide necessary interconnections, services, and adjustments required for a complete and operable system. Adjust or replace devices not conforming to the required accuracies. Replace factory sealed devices, rather than adjusting. Installation, adjustment, and operation of the equipment specified must be supervised by a manufacturer's representative experienced in the installing, adjusting, and testing of the equipment.

- a. Install instrumentation and communication equipment and cable grounding as necessary to preclude ground loops, noise, and surges from adversely affecting system operation.
- b. Install wiring in exposed areas, including low voltage wiring, as specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Wiring in air plenum areas installed without conduit must be plenum-rated in accordance with NFPA 70.
- c. Submit detail drawings containing complete piping, wiring, schematic, flow diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Piping and Instrumentation (P&ID) drawings (prepared using industry recognized device symbols, clearly defined and describing piping designations to define the service and materials of individual pipe segments and instrument tags employing Instrument Society of America suggested identifiers). Include in the Drawings, as appropriate: product specific catalog cuts; a drawing index; a list of symbols; a series of drawings for each process control system using abbreviations, symbols, nomenclature and identifiers as shown; valve schedules; compressed instrument air station schematics and ASME air storage tank certificates for each type and make of compressed instrument air station.

#### 3.2.1.1 Isolation, Penetrations and Clearance from Equipment

Dielectric isolation must be provided where dissimilar metals are used for connection and support. Penetrations through and mounting holes in the building exteriors must be made watertight. Holes in concrete, brick, steel and wood walls must be drilled or core drilled with proper equipment; conduits installed through openings must be sealed with materials which are compatible with existing materials. Openings must be sealed with materials which meet the requirements of NFPA 70 and Section 07 84 00 FIRESTOPPING. Installation must provide clearance for control-system maintenance. Process control system installation must not interfere with the clearance requirements for mechanical and electrical system maintenance.

#### 3.2.1.2 Device Mounting

Devices must be installed in accordance with manufacturers' recommendations and as shown. Control devices to be installed in piping must be provided with required gaskets, flanges, thermal compounds, insulation, piping, fittings, and manual valves for shutoff, equalization, purging, and calibration. Any deviations must be documented and submitted to the Government for approval prior to mounting. Damaged insulation must be replaced or repaired after devices are installed to match existing work. Damaged galvanized surfaces must be repaired by touching up with zinc paint.

#### 3.2.1.3 Pneumatic Tubing

Tubing must be concealed in finished areas. Tubing may be run exposed in unfinished areas, such as mechanical equipment rooms. For tubing to be enclosed in concrete, rigid metal or intermediate metal conduit must be provided. Tubing must be installed parallel or perpendicular to building walls throughout. Maximum spacing between tubing supports must be 1.5 m 5 feet. Each tubing system must be tested pneumatically at 1.5 times the working pressure for 24 hours, with a maximum pressure drop of 2 psig with compressed air supply turned off. Joint leaks must be corrected by remaking the joint. Caulking of joints will not be permitted. Tubing and two insulated copper phone wires for installation checkout may be run in the same conduit. Tubing and electrical power conductors must not be run in the same conduit; however, control circuit conductors may be run in the same conduit as polyethylene tubing.

#### 3.2.2 Sequences of Operation

Study the operation and sequence of local equipment controls, as a part of the conditions report, and note any deviations from the described sequences of operation on the contract drawings. Perform necessary adjustments to make the equipment operate in an optimum manner and must fully document changes made.

#### 3.3 INSTALLATION OF EQUIPMENT

Install equipment as specified, as shown and as required in the manufacturer's instructions for a complete and fully operational control system.

### 3.3.1 Control Panels

Control panels must be located as indicated on the drawings. Devices located in the control panels must be as shown on the drawings or as needed to provide the indicated control sequences.

### 3.3.2 Flow Measuring Device

Fluid flow instruments must be installed in accordance with manufacturer's recommendations, unless otherwise indicated in the specification. The minimum straight unobstructed piping for the flowmeter installation must be 10.0 pipe diameters upstream and 5.0 pipe diameters downstream. Meters for gases and vapors must be installed in vertical piping, and meters for liquids must be installed in horizontal piping, unless otherwise recommended by the manufacturer or indicated in the specifications.

#### 3.3.2.1 Flow Switch

Flow switches must be installed in such a manner as to minimize disturbance of the flow of fluid while maintaining reliable operation of the switch.

#### 3.3.2.2 Magnetic Flowmeter

Meter must be installed in vertical piping so that the flow tube remains full of the process fluid under all operating conditions. A minimum of ten pipe diameters straight run upstream of the flowmeter and five pipe diameters straight run downstream of the flowmeter must be provided. The flowmeter and piping system must be grounded to earth ground.

### 3.3.3 Level Instruments

#### 3.3.3.1 Float Switches

Switches must be mounted in accordance with manufacturer's published instructions. Procedures must be those used for equipment in hazardous locations.

#### 3.3.3.2 Ultrasonic Level Sensor

Sensor must be installed vertically in the top of the tank and in accordance with the manufacturer's instructions. Switches must be accessible for maintenance and calibration. In applications where switches cannot be directly mounted to a tank by the threaded or flanged connection, a mounting bracket must be provided for connection to the inside tank wall. Sensor must be positioned to maximize the return echo signal and minimize vessel obstructions in the sensors line of sight. The minimum recommended distance from the tank fill opening and from the side of the tank must be maintained.

### 3.3.4 Pressure Instruments

Pressure sensors and pressure transducers must be verified by calibration. All pressure taps must incorporate appropriate snubbers. Pressure sensors and pressure switches must have valves for isolation, venting, and taps for calibration. Pressure switches and pressure transducers installed on liquid or steam lines must have drains. Pressure transducers, differential pressure sensors and differential pressure switches must have nulling valves. Pressure switches must be adjusted to

the proper setpoint and must be verified by calibration. Switch contact ratings and duty must be selected for the application.

### 3.3.5 Temperature Instrument Installation

#### 3.3.5.1 RTD

When the RTD is installed in pipe or is susceptible to corrosion or vibration, the RTD must be installed in a thermowell. Thermowells must be filled with conductive heat transfer fluid prior to installation of the RTD in the thermowell. RTDs used for space temperature sensing must include a housing suitable for wall mounting. RTDs used for outside air sensing must have an instrument shelter or sun shield as shown to minimize solar effects, and must be mounted to minimize building effects. RTD assemblies must be readily accessible and installed to allow easy replacement.

#### 3.3.5.2 Temperature Switches

Temperature switches must be installed as specified for RTDs. Temperature switches must be adjusted to the proper setpoint and must be verified by calibration. Switch contact ratings and duty must be selected for the application.

### 3.3.6 Process Analytical Instrumentation

#### 3.3.6.1 Ammonia Monitor

The controller must be located as shown on the drawings. The ammonia sensor must be mounted as recommended by the manufacturer. The location of the sensor must be representative of the area to be monitored and must allow access to the sensor for periodic calibration. The sensor must be located in a dry area or must be protected from moisture without restricting the flow of ammonia gas to the sensor.

#### 3.3.6.2 Chlorine in Water

The controller must be located in the control panel or other location as shown on the drawings. The chlorine sensor must be immersed in the fluid being monitored using an assembly that will allow removal of the sensor from the water. The sensors must be located in an area of continuous flow.

#### 3.3.6.3 Dissolved Oxygen

The dissolved oxygen sensor must be immersed in the fluid to be monitored using manufacturer's mounting assembly. The sensor must be located in an area of continuous fluid flow. The transmitter must be located remote from the sensor. The transmitter and wiring connections must be in a weathertight enclosure. The transmitter must be mounted to allow the digital readout to be easily viewed.

#### 3.3.6.4 PH and ORP Sensor

Pipe mounted flow sensor must be located in a threaded tee or fitting to allow removal from the pipe. Submersible sensor must be completely immersed in the fluid being monitored using an ensemble that will allow for removal of the sensor from the fluid for replacement. The sensor must be located in an area of continuous flow. The transmitter must be located remote from the sensor. The transmitter must be mounted to allow

the digital readout to be easily viewed.

#### 3.3.6.5 Total Dissolved Solids

The sensor must be pipe type as indicated on the drawings. Pipe mounted sensor must be mounted in a threaded tee or fitting to allow removal of the sensor. The transmitter must be located remote from the sensor. The transmitter and wiring connections must be located in a weathertight enclosure.

#### 3.3.7 Instrument Shelters

Instrument shelters must be installed in the location shown with the bottom 4.0 feet above the supporting surface using legs and secured rigidly to minimize vibrations from winds. Instrument shelters must be oriented with door facing North. Instruments located in shelters must be mounted in the 3-dimensional center of the open space of the shelter.

#### 3.3.8 Output Devices

Output devices (transducers, relays, contactors, or other devices) which are not an integral part of the control panel, must be mounted in an enclosure mounted adjacent to the control panel, unless otherwise shown. Where H-O-A and/or override switches on the drawings or required by the control sequence, the switches must be installed so that the process control system controls the function through the automatic position and other controls work through the hand position.

#### 3.3.9 Enclosures

All enclosure penetrations must be from the bottom of the enclosure, and must be sealed to preclude entry of water using a silicone rubber sealant.

#### 3.3.10 Transformers

Transformers for control voltages below 120 VAC must be fed from the nearest power panel or motor control center, using circuits provided for the purpose. Provide a disconnect switch on the primary side and a fuse on the secondary side. Transformers must be enclosed in a steel cabinet with conduit connections.

### 3.4 WIRE, CABLE AND CONNECTING HARDWARE

#### 3.4.1 LAN Cables and Connecting Hardware

LAN cables and connecting hardware must be installed in accordance with Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSTEM Modify the existing B72 fiber loop to connect the control system specified herein to the plant network. Provide new ethernet and fiber optic cable per Section 27 10 00.

#### 3.4.2 Metering and Sensor Wiring

Metering and sensor wiring must be installed in accordance with the requirements of ANSI C12.1, NFPA 70,

##### 3.4.2.1 Power Line Surge Protection

Control panels must be protected from power line surges. Protection must

meet the requirements of IEEE C62.41.1 and IEEE C62.41.2. Fuses must not be used for surge protection.

#### 3.4.2.2 Sensor and Control Wiring Surge Protection

Digital and analog inputs must be protected against surges induced on control and sensor wiring. Protect binary and analog outputs against surges induced on control and sensor wiring installed outdoors and as shown. Fuses must not be used for surge protection. Test the inputs and outputs in both the normal and common mode using the following two waveforms: The first waveform must be 10 microseconds by 1000 microseconds with a peak voltage of 1500 volts and a peak current of 60 amperes. The second waveform must be 8 microseconds by 20 microseconds with a peak voltage of 1000 volts and a peak current of 500 amperes. Submit certified test results for surge protection.

### 3.5 SOFTWARE INSTALLATION

Load software required for an operational process control system, including databases (for points specified and shown), operational parameters, and system, command, and application programs. Adjust, tune, debug, and commission all software and parameters for controlled systems to assure proper operation in accordance with the sequences of operation and database tables.

### 3.6 CONTROL DRAWINGS

#### 3.6.1 Control

Control drawings, reproducible, with corresponding CADD files, must be provided for equipment furnished and for interfaces to equipment at each respective equipment location. Condensed operating instructions explaining preventive maintenance procedures, methods of checking the system for normal safe operation and procedures for safely starting and stopping the system manually must be prepared in typed form, reproducible, with corresponding word processor files and posted beside the diagrams. Diagrams and instructions must be submitted prior to posting. The framed instructions must be posted before acceptance testing of the system.

#### 3.6.2 Contractor Design Drawings

Contractor Design Drawings as a single complete package: 2 hard copies and 2 copies in electronic form. As a minimum they must include wiring, logic, and layout. Submit hardcopy drawings on A3 420 by 297 mm 17 by 11 inches sheets, and electronic drawings in PDF and in AutoCAD format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule. Contractor Design Drawings must be approved prior to any fabrication.

##### 3.6.2.1 Draft As-Built

Draft As-Built Drawings as a single complete package: 2 hard copies and 2 copies in electronic form. Submit hardcopy drawings on A3 420 by 297 mm 17 by 11 inches sheets, and electronic drawings in PDF and in AutoCAD format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule.

#### 3.6.2.2 Final As-Built

Final As-Built Drawings as a single complete package: 2 hard copies and 2 copies in electronic form. Submit hardcopy drawings on A3 420 by 297 mm 17 by 11 inches sheets, and electronic drawings in PDF and in AutoCAD format. In addition, submit electronic drawings in editable Excel format for all drawings that are tabular, including but not limited to the Point Schedule and Equipment Schedule.

#### 3.6.3 Points Schedule

Provide a Points Schedule in tabular form for each system, with the indicated columns and with each row representing a hardware point, network point or configuration point in the system.

- a. When a Points Schedule was included in the Contract Drawing package, use the same fields as the Contract Drawing with updated information in addition to the indicated fields.
- b. When Point Schedules are included in the contract package, items requiring contractor verification or input have been shown in angle brackets (" $<$ " and " $>$ "), such as  $< \_\_\_ >$  for a required entry or  $< \text{value} >$  for a value requiring confirmation. Complete all items in brackets as well as any blank cells. Do not modify values which are not in brackets without approval. Points Schedule Columns must include:

##### 3.6.3.1 Point Name

The abbreviated name for the point using the indicated naming convention.

##### 3.6.3.2 Description

A brief functional description of the point such as "Supply Air Temperature".

##### 3.6.3.3 DDC Hardware Identifier

The Unique DDC Hardware Identifier shown on the DDC Hardware Schedule and used across all drawings for the DDC Hardware containing the point.

##### 3.6.3.4 Settings

The value and units of any setpoints, configured setpoints, configuration parameters, and settings related to each point.

##### 3.6.3.5 Range

The range of values, including units, associated with the point, including but not limited to setpoint adjustment range, a sensor measurement range, or the status of a safety.

##### 3.6.3.6 Input or Output (I/O) Type

The type of input or output signal associated with the point. Use the following abbreviations for entries in this column:

- a. AI: The value comes from a hardware (physical) Analog Input
- b. AO: The value is output as a hardware (physical) Analog Output

- c. BI: The value comes from a hardware (physical) Binary Input
- d. BO: The value is output as a hardware (physical) Binary Output
- e. PULSE: The value comes from a hardware (physical) Pulse Accumulator Input
- f. NET-IN: The value is provided from the network (generally from another device). Use this entry only when the value is received from another device as part of scheduling or as part of a sequence of operation, not when the value is received on the network for supervisory functions such as trending, alarming, override or display at a user interface.
- g. NET-OUT: The value is provided to another controller over the network. Use this entry only when the value is transmitted to another device as part of scheduling or as part of a sequence of operation, not when the value is transmitted on the network for supervisory functions such as trending, alarming, override or display at a user interface.

#### 3.6.3.7 Network Data Exchange Information

(Gets Data From, Sends Data To) Provide the DDC Hardware Identifier of other DDC Hardware the point is shared with.

#### 3.6.3.8 Override Information

For each point requiring an Override, indicate if the Object for the point is Commandable.

#### 3.6.3.9 Trend Object Information

For each point requiring a trend, indicate if the trend is Local or Remote. For remote trends provide the DDC Hardware Identifier for the device performing the trend.

#### 3.6.3.10 Alarm Information

Indicate the Alarm Generation Type.

### 3.7 FIELD TESTING AND ADJUSTING EQUIPMENT

Provide personnel, equipment, instrumentation, and supplies necessary to perform site testing. The Government will witness the PVT, and written permission must be obtained from the Government before proceeding with the testing. Original copies of data produced, including results of each test procedure, during PVT must be turned over to the Government at the conclusion of each phase of testing prior to Government approval of the test. The test procedures must cover actual equipment and functions specified for the project.

#### 3.7.1 Testing, Adjusting and Commissioning

After successful completion of the factory test as specified, the Contractor will be authorized to proceed with the installation of the system equipment, hardware, and software. Once the installation has been completed, tested, adjusted, and commissioned each control loop and system

in accordance with NIST SP 250 and must verify proper operation of each item in the sequences of operation, including hardware and software. Calibrate field equipment, including control devices, adjust control parameters and logic (virtual) points including control loop setpoints, gain constants, constraints, and verify data communications before the system is placed online. Test installed ground rods as specified in IEEE 142 and submit certification stating that the test was performed in accordance with IEEE 142. Calibrate each instrumentation device connected to the process control system control network by making a comparison between the reading at the device and the display at the workstation, using a standard at least twice as accurate as the device to be calibrated. Check each control point within the process control system control network by making a comparison between the control command at the central station and field-controlled device. Deliver trend logs/graphs of all points showing to the Government that stable control has been achieved. Points on common systems must be trended simultaneously. One log must be provided showing concurrent samples taken once a minute for a total of 4 hours. One log must be provided showing concurrent samples taken once every 30 minutes, for a total of 24 hours. Verify operation of systems in the specified failure modes upon Process control system network failure or loss of power, and verify that systems return to process control system control automatically upon a resumption of process control system network operation or return of power. Deliver a report describing results of functional tests, diagnostics, calibrations and commissioning procedures including written certification to the Government that the installed complete system has been calibrated, tested, adjusted and commissioned and is ready to begin the PVT. The report must also include a copy of the approved PVT procedure.

### 3.7.2 Performance Verification Test (PVT)

Submit test procedures for the PVT. The test procedure must describe all tests to be performed and other pertinent information such as specialized test equipment required and the length of the PVT. The test procedures must explain, in detail, step-by-step actions and the expected results, to demonstrate compliance with all the requirements of the drawings and this specification. The test procedure must be site specific and based on the inputs and outputs, required calculated points and the sequence of control. Refer to the actions and expected results to demonstrate that the process control system performs in accordance with the sequence of control. Include a list of the equipment to be used during the testing plus manufacturer's name, model number, equipment function, the date of the latest calibration and the results of the latest calibration.

Demonstrate that the completed Process control system complies with the contract requirements. All physical and functional requirements of the project including communication requirements must be demonstrated and shown. Demonstrate that each system operates as required in the sequence of operation. The PVT as specified must not be started until after receipt of written permission by the Government, based on the written report including certification of successful completion of testing, adjusting and commissioning as specified, and upon successful completion of training as specified. Upon successful completion of the PVT, furnish test reports and other documentation.

### 3.7.3 Endurance Test

Use the endurance test to demonstrate the overall system reliability of the completed system. The endurance test must be conducted in phases.

The endurance test must not be started until the Government notifies the Contractor in writing that the PVT is satisfactorily completed, training as specified has been completed, outstanding deficiencies have been satisfactorily corrected, and that the Contractor has permission to start the endurance test. Provide an operator to man the system during Phase I endurance testing, in addition to any Government personnel that may be made available. The Government may terminate testing at any time when the system fails to perform as specified. Upon termination of testing by the Government or by the Contractor, commence an assessment period as described for Phase II. Upon successful completion of the endurance test, deliver test reports and other documentation, as specified, to the Government prior to acceptance of the system.

#### 3.7.3.1 Phase I (Testing)

The test must be conducted 24 hours per day, 7 days per week, for 30 consecutive calendar days, including holidays, and the system must operate as specified. Make no repairs during this phase of testing unless authorized by the Government in writing.

#### 3.7.3.2 Phase II (Assessment)

After the conclusion of Phase I, identify failures, determine causes of failures, repair failures, and deliver a written report to the Government. The report must explain in detail the nature of each failure, corrective action taken, results of tests performed, and must recommend the point at which testing should be resumed. After delivering the written report, convene a test review meeting at the job site to present the results and recommendations to the Government. The meeting must not be scheduled earlier than 5 business days after receipt of the report by the Government. As a part of this test review meeting, demonstrate that failures have been corrected by performing appropriate portions of the performance verification test. The Government reserves the right to cancel the test review meeting if no failures or deficiencies occur during the Phase I testing. If the Government chooses to do so, the Contractor will be notified in writing. Based on the Contractor's report and the test review meeting, the Government will determine if retesting is necessary and the restart point. The Government reserves the right to require that the Phase I test be totally or partially rerun. Do not commence any required retesting until after receipt of written notification by the Government. After the conclusion of any retesting which the Government may require, the Phase II assessment must be repeated as if Phase I had just been completed.

#### 3.7.3.3 Exclusions

The Contractor will not be held responsible for failures resulting from the following: Outage of the main power supply in excess of the capability of any backup power source, provided that the automatic initiation of all backup sources was accomplished and that automatic shutdown and restart of the process control system performed as specified. Failure of a Government furnished communications link, provided that the PLC automatically and correctly operates in the stand-alone mode as specified, and that the failure was not due to Contractor furnished equipment, installation, or software. Failure of existing Government owned equipment, provided that the failure was not due to Contractor furnished equipment, installation, or software.

### 3.8 FIELD TRAINING

Field training oriented to the specific system must be provided for designated personnel. Furnish a copy of the training manual for each trainee plus two additional copies. Manuals must include an agenda, the defined objectives for each lesson, and a detailed description of the subject matter for each lesson. Furnish audiovisual equipment and other training supplies and materials. Copies of the audiovisuals must be delivered with the printed training manuals. The Government reserves the right to videotape training sessions for later use. A training day is defined as 8 hours of classroom instruction, excluding lunchtime, Monday through Friday, during the daytime shift in effect at the training facility. Submit the training manual and schedule to receive approval from the Government at least 30 days before the training.

#### 3.8.1 Preliminary Operator Training

Prior to the start of field testing, preliminary operator training must be taught at the project site for 2 consecutive training days. Upon completion of this course, each student, using appropriate documentation, should be able to perform elementary operations with guidance and describe the general hardware architecture and functionality of the system. This course must include: general system architecture; functional operation of the system, including workstations; operator commands; application programs, control sequences, and control loops; database entry and modification; reports generation; alarm reporting; diagnostics; and historical files.

#### 3.8.2 Additional Operator Training

Following the field testing, additional classroom training for operators must be taught for 2 consecutive training days; individual instruction sessions of 4 -hour periods in the morning (or afternoon) of the same weekday for 2 consecutive weeks and an additional 1 day classroom session for answering operator questions. Individual instruction must consist of "hands-on" training under the constant monitoring of the instructor. Classroom training must include instruction on the specific hardware configuration of the installed process control system and specific instructions for operating the installed system. Schedule activities during this period so that the specified amount of time on the equipment will be available for each student. The final session will address specific topics that the students need to discuss and to answer questions concerning the operation of the system. Upon completion of the course, the students should be fully proficient in system operation and have no unanswered questions regarding operation of the installed process control system. Each student should be able to start the system, operate the system, recover the system after a failure and describe the specific hardware architecture and operation of the system and be fully proficient in all system operations. Report the skill level of each student at the end of this course.

#### 3.8.3 Maintenance Training

Following the endurance test a minimum period of one training days must be provided by a factory representative or a qualified Contractor trainer for five designated personnel on maintenance of the equipment. The training must include: physical layout of each piece of hardware, calibration procedures, preventive maintenance procedures, schedules, troubleshooting, diagnostic procedures and repair instructions.

#### 3.8.4 Specialized Training

Following the maintenance training, a minimum period of five , total training day(s) must be provided by a factory representative or a qualified Contractor trainer for ten people on the input devices.

##### 3.8.4.1 Flow Meter Training

Each type of flow meter, to include calibration, maintenance and testing of flow elements and transducers.

##### 3.8.4.2 Specialized Sensor Training

Provide training on each type of specialized sensor such as chlorine, turbidity, pH, to include calibration, maintenance and testing of sensing elements and transducers for five people.

#### 3.9 OPERATION AND MAINTENANCE DATA REQUIREMENTS

Outline the step-by-step procedures required for system startup, operation and shutdown. Include in the instructions layout, wiring and control diagrams of the system as installed, the manufacturer's name, model number, service manual, parts list and a brief description of all equipment and their basic operating features. List routine maintenance procedures, possible breakdowns and repairs and troubleshooting guides.

1.2 DEFINITIONS

- a. Bridge Crane: That part of an overhead crane system consisting of girder(s), end trucks, end ties, walkway, and drive mechanism which carries the trolley(s) and travels along the runway rails parallel to the runway.
- b. Crane Runway: The track system along which the crane operates horizontally, including track hangar rods, track connection devices, and runway structural supports.
- c. Dead Loads: The loads on a structure which remain in a fixed position relative to the structure.
- d. Girder: The principal horizontal beam of the crane bridge. It is supported by the crane end trucks.
- e. Lifted Load: The load consisting of the rated load and the weight of lifting devices attached to the crane such as the load block, bucket, or other supplemental devices.
- f. Pendant: A control for a hoist and a crane. The pendant hangs from the hoist or the crane by a cable at a height that is easy for the

operator to reach.

- g. Rated Load: The maximum working load suspended under the load hook.
- h. Standard Commercial Cataloged Product: A product which is currently being sold, or previously has been sold, in substantial quantities to the general public, industry or Government in the course of normal business operations. Models, samples, prototypes or experimental units do not meet this definition. The term "cataloged" as specified in this section is defined as "appearing" on the manufacturer's published product data sheets. These data sheets must have been published or copyrighted prior to the issue date of this solicitation and have a document identification number or bulletin number.
- i. Top Running Crane: An electric overhead traveling crane that runs on rails on top of support girders.
- j. Trolley Load: Weight of the trolley and its associated equipment carried by the trolley wheels.
- k. Operating Environments:
  - (1) General Purpose Service: This applies to most cranes and are, in large measure, the manufacturers' standard designs. Cranes should be classified as General Purpose Service if they are operating in routine environments.

### 1.3 SYSTEM DESCRIPTION

The overhead crane system shall be a top-running, single-girder bridge crane designed and constructed in accordance with CMAA Class C minimum service requirements, and the hoist shall conform to ASME HST-4 Duty Class H4 minimum. The system shall include a 7.5-ton wire rope hoist with a motor-driven trolley, dual bridge drives, and variable frequency drive (VFD) controls to provide smooth acceleration and deceleration of bridge and trolley motions. The hoist shall provide true vertical lift through a double-reeved configuration and include both electro-mechanical and mechanical load brakes for safe load handling. The hoist headroom shall not exceed 24 inches, measured from the hook saddle to the underside of the bridge girder. All motors shall have a 60-minute duty rating, and the bridge control panel shall include a keyed bypass for the hoist brake circuit. The crane shall be suitable for indoor service in an industrial environment typical of Navy maintenance facilities. Requirements for the crane runway system and supporting structures are specified in Section 05 12 00 - STRUCTURAL STEEL and shall conform to AISC 360.

#### 1.3.1 Crane Design Criteria

Cranes will operate in the given spaces and match the runway dimensions and rails indicated. Hook coverage, hook vertical travel, clear hook height, lifting capacity, and load test weight must not be less than that indicated.

##### 1.3.1.1 Classification

Provide top running overhead electric traveling (OET) single girder cranes conforming to CMAA 70 service class C for operation in an indoor environment, general purposeservice.

The crane must be pendant controlled and radio controlled and operate in the spaces and within the loading conditions indicated. The pendant controller must be mounted on a separate festooned cable system from the trolley power supply. The crane must operate on 480-volts AC, 60 Hz, three phase power source. Maximum crane wheel loads (without impact) due to dead, trolley, and lifted loads, with the trolley in any position, must not cause a more severe loading condition in the runway support structure than that produced by the design wheel loads and spacing indicated.

- a. The 7.5-ton top running crane shall consist of a single girder and a structural runway with a festoon system. The crane shall have a maximized lifting height as shown on the Drawings (minimum of 11' 3/4" from the hook to the top of the curb). Top Running girder and structural runway dimensions shall be based on the limits identified on the Contract Documents.
- b. The crane manufacturer shall be responsible for furnishing and installing the gantry beam, hoist, and runway rail system on top of horizontal structural beams provided by the General Contractor, as shown on the structural drawings, to deliver a complete and operable system. The crane manufacturer shall coordinate with the General Contractor and the structural engineer to confirm final runway elevation, anchorage details, and interface tolerances prior to fabrication and installation. The gantry crane shall be sized to span approximately 12' - 9 3/4", as indicated on the structural plans, and shall provide a minimum lifting height of 15 feet. The crane manufacturer shall ensure the crane rails are installed in accordance with applicable Crane Manufacturers Association of America (CMAA) tolerances. The Contractor shall furnish a complete, coordinated, and fully operable crane system in accordance with the crane manufacturer's requirements for rated load and duty cycle. The Contractor shall also submit a design certification letter, stamped by a licensed structural engineer, verifying that the crane girders, rails, and all related components have been designed, detailed, and installed in accordance with CMAA requirements, applicable building codes and standards, and are capable of safely supporting the crane's rated capacity under all operating conditions.
- c. Hoist to include 7.5-ton capacity R&M wire rope hoist, two speed (19/3.2 FPM) motor.
- d. Trolley Drive to provide approximately 65 FPM travel speed via VFD motor.
- e. Bridge drive to provide approximately 100 FPM travel speed via VFD motor; controls to be push-button, festooned on a separate track.
- f. Deflection of the rail shall be limited to a maximum of L/600 (vertical) and L/400 (horizontal) of the span.
- g. All crane supporting members, connections, and attachment details shall be fabricated of structural steel, plate or forgings only. No castings will be permitted. System shall be suspended using components supplied by the crane manufacturer or approved equal.
- h. The rated load of the crane shall be the maximum load for which the crane is designed and built by the manufacturer. In determining the rated load, all handling devices such as buckets, magnets, grabs, etc., shall be included as part of the load to be handled.

#### 1.3.1.2 Rated Capacity and Speeds

Provide crane with rated capacity of 7.5 tons. Lower load block or assembly of hook, swivel bearing sheaves, pins, and frame suspended by the hoisting ropes are not considered part of the rated capacity.

Rated (maximum) speeds plus or minus 10 percent (feet/min) for the main hoist, bridge, and trolley at the rated load are specified in the table below. The minimum speed must not exceed the values listed. Values in the table are for a fully loaded crane. Using overspeed, the hoist function must be capable of approximately double when not loaded.

| Rated Speeds<br>feet/min |         |         |
|--------------------------|---------|---------|
| Description              | Minimum | Maximum |
| Main Hoist               | 10      | 20      |
| Auxiliary Hoist          | NA      | NA      |
| Trolley                  | 15      | 65      |
| Bridge                   | 20      | 100     |

#### 1.4 VERIFICATION OF DIMENSIONS

The Contractor is responsible for the coordination and proper relation of their work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

#### 1.5 SUBMITTALS

Government approval is required for submittals with a "G" classification.

Submittals not having a "G" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00

SUBMITTAL PROCEDURES. Submittals shall include complete data demonstrating conformance with this specification and all referenced standards. Drawings and data shall clearly indicate equipment arrangement, performance ratings, electrical characteristics, and all interfaces with structural and electrical systems. Shop drawings shall show the runway beams, rail alignment, gantry assembly, and all connections to the supporting structure furnished by others. Submittals shall provide sufficient detail to verify compliance with CMAA and NAVFAC requirements.

### 1.6 QUALITY ASSURANCE

#### 1.6.1 Manufacturer Qualification

Overhead Electric Traveling Crane must be designed and manufactured by a company with a minimum of 10 years of specialized experience in designing and manufacturing the type of overhead crane required to meet requirements of the Contract Documents. Crane design must be accomplished by, or directly supervised by, a registered professional engineer (PE). PE

licensing must be by a board or agency authorized to license and register professional engineers. The PE may be a Contractor's regular employee or a consultant. The PE's review and attestation of specification compliance and professional responsibility must be signified by his or her PE original seal and dated signature on the final drawings. The professional engineers must only undertake and perform work under this contract in the branch(s) of engineering in which they are licensed.

#### 1.6.2 Pre-Delivery Inspections

Contractor is responsible for performance of quality control inspections, testing, and documentation. Submit all crane test data recorded on appropriate test record forms suitable for retention for the life of the crane.

##### 1.6.2.1 Inspection of Steel Castings

Visually inspect load-carrying steel castings. All load bearing components, couplings, shafts, and gears, in the hoist drive train must be rolled or forged steel, except brake drums which may be ductile iron. Methods of repairing the discontinuities is subject to review by the Contracting Officer.

##### 1.6.2.2 Inspection of Hook Assembly

Inspect hook by a magnetic-particle type inspection prior to delivery. Furnish documentation of hook inspection to Contracting Officer prior to field operational testing. As part of the acceptance standard, linear indications are not allowed. Welding repairs of hook are not permitted. A hook showing linear indications, damage or deformation is not acceptable and must be replaced immediately.

##### 1.6.2.2.1 Hook Non-Destructive Test (NDT)

Magnetic-particle inspect the hook over the entire area in accordance with ASTM A275/A275M. Acceptance standard is no defects. A defect is defined as a linear indication that is greater than 1/8 inch long. For hooks of non-magnetic material, NDT will be liquid penetrant (PT) method in accordance with ASTM E1417/E1417M. For PT testing of hooks containing stainless steels, titanium, or nickel based alloys, total halogens and Sulphur used in the NDT process must be controlled as specified in T9074-AS-GIB-010/271.

Inspect each hook and shank over the entire surface area by magnetic particle inspection.

- a. Procedure: Conduct magnetic particle inspection in accordance with ASTM A275/A275M with the following restrictions: Do not use DC yokes (including switchable AC/DC yokes used in the DC mode) or permanent magnet yokes. Do not use automatic powder blowers or any other form of forced air other than from a hand-held bulb for the application or removal of dry magnetic particles. Remove arc strikes. Equipment ammeters must have an accuracy of plus or minus 5 percent of full scale (equipment ammeter accuracy other than that stated is acceptable provided the MT procedure states that a magnetic field indicator is used to establish and verify adequate field strength for all aspects of the inspection.)
- b. Acceptance Criteria: Defects found on the hook will result in

rejection of defective items for use on furnished hoist. For this inspection, a defect is defined as a linear indication for which the largest dimension is greater than 1/8 inch.

- c. Test Report: Submit a test report of the magnetic particle inspection of each hook provided the Contracting Officer for approval prior to final acceptance of hoist installation. Certify test reports by the testing organization. The performing organization must provide a written statement of certification to ASTM E543, current within one year of the date the NDT was performed. The NDT procedures including technique sheets specific to the types, shapes, and size of the parts being examined must adequately describe the orientation of the hooks within the magnetizing equipment. The performing organization must have the NDT procedures and its technique sheet used for testing of the hook reviewed and approved by an independent Level III examiner. Submit the (Level III examiner) approved procedures, technique sheet, and certification to the Contracting Officer with the test report.

#### 1.6.3 Certificates

All certifications must be dated and bear the original signature (above the printed name) of the authorized representative of the Contractor or the manufacturer of the items or equipment being certified. Each certification will clearly identify the crane, the drives, components, and location (as applicable) to which it applies:

- a. Submit a Wire Rope Certification with the wire rope manufacturer's certification that the rope meets the published breaking strength or the actual breaking strength of a sample taken from the reel and tested. Certification is to be traceable to the hoist, crane, and reel.
- b. Submit a Crane Runway System Certificate stating that the new crane will operate properly on the runway; if the crane(s) cannot operate without restriction, the Contractor must indicate crane limitations.
- c. Submit a Hazardous Material Certificate that the crane does not contain hazardous material including asbestos, lead, cadmium, chromium, PCBs, or elemental mercury. Products required for the designing and manufacturing of cranes must not contain the prohibited materials.
- d. Submit a Loss of Power Test Certificate stating that a test may be performed in which power is removed from the crane while the hoist, bridge, and trolley are in operation.
- e. Submit a Certificate of the Coupling Alignment Verification Record.
- f. Submit an Overload Test Certificate stating that the crane can be periodically load tested to 125 percent (plus 0 minus 5 percent) of rated load.
- g. Submit a Certificate of the Brake Adjustment Record. Provide a brake adjustment record and installation/maintenance manuals for each brake on the crane. Each brake measurement must have a tolerance traceable to the associated brake manual or documentation provided by the brake manufacturer, location of measurements, and the actual brake setting. Changes made to settings of the brake, at any time, will void the record.

- h. Submit a Certificate of Compliance with Listed Standards
  - i. Provide a Contractor Hazardous Environment Certificate stating that the new crane and all associated components excluding the hoist are designed for operation in the hazardous environment specified in the Classification section.
  - j. The Contractor must provide a Public Domain Software Certificate declaring that public domain software (e.g., freeware, shareware) is not used in the system.
  - k. The Contractor must provide a certificate stating that all Software and Services that are not required for operation and/or maintenance of the product have been removed. The software/services to be removed are identified in paragraph SOFTWARE AND SERVICES.
- 1.6.4 Drawings: Overhead Electric Traveling Crane

- a. Submit drawings showing the general arrangement of all components in plan, elevation, and end views. Show all major features of the crane including: hook approaches on all four sides, clearances and principal dimensions, assemblies of hoist, trolley and bridge drives, motor nameplate data, overcurrent protective device ratings, and electrical schematic drawings. Include weights and centers of gravity of major components. Provide maximum wheel loads (without impact) and spacing imparted to the crane runway system track beams. Indicate the crane speeds along the runway, the trolley speeds along the bridge girder, and the hoist lifting speeds; all speeds indicated are speeds with hoist loaded with rated crane capacity load.
- b. Submit shop drawings of all fabricated components. Shop drawing quality must be equivalent to the contract drawings accompanying this solicitation. Drawings must be reviewed, signed, and sealed by a registered professional engineer.
- c. Provide integral schedule of crane components on each drawing. Drawings should also include fastener torques (installation/mounting fasteners) and specific lubrication (Greases/oils) as applicable. The schedule must provide a cross reference between manufacturer data and shop drawings. Components listed on the schedule of crane components must include total quantity, description, original manufacturer, and part number. Distributing agents will not be acceptable in lieu of the original manufacturer.
- d. Provide control system and network drawings. Network diagram must show equipment locations, names, models, and IP addresses on network communications schematic for all Programmable Logic Controllers (PLCs), Remote Terminal Unit (RTU), Supervisory Controller, and Other Network-Capable Devices. In addition, the drawings must consist of all software block, flow, and ladder diagrams.

1.6.5 Design Data: Load and Sizing Calculations

Submit complete list of equipment and materials, including manufacturer's descriptive data and technical literature, performance charts and curves, catalog cuts, and installation instructions. Submit calculations reviewed, signed, and sealed by a registered professional engineer verifying the load cases, sizing of the bridge girders, end trucks, travel

drives, brake selections, and overcurrent protection for motors, controllers, and branch circuits. Provide a list of all codes and standards, design assumptions, equations, specified efficiencies, limits, factors of safety, component ratings, and sources of values used. Include free body diagrams or sketches of each load case.

#### 1.6.6 Welding Qualifications and Procedures

Welding must be in accordance with qualified procedures using AWS D14.1/D14.1M as modified. Written welding procedures must specify the Contractor's standard dimensional tolerances for deviation from camber and sweep and not exceed those specified in AWS D14.1/D14.1M and CMAA 70. Welders and welding operators must be qualified in accordance with AWS D1.1/D1.1M or AWS D14.1/D14.1M.

#### 1.7 CRANE SAFETY

Comply with the mandatory and advisory safety requirements of ASME B30.10, ASME B30.2, CMAA 70, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306, and all applicable provisions of 29 CFR 1910 and NFPA 70. Where personal fall arrest anchorages are provided, design anchorages in accordance with ASSP Z359.

### PART 2 PRODUCTS

#### 2.1 MATERIALS

##### 2.1.1 General

Provide materials and equipment which are standard products of manufacturers regularly engaged in the fabrication of complete and totally functional cranes including necessary ancillary equipment. Material will be free from defects and imperfections that might affect the serviceability and appearance of the finished product. All material must be new and unused.

##### 2.1.2 Nameplates

Secure nameplates to each major component of equipment with the manufacturer's name, address, type or style, model or catalog number, and serial number. Provide two bridge identification plates, one for each side of the bridge. Provide noncorrosive metal identification plates with letters "BC-1" such that they are easily read from the floor.

##### 2.1.3 Capacity Marking

Mark the rated capacity in tons on each side of the crane on the bridge girders and both sides of the hook block. Capacity marks must be large enough to be clearly visible from the floor. The markings must be positioned to be visible at the operator's position after the crane has been installed.

##### 2.1.4 Safety Warnings

Affix labels in a readable position to each lift block or control station in accordance with ASME B30.2. Submit safety warnings, diagrams and other instructions suitably framed and protected for display as indicated by the Contracting Officer as follows:

Design and locate the word "WARNING" or other legend to bring the label to the attention of the operator. Provide durable type warning labels and display the following information concerning safe-operating procedures: Cautionary language against lifting more than the rated load; operating the hoist when the hook is not centered under the hoist; operating hoist with twisted, kinked or damaged rope; operating damaged or malfunctioning hoist; operating a rope hoist with a rope that is not properly seated in its hoist drum groove; lifting people; lifting loads over people; and removing or obscuring the warning label.

## 2.2 STRUCTURAL REQUIREMENTS

Structural requirements must be in accordance with CMAA 70, Section 3. Structural steel materials must conform to the standards permitted in CMAA 70 and AISC 360.

### 2.2.1 Structural Connections

High-strength bolted structural connections must be designed and installed in accordance with RCSC A348. Bolts must be of ASTM F3125/F3125M Grade A325/A325M or Grade A490/A490M material. Galvanized bolts are not acceptable.

Welded connections must be performed in accordance with AWS D14.1/D14.1M. Allowable stress values must comply with CMAA 70.

### 2.2.2 Bridge Girder or Girders

Provide wide flange beam, standard I-Beam, or section fabricated from rolled plates and shapes bridge girders. If the ends of bridge girders are notched to fit over the end trucks, the notches must be reinforced with vertical diaphragms and horizontal stiffeners.

### 2.2.3 Bridge Rails

Provide bridge rails, crane girders and other sections that are straight and true. Make all rail joints flush and true without misalignment of running tread and design to minimize vibration. The gap between adjacent rail ends and the vertical misalignment of running treads must not exceed 1/32 inch. Solid stock (e.g. square bar, roundstock) is not permitted as bridge rail. Center bridge rail on top flange or position bridge rail over girder web for torsion box girders. Fasten rail to girder with welded clips. Position rail clips in pairs and at not more than 36 inches on center. Bolt bridge rail joints using standard joint bars. Stagger and position rail joints directly over girder diaphragms. Provide a positive stop at bridge rail ends to prevent creep.

### 2.2.4 End Ties and Bridge Girder End Connections

If equalizing end trucks are used, provide rigid end ties between girders to form a frame that is rigid about the vertical and horizontal axes. If compensating end trucks are used, provide end ties which are rigid about the vertical axis but relatively flexible about the horizontal axis to permit partial rocking motion for wheel load compensation. Provide full depth diaphragms at girder connections and jacking points. Provide horizontal gusset plates at the elevation of top and bottom end tie flanges for connection to girder ends. Make end connections with high-strength bolts in accordance with the Structural Connections section of this specification. Use tapered alignment pins to maintain original

shop alignment between bridge girders and end ties/trucks.

#### 2.2.5 End Trucks

Provide fixed axle type end trucks fabricated from structural steel plate to provide a rigid box section structure. Center wheels between the webs of the box section. Configure bridge and trolley trucks with a feature that limits load movement to 1 inch in the event of wheel or shaft failure. Provide jacking pads for removal of wheel assemblies. Wheel axle bearing seats must be designed such that wheel and axle bearing assembly can be removed with not more than 3 inches of jacking. Provide tapered alignment pins between bridge girders and end truck flanges to ensure accurate field alignment of components, in accordance with NAVFAC 11450.2A paragraph 2-1.3.1.4(c).

#### 2.2.6 Trolley Frame

Provide trolley frame as a one-piece structural steel weldment. Provide pads for the use of jacks or wedges when changing truck wheels. Make all trolley yokes and load bars of drop forged, cast or rolled steel.

#### 2.2.7 End Stops and Bumpers

Fit bridge girders with structural steel end stops. Locate stops to permit maximum trolley travel. Fit bridge end trucks and trolley frames with shock-absorbing bumpers capable of decelerating and stopping the bridge and trolley within the limits stated by 29 CFR 1910 and CMAA 70. Bumpers must fully engage end stops. Mount bumpers so that there is no direct shear on mounting bolts (if any) upon impact. Bumpers must provide adequate clearance between the crane and surrounding structure when compressed to preclude damaging equipment. Ensure bridge and trolley bumper retention in accordance with ASME B30.2. When more than one crane is located and operated on the same runway, bumpers must be provided on their adjacent ends or on one end of one crane. Fit the other end of the end-truck with a structural steel stop to engage the bumpers of the adjacent crane. Ensure bridge bumpers are properly aligned with runway end stops.

### 2.3 MECHANICAL REQUIREMENTS

- a. Provide steel shafts, gears, keys, and couplings. Cast iron and aluminum used to support components of the hoist power transmission train must be ductile.
- b. All bearings, except those subject only to small rocker motion, must be anti-friction type. All connections subject only to small rocking motion are to be fitted with bushings or thrust washers in the pivot pin bore, as applicable. Bronze bushings must have provisions for grease lubrication.
- c. All mechanical components must be accurately aligned and positively secured to maintain the alignment. Parts must not be forced into position to obtain apparent alignment.

#### 2.3.1 Hoists

Provide hoist conforming to ASME B30.2 and CMAA 70 service class C or better, double reeved, except as modified and supplemented in this section. Hoist shall conform to ASME HST-4 Duty Class H4 minimum.

## 2.3.2 Drives

### 2.3.2.1 Bridge Drives

Provide A-4 bridge drive arrangement as specified in CMAA 70 consisting of a single electric motor mechanically connected through gear reduction and drive shafts to the drive wheels or separate drive motors at each end of bridge.

Acceleration and deceleration must meet the requirements specified in this section. Gears must conform to applicable AGMA standards. Provide oil tight fully enclosed gear reducers with pressure or splash type lubrication. Bridge travel limit switches are optional.

### 2.3.2.2 Trolley Drives

Provide complete trolley drive arrangement with a minimum of two wheels driven by an integral electric motor. Drive mechanism must run in totally enclosed oil bath. Limit switches are optional for drive mechanism. Acceleration and deceleration controls must meet requirements specified in this section.

### 2.3.3 Load Blocks and Hooks

The load block must be forged carbon steel-unpainted/unplated hook-minimum throat dimensions of 2.5 inches and shall be designed to prevent steel-to-steel contact of moving parts. . The block must be fully enclosed, concealing the sheaves and wire ropes, except for wire rope slots and drain holes. The block must be clearly marked with the capacity in pounds on both sides. Standard commercial blocks may be used at their published ratings when their published design factors are 5.0 or greater.

Provide an unpainted single barbed forged steel hook complying with ASTM A668/A668M. Fit hook with a safety latch designed to preclude inadvertent displacement of slings from the hook saddle. The hook and hook nut must be removable without unreeving of the hoist. Provide hook nut with a removable type set screw or other similar fastener, installed in a plane parallel to the longitudinal axis of the hook shank. Do not weld hook nut. Uniquely mark the hook in a permanent fashion that is traceable to the NDT certification. The hook nut must be of non-sparking materials.

Hook must be free to rotate through 360 degrees when supporting the test load up to 125 percent of the rated capacity. Provide only hooks which are designed and commercially rated in accordance with CMAA and conforming to ASME B30.10 and CMAA 70.

### 2.3.4 Wire Ropes

- a. Wire ropes must conform to ASTM A1023/A1023M and be tested as required by ASTM A931. The wire rope must be in a double reeved configuration and equalized with a sheave. Provide wire rope with a minimum design factor of 5 to 1 based on the load experienced at rated capacity and minimum breaking strength of the wire rope.
- b. Provide hoisting ropes with improved plow steel, extra improved plow steel, or extra-extra improved plow steel, regular lay, bright, and uncoated with an independent wire rope, wire strand, or otherwise,

steel core. Hot-dipped galvanized wire rope is not permitted.

- c. Maximum hoisting rope fleet angles must be 4 degrees for drums and 4.75 degrees for sheaves.

For hoists with external wire rope terminations, rope end connections (other than drum connections) must be speltered sockets with forged steel terminals or swaged fittings installed to provide 100 percent of the wire rope's breaking strength.

For hoists utilizing a true vertical lift configuration with equalizer sheaves, rope dead ends are located at the drum only, and this requirement is not applicable.

Provide proof of wire rope Breaking Strength Test Report. Wedge sockets or aluminum swages are not permitted on wire rope end connections.

#### 2.3.5 Sheaves

Provide steel sheaves. Minimum pitch diameters must be not less than 18 times the rope diameter for running sheaves, and not less than 12 times the rope diameter for equalizer sheaves. Sheave surfaces that contact wire rope must not be painted. Sheaves must be heat-treated to a minimum hardness of 320 Brinell Hardness Number (BHN) in the wire rope contact area, have a groove depth not less than 1.5 times the hoisting rope diameter, and a throat angle of 30 to 40 degrees.

#### 2.3.6 Hoist Drum

Provide drum made of steel. Design the drum such that all hoisting rope is wound in a single layer and so that not less than two dead wraps of hoisting rope remain on each anchorage when the hook is in its extreme low position. Drum grooving must be machined right and left hand beginning at the ends and grooving toward the center of the drum. Minimum drum groove depth must be 0.375 times the rope diameter. Minimum drum groove pitch must be either 1.14 times the rope diameter or the rope diameter plus 1/8 inch, whichever is smaller. Do not paint, coat, or galvanize the surface of the drum which comes in contact with wire rope.

For wire rope drums installed directly onto the output shaft of the hoist speed reducer without an intermediate flexible coupling, the drum to shaft connection must be a barrel coupling.

#### 2.3.7 Gearing

Provide gearing of the enclosed gear reducers type. Provide steel spur, helical, or herringbone type gears and pinions only. Gearing must conform to ANSI/AGMA 2001 and AGMA 908. Internal and external gear dimensional tolerances must conform to the applicable AGMA standard for tooth geometry and tolerances. Gearing within hoist, trolley, and bridge reducers shall meet these requirements. Open-type gearing is not acceptable, except for final drives.

##### 2.3.7.1 Gear Reducers

Gear reducers must be integral components of the hoist, trolley, and bridge drive assemblies furnished with the crane package and shall be the standard products of manufacturers regularly engaged in the design and manufacture of gear reducers for CMAA Class C cranes. Gear reducers must

be designed, manufactured, and rated in accordance with ANSI/AGMA 6113 (ANSI/AGMA 6013 for hoist and bridge drives), fully enclosed and oil-tight except for final reduction, and operate in an oil bath with smooth, quiet performance. Reducers shall have a minimum service factor of 1.25 for bridge and trolley drives and 1.5 for hoist drives, with bearings providing a minimum L10 life of 10,000 hours at rated load and duty. Enclosed gearing shall be selected for Industrial Duty and designed in accordance with CMAA 70 and NAVFAC 11450.2A requirements.

#### 2.3.7.2 Open Gearing

Provide all gears and pinions with adequate strength and durability for the crane service class and manufactured to ANSI/AGMA 2015-1 Accuracy Grade A8 or better. Open gears must be enclosed with safety guards provided with openings with covers for inspection and access for grease lubrication.

#### 2.3.8 Wheels

Provide double flanged, straight tread trolley and bridge travel wheels of rolled-to-shape or roll-forged steel. The rim, flanges, and wheel tread must be hardened to not less than 320 Brinell Hardness Number (BHN). Wheel sizing and flange-to-rail head clearances must be in accordance with CMAA 70 recommendations.

#### 2.3.9 Bridge and Trolley Travel Brakes

Provide bridge and trolley drives with electro-mechanical brakes or non-freecoasting mechanical drive capable of stopping the motion of the bridge or trolley within a distance in feet equal to 10 percent of the full load speed in feet per minute when traveling at full speed with a full load. Mechanical bridge or trolley brakes are not required when the VFD drive provides dynamic braking and controlled deceleration under all operating conditions. Brakes must have an externally accessible means to manually release the brake.

#### 2.3.10 Hoist Brakes

- a. Equip hoist with a minimum of two electro-mechanical holding brakes, each with a minimum torque rating of 125 percent of the rated load hoisting torque. Designate one brake as the primary brake (mounted closest to the motor) and one as the secondary brake.
- b. The primary brake shall be non-time-delayed and shall set immediately upon removal of power to the hoist motor.  
The secondary brake shall have an adjustable setting time delay of 1 to 3 seconds after the primary brake sets.  
Do not use an uninterruptible power supply (UPS) or other stored-energy device to create the time delay.
- c. Each brake shall be adjustable to 50 percent of its rated capacity, have externally accessible manual release means, and be designed for inspection and adjustment without disassembly.  
Brakes shall have manual or automatic return-to-ON feature upon release. Torque adjustments shall not be required where brakes are used solely as holding brakes.
- d. Brakes shall be electrically and mechanically interlocked so that loss of power to one brake does not prevent operation of the other.

Brake components shall comply with NAVFAC 11450.2A paragraphs 2-4.2.1 and 2-4.2.2.

- e. Provide hoist load-limit switch factory-set to actuate at 100 percent of rated load per ASME B30.2 § 3-1.3.

#### 2.3.11 Couplings

Provide flexible, grid, or gear-type couplings between motor and gearbox shafts, and between gearbox and drum shafts, where applicable. Couplings shall be designed for continuous duty and capable of transmitting 150 percent of rated motor torque. Chain and continuous sleeve type couplings are not permitted. Spline couplings are acceptable when provided as part of C-face or D-face motor assemblies. Conventional couplings must not be loaded in the radial direction. Brake wheel or brake disc couplings (if used) must be compatible with the required coupling type. Flexible couplings must not be relied upon to compensate for poor alignment. Ends of coupled shafts must be aligned within the manufacturer's recommended tolerances. Provide coupling guards in accordance with OSHA 29 CFR 1910.219.

#### 2.3.12 Drip Pans

- a. The crane must be designed to preclude leakage of lubricants onto the lifted loads or the floor. Equipment or components, which cannot be made leak-proof, must be fitted with unpainted corrosion resistant steel drip pans or must have the foundations seal welded to create a dam. Drip pans that utilize liquid sealant to prevent leakage of lubricants are not permitted.
- b. The drip pans must be sized to hold the entire gear case fluid capacity, installed under all drive machinery, designed to permit easy removal of collected lubricant. A trolley floor designed to contain any lubricant drips may be used as fluid containment for any equipment that is mounted on it.

#### 2.3.13 Shims

Provide shims in accordance with NAVCRANECENINST 11450.2A § 2-2.15.3. Shims shall be corrosion-resistant for all indoor and outdoor applications. Shim stacks shall not exceed four shims, and commercially available shim kits shall be used to ensure consistent, pre-cut shims sized for standard fasteners. All new equipment shall be installed with shims under each foot, with a minimum shim thickness of 0.100 inch. Soft foot shall be limited to 0.001 inch and shall not exceed 0.003 inch after installation.

### 2.4 ELECTRICAL REQUIREMENTS

#### 2.4.1 Motors

Motors must meet all applicable requirements of NEMA MG 1 and UL 1004-1. All motors must have a minimum of a 60-minute duty rating and be Totally Enclosed Non-Ventilated (TENV), Totally Enclosed Fan Cooled (TEFC), or Totally Enclosed Blower Cooled (TEBC). Provide inverter-duty motors for open-loop variable frequency drives (VFDs). Provide vector-duty motors for closed-loop VFDs. Provide single-speed AC squirrel-cage induction type motors for the bridge and trolley drives. Provide vector-duty AC squirrel-cage induction type motor with encoder for the

hoist. Provide motors with a minimum of Class F insulation and Class B temperature rise at rated load. Provide motor overload protection utilizing thermal sensors embedded in the windings and include space/anti-condensation heaters where applicable. Coordinate motor ratings with the drive manufacturer to ensure compatibility with the specified VFD system.

#### 2.4.2 Controls

- a. Provide static reversing, variable frequency drives (VFD) for the bridge and trolley electric controls. Provide static reversing, VFD, speed regulated, closed loop, flux vector electric controls for the hoist. For feedback, provide hoist motors with encoders. The hoist controller must enable the drive motor to develop full torque continuously at zero speed. The hoist secondary brake must be controlled separate from the primary and connected to different output (within the drive) from the primary brake. VFD controllers must meet NEMA ICS 8, Part 8 and at a minimum, provide under-voltage protection, electronic instantaneous over current protection, DC bus over voltage protection, and be able to withstand output line to line shorts without component failure. Select bridge and trolley drives such that the continuous rating of the controller is not less than the calculated motor full load current based on CMAA 70 5.2.9.1.1.1 and NEC Table 430.250. Select hoist drives such that the continuous rating of the controller is not less than 130 percent of the calculated motor full load current based on CMAA 70 5.2.9.1.1.1 and NEC Table 430.250. All hoist drives must have a motor over-torque limit to lock out the hoist and prevent gross overload of the associated hoist. Provide dynamic braking for each electric drive that is sized per VFD manufacturer's requirements. Submit VFD Control Parameter Settings. Crane controls to be designed such that operator will be safely away from lifting load. Emergency safety stops to be provided locally at the crane motor and via remote control.
- b. Push button controls and cable assembly shall be suspended from an independent festoon track. The pushbutton station shall have a NEMA4 rating with the following features: bright yellow polypropylene enclosure for easy visibility, 8-button enclosure, momentary on / off, six each 2-speed buttons, double break silver-plated switch contacts, multi-grip cord grip accepts eight through 24 conductor round cable, strain relief cable and fittings, easy to read legend plates, replaceable neoprene boots, neoprene brushing, and warning tag.
- c. Push button festooning shall carry control wiring from the independently suspended push button station to the control panel. Push button festooning shall be a rugged steel C track system with trolleys. NEMA12 junction box, flat cable, and all other components required to control the 2-step bridge control panel, the 2-speed hoist, and the 2-stop trolley.
- d. The hoist, trolley, and bridge brakes must set after the associated controller decelerates the drive motor to a controlled stop. The hoist, trolley, and bridge controllers must be sized to provide sufficient starting torque to initiate motion of that crane drive mechanism from standstill with 0 to 125 percent of rated load on the hook. The hoist controller must prove torque before release of the brakes and enable the drive motor to develop full torque continuously at zero speed. Motors must operate smoothly at all speeds without torque pulsations, and must only be energized within the frequency

range of 50-60 Hz at rated speed. Radio controls shall have safety features that include receiver self-diagnosing, transmitter self-diagnosing, transmitter low voltage detection and warning, transmitter and receiver MAIN deactivation when the transmitter is not in use, during transmitter low voltage, and when the system is in sleep mode. The encoder / decoder system shall utilize advanced microprocessor control. If the receiver MAIN relay is defective (fails to open or close during operation), the safety relay shall signal the system to shut-down immediately to avoid the possibility of any accidents occurring. Synthesized PLL receiving module shall accept signals from 30 available channels. Transmitter and receiver enclosures shall be fully waterproofed and also be impervious to dust, water, oil, grease, acid, alkaline, heat and sunlight.

- e. Provide two-speed magnetic controls for the bridge drive, trolley drive, and hoist drive. Controllers must meet the requirements of NEMA ICS 8. Ensure that an energized drive motor initially rotates only in the direction selected by the operator by activating the corresponding direction; i.e., is not overhauled. For AC squirrel cage motor controllers, the requirements of NEMA ICS 2, Part 2, for general-purpose controllers, must be met. Remote controller unit shall operate via rechargeable battery. Equipment supplier to provide the following:
  - (1) Battery backups to cover power requirements for three full shifts of operation.
  - (2) Battery charger unit and / or cords.
- f. Provide the bridge and trolley motor control systems with a drift point between OFF and the first speed control point in each direction. Crane mounted controls shall be enclosed in NEMA 4 enclosures, pre-wired and tested prior to shipment, unless otherwise noted.
- g. The use of definite purpose contactors is prohibited. If IEC contactors are used, the application cannot exceed the contactor manufacturer's AC3 ratings for the contactor at a minimum. Provide electrical transformer, sized to system, to step down voltages for the required controls and accessories.
- h. On hoist function roll-up must be less than 1/8 inch measured at the hook block and roll-back must not occur over the entire load range. Disconnect and power feeds shall be in accordance with Division 26 Electrical and so shown on the Electrical Drawings.
- i. Use of Uninterruptable Power Supplies (UPS) is prohibited. Feed control circuits from a single phase, air cooled, double wound transformer with a grounded metal screen between the primary and secondary windings of the transformer. Crane manufacturer shall provide final power and control wiring diagrams, load data, and conduit requirements to the electrical contractor.
- j. Provide a main line contactor. Energization of the main line contactor must be controlled by the POWER-OFF/POWER-ON switch/pushbutton on all controllers. Upon actuation of the POWER-OFF pushbutton; power to all drive motors, brakes, and controls must be removed. The mainline contactor must not be able to be energize while the POWER-OFF pushbutton is actuated. The POWER-OFF pushbutton circuitry must be independent of all controls or any other electronic

devices.

- k. Provide anti-condensation heaters in all control panels and electrical enclosures to prevent moisture accumulation and corrosion resulting from humidity or temperature fluctuations.

#### 2.4.3 Protection

Protection must not be less than that required by NEMA ICS 8, CMAA 70, NFPA 70, UL 1004-1, UL 1449, UL 489, UL 50, UL 943, 29 CFR 1910.147, 29 CFR 1910.179, 29 CFR 1910.306 and all applicable provisions of 29 CFR 1910. Provide an On/Off button that removes power from the motors, brakes and control circuit on all operator control stations. Provide for lockout/tagout of all hazardous energy sources. The main crane disconnect will be furnished and installed under Division 26 work.

#### 2.4.4 Resistors

Provide resistors with natural convection cooling sized as recommended by the VFD OEM and fabricated of corrosion resistant metal; the use of "wire wound" type resistors is prohibited for segments of 8 ohms or less. Mount resistors in substantial, ventilated enclosures constructed entirely of non-combustible materials. Provide resistors with terminals fitted in the coolest position in the enclosure.

#### 2.4.5 Transients and Harmonics Protection

- a. Provide contactors and relays with appropriate Metal Oxide Varistors (MOV) or resistor-capacitor (R-C) surge absorbers installed across the respective coil.
- b. Provide transient protection for electronic drive controllers that is either internal to the drive or via an MOV connected line-to-ground close to the line terminals of the drive.
- c. Provide line reactors rated for continuous duty operation based upon the motor nameplate amperes. With motors of 50 horsepower or greater, harmonics protection must be provided by an isolations transformer or as recommended by the VFD OEM. For a drive motor branch circuit that exceeds 150 feet in length, a reactor must also be connected in series with the controller load (output) terminals to provide standing wave protection or as otherwise recommended by the VFD or motor OEM.

#### 2.4.6 Limit Switches

- a. Provide primary upper and lower geared limit switches. Geared limits must allow reversing direction to back out of the limit without resetting. The lower limit switch must be set such that there are a minimum of two wraps of rope on the hoist drum.
- b. Provide a backup mechanical hook block activated upper limit switch wired independent of the directional controllers and the primary upper limit switch that removes power from the hoist motor, hoist brake and hoist controls conforming to NEMA ICS 5. The backup limit must require hoist resetting prior to operation of the hoist in any direction.
- c. Travel limit switches must be provided to slow the crane to 25 percent of its rated speed 1 foot before the bridge end stops and 5 feet from

the trolley end stops. Limit switches must be mounted rigidly in a manner so as to protect the switch from misalignment or damage. The target/trip arm must be large enough to provide interception given a misalignment were to occur.

#### 2.4.7 Operator Controls

- a. Provide crane equipped with a pendant pushbutton station and radio control system.
- b. Provide a selector switch to allow the use of only one of the two available control stations on the pendant controller.

##### 2.4.7.1 Pendant Pushbutton Station

The cranes must be controlled from a pendant pushbutton station suspended from an independent festooned messenger track system, operating the length of the bridge. Provide multiconductor flexible cords for pendant pushbutton stations with No. 16 AWG minimum conductors. Provide a method of strain relief to protect the electrical conductors from damage. Locate the pendant pushbutton station 4 feet above the finished floor. Pushbutton pendant station must have its elements legibly marked and arranged vertically, in order, in accordance with CMAA 70. Provide two speed pendant pushbuttons for control of the hoist bridge and trolley. Provide pendant pushbuttons for control that spring return to the OFF position. Voltage in the pendant pushbutton station must not exceed 150 Volts AC or 300 Volts DC. Provide a maintained two-position selector switch for slow speed selection.

##### 2.4.7.1.1 Pendant Conductor System

Provide a festoon type pendant conductor system. The festoon cables must be flat cables suspended from carriers riding on an I-beam or C-track. The pendant controller must be capable of traveling the entire length of the bridge and move independently of the trolley. Festoon loops must not extend below the high hook position.

##### 2.4.7.2 Radio Control System

Provide each system with a handheld type portable transmitter unit. Only one transmitter at a time can control the crane and there must be no interference from one crane's controller affecting operation of the other cranes in the building. Each transmitter must include: individual push button controls for each hoist, trolley, and bridge; a maintained contact, keyed switch, marked ON-OFF, for portable transmitter unit power; indication of Battery Power, and indication of Transmitting Status; a red emergency STOP mushroom pushbutton. The transmitters and all controls must each be clearly and permanently labeled with functionality and direction. Directions for controllers must be in accordance with CMAA 70 recommendations. The remote radio control system must be designed to meet the requirements of NEMA ICS 8, Part 9 and ECMA 15. Each radio remote control lever must be in the OFF position before the associated crane function can begin. The system frequency must be within the unlicensed FCC Part 15 range. Each control unit must maintain a continuous status signal to the associated receiver during operation. There must be no significant loss in systems efficiency and function at the end of eight hours of continuous battery use.

## 2.4.8 Electrification Systems

### 2.4.8.1 Runway Conductor System

- a. Provide a Festoon System for the runway conductor system utilizing cables suspended from carriers riding on an I-beam or C-track for the crane, including all necessary cables and hardware to the crane from a wall or column mounted disconnect switch. Provide electrification system with three power conductors and an equipment grounding conductor. Conductors must be fabricated from copper. The crane is required to be grounded through this conductor system. Provide conductors sized for simultaneous motions of the hoist, bridge, trolley mechanisms and any ancillary loads. Festooned cable loops must not extend low enough to come into contact with any obstructions.

### 2.4.8.2 Bridge Conductor System

- a. Provide Festoon System for the bridge conductor system utilizing cables suspended from carriers riding on an I-beam or C-track. Conductors must be fabricated from copper. A minimum of 20 percent of the festoon control circuit conductors for each electrification system must be spares at the time of crane acceptance. The trolley is required to be grounded through this conductor system. Festooned cable loops must not extend low enough to come into contact with any obstructions.

### 2.4.9 Capacity Overload Protective Device

- a. Provide a capacity overload protective device for all hoist systems using VFD drive capacity overload protection (separate from torque limiting feature of the VFD) . Set hoist capacity overload protection at 110 percent. Provide a keyed override or other means to disable the hoist capacity overload protection when performing a load test.
- b. Initially, set the torque limiting capability of the VFD (that is separate from the capacity overload protective device) to 150 percent of the motor torque (amperage) necessary to hoist 100 percent load. It may be adjusted up only to avoid nuisance trips and adjusted down if possible while still avoiding nuisance trips.

### 2.4.10 Enclosures

- a. Provide enclosures for control panels, controls, and brakes in accordance with NEMA 250 and NEMA ICS 6, Classification Type 1 indoor, general purpose12 indoor without knockouts, general purpose. There must not be any condensation inside the control panels. Provide anti-condensation heaters that remain energized when the main line contractor is energized.
- b. Provide a non-resettable hour meter, connected across the main line contactor, readable from the exterior of the main control panel, to indicate the elapsed number of hours the crane is energized.
- c. Gaskets of enclosures and fixtures, and joints and contact surfaces of hazardous/explosive enclosures must be kept free of any paint to prevent damage during removal and reinstallation of gaskets of enclosures.

#### 2.4.11 Warning Devices

Provide a warning horn that is operable from a push button at the radio control station. Provide a warning rotating beacon that is illuminated at all times during movement of the hoist, trolley, or bridge function.

#### 2.4.12 Indicator Lights

Provide fault light, slow speed light, and hoist brake fault, as applicable. Provide Indicator Lights mounted in an enclosure on the bottom of the bridge with lights sized and positioned to be visible from the ground. The lights must be the dual-lamp type. Provide a white light to indicate that power is available on the load side of the crane disconnect and a blue light to indicate that the main contactor is energized. Light voltage must be 115 VAC. Provide nameplates that are legible from ground level. The nameplates must read, in their respective order, "POWER AVAILABLE" and "CRANE ENERGIZED". The POWER AVAILABLE light must be supplied by a separate, fused transformer for its energization.

#### 2.4.13 Cyber Security of Control Systems

- a. Provide the following for PLC, RTU, Supervisory Controller, or other network-capable (whether networked or not upon delivery) control devices as applicable:
  - (1) Hardware list (Hardware list must include the following for each device):
    - (a) Manufacturer
    - (b) Model
    - (c) Location
    - (d) Key technical ratings (e.g. memory)
    - (e) Serial number
    - (f) MAC addresses
    - (g) IP addresses
  - (2) Software List (Software list must include the following for each device):
    - (a) Manufacturer
    - (b) Version/subversion
    - (c) Location/device
    - (d) Used network ports/protocols/services
  - (3) List and discussion of all security features of Contractor hardware and software.
- b. For every PLC, RTU, Supervisory Controller, or other network-capable control devices (whether networked or not upon delivery), deliver the following on CD/DVD:
  - (1) Original firmware
  - (2) Original firmware hash
  - (3) SOP for application of firmware updates/patches
  - (4) POC or website for firmware updates/patches
  - (5) Count of interfaces and types
  - (6) Protocols in use, per interface
  - (7) Configuration file
  - (8) SOP for configuration

#### 2.4.13.1 Control System and Network

- a. Provide a rugged laptop type workstation (computer) complete with all compatible software (including software licenses), redundant physical back-up copies on CD/DVD of the installed software, and all necessary cables and special connectors to allow crane software to be troubleshot, checked and upgraded, and for the data recorder to be accessed and information retrieved. Equip the workstation with a CD/DVD drive and the associated CD/DVD burning software. The workstation must also be equipped with USB ports (2.0 and 3.0), an Ethernet port, and a serial port. Delivering the software on a USB (flash drive) device is prohibited.
- b. The laptops must be designed for an industrial environment and must be shock resistant and weatherproof as a minimum. Provide the laptop with a built-in CD/DVD reader with the capability to burn CDs and DVDs including associated software to burn CDs and DVDs.
- c. The Contractor must provide all equipment, including software and hardware, necessary for testing, installation, and communicating/troubleshooting all systems provided with the crane (e.g. engine/generator, control system, LID, etc.). The Contractor must provide all crane specific operational software files (e.g. ladder logic, functional block programming, etc.) for their associated systems (e.g. control systems, LID, engine generator, etc.).
- d. A single common networked design must not be used for the control systems. A network for an individual function may be used as long as a failure of the network does not affect any other function/network except as defined for specific safety interlocks (e.g. LMI system). A common crane network may be used in a monitoring mode for recording faults and trending and is encouraged. Failure of the monitoring system must not affect crane functions.
- e. All provided hardware and software must be currently marketed products, not currently scheduled for end of life or obsolescence, to ensure system sustainability.
- f. Ensure there is no remote access capability enabled as remote access capabilities are prohibited. Physically disable or remove all modem/network devices not required for operational purposes.

#### 2.4.13.2 Software and Services

- a. Remove all Software and Services not required for operation and/or maintenance of the product. If removal is not technically feasible, then disable software not required for the operation and/or maintenance of the product. Configure the product to allow the ability to re-enable ports and/or services if they are disabled by software. The removal of software or services may not impede the primary function of the product. If software that is not required cannot be removed or disabled, document a specific explanation and provide risk mitigating recommendations and/or specific technical justification. The software/service to be removed and/or disabled includes, but is not limited to:
  - (1) Cameras
  - (2) Games

- (3) Device drivers for product components not procured/delivered
  - (4) Messaging services (e.g., email, instant messenger, peer-to-peer file sharing)
  - (5) Source code
  - (6) Software compilers in user workstations and servers
  - (7) Software compilers for programming languages that are not used in the control system
  - (8) Unused networking and communications protocols
  - (9) Unused administrative utilities, diagnostics, network management, and system management functions
  - (10) Backups of files, databases, and programs used only during system development
  - (11) All unused data and configuration files
  - (12) Remove and/or disable, through software, physical disconnection, or engineered barriers, all services and/or ports in the procured product not required for normal operation, emergency operations, or troubleshooting. This includes communication ports and physical input/output ports (e.g., USB docking ports, video ports, and serial ports).
- b. Provide documentation showing all disabled ports, connectors, and interfaces for all network-capable devices. In addition, the documentation must provide summary documentation of the procured product's security features and security-focused instructions on product maintenance, support, and reconfiguration of default settings.
  - c. For the evaluation status of hardware and software, the Contractor must provide information on Common Criteria or National Information Assurance Partnership (NIAP) or Federal Information Processing Standards (FIPS) evaluation status of hardware and software.

#### 2.4.13.3 Access Control

- a. The Contractor must configure each component of the procured product to operate using the principle of least privilege. This includes operating system permissions, file access, user accounts, application-to-application communications, and energy delivery system services.
- b. Provide user accounts with configurable access and permissions associated with one or more organizationally defined user role(s), where roles are used.
- c. Provide a system administration mechanism for changing user(s') role (e.g., group) associations.
- d. The Contractor must document control system access control options by defining access and security permissions, user accounts, and applications with associated roles.

- e. Provide recommended methods for the Acquirer to prevent unauthorized changes to the Basic Input/Output System (BIOS) and other firmware. If it is not technically feasible to protect the BIOS to reduce the risk of unauthorized changes, the Contractor must document this case and provide mitigation recommendations.

#### 2.4.13.4 Control System Account Management

The Contractor must document all accounts (including, but not limited to, generic and/or default) that need to be active for proper operation of the procured product.

Remove or disable any accounts that are not needed for normal or maintenance operations, emergency, or troubleshooting of the energy delivery system.

#### 2.4.13.5 Session Management

The Contractor may not allow multiple concurrent logins using the same authentication credentials, allow applications to retain login information between sessions, provide any auto-fill functionality during login, or allow anonymous logins.

Provide account-based and group-based configurable session-based logout and timeout settings (e.g., alarms and human-machine interfaces).

#### 2.4.13.6 Authentication/Password Policy and Management

Provide a configurable account password management system that allows for, but is not limited to, the following:

- a. Changes to passwords (including default passwords)
- b. Selection of password length
- c. Frequency of change
- d. Setting of required password complexity
- e. Number of login attempts prior to lockout
- f. Inactive session logout
- g. Screen lock by application
- h. Comparison to a library of forbidden strings
- i. Derivative use of the user name
- j. Denial of repeated or recycled use of the same password

The Contractor must time stamp log files.

#### 2.4.13.7 Logging and Auditing

Provide logging capabilities that cover the following events, at a minimum (as appropriate to their function):

- a. Information requests and server responses
- b. Successful and unsuccessful authentication and access attempts
- c. Account changes
- d. Privileged use
- e. Application start-up and shutdown
- f. Application failures
- g. Major application configuration changes

#### 2.4.13.8 Heartbeat Signals

The Contractor must identify heartbeat signals or protocols and recommend which should be included in network monitoring. At a minimum, a last gasp report from a dying component or equivalent must be included in network monitoring.

The Supplier must provide packet definitions of the heartbeat signals and examples of the heartbeat traffic if the signals are included in network monitoring.

#### 2.4.13.9 Patch Management and Updates

The Contractor must verify that procured products (including third-party hardware, software, firmware, and services) have appropriate updates and patches installed prior to delivery.

Provide documentation of the patch management program and update process (including third-party hardware, software, and firmware). This documentation must include resources and technical capabilities to sustain this program and process. Provide the Contractor's method or a recommendation for how the integrity of the patch is validated by the Acquirer as well as the Supplier's approach and capability to remediate newly reported zero-day vulnerabilities.

#### 2.4.13.10 Malware Detection and Protection

- a. The Contractor is required to implement at least one of the following:
  - (1) Provide a host-based malware detection capability that quarantines (instead of automatically deleting) suspected infected files. Provide an updating scheme for malware signatures. The Contractor must test and confirm compatibility of malware detection application patches and upgrades.
  - (2) If the Contractor is not providing the host-based malware detection capability, the Contractor must suggest malware detection products to be used and provide guidance on malware detection and configuration settings that will work with Contractor products.
- b. The Contractor must validate that cybersecurity services running on the procured product (e.g., virus checking and malware detection) do not conflict with other such services running on the procured product.

- c. For malware detection and protection, the Contractor must provide, or specify how to implement, the capability to automatically scan any removable media that is introduced to the product being acquired.

#### 2.4.13.11 Physical Security

Provide lockable or locking enclosures or rooms for energy delivery systems and system components (e.g., servers, clients, and networking hardware) and for the systems used to manage and control physical access (e.g., servers, lock controllers, and alarm control panels). Provide a method for tamper detection on lockable or locking enclosures. If a physical security and monitoring system is used, tamper detection must be compatible. The Contractor must ensure that physical security features do not hamper the crane system operations. Provide the tools and instructions for making changes to locks, locking codes, keycards, and any other keyed entrances.

#### 2.4.13.12 Wireless Technology

For wireless technology provisions, the Contractor must document:

- a. Specific protocols and other detailed information required for wireless devices to communicate with the control network, including other wireless equipment that can communicate with the Contractor-supplied devices.
- b. Use, capabilities, and limits for the wireless devices.
- c. Power and frequency requirements of the wireless devices (e.g., microwave devices meet the frequency requirements of Generic Requirements (GR)-63 Network Equipment Building System (NEBS) and GR-1089).
- d. Range of the wireless devices and verify that the range of communications is minimized to both meet the needs of the Acquirer's proposed deployment and reduce the possibility of signal interception from outside the designated security perimeter.
- e. Wireless technology and associated devices compliance with standard operational and security requirements specified in applicable wireless standard(s) or specification(s) (e.g., applicable IEEE standards, such as 802.11).
- f. Configuration control options that enable varying of the security level of the devices.

#### 2.4.13.13 Control System Inventory

Provide the complete control system inventory. The Control System Inventory must include the following attributes, in tabular format, as applicable:

| General Information        | Location Information                   | Hardware Details                                     | Operating System and Platform | Network Information (Actual Function, not potential function) |
|----------------------------|----------------------------------------|------------------------------------------------------|-------------------------------|---------------------------------------------------------------|
| Unique ID                  | Facility Name                          | Device Type                                          | Embedded OS (Yes/No)          | MAC Address(es)                                               |
| Barcode or Identifier      | NFAID                                  | Device Sub-Type                                      | OS Contractor                 | IP Address(es)                                                |
| Region                     | Commodity                              | Device Function                                      | Operating System (O/S)        | Upstream Device                                               |
| Installation               | Floor                                  | Manufacturer                                         | O/S Version                   | Protocols In Use                                              |
| Special Area (Option DNA1) | Room                                   | Product Line                                         | Platform Contractor           | Host Name                                                     |
|                            | Location                               | Model No.                                            | Platform Product Line         |                                                               |
|                            | System Type                            | Serial No.                                           | Platform                      |                                                               |
|                            | Functional System or Equipment Control | Remote Connectivity: (Wired / Wireless / None)       | Platform Version              |                                                               |
|                            |                                        | Network Type Used: (Serial / Ethernet / Both / None) |                               |                                                               |

## 2.5 PAINTING SYSTEM

- a. Remove all grease, oil, and surface debris by solvent wiping or detergent/water scrubbing, prior to blast cleaning. Prepare surfaces to be coated by abrasive blasting to SSPC SP 6/NACE No.3, Commercial Blast Cleaning, or in accordance with the coating manufacturer's requirements, whichever is more stringent.
- b. Use a painting system appropriate for the conditions provided in the Crane Design Criteria section. Paint exposed portions of the crane using a three-coat system as follows: zinc-rich primer consisting of a minimum of 85 percent zinc by weight in the dry film, an anticorrosive epoxy intermediate coat, and an aliphatic polyurethane top coat . All paint products must be supplied by a single manufacturer and free of chromates, lead, and mercury. Apply each coat in accordance with manufacturer's instructions and requirements. Ensure each coat is smooth, even, and free of runs, sags, orange peel, and other defects. Desired color of finish coat is brilliant yellow. Submit product data for painting system.
- c. Coat faying surfaces of bolted connections per RCSC A348, but do not apply finish paint.
- d. Paint the load block brilliant yellow with black diagonal striping. Paint, coatings, or galvanizing on the following items or areas is not

acceptable: hoist wire ropes, hooks, hook nuts, running bearing surfaces (including sheaves and wheel treads), grease fittings, or other items not normally painted.

- e. Factory paint electrical and mechanical equipment in accordance with the manufacturer's best standard practice (for the specified environment), except that electrical equipment doors, which expose current-carrying electrical conductors when opened, must be orange.

## 2.6 IDENTIFICATION PLATES

Furnish and install identification plates. Provide non-corrosive metal identification plates with clearly legible permanent lettering giving the manufacturer's name, model number, serial number, capacity in pound units printed in different colors, and other essential information or identification.

### 2.6.1 Markings on Crane, Trolley, and Hook

To avoid operation of the crane in the wrong direction, affix the appropriate directions (NORTH, SOUTH, EAST, and WEST) with arrows on the bottom of the bridge girder where they can be easily seen by the operator and from the loading point. Provide labels on the controls with corresponding directional (NORTH, SOUTH, EAST, and WEST) markings. Markings must agree with the markings on controller. Do not indicate directional arrows on controller.

Mark the hook rated capacity in pounds on both sides of the hoist load block.

## PART 3 EXECUTION

### 3.1 EXAMINATION

After becoming familiar with all details of the work, and before performing any work, verify all dimensions in the field. The Contractor is responsible for the coordination and proper relation of the contracted work to the building structure and to the work of all trades. Verify all dimensions of the building that relate to fabrication of the crane and notify the Contracting Officer of any discrepancy before finalizing the crane order.

### 3.2 SHOP ASSEMBLY AND TESTS

Shop assemble major components as completely as possible, except for reeving of drums and sheaves. Functionally test the crane system at the construction facility prior to shipment. The Government reserves the right to inspect the crane for compliance with this specification and to witness the functionality tests. Notify the Contracting Officer 14 days prior to starting testing operations.

### 3.3 ERECTION AND INSTALLATION

Perform the entire crane erection in accordance with manufacturer's instructions under the full-time supervision of the manufacturer's representative.

### 3.3.1 Mechanical Alignment

Align motors, couplings, brakes, gear boxes and drive components in accordance with manufacturer's instructions. Complete the Coupling Alignment Verification Record.

### 3.3.2 Electrical Adjustments

Adjust control system in accordance with manufacturer's instructions. Store a copy of all Control Parameter Settings (PLC, VFD). Provide the final alignment data on the Complete Schematic Wiring Diagram, including but not limited to, timer settings, resistor tap settings, potentiometer settings, test-point voltages, supply voltages, motor voltages, motor currents. Provide the test conditions such as ambient temperature, motor load, date performed and person performing the alignment as part of the Operational Tests report.

### 3.3.3 Field Welding

Perform welding indoors, where possible. Surface of parts to be welded must be free from rust, scale, paint, grease or other foreign matter. Minimum preheat and interpass temperatures must conform to the requirements of AWS D14.1/D14.1M. Perform welding of girders and beams conforming to AWS D14.1/D14.1M.

### 3.3.4 Field Painting

Perform painting indoors, where possible. Field painting (including touch-up) must conform to the requirements of the coating manufacturer and as specified in PAINTING SYSTEM.

## 3.4 FIELD QUALITY CONTROL

### 3.4.1 Post-Erection Inspection

After erection, the Contractor, the Activity Crane Inspector/Test Director, and the Contracting Officer must jointly inspect the crane bridge and hoist systems and components to determine compliance with specifications and approved submittals. Notify the Contracting Officer 14 days before the inspection. Provide a report of the inspection indicating the crane is considered ready for operational tests.

### 3.4.2 Operational Tests

Check the clearance envelope of the entire crane prior to picking or traversing any load to ensure there are no obstructions. Test the systems in service to determine that each component of the system operates as specified, is properly installed and adjusted, and is free from defects in material, manufacture, installation, and workmanship. Rectify all deficiencies disclosed by testing and retest the system or component to prove the crane is operational.

#### 3.4.2.1 No-Load Test

Raise and lower each hook through the full range of normal travel at rated speed for three complete cycles. Raise and lower each hook, testing other speeds of the crane. Verify proper operation of hoist limit switches. Operate the bridge and trolley in each direction the full distance between end stops. Operate through the entire speed range and verify proper brake

operation. Verify correct operation of all indication and ancillary devices.

#### 3.4.3 Test Data

Record test data on appropriate test record forms suitable for retention for the life of the crane. Record operating and startup current measurements for hoist, trolley, and bridge motors using appropriate instrumentation (i.e., clamp-on ammeters). Compare recorded values with design specifications or manufacturer's recommended values; abnormal differences (i.e., greater than 10 percent from manufacturer's or design values) must be justified or appropriate adjustments performed. In addition, note, investigate, and correct any high temperatures or abnormal operation of any equipment or machinery. Record hoist, trolley, and bridge speeds during each test cycle.

#### 3.4.4 Hook Tram Measurement

Establish a throat dimension base measurement by installing two tram points and measuring the distance between these tram points (plus or minus 1/64 inch). Record this base dimension. Measure the distance between tram points before and after load test. An increase in the throat opening from the base measurement is cause for rejection.

#### 3.4.5 Load Tests

Perform the following tests for each hoist, as specified below.

Test loads used in this section are defined as the following:

Wire rope run-in load: 25 - 50 percent of rated load.

Rated load test: 100 percent (plus 0 minus 10) of rated load.

Overload test: 125 percent (plus 0 minus 5) of rated load.

##### 3.4.5.1 Wire Rope Run-In

The primary purpose of this procedure is to exercise the newly installed wire rope.

Place the load on the hook. Start at ground level and hoist up to one foot below upper limit at slow speed. Hoist down to lower limit at slow speed. Repeat hoisting and lowering of the load for approximately 10 hoisting cycles, increasing the speed for each cycle. During this test, the capacity overload lockout should not activate.

##### 3.4.5.2 Rated Load Test

###### 3.4.5.2.1 Hoist

- a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees to check bearing operation with no binding. Observe lowering that may occur which indicates a weakness in the structure or malfunction of hoisting components or brakes. Verify that maximum beam and girder deflections do not exceed CMAA 70 design limits.

- b. For hoists with primary and secondary holding brakes, raise the test load and release the secondary holding brake while testing the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage secondary holding brake and release the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage the primary holding brake. Recheck proper operation of time delay and ensure smooth positive stopping.
- c. Hoist Mechanical Load Brake (if present): Raise test load approximately 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.
- d. Raise and lower test load through the full lift range and visually observe smooth control and acceleration between points. Completely stop the machinery at least once in each direction to ensure proper brake operation.
- e. Hoist Loss of Power Test: Raise the test load to approximately 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

#### 3.4.5.2.2 Trolley

Operate the trolley (if space is available) the full distance of the bridge rails in each direction with a test load on the hook. Check proper functioning through the range of speeds. Verify proper brake action.

#### 3.4.5.2.3 Bridge

With a test load on the hook, operate the bridge for the full length of the runway (if space is available) in one direction with the trolley at the far end of the bridge, and in the opposite direction with the trolley at the opposite end of the bridge. Use extreme caution. Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

#### 3.4.5.2.4 Trolley Loss of Power Test

With a test load of 100 percent of rated load, raise the test load approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of trolley travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the trolley stops and that the brake sets properly. Measure the distance required for the trolley to stop.

#### 3.4.5.2.5 Bridge Loss of Power Test

With a test load of 100 percent of rated load, raise the test load

approximately midway between the trolley and any permanent obstruction on the operating floor. Starting at a safe distance from walls or other obstructions, attain a slow speed of bridge travel. While maintaining a safe distance from obstructions, disconnect the main power source at the wall mounted safety switch (disconnect) to simulate a power failure. Verify that the bridge stops and that the brake sets properly. Measure the distance required for the bridge to stop.

#### 3.4.5.3 Overload Test

##### 3.4.5.3.1 Hoist

Disconnect or adjust the overload limit device to allow the hoist to lift the test load. Verify proper operation of the overload limit device after it is reconnected.

- a. Static Load Test: With the trolley in the center of the bridge span, raise the test load approximately one foot. Hold the load for 10 minutes. Rotate the load and hook 360 degrees to check bearing operation with no binding. Observe lowering that may occur which indicates a weakness in the structure or malfunction of hoisting components or brakes.

For hoists with primary and secondary holding brakes, raise the test load and release the secondary holding brake while testing the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage secondary holding brake and release the primary holding brake. Hold for 10 minutes. Observe for lowering of the load, which may indicate malfunction of hoisting components or brakes. Re-engage the primary holding brake. Recheck proper operation of time delay and ensure smooth positive stopping.

- b. Raise and lower test load and visually observe smooth control. Stop the load during raising and lowering to verify that the brakes holds the load.
- c. Hoist Load Brake (if present): Raise test load approximately 5 feet. With the hoist controller in the neutral position, release (by hand) the holding brake. Document the method used to release the holding brake. The load brake must hold the test load. Again with the holding brake in the released position start the test load down at slow speed and return the controller to the "off" position as the test load lowers. The load brake must stop and hold the test load.
- d. Hoist Loss of Power Test: Raise the test load to approximately 8 feet. While slowly lowering the test load, disconnect the crane's power source. Verify that the test load does not lower and that the brake is set.

##### 3.4.5.3.2 Trolley

Operate the trolley the full distance of the bridge rails in each direction with a test load on the hook (one cycle) through the range of speeds. Verify proper brake action.

##### 3.4.5.3.3 Bridge

With a test load on the hook, operate the bridge for the full length of

the runway in one direction with the trolley at the extreme end of the bridge, and in the opposite direction with the trolley at the opposite extreme end of the bridge (one cycle). Check proper functioning through the range of speeds. Check for any binding of the bridge end trucks and verify proper brake action. Record deficiencies. Secure from testing if deficiencies are found.

### 3.5 MANUFACTURER'S FIELD SERVICE REPRESENTATIVE

Furnish a qualified experienced manufacturer's field service representative to supervise the crane installation, assist in the performance of the on-site testing, and instruct personnel in the operational and maintenance features of the equipment.

### 3.6 OPERATION AND MAINTENANCE MANUALS

Provide two hard copies of operation and two hard copies of maintenance manuals for the equipment furnished along with an electronic copy (PDF) of each on a Compact Disc. Provide one complete set prior to performance testing and final copies upon acceptance. Provide operation manuals that detail the step-by-step procedures required for system startup, operation and shutdown. Include the manufacturer's name, model number, parts list, and brief description of all equipment and basic operating features. List in the maintenance manuals routine maintenance procedures, including weekly, monthly, semi-annual, and annual required maintenance items, possible breakdowns and repairs, and troubleshooting guides. Also include as-built drawings, piping and equipment layout, design calculations, Control Parameter Settings and printouts of any software, and simplified wiring and control diagrams of the system as installed. Secure approval of operation and maintenance manuals prior to the field training course.

### 3.7 FIELD TRAINING

Conduct a training course for 8 operating and maintenance staff and provide a copy of the training material to each participant. Provide a training period consisting of a total of hours of normal working time and starting after the system is functionally completed but prior to final acceptance. Cover all pertinent points involved in operating, starting, stopping, and servicing the equipment, including all major elements of the Operation and Maintenance Manuals. Demonstrate in course instructions all routine maintenance operations such as lubrication, general inspection, and critical maintenance.

### 3.8 FINAL ACCEPTANCE

Final acceptance of crane system will not be given until Contractor has successfully completed all testing operations, corrected all material and equipment defects, made all proper operation adjustments, and removed paint or overspray on wire rope, hook, and electrical collector bars.

-- End of Section --

SECTION 43 21 13.16

HORIZONTAL END SUCTION PUMPS  
09/24

PART 1 GENERAL

1.1 WORK INCLUDED

This Section covers the furnishing and installation of pump motor and variable frequency motor drive as required for complete operation of the pumps.

1.2 RELATED WORK

- A. Equipment Checkout and Testing is covered by Section 01 75 13 .
- B. Finish paint: all items of equipment such as motors, pumps, instrumentation panels, electrical switchgear, and similar items, that have been given shop coats, paint filler, enamel or other treatment customary with the manufacturer, shall have, after installation, all scratches and blemishes touch up prior to application of the first field coat. Factory prefinished items not to be field painted shall be touched up with matching paint to repair any areas damaged during installation. Shop coats shall be fully compatible with the finish coat.
- C. Power to all equipment specified in this section shall be coordinated with Division 26 ELECTRICAL . Coordinate the requirements as outlined in Section 26 29 23 ADJUSTABLE SPEED DRIVES (ASD) SYSTEMS UNDER 600 VOLTS and the requirements listed in sections 2.02 and 2.03 below.
- D. Discharge piping and valves for all pumping equipment shall be as specified in Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING.

1.3 DESIGN CRITERIA

- A. Adequate tolerances in the listed capacity, head and efficiency values have been included. No deviation below the listed parameters will be permitted.
- B. All listed parameters shall be considered design points.
- C. End Suction Pump Schedule

| Pump Tag               | Pump                          | Description                                                      | Max.<br>Capacity<br>(gpm) | TDH<br>(PSI) | Motor<br>Horsepower | Voltage | Starter<br>Type |

#### 1.4 SUBMITTALS

##### SUBMITTAL PROCEDURES:

##### A. Shop Drawings (Six Copies)

1. Show complete details of construction and installation of all equipment, including appurtenances; include all dimensions.
2. Include all specifics of this installation.
3. Delete all references not applicable to this installation.
4. Outline specific areas where the proposed equipment differs from that specified.
5. Include complete wiring diagrams required for installation.
6. Certified pump curves showing the actual performance of the pumps to be supplied under factory testing. Pump certification shall include testing for head, capacity, efficiency and brake horsepower, at 50%, 65%, 85% and 100% for variable speed driven pumps; and at the rated speed for constant speed pumps. Six certified copies of the results in the form of pump characteristic curves shall be furnished to the Engineer for review prior to shipment.
7. Complete test results on each motor for the tests as defined in the NEMA standard for a motor of its class and rating, to determine that it is free from electrical and mechanical defects and to provide assurance that it meets the design specifications.

8. The manufacturer's complete test results for each motor model design tested for efficiency by the following means:
  - (a) The full load Dynamometer test shall be based on IEEE 112 Method B, per NEMA MG1 12.53 A & B including six (6) load point testing and stray load loss segregation and correction steps.
9. A complete, easily readable functional description of the proposed equipment.

B. Operations and Maintenance Manuals (Four Sets)

1. Complete operation and maintenance information for this specific equipment.
2. The manuals will be reviewed by the Engineer for completeness; those that are deemed inadequate will be returned for correction.
3. Complete parts list including the manufacturer's reference and ordering numbers.
4. A complete list of the manufacturer's name, address and phone number, the local representative's name, address and phone number, and the model and serial numbers of all equipment supplied.
5. Recommended Spare Parts List.

C. Installation Submittals (Four Sets)

Upon completion of installation, the results of the field and acceptance tests as specified under this section of the specification shall be submitted to the Engineer.

Upon completion of installation, the results of the field and acceptance tests as specified under this section of the specification shall be submitted to the Engineer.

1.5 QUALITY ASSURANCE

A. General

1. This Section directs special attention to certain features but does not purport to cover all details of the design, manufacture or installation of the pumping units. The final responsibility for supplying and installing pumping equipment which functions as specified herein rests with the Contractor.
2. Workmanship and the method and materials of construction shall conform to the best practice and highest standards applicable for the design use as specified.
3. Pumping units furnished shall be complete in all particulars and ready for final assembly, installation and operation.
4. Any structural, mechanical, civil, architectural, HVAC, plumbing or electrical changes required by the use of an approved equal product shall be the responsibility of the Contractor.

B. Manufacturer Requirements

1. Pump manufacturers shall certify proof of successful operating experience during the last 10 years of five installations of equipment comparable to that specified herein.
2. The electrical drive equipment specified herein (including a/c drive induction motor) shall be designed and sized by the supplier, who shall assume responsibility for correct operation of the system.
3. The manufacturer of the a/c drive induction motor specified herein shall have a factory trained service engineer in residence for at least 50 major cities within the United States.

1.6 STORAGE

- A. Pump shafts stored on site shall have covered and taped ends for protection. Pump equipment damaged or bent during shipping or storage shall be replaced.
- B. All pump motors shall be stored on site according to motor manufacturer's recommendations until pumps are operational and accepted by the Engineer. Pumps with motor space heaters shall be energized during storage; the Contractor shall be responsible for such arrangements.

1.7 WARRANTY

- A. The pump manufacturer and the pump motor manufacturer shall each individually and separately warrant that the equipment they supplied under this Section fully meets the criteria specified herein and shall further warrant that the equipment is free from all defects in materials and workmanship.
- B. The manufacturer's warranties from defects shall contain a provision that the manufacturer shall repair or replace any defects, to the satisfaction of and at no additional cost to the Owner, for a period of twenty-four (24) months for the pump and motor from the date of Substantial Completion of the project.
- C. The variable frequency drive shall be warranted for a period of 24 months after date of shipment. Warranty shall include parts and labor by the manufacturer.

PART 2 PRODUCTS

2.1 HORIZONTAL END SUCTION PUMPS

A. Pump Manufacturer

The pump supplier shall assume complete responsibility for each pump, motor, variable frequency drive and controls. The pump supplier shall have successfully manufactured pumping units for water for a minimum of five years and shall manufacture the major components of the pumping units.

Horizontal end suction pumps shall be manufactured by Goulds

Pumps, Seneca Falls, NY, or approved equal.

B. Horizontal Pump Casings

1. The pump casings shall be of cast alloy, high alloy/stainless steel, conforming to ASTM A890/A995, horizontally end suction.
2. The casings shall have tapped and plugged holes for priming, vent and drain and shall be equipped \_\_\_\_\_.
3. The interior of the casings shall be smooth and free from surface defects.
4. Suction and discharge flanges for pump shall be cast solid with the casing. Drilling and dimensions of flanges shall conform to the 125 pound American Standard.
5. Pump casings shall be designed for 290 psi maximum allowable working pressure and shall be hydrostatically tested at 150 percent of working pressure.

C. Horizontal Pump Impellers

1. The impellers shall be carefully designed to give the characteristics desired, and shall be both hydraulically and dynamically balanced.
2. The impellers shall be of the semi-open type, cast in one piece and meeting current lead standards, of cast alloy, high alloy/stainless steel, conforming to ASTM A890/A995.
3. The impellers shall be finished all over, the exterior being turned and polished and the interior finished smooth by hand to match templates.

D. Horizontal Pump Shaft Sleeves

1. Sleeves shall be straight slip on type, o ring sealed and secured in place with threaded sleeve nuts located external to the stuffing box.
2. Each sleeve shall be driven by an impeller key.
3. Sleeve material shall be 316 stainless steel. The sleeve shall extend through and beyond the packing gland.

E. Horizontal Pump Mechanical Seal

1. The A backplate with deflector vanes constructed shall be provided, including a single mechanical seal shall be John Crane (Morton Grove, IL) model 5615Q (Silicone Carbide versus Silicon Carbide with EPR) or better. The design shall allow for continuous operation without the need for external flush water or venting.

F. Horizontal Pump Bearings

1. Bearings shall be designed and sized for at least 100,000 hours minimum rated bearing life.

2. The bearings shall be protected from water seepage and dust.
3. Bearing lubrication shall be oil bath equipped with oil slinger.

G. Horizontal Pump Shafts

1. The pump shafts shall be of series SAE 4140 alloy steel, ground to accurate dimensions to run true, finished and polished on all sections.
2. The shafts shall be of ample strength and rigidity, with the shortest practicable distance between bearings to keep deflection and vibration to a minimum.
3. All parts of the shaft in contact with water or passing through stuffing boxes shall be protected by easily removable locked on stainless steel sleeves.
4. The maximum allowable deflection of the shaft shall be 0.002-inch at any point of operation on the pump curve.

H. Horizontal Pump Baseplates

1. Suitable baseplates, each with an opening for grout, shall be furnished with the pumping units. Baseplates shall be solidly imbedded in the concrete pad for vibration free operation.
2. The baseplate shall be designed to support both pump and close-coupled motor.
3. Planed surfaces or bearing pads shall be provided for the pump and motor.
4. The baseplates shall be provided with a suitable raised edge or drip pan arrangement for catching oil and water drops and shall have tapped connections for drainage.
5. Baseplates shall be of Galvanized steel to ANSI 1991. SWRO distribution pump skid P4, P10, and P11 shall be of stainless steel or corrosion resistant material.

I. Miscellaneous Fittings

1. Drain connections shall be provided at the pump volute, the drip pocket below the stuffing box (if applicable) and at all other possible drainage points.
2. The volute shall be provided with air vents so that the pump can be freed from air pockets.

2.2 A/C INDUCTION DRIVE MOTORS FOR VARIABLE SPEED APPLICATIONS

- A. The pumps shall be driven over the specified speed range by a/c motors sized to operate in conjunction with variable voltage/variable frequency rectified power and provide 100 percent motor torque and horsepower rating at 1.0 service factor. Motors used for the a/c variable speed drives shall be Reliance Duty Master, High Efficient XE Design, Premium Efficiency by U.S. Motors, or approved equal.

- B. The motor base speed shall be selected so that the maximum operating speed of the centrifugal pump and motor are compatible.
- C. Motors shall not exceed 3600 rpm.
- D. The a/c motors for variable frequency applications shall be 3 Phase, 60 Hertz, 208 Volts. They shall be rated for operation in 40°C ambient at 1.15 service factor for constant speed operation and 1.0 service factor for operation on variable frequency, variable voltage. The motor shall have a KVA per horsepower rating of NEMA code letter G or better.
- E. The motors shall be open protected enclosure, premium high efficiency design (minimum 94% nominal efficiency at full load), cast iron construction, NEMA design B, Class B insulation with the following minimum features:
  - 1. Cast iron conduit boxes, diagonally split neoprene gasketed, rotatable 360° in 90° increments.
  - 2. Grounding clamp in box.
  - 3. Removable lifting lug.
  - 4. Permanently numbered non-wicking leads.
  - 5. Lead separator motor frame and conduit box.
  - 6. Zinc-plated hardware.
  - 7. Stainless steel nameplate.
  - 8. Stator windings shall be copper construction.
  - 9. Stator and rotor completely epoxy coated for corrosion protection.
  - 10. The motors shall have a non reverse ratchet shall be furnished with the motor of the ball or pin type.
  - 11. The motor shall develop sufficient torque to start the pump and bring it up to full speed when the pump is full of water and operate the pump at any point of its characteristic curve without entering into the service factor.

## 2.3 A/C VARIABLE FREQUENCY CONTROLLER

### A. General

- 1. The alternating current (a/c) drive systems shall provide variable speed to the booster pumps. The Contractor shall provide a new VFD to control each pump. The drive shall be sized to meet the amperage conditions of each individual booster pump.
- 2. All pumps specified herein shall be placed on duplex pump skids and operate lead/lag. Pumps shall have hand/off/automatic control capabilities.
- 3. The Variable Frequency Controllers and all associated appurtenances (e.g. harmonic filters, etc.) shall be as specified

in 26 29 23 ADJUSTABLE SPEED DRIVE (ASD) SYSTEMS UNDER 600 VOLTS.

## 2.4 PAINTING

- A. Ferrous surfaces obviously not to be painted shall be given a shop coat of grease or other suitable rust resistant coating.

Painting shall be done in accordance with 09 90 00 PAINTS AND COATINGS.

## PART 3 EXECUTION

### 3.1 FIELD ACCEPTANCE TESTS

- A. After the pump has been installed and connected, checked out as required by Section 01 75 00 and after inspection, operation, and adjustment have been completed by the manufacturer's representative, the equipment shall be field tested in the presence of the Engineer, for overall wire to water efficiency and for general performance and fitness for the service specified. Results of these tests shall be submitted to the Engineer.

### 3.2 MANUFACTURER'S SERVICES:

- A. The services of a factory trained manufacturer's representative shall be provided as described in Section 01 75 00 START UP AND TESTING and as specified herein.

- B. Services to be Provided:

- 1. For the pumps, the service representative shall be responsible for complete component inspection on site after delivery and shall assist in the correct assembly of the components for a minimum period of one (1) eight hour day.

- (a) For inspection and check out of the erected equipment.

- (b) For start up services and supervision.

- (c) For complete instruction of the Owner's operating personnel.

- C. The minimum period of time herein specified does not relieve the manufacturer from providing sufficient time to satisfactorily complete the required service functions.

- D. The manufacturer's representative shall certify in writing that the pump has been properly installed.

- E. The Owner reserves the right to video tape the instruction of the operating personnel for future use in training.

### 3.3 SPARE PARTS

- A. Provide all other spare parts as recommended in the manufacturer's standard operations and maintenance information.

- B. Provide minimum two (2) mechanical seals for each pump.

-- End of Section --

SECTION 43 41 45

FIBERGLASS REINFORCED PLASTIC CHEMICAL STORAGE TANKS

01/25

PART 1 GENERAL

1.1 REQUIREMENTS

The Contractor shall furnish, deliver, install, test and place in satisfactory operation fiberglass reinforced plastic storage tanks, complete with all necessary accessories, as shown on the Drawings and as specified herein.

##### SD-02 Shop Drawings

CONDITIONS OF SERVICE / STORAGE TANK SCHEDULE; G, AE

Drawings and details for tanks and ladder as recommended by Manufacturer and conforming with OSHA standards. Submittal shall also include weight of the tanks, resin specification and complete manufacturer's recommendation, calculation for tank design signed by a professional engineer including restraint system, and details of the anchoring system.

##### SD-03 Product Data

Installation; G, AE

List of at least five similar installations of the tank type, size, chemical service, and location conditions being proposed, including date installed, contact name, address and phone number.

Dimensions; G, AE

Dimensions of tank and dimensions, location, and orientation of openings, fittings, accessories, attachments, restraints and

supports, anchor bolts, manways, and flexible connections.

#### SD-06 Test Reports

INSPECTION AND TESTING; G, AE

#### SD-08 Manufacturer's Instructions

Instructions

Detailed instructions for pipe connections and bolt torque values.

Post Curing Requirements

Manufacturer's recommendation regarding post cure requirements

#### SD-10 Operation and Maintenance Data

Operation and Maintenance Manual; G, AE

#### SD-11 Closeout Submittals

Warranty; G, AE

### 1.5 WARRANTY

- A. Warranty and Guarantee shall be a minimum of two (2) years.

## PART 2 PRODUCTS

### 2.1 ACCEPTABLE MANUFACTURERS

- a. The fiberglass reinforced plastic storage tanks shall be manufactured by Plas-Tanks Industries or Premier Production Equipment.
- b. The fiberglass reinforced plastic tank manufacturer shall specialize in manufacture, assembly, and field service of FRP chemical storage tanks with a minimum of five years of experience.

### 2.2 GENERAL

- a. The Contractor is responsible for the coordination and selection of corrosion resistant materials for the chemical solutions specified below. The fiberglass reinforced plastic storage tank manufacturer shall become familiar with the characteristics of the specified chemical solutions and guarantee the suitability of the materials used in manufacturing of the tank and appurtenances. The Contractor and manufacturer shall include all features as necessary for satisfactory operation of the tank system for all specified chemical solution concentrations and temperatures.
- b. All tank capacities (volumes) specified shall include only that volume

in the straight shell below the maximum tank fill level (generally 6" below the overflow pipe invert elevation) and above the top of the outlet pipe. At least four inches of freeboard shall be provided between the top of the overflow pipe and the top of the straight shell.

- c. The tank manufacturer shall be fully responsible for the structural design and integrity and watertightness of all tanks including all connections.
- d. Tanks shall be anchored to the concrete base by the Contractor in accordance with the Drawings and manufacturer recommendations.

## 2.3 MATERIALS AND CONSTRUCTION

### a. Construction

(1) Tank construction shall be as follows:

| Parameter           | RO Permeate Tank                                |
|---------------------|-------------------------------------------------|
| Resin               | CorVE8301 or Derakane 411 resin with nexus Veil |
| Resin Cure System   | MEKP                                            |
| Liner Reinforcement | Double C-glass veil                             |
| Structural Layer    |                                                 |
| Resin Cure System   | MEKP                                            |

### b. Resin

- (1) The resin for fiberglass reinforced plastic storage tanks shall be a commercial-grade, corrosion-resistant thermoset that has either been evaluated in a laminate by testing in accordance with ASTM C581 or that has been determined by previous documented service to be acceptable for the service conditions.
- (2) The resin used shall not contain any fillers, pigments, dyes, or colorants, which may interfere with visual inspection of laminate quality, except as required for viscosity control. The limit of filler shall be 5 percent by weight. No fillers or bulking agents shall be used in the exterior structural layer to decrease the glass loading ratio. Resin pastes used to fill crevices before overlay are permitted.
- (3) The initiators used will be of the type, manufacturing origin, and amounts specified by the resin manufacturer.
- (4) Tank shall be provided with UV inhibitor in the resin mix to prevent degradation of the tank.

### c. Reinforcement

- (1) The reinforcing material shall be a commercial grade glass fiber

having a coupling agent which shall provide a suitable bond between the glass reinforcement and the resin and shall be suitable for the fabrication method used. The reinforcing material shall be comparable to that used to generate corrosion resistance.

- (2) Chopped Strand Mat - Chopped strand mat shall be constructed from chopped commercial-grade E-type glass strands bonded together using a binder. The strands should be treated with a sizing that is chemically compatible with the resin system used.
- (3) Continuous Roving - Continuous roving shall be a commercial-grade E-type glass fiber with a sizing that is chemically compatible with the resin system used.
- (4) Woven Roving - Woven roving shall be in accordance with referenced ASTM Specifications.
- (5) Surface Mat - The reinforcement used for the inner surface shall be a commercial-grade chemical resistant glass surface mat as recommended by the resin manufacturer for the intended service.

d. Laminate Construction

- (1) The laminate comprising the structural tank (bottom, cylindrical shell, top head) shall consist of a corrosion-resistant barrier comprised of an inner surface, interior layer, and a structural layer.
- (2) The inner surface exposed to the chemical environment shall be resin-rich, not less than 0.01 inch thick, and reinforced with chemically resistant surfacing material. The surface shall be smooth, glossy, and free of pits. The inner surface of the tanks shall have one or two layers of 'C' glass veil or a polyester synthetic veil depending on the chemical environment. Material used as reinforcing on the surface exposed to chemical attack shall be a commercial grade chemical resistant glass fiber having a coupling agent.
- (3) The interior layer shall be not less than 0.1 inch thick and composed of resin, reinforced only with noncontinuous glass strands applied in a minimum of two plies of chopped strand mat or in a minimum of two passes by the spray up process. Glass strands shall not be shorter than 1.0 inch or longer than 2.0 inches. Glass content of the inner liner and interior layer combined shall be 27% +/- 5% by weight.
- (4) Before the reinforcement of the exterior layer is applied, the interior layer shall be allowed to cure completely so that the thickness of the corrosion barrier, consisting of the inner surface and interior layer, will not be reduced. Cure systems for corrosion barrier and structural layers shall be as specified above. The degree of cure of the laminate, after post cure, shall be such as to exhibit a Barcol hardness on the inner surface of at least 90% of the resin manufacturer's minimum specified hardness for the cured laminate. Post cure of the tanks shall be provided when recommended by the resin manufacturer for a particular service; post cure shall be provided in accordance with the resin manufacturer's guidelines.

- (5) The structural layer shall provide additional strength necessary to meet the tensile and flexural requirements. The reinforcement shall be filament wound, contact molded or a combination of both and may consist of continuous roving, woven roving, chopped strand mat or chopped strands. Where separate layers of reinforcement are used, all layers shall be lapped a minimum of 1.0 inch. Laps shall be staggered as much as possible. If woven roving or cloth is used in successive layers, it shall be alternated with a layer of chopped strand glass.
- (6) Glass content of the filament-wound structural layer shall be 50 to 80 percent by weight. The thickness of the filament wound portion of the tank shell may vary with tank height, provided that all stress and other requirements are met at any height level. All reinforcement used shall be resistant to corrosion by the particular chemical stored in the tank.
- (7) The outer surface shall consist of chopped strands or surfacing mat, or both, over which shall be applied a resin rich coating. The outer surface shall not be pigmented, painted or dyed except to prevent ultraviolet degradation of the tank contents, as applicable. This surface shall be at least 0.02 inch thick.
- (8) The tank top shall be domed with openings and connections as shown and specified. The tank top shall be able to support a 250pound load on a 4 inch by 4 inch area.
- (9) Tank bottom attachment to tank wall shall be per ASTM D 3299 and D 4097.

#### 2.4 CONNECTIONS AND ACCESSORIES

- a. All flanged nozzles shall be of hand lay-up construction with pipe stub molded integrally with the pipe flange. All connections/openings shall be flanged in accordance with ASME B16.5 150 pounds and provided with flanged gasket. Flanged connections, nozzles, and openings shall be FRP gusseted and flat face. All pipe supports, hardware, accessories, etc., shall be provided. All piping connected to the tanks shall be perpendicular or parallel to the straight shell of the tanks. All piping into the tanks shall be supported such that no weight is placed on the tank and its connections. Piping supports requiring holes through the side wall of the tanks shall not be allowed.
- b. Tank outlet connections shall be full bottom drain connections to allow for the tank to be completely drained. If recommended by tank manufacturer, each tank outlet connection shall be provided with a flexible connector, supplied by the tank manufacturer, resistant to the specified chemical to allow for expansion and contraction of the tank and to isolate the tank from vibration. Each tank drain line shall be provided with an isolation valve by the Contractor as indicated on the Drawings.
- c. Vent lines shall be top mounted. Each vent shall be extended to the atmosphere, extend 24-inches above the roof, and shall have a 180 degree return and a fiberglass vent insect screen. Vent lines shall be supplied and furnished by the Contractor as required or as directed by the Engineer.

- d. Each tank shall be provided with an overflow pipe as specified and indicated on the Drawings. Contractor shall provide the overflow pipe, but tank manufacturer shall provide pipe supports. The Contractor shall provide a Flange Insert Check Valves (FIV) for the overflow.
- e. Each tank shall be provided the mounting and connecting requirements, including mounting flange diameter, required clearance between mounting flange and tank wall, and height above liquid level, shall be coordinated with the Instrument Supplier.
- f. Each tank shall be provided with flat faced flanged manway(s) with gaskets, blind flanges, and bolts that are constructed of materials resistant to corrosion by the specified chemicals as shown in the Tank Schedule. Manway covers shall be hinged.
- g. Each storage tank shall be equipped with an exterior access ladder for access to the manway. Ladders shall comply with specification 05 51 33 Metal Ladders. Ladders must be secured to the tank and secured to the concrete to allow for tank expansion/contraction due to temperature and loading changes. Use proper chemical resistant materials when anchoring to tank dome or sidewall. Ladders shall be designed to meet applicable OSHA standards.
- h. Each tank shall be provided with a minimum of four lifting lugs. Lifting lugs shall be capable of withstanding the weight of an empty tank with a safety factor of 3 to 1.
- i. Each tank shall be provided with a minimum of four tie down lugs and all necessary anchor bolts. The tank restraints shall withstand wind load or seismic load, whichever is greater, calculated in accordance with current UBC code.
  - (1) The anchor lugs shall be designed and supplied by the tank manufacturer.
  - (2) The tank manufacturer shall submit calculations, sealed by a Professional Engineer, to verify that tie-down lugs can withstand buoyancy, seismic activity, and wind load.
  - (3) The tank manufacturer shall submit calculations, sealed by a Professional Engineer, to verify that tie-down lugs can withstand buoyancy, seismic activity, and wind load.
  - (4) The Contractor shall submit calculations, sealed by a Professional Engineer, to verify that anchor bolts can withstand buoyancy, seismic activity, and wind load.
- j. J. Each tank shall be provided with a harness lug to meet the OSHA 5000-lb rating on top of the tank for safety tie-off. This lug shall be adjacent to and reachable from the ladder.
- k. The tank shall be provided with a permanently attached label providing the following information:
  - (1) Name, concentration, and specific gravity of material stored.
  - (2) Resin, cure system, and liner reinforcement for corrosion barrier layer.

- (3) Resin and cure system for structural layer.
- (4) Tank dimensions and capacity.
- (5) Maximum temperature rating of tank.
- (6) Manufacturer.
- (7) Date of manufacture.
- l. All metallic parts, fasteners, brackets, mounting hardware, and accessories provided by the tank manufacturer shall be constructed of corrosion resistant metals as specified in the Tank Schedule.
- m. Tank shall be provided with 2 inches of insulation and heating system by Chloramax Heating and Control. The insulation shall be glass fiber (ASTM C527) and designed to meet a minimum temperature of 36 degrees F in the water in the tank with an outside temperature of -10 degrees F. Wind will be 20 mph and a safety factor of 25% will be implemented.

## 2.5 PIPING SUPPORT

All piping into the tanks shall be supported such that no weight is placed on the tank or its connections.

## PART 3 EXECUTION

### 3.1 MANUFACTURER'S FIELD SERVICES

The services of a qualified manufacturer's technical representative shall be provided and shall include the following site visits for each series of tanks:

| Service                     | Number of Trips                            | Number of Days / Trips |
|-----------------------------|--------------------------------------------|------------------------|
| Installation and Inspection | 1                                          | 1                      |
| Annual Inspection           | As required for warranty.<br>Minimum of 1. | 1                      |

### 3.2 INSTALLATION

- a. The Contractor shall furnish and install the Fiberglass Reinforced Plastic storage tanks, and related items in accordance with the manufacturers' recommendations and in accordance these specifications.
- b. A manufacturer's field representative shall be on site when each tank is installed to observe installation and verify that each tank has been installed according to the manufacturer's recommendations. The manufacturer shall provide a report certifying that each tank has been installed properly.
- c. All piping, valves, fittings, conduit, wiring, etc., required to interconnect system components shall be furnished and installed by the Contractor.
- d. All metallic fasteners, brackets, mounting hardware, and accessories

located in chemical storage and feed areas shall be constructed of corrosion-resistant metals as specified in the Tank Schedule.

- e. All tanks shall be mounted on concrete pads only when demonstrated to be fully cured. Tank pad notches are required for the full drain outlet connections.
- f. The finished surface of each tank bottom shall be sufficiently flat, smooth, and free of irregularities, to prevent the possibility of tank failure from point loads or other sources.
- g. The Contractor shall install a 3/8" EPDM mat between each concrete pad and storage tank. The tanks shall be installed on level pads.

### 3.3 INSPECTION AND TESTING

- a. A 3-stage inspection process shall be performed on the tank during various stages in the fabrication process. The first inspection shall be performed at the completion of the corrosion barrier and before structural winding occurs. The second inspection will be performed after the tank is removed from the mandrel and before any nozzles are attached. The third inspection shall be a final inspection prior to shipment of the tank and shall be performed by an inspector with at least 5 years of experience with FRP vessels.
- b. Upon completion of installation of tank and prior to connecting piping, the Contractor shall provide blind flanges or other suitable plugs for all openings in the side wall of the tank, fill tank with potable water from a source approved by the Engineer and conduct a leakage test. Tank shall be filled up to the top of the straight shell and left to sit over a 5-consecutive day test period. There shall be no leakage over the test period. Leakage tests shall be repeated for any replaced or repaired tank. Upon satisfactory completion of leakage test, Contractor shall drain, thoroughly clean, and dry the tank and dispose of water in a suitable manner.
- c. Degree of surface cure shall be tested per the referenced ASTM specifications.
- d. Quality control for visual defects shall be per the referenced ASTM specifications.
- e. After the tank has completed a successful field hydrostatic test, the tank shall undergo a mechanical integrity test using Acoustical Emission Test (AE Test) in accordance with the latest version of ASTM E1067/E1067M. The Contractor shall secure the services of Non-Destructive Evaluation International (Indian Trail, NC) or an equally qualified firm to perform the AE testing. Firms shall be considered equally qualified by demonstrating the following:
  - (1) The firm shall specialize in AE testing.
  - (2) The firm shall have all the necessary equipment to perform AE testing.
  - (3) The firm shall have a minimum of five (5) years of experience in AE testing and shall provide a list of AE tests performed to demonstrate experience.

(4) The firm's testing staff shall have a minimum of five (5) years of experience with AE testing.

- f. Contractor shall provide all labor and materials necessary for completing AE testing including water to fill tanks with during testing. After testing is completed, a final report shall be submitted to the Engineer. In the event the AE test results indicate repairs are required; the tank manufacturer shall promptly repair all faulty areas of the tank as identified by the test. The tank shall then be re-tested using the hydrostatic test and the AE test. The second AE test report shall be submitted to the Engineer. Any tank failing the second hydrostatic test, or the AE test shall be removed from the project site and replaced with a new tank at no cost to the Owner. The replacement tank shall undergo hydrostatic and AE testing and shall be subject to the same acceptance criteria as the initial tank. This process shall be repeated until all tanks provided to the project pass the AE test.

### 1.3 MAINTENANCE MATERIAL SUBMITTALS

Concurrent with delivery and installation of the specified equipment, furnish auxiliary equipment and spare parts as follows:

- a. Spare parts for each different item of material and equipment specified including all of the parts recommended by the manufacturer to be replaced after 1 year service.
- b. For each machine: one extra of each part used that is made from glass, hard rubber, or clear plastic; one extra set of solution-hose connections; one extra set of diaphragms, two filler plug seal washers; two ball checks; two seats; two complete sets of all gaskets; one spare diaphragm for each back pressure regulator; one hydraulic plunger assembly for each different size metering pump; one of each type of material back pressure regulator, with three spare springs and fluorocarbon resin diaphragms for each; one spare diaphragm and air valve for pulsation dampener.
- c. For each different size of direct current motor one SCR circuit board with 12 drive motor fuses and 12 SCR controller fuses; overload replacement elements for each size and type of motor.
- d. One set of special tools for each type of equipment including calibration devices, and instruments required for adjustment, calibration, disassembly, operation, and maintenance of the equipment.
- e. Two pairs of safety goggles and/or face shields, two chemical resistant aprons, and two pairs of chemical resistant gloves in one or more wall mounted steel cases.
- f. One assembly tool for tubular diaphragm.
- g. One lever type grease gun or other lubricating device for each type of grease required.
- h. One or more steel tool cases mounted on the wall in a convenient location complete with flat key locks, two keys, and clips or hooks to hold each special tool.

#### 1.4 DELIVERY, STORAGE, AND HANDLING

Protect material and equipment delivered and placed in storage from the weather, excessive humidity and excessive temperature variation, dirt, dust, or other contaminants.

### PART 2 PRODUCTS

#### 2.1 SYSTEM DESCRIPTION

Provide a chemical feed system consisting of a chemical supply storage tank from which the chemical solution is pumped through piping or tubing, as appropriate, to the point of application. Include with each chemical feed system controlled volume pumps, tanks, mixers, gauges, back pressure regulators, strainers, pressure relief valves, sight glasses and flow metering devices, check valves, and hand valves.

##### 2.1.1 System Requirements

Select and fabricate the pumps in accordance with HI ANSI/HI 7.1-7.5 and HI 9.1-9.5 except as modified herein. Provide a pump simplex or duplex skid mounted system as noted below and in Contract Drawings. Provide pump stands and platforms adequate to support the pumping and skid system.

##### 2.1.2 Performance Requirements

Capacity and features of the chemical feed systems and accessories must be suitable for 24-hour full load service in ambient, non-freezing conditions.

##### 2.1.3 Submittal Data for Chemical Feed System

Submit manufacturer's performance charts, and pump curves. List of materials, list of equipment, including a complete list of parts and supplies with current unit prices and source of supply. List of special tools for each type of equipment furnished including special tools necessary for adjustment, operation, maintenance, and disassembly.

##### 2.1.4 Extended Warranty

provide Manufacturer's Extended Warranty to cover system components for 3 years.

#### 2.2 EQUIPMENT

##### 2.2.1 Standard Products

Provide materials and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of the products and that essentially duplicate items that have been in satisfactory use for at least 2 years prior to bid opening. Equipment must be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site. Submit Service Organization Certificates outlining their location and qualifications to the Contracting Office.

##### 2.2.2 Nameplates

Secure a plate to each major item of equipment containing the manufacturer's name, address, type or style, model or serial number, and

catalog number.

### 2.2.3 Controlled Volume Pumps

Provide the chemical feed systems in Table 1.

Table 1: Chemical Feed Pumps

### 2.2.4 Controls

Provide the chemical metering equipment with the appurtenances and accessories, as required, for flow capacity adjustment. Provide manual range adjustment on all systems.

#### 2.2.4.1 Automatic Control

Provide automatic control with the capability to vary feed rate based on signals from a flow or pH meter or controller. The pump controller shall be supplied by the manufacturer, but must be compatible with CTI Dynamic LLC control station out of Attleborough, MA for the control of the pump in automatic/hand/off modes.

#### 2.2.4.2 Manual Control

Provide non-automatic control with the capability for starting or stopping the chemical metering equipment and adjustment of the solution feed rate by the operator.

##### 2.2.4.2.1 Spare Pumps

Provide one spare pump for each model listed in Table 1. Where the pump head or internals are not compatible with the chemical, provide a spare pump head without the pump motor. The intention is to provide spare pump and if necessary interchangeable heads/internals to be compatible with the chemicals being implemented in the project, so project has redundancy without providing a spare pump for each chemical.

- a. Prominent model No. GMXA1604PVT2M000UDC0300EN.
- b. Finish Thompson model No. DB9V-E-FF-M219.
- c. Prominent model No. S2CBH07220PVTS070UD11001EN.

### 2.2.5 Drives for Controlled Volume Pumps

Provide with and drive the metering pumps by alternating current electric motor drives for chemical pumps.

#### 2.2.5.1 Electric Motor Drive

Electric motor must be of sufficient capacity to operate the chemical metering equipment under all operating conditions without exceeding their rated nameplate current or power, or their specified temperature limits. Provide motors having starting characteristics and ruggedness necessary under the actual conditions of operations or clean-up procedures used in the areas where they are located. Alternating current motors with power rating of 1/3 hp or less must be 115 volts, single-phase, 60-Hz service; motors with power rating in excess of 1/3 hp must be 460 volts, three-phase, 60-Hz service. Electrical features of direct current motors, including the ratings of the motors, must be compatible with the

capabilities and ratings of the rectifier controllers with which they are used.

#### 2.2.6 Calibration Standpipes

Provide chemical metering equipment with a calibration standpipe for measuring pump output. Note that chemical transfer pumps do not require calibration standpipes. See the Contract Drawings for more detail. The standpipe must allow convenient observation of the change of fluid level for at least 1/2 minute at full stroke and maximum speed settings, and of Schedule 80, clear PVC pipe conforming to ASTM D1785 with Schedule 80 fittings equipped with a flanged connection to the pump manifold and an end cap fitted with a PVC vacuum breaker and ball valve for air venting. The standpipe must have a clear, observable length of at least 12 inches and be permanently calibrated to allow for gph or lph readings, to allow reading of the fluid contents with an accuracy of 1 percent.

#### 2.2.7 Valves

##### 2.2.7.1 Metering Pump Valves

Equip the metering pump with adjustable internal vacuum and pressure relief valve, hydraulic oil refill valve (if required by model), and automatic air bleed valve. The relief valve must be adjustable over the full pressure range of the pump and preset at the factory.

##### 2.2.7.2 Suction and Discharge Valves

Fit suction and discharge valve cartridges with ball checks that open to full pipe diameter.

##### 2.2.7.3 Back Pressure Valve

Install back pressure regulating valve on the pump discharge and factory adjust to crack open at the indicated pressure. Provide spring opposed diaphragms with loading pressures adjustable by means of a screw in the top works. Locate back pressure valve as close to the injection point as possible.

##### 2.2.7.4 Pulsation Dampeners

Size pulsation dampeners for the displacement of each pump. Pulsation dampeners must have a diaphragm separating the upper chamber from the lower chamber. Charge the upper chamber with compressed air to 50 percent of the expected line pressure. Provide the diaphragm of molded construction and prevent the air charge from being dissolved in the process fluid. The lower chamber must be plastic or lined with inert plastic material to prevent corrosion by the process fluid. Equip the upper chamber with a tire valve type charging valve and air pressure gauge. Provide an air line and air hose with pressure regulator and hand-operated, lever-type valve suitable for charging the pulsation dampers.

#### 2.2.8 Solution Tanks

##### 2.2.8.1 Polyethylene Storage Tanks

- a. Service: Chemical storage tanks shall be suited for the following operating conditions:

- b. High Density Cross-linked Polyethylene resin used in the tank manufacture shall be Poly CL™ and shall contain ultraviolet stabilizer as recommended by resin manufacturer. Where black tanks are indicated, the resin shall have a carbon black compounded into it. The tank material shall be rotationally molded and be a resin that is commercially available at the time of tank manufacture.
- c. For sodium hypochlorite and sulfuric acid, tank resin shall include an antioxidant polyethylene system (OR-1000) with four times the antioxidant properties of a standard polyethylene bonded to the interior surface during the manufacturing process.
- d. Wall thickness for a given hoop stress is to be calculated in accordance with ASTM D 1998. In NO case shall the tank thickness be less than design requirements per ASTM D 1998.

- (1) The wall thickness of any cylindrical portion at any fluid level shall be determined by the following equation:

$$T = P \times OD/2SD \text{ or } 0.433 \times SG \times H \times OD/2SD$$

Where:

T = wall thickness, in

P = pressure, psi

SG = specific gravity, gm/cc

H = fluid head, ft

OD = outside diameter, ft

SD = hydrostatic design stress

- (a) The minimum wall thickness shall be sufficient to support its own weight in an upright position without external support but shall not be less than 0.187" thick.
- (b) **Specific Gravity for design in all tanks shall be 1.9.**
- (2) On closed top tanks the top head shall be integrally molded with the cylindrical wall. Its minimum thickness shall be equal to the thickness of the top of the straight sidewall. In most cases, flat areas shall be provided for attachment of large fittings on the dome of the tank.
- (3) The bottom head shall be integrally molded with the cylindrical wall. Knuckle radius shall be:

| Tank Diameter, ft.      | Min Knuckle Radius, in. |
|-------------------------|-------------------------|
| less than or equal to 6 | 1                       |
| greater than 6          | 1 - 1/2                 |

- (4) Tanks with 3000 gal capacity or larger shall have at least 3 lifting lugs. Lugs shall be designed for lifting the tank when empty.
- (a) Unless otherwise indicated by Contract drawings, for indoor pneumatic fill, manways shall be 24-in diameter or greater and equipped with an emergency pressure relief device or SAFE- Surge™ Manway with pressure relief at 6" water column to prevent over-pressurization. The SAFE-Surge manway shall be chemically compatible with the chemical being stored. Gaskets shall be closed cell, cross-linked polyethylene foam, Viton, or EPDM materials.
  - (b) Unless otherwise indicated by Contract drawings, for outdoor pneumatic fill, manways shall be 24-in diameter or greater and equipped with Poly Processing Company's F.S.2650® combined manway and vent to prevent over pressurization of tank. Manway must be capable of relieving a volume flow rate of up to 2650 ACFM. Gaskets shall be closed cell, cross-linked polyethylene foam, Viton, or EPDM materials.
  - (c) Unless otherwise indicated, tanks less than 2000 gallons in non-pneumatic applications shall have a manway cover 17-in or smaller of Polyethylene material with a coarse thread. The 405 gallon tanks shown on the drawings are allowed to have a 7 inch diameter, threaded cap for access. Gaskets, when required for sealing, shall be closed cell, cross-linked polyethylene foam, viton or EPDM materials compatible with the chemical being implemented.
  - (d) NOTE: Tanks must be vented to allow for performance at atmospheric pressure, in accordance with the Venting Requirements for Polyethylene Tanks matrix.

e. Tank color shall be natural.

#### 2.2.8.2 Tank Accessories

##### a. Ladder

- (1) Ladders shall comply with specification 05 51 33 Metal Ladders.
- (2) Ladder will only be provided when climb height is greater than 20 ft. Ladders must be secured to the tank and secured to the concrete to allow for tank expansion/contraction due to temperature and loading changes. Use proper chemical resistant materials when anchoring to tank dome or sidewall.
- (3) All ladders shall be designed to meet applicable OSHA standards.

##### b. Restraint System (See Tables 2 and 3):

- (1) Metal components to be stainless steel and tension ring with stainless steel cables and clamps.
- (2) Tank restraint system shall be supplied and the design of same certified by a Structural Engineer registered in the State of tank installation. Design shall conform to the most recent edition of the IBC code for seismic and wind load. Anchor bolts

as required by the calculations shall be supplied by the general contractor.

c. Heat Tracing (See Tables 2 and 3)

(1) Heat tracing system for temperature maintenance shall be SilcoPad® tank heating systems, designed to maintain a desired product temperature, not to exceed 100 degrees F. Each system shall include tank heating pads and a temperature controller. The quantity and type of SilcoPad® is determined by the size of the tank, the desired temperature maintenance and environmental conditions. Systems shall be able to provide a delta of 60 degrees F. Tanks are supplied with the heating panels and a controller installed by Poly Processing Company. Power supply to be the only field installation required.

(a) Pads to operate on 120 vac single phase with a maximum power density of 0.5 watts / sq. inch.

(b) Silicone pad heaters must fully comply with Article 427-23(b) of the National Electric Code.

(c) Tank shall be supplied with a 2XTC Microprocessor based tank heating controller. Controller shall have high-limit protection, High temperature, Low temperature, and low current alarms, and a 4-20mA retransmission output. Controller shall have LED's on the face for alarm indications.

d. Insulation: The tanks shall be insulated to maintain the desired temperature. See Tables 2 and 3 for those tanks that require insulation.

(1) Insulation used shall be polyurethane foam with a density of 2.5 lb/ft<sup>3</sup> with a minimum an "R" value of 6.3/in. The foam shall be applied with a nominal thickness of 2" to the external tank surfaces except the tank bottom.

(2) Upon completion of application and curing of the insulation, 2 full coverage coats of latex mastic coating shall be applied to the surface of the insulation in such manner as to seal the insulation from the outside environment.

2.2.8.3 Tanks

a. See Tables 2 and 3 per the following specifications.

Note 1: Approximate overall height is measured along the straight cylindrical portion of the tank and includes the dome top.

b. Fittings

(1) Tank fittings shall be according to the fitting schedule. Threaded fittings shall use American Standard Pipe Threads. If tanks are insulated, fittings shall be installed at the factory prior to application of the insulation.

(2) Bolted flange fittings shall be constructed of one 150 lb. flange with ANSI bolt pattern, one flange gasket and stud bolts with

gaskets. Stud bolts to have chemical resistant polyethylene injection molded heads and gaskets to provide a sealing surface between the bolt head and the interior tank wall. Stud bolt heads are to be color coded for visual ease of identifying the bolt material by onsite operators. Green- 316 Stainless Steel, Black- Titanium, Red- Alloy C-276, Blue- Monel. All materials shall be compatible with chemical service and as indicated in the fitting schedule above. EPDM or Viton GF gaskets shall be supplied as required based on the chemical.

- (3) For sodium hypochlorite and sulfuric acid storage, Bolted One-Piece Sure Seal (B.O.S.S.), double flange fittings constructed of virgin polyethylene shall be supplied. Bolts will be welded to a common backing ring and encapsulated with polyethylene preventing fluid contact with the metal material. Flange will have one full face gasket to provide a sealing surface against inside tank wall. All materials shall be compatible with chemical service and as indicated in the fitting schedule above.
- (4) Down Pipes and Fill Pipes: Down pipes and fill pipes shall be supported at 6-ft max intervals. Down pipes and fill pipes shall be PVC or material compatible with the chemical stored.
- (5) U-Vents: Each tank must be vented for the material and flow and withdrawal rates expected. Vents should comply with OSHA 1910.106(F)(iii)(2)(IV)(9). U-vents shall be sized by the tank manufacturer and be furnished complete with insect screen if required in accordance with the venting schedule listed above.
- (6) On dual wall tank(s) greater than 1000 gallons, bottom fitting(s) must be designed to maintain 110% secondary containment integrity. Bottom containment fitting must include PTFE expansion joint designed to accommodate movement of primary tank in design accordance with ASTM-D 1998 tolerances. All secondary containment fittings and parts shall be resistant to chemical fume corrosion. Fitting shall include the option to connect a secondary containment pipe over primary pipe.
- (7) All fittings on the 1/3 lower sidewall of tanks with capacities > 1000 gallons shall have 100% virgin PTFE Flexijoint® expansion joint. Expansion joint to have 3 convolutions, stainless steel limit cables, FRP composite flanges and meet the following minimum performance specifications. Galvanized parts will not be accepted.

Expansion joints to meet the following minimum performance requirements:

Axial Compression greater than or equal to 0.67"

Axial Extension greater than or equal to 0.67"

Lateral Deflection greater than or equal to 0.51"

Angular Deflection greater than or equal to 14"

Torsional Rotation greater than or equal to 4"

#### 2.2.8.4 Factory Testing

##### a. Material Testing

- (1) Perform gel and low temperature impact tests in accordance with ASTM D 1998 on condition samples cut from each polyethylene chemical storage tank.
- (2) Degree of Crosslinking. Use Method C of ASTM D 1998- Section 11.4 to determine the ortho-xylene insoluble fraction of cross-linked polyethylene gel test. Samples shall test at no less than 60 percent.

##### b. Tank Testing

- (1) Dimensions: Take exterior dimensions with the tank empty, in the vertical position. Outside diameter tolerance, including out-of-roundness, shall be per ASTM D 1998. Fitting placement tolerance shall be +/- 1/2-in vertical and +/- 1 degree radial.
- (2) Visual: Inspect for foreign inclusions, air bubbles, pimples, crazing, cracking, and delamination.
- (3) Hydrostatic test: Following fabrication, the bottom tanks, including inlet and outlet fittings, shall be hydraulically tested with water by filling to the top sidewall for a minimum of 1 hour and inspected for leaks. Following successful testing, the tank shall be emptied and cleaned prior to shipment.

Table 2: Chemical Tanks

Table 3: Tank Accessories

#### 2.2.9 Pressure Gauges

Provide diaphragm type gauges with Bourdon tube and diaphragm compartments filled completely with oil, and made of materials suitable for the application. Install diaphragm seals at each gauge connection to isolate gauges from corrosion, sludge or other hazards of the process fluid. Provide seal material that is compatible with the oil in the gauge and the process fluid.

#### 2.2.10 Mixers and Injectors

##### 2.2.10.1 Static Mixer

Provide a tab style static mixer manufactured by Westfall Manufacturing. Mixers shall be manufactured from fiberglass material and rated for the pressure of the application.

##### 2.2.10.2 Injectors

Introduce injectors for chemical solution into the pipeline mains by means of a CPVC plastic injection nozzle, or by means of a suitable diffuser tube inserted through a corporation cock. Construct the device for introducing the solution into a pressure main in such a way that accidental breakage of discharge hose or tubing does not cause water to escape from the pipeline, and allows disassembling of the unit without leakage. Injectors shall be manufactured by Saf-T-Flo and rated for the

pressure of the application.

#### 2.2.10.2.1 Sample Waste Pump and Tank

Provide sample waste pump model 730EnN drive with 720 R pumphead and controls for pumping analyzer waste to the sanitary sewer drain. Provide 19 mm diameter hose. Pumps capacity to be 30 psig. Pump shall be provided with a control panel to control the speed of the pump based on the level of water in the associated waste tank. Waste tank to be 10 gallons size and provided with a connection to supply water to the waste pump and inlet collection line.

#### 2.2.11 Piping

##### 2.2.11.1 Backflow Preventor

Provide backflow prevention devices or air gaps on tank fill lines in accordance with NAPHCC NSPC.

##### 2.2.11.2 Chemical Solution Piping

Incorporate provisions to allow solution piping to be conveniently and safely bleed off trapped air and minimize infiltration of air bubbles. Provide chemical solution piping in accordance with Section 40 05 13 PIPELINES, LIQUID PROCESS PIPING.

##### 2.2.11.2.1 Smaller than 1 inch Diameter

Chemical solution piping smaller than 1 diameter must be braided PVC tubing rated for 250 psig by Kuri-tec. Make joints for tubing using a clamp-type mechanical coupling.

##### 2.2.11.2.2 Piping 1 inch Diameter or Greater

Chemical solution piping of 1 inch diameter or larger must be CPVC pipe conforming to ASTM F441/F441M, sch. 80

#### 2.2.12 Electrical Work

Provide electric motor-driven equipment complete with motor, motor starter, and controls. Provide electrical equipment and wiring in accordance with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Implement hazard classifications in accordance with NFPA 70.

##### 2.2.12.1 Motor Starters

Provide motor starters complete with thermal overload protection and other appurtenances necessary for the motor control specified.

##### 2.2.12.2 Control and Protective Devices

Provide manual or automatic control and protective or signal devices required for the operation and any control wiring required for controls and devices. Provide motor controls conforming to NEMA ICS 1 or NEMA ICS 2. Prewire equipment to the maximum practicable extent. Control cabinets must conform to the requirements of UL 50, NEMA 250, Type 4X.

#### 2.2.13 Equipment Appurtenances

Provide PTFE coated steel, cadmium plated or Type 316 stainless steel bolts, nuts, anchors, washers and all other types of supports necessary for the installation of the equipment.

#### 2.2.14 Factory Painting

Factory painting must conform to manufacturer's standard factory finish, provided it does not discolor in the presence of hydrogen sulfide fumes, high water vapor atmosphere, alkaline water vapor, and concentrated chlorine (oxidizing) conditions. Coating must be at least 1.75 mils thick.

#### 2.2.15 Factory Test Report

Factory examine fiberglass tanks in accordance with ASTM E1067/E1067M prior to shipping. Furnish a copy of the corresponding test report with each tank.

### 2.3 MATERIALS

Submit Safety Data Sheets in conformance with ANSI Z400.1/Z129.1 for each chemical. Provide a 90 day supply at the maximum pumping rate for each feeder or pair of duplexed feeders. Submit two copies of certification stating that each supplied chemical meets the following requirements.

#### 2.3.1 Acids

Sulphuric (sulfuric acid).

Sulfuric acid for ultrafilter cleaning procedures, citric acid for ultrafilter cleaning procedures, Kleen MTC 113 or similar for RO CIP procedures.

#### 2.3.2 Bases

AWWA B501 caustic soda for ultrafilter cleaning procedures, AWWA B501 for continuous injection, Kleen MTC405 or similar for RO CIP procedures.

#### 2.3.3 Disinfecting Agents

AWWA B300 hypochlorites. 2.3.4 Miscellaneous

Sodium bisulfite for continuous injection, antiscalant Hypersperse MDC714 or similar for continuous injection, sodium bisulfite for ultrafilter cleaning procedures.

## PART 3 EXECUTION

### 3.1 EXAMINATION

After becoming familiar with details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy before performing the work.

### 3.2 INSTALLATION

Submit detail drawings containing complete piping, wiring, schematic, flow diagrams, and any other details required to demonstrate that the system

has been coordinated and properly functions as a unit. On the drawings show proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for installation, maintenance and operation.

### 3.2.1 Chemical Feeding Equipment

Install controlled volume pumps, equipment, and appurtenances to provide a complete and integrated system in accordance with the instruction of the manufacturer and under the direct supervision of the manufacturer's representative.

### 3.2.2 Field Painting

Thoroughly clean, prime and top-coat factory painted items requiring touching up in the field with the manufacturer's standard factory finish provided it does not discolor in the presence high water vapor atmosphere, alkaline water vapor, and concentrated chlorine (oxidizing) conditions. Paint the equipment which did not receive a factory finish as specified in Section 09 90 00 PAINTS AND COATINGS. Coating must be at least 1.75 mils thick. Provide piping identification as specified in Section 09 90 00 PAINTS AND COATINGS. Mark pipe carrying materials not listed in Section 09 90 00 PAINTS AND COATINGS in accordance with ASME A13.1.

### 3.2.3 Framed Instructions

Submit framed instructions for approval prior to postings. Final size must be easy to read by operators 5 feet from instructions. Limit frame size to 11" x 17" size provide multiple frames if needed. Post framed instructions, containing wiring and control diagrams, where directed. Post condensed operating instructions as outlined in paragraph 3.4.2 Operating Instructions. Post the framed instructions before acceptance testing of the systems.

## 3.3 FIELD QUALITY CONTROL

### 3.3.1 Testing

After installation of each controlled volume pump, carry out operating tests as specified below to assure that the chemical metering installation operates properly. If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests. Submit reports of all tests in booklet form prior to final acceptance of the installation. Show all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of the installed system. Indicate in each test report the final position of controls.

#### 3.3.1.1 Tank Testing

Clean tanks of loose debris and dry prior to testing. Field test tanks for leaks or damage in shipment. Hydrostatically test tanks to detect large leaks and then with the specified chemical to detect small leaks. Test each tank with its solution for a period of 24 hours at which time no visible leakage is evident. Supply all pipes, hoses, pumps, water, power and other equipment required to convey the test liquids and to carry out the tests. Repair damage or leaks in tanks or replace tanks. Replace damaged ceramic tanks.

#### 3.3.1.2 Controlled Volume Pumps - Operational Tests

Test pumps to demonstrate that the pumps are capable of operating without vibration or leakage. Perform testing at the pump's maximum flow rate and at half the flow rate. Demonstrate testing while controlled and operated in all feasible modes with the pumps operated singly and in unison. Plot the response of each pump on curves for the various operating pressures encountered and the results compare to the curves shown on the manufacturer's published pump data. If control characteristic curves are not available at the time of testing, the pump manufacturer's service engineer must generate such curves for each pump; graphically depicting the pump displacement at 25, 50, 75, and 100 percent of motor speed for SCR equipped pumps, and at 25, 50, 75, and 100 percent of maximum stroke position for all pumps. Generate curves only for the specified back pressure. Chemical can be recycled back to the bulk tank. If chemical cannot be safely handled, the general contractor and request from the Engineer to use water instead of the chemical of interest.

#### 3.3.1.3 System Pressure Tests

Carry out tests at system pressure. Manually control back pressure valves for this testing, and reset as necessary after testing. The time to deliver a given quantity of chemical at a given stroke and speed setting must be the same at all pressures.

#### 3.3.1.4 Flow Tests

Test pumps to demonstrate zero gpm flow at a zero stroke or speed setting. Failure to meet this test is cause for rejection. Test pumps through full range of performance. Submit test results to prove pump functions within specified system parameters.

#### 3.3.1.5 Synchronization Tests

Operate the pumps for a period of 4 hours to demonstrate that the double diaphragm systems do not lose their synchronization. Loss of synchronization is also cause for rejection; repair or replace the pump as necessary to achieve synchronization. Fully retest repaired or replaced equipment.

#### 3.3.2 Chemical Waste

Neutralize chemicals wasted during testing procedures to achieve a pH value between 6.5 and 9.5 and a chlorine concentration of not more than 1 percent (10,000 mg/L). Route all chemicals wasted during testing procedures to the sanitary sewer at a rate that the process can assimilate without upset.

#### 3.3.3 Manufacturer Field Service

Provide the services of a manufacturer's representative who is certified by manufacturer in the installation, adjustment, and operation of the equipment specified. The representative must supervise the installation, adjustment, and testing of the equipment. Submit certificates to Contracting Officer for approval.

### 3.4 CLOSEOUT ACTIVITIES

#### 3.4.1 FIELD TRAINING

Conduct a field training course for designated operating, maintenance and supervisory staff members. Provide training for a total period of 8 hours of normal working time and start after the system is functionally complete but prior to final acceptance tests. Cover all of the items contained in the Operating and Maintenance Instructions during field training.

#### 3.4.2 Operating Instructions

Submit complete copies of operating instructions outlining the step-by-step procedures required for system startup, operation and shutdown. Include in the instructions the manufacturer's name, model number, service manual, parts list, and brief description of all equipment and their basic operating features. Also include in the instructions as-built drawings of the piping layout, equipment layout, simplified wiring and control diagrams of the system as installed, and flow diagrams.

#### 3.4.3 Maintenance Instructions

Submit complete copies of maintenance instructions listing routine maintenance procedures, possible breakdowns and repairs, and trouble-shooting guides.

Notes

- \* Two 3-inch openings for the following source waters: 1.) heating recirculation, and 2.) neutralization recirculation.
- \*\* Overflow tank will receive the overflow from the bulk tank have a vent and be provided with a 1-inch flanged connection to accept a level and accessories. The float in the tank will alarm the facility. In the case of the CIP tank, it will shut down the CIP loop and/or the plant.

SECTION 46 64 30

TEMPORARY ASW PUMP STATION  
**11/24**

PART 1 GENERAL

1.1 SUMMARY

This Section specifies the temporary ASW pump station equipment and components including associated testing.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" classification. Submittals not having a "G" classification are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Sequence of Construction; G, AE

SD-02 Shop Drawings

System Coordination; G, AE

General Arrangement and Dimensional Drawings for Pumps, Piping Systems, Cooling Water Intake Structure, and associated equipment and components; G

SD-03 Product Data

TEMPORARY ASW SYSTEM; G, AE

Submittal Package to be inclusive of the following items:

- (a) Cooling Water Intake Structure
- (b) Airburst Backwash System
- (c) Pumps
- (d) Y-Strainer
- (e) Motors
- (f) Gate Valves
- (g) Butterfly Valves
- (h) Check Valves
- (i) Air and Vacuum Valves
- (j) Pressure Relief Valve
- (k) Pressure Gauges
- (l) Magnetic Flow Meter
- (m) Pressure Transmitter
- (n) Pressure Switches
- (o) Stem Covers
- (p) Discharge Piping
- (q) Hard Piping
- (r) Fittings and Flanges
- (s) Bolts, Nuts, Washers and Fasteners
- (t) Gaskets
- (u) Unions
- (v) Pipe Hangers, Inserts, and Supports
- (w) Insulation and Heat Tracing
- (x) Electrical Equipment
- (y) Controls
- (z) Field Testing and Commissioning Procedures

SD-06 Test Reports

Temporary ASW System Performance; G, AE

Field Quality Control and Commissioning; G, AE

SD-07 Certificates

Manufacturer's Representative; G, AE

Pumps; G, AE

Gate Valves; G, AE

Butterfly Valves; G, AE

Check Valves; G, AE

Air and Vacuum Valves; G, AE

Pressure Relief Valve; G, AE

Magnetic Flow Meter; G, AE

Pressure Transmitter; G, AE

Piping; G, AE

Fittings and Flanges; G, AE

Bolts, Nuts, Washers and Fasteners; G, AE

Gaskets; G, AE

Union; G, AE

1.4 QUALITY ASSURANCE

1.4.1 Manufacturer Services

Provide the services of a manufacturer's representative experienced in the installation, adjustment, and operation of the equipment specified. The representative must supervise the installation, adjustment, testing of the equipment, and conduct training.

Submit the names and qualifications of the manufacturer's representative and training engineers and written certification from the manufacturer that the representative and trainers are technically qualified.

1.4.2 Standard Products

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacture of such products and that essentially duplicate equipment that has been in satisfactory operation at least 2 years prior to issuance of this solicitation. Support equipment with a service organization that is reasonably convenient to the jobsite. Pumps and motors of the same types must each be the product of one manufacturer.

#### 1.4.3 Conformance with Agency Requirements

Where materials or equipment are specified to be an approved type, attach the seal or label of approval from a nationally recognized testing agency, adequately equipped and competent to perform such services. A written certificate from the testing agency must accompany the materials or equipment and be submitted stating that the items have been tested and that they conform to the applicable requirements of the specifications and to the standards listed herein. The certificate must indicate the methods of testing used by the testing agency. In lieu of a certificate from a testing agency, published catalog specification data, accompanied by the manufacturer's certified statement to the effect that the items are in accordance with the applicable requirements of the specifications and the referenced standards, will be considered and may be acceptable as evidence that the items conform with agency requirements.

#### 1.5 DELIVERY, STORAGE, AND HANDLING

Protect equipment, delivered and designated for storage, from the weather, humidity and temperature variations, dirt and dust, or other contaminants.

### PART 2 PRODUCTS

#### 2.1 SYSTEM DESCRIPTION

A Temporary ASW Pumping System will be required to bypass the existing ASW and CWIS system, and will be considered as a single, standalone package, encompassing all components required meet NDPES permit requirements and performance requirements. The delegated design, selection, installation, performance testing, training, maintenance, monitoring, repair and subsequent demolition of the Temporary ASW System will be the responsibility of the Contractor. Operation of the Temporary ASW System will be provided by NAVSEA Code 984 and Shop 99DD. The contractor must provide initial training to NAVSEA personnel for system operation, and maintain operational capability of the Temporary ASW System at all times between decommissioning and recommissioning of the permanent ASW system unless there is an approved outage. Any outage associated with maintenance or repair of the Temporary ASW System must be coordinated with Code 984 and follow the outage request procedures outlined in paragraph 1.4 of Section 01 14 00.00 22 Work Restrictions.

##### 2.1.1 System Coordination

Submit drawings containing complete wiring and piping schematic diagrams and any other details required to demonstrate that the system has been coordinated and will properly function as a unit. Show the proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of the work including clearances for maintenance and operation. Provide a complete listing of equipment, materials and miscellaneous components including mechanical seals, bearings, and couplings.

##### 2.1.2 Safety Requirements

Fully enclose or guard couplings, projecting set-screws, keys, and other rotating parts, that pose an entangling hazards.

### 2.1.3 General

All pumps must conform to the standards of the Hydraulic Institute with respect to nomenclature, composition, construction, dimensions, tolerances, safety, operating characteristics, performance, quality, rating, testing, and related items. Drives and intermediate shafting and appurtenances must be provided by the pump manufacturer.

## 2.2 MATERIALS AND EQUIPMENT

### 2.2.1 Nameplates

Securely affix a standard nameplate to pumps and motors in a conspicuous place showing the manufacturer's name, address, type or style, model, serial number, and catalog number. In addition, for each pump show the capacity in gpm at rated speed in rpm and total head in feet of water. For each electric motor show at least the minimum information required by NEMA MG 1. Show such other information as the manufacturer may consider necessary to complete identification on the nameplate. Pumps must be listed and labeled by UL.

### 2.2.2 Pump Characteristic

Operate pumps at optimum efficiencies to produce the most economical pumping system under the conditions encountered and size to make optimum match with the system head curve as shown. Pumps must furnish not less than 150 percent of rated capacity at a total discharge head of not less than 65 percent of total rated head. The shutoff total head must not be greater than 120 percent of total rated head. Operate pumps at specified system fluid temperatures without vapor binding and cavitation. Operate pumps to HI ANSI/HI 9.6.3 standard for Preferred Operating Region (POR).

### 2.2.3 Equipment Data

Submit catalog information, certified pumps curves, rated capacities, final impeller dimensions, and accessories provided for the product indicated. Indicate operating point of each pump on curves. Furnish pump curves for each pump and combination of pumps designed to operate in parallel. The pump curve must show as a minimum; bhp, flow, total dynamic head, efficiency, NPSH, impeller diameter and system curve (individually and in combination for each pump operating in a parallel application). Select pumps operating in parallel operation to cross the system curve when operating individually.

## 2.3 TEMPORARY ASW SYSTEM

### 2.3.1 Cooling Water Intake Structure

The temporary intake system components and equipment shall be furnished as a complete integrated system by one manufacturer to ensure a properly designed and integrated intake system.

System shall be designed for hydrostatic load depth of 30 feet and collapse rate of 13 psi. Install at an elevation of -11.5 feet (NAVD88) or lower, to meet all low tide conditions.

Intake Screens assembly shall be horizontal orientation, of all-welded continuous slot construction and shall be designed for air flushing of screen surface for debris removal. Equipment manufacturer shall maintain

an ongoing quality assurance program, including ISO-9000 certification. All welders shall maintain certification to ASME Section IX. Copies of certification shall be provided upon request. The single manufacturer supplying this equipment shall be able to furnish proof of at least 5 installations and 10 years of manufacturing equipment of similar technology.

Manufacturer shall submit a complete and detailed pre-submittal package containing the below information:

- a. Detailed layout drawings.
- b. Supporting flow distribution data via a CFD (Computational Fluid Dynamics) analysis.
- c. Weld certifications.
- d. Evidence of a recognized ongoing quality assurance program.
- e. Detailed component specifications and catalog cuts as required.
- f. Detailed list of all variations required from the original design if an alternate screen is used, referencing appropriate sections of the specifications and locations on the drawings.

#### 2.3.1.1 Capacity and Strength

Intake assembly capacity shall be 950 GPM at a maximum through-slot velocity, as a result of water withdrawal, of 0.35 feet per second. The corresponding average through-slot velocity shall be 80-90 percent of the maximum velocity. The hydraulic design of this system is based on this maximum headloss - screens that exceed this headloss are not acceptable. The manufacturer's clean screen assembly headloss shall be stated in the bid documents.

Total intake assembly of 1900 GPM shall be handled by two horizontal screens of intake drum screen assembly.

Evidence of the intake assembly capacity and flow distribution shall be proven by a Computational Fluid Dynamic (CFD) analysis, supplied by the manufacturer. The CFD Analysis Method must be verified by actual physical testing.

Intake assembly shall be designed to a maximum 4.33 psi negative pump pressure or differential headloss. Design stress used for determining strength of the assembly shall be no more than 90 percent of the published yield strength of the material used. Strength calculations verifying compliance with these criteria shall be provided upon request.

#### 2.3.1.2 Construction and Slot Opening Size

Intake screen surface wire #69, support beam and stiffener structure shall be an all-welded matrix designed to provide the specific strength with minimal interference with the through screen flow pattern.

End plates and tee body shall be a minimum of 0.105 inches thick. All structural butt welds shall be full penetration fillet welds and shall be the thickness of the thinner component.

Screen slot size shall be 0.8 mm. The open area for this slot opening shall be 30.73 percent. Slot size shall be controlled and continuously monitored during manufacture.

For slot openings of 0.040-inch through 0.100-inch the mean slot size shall be within +/- 0.002-inch with a standard deviation no greater than 0.002-inch throughout the assembly.

For slot openings greater than 0.100-inch the mean slot size shall be within +/- 0.003-inch with a standard deviation no greater than 0.003-inch throughout the entire assembly.

Intake Screen shall be manufactured of 70-30 copper nickel material.

#### 2.3.1.3 Intake Screen Butterfly Valves

Butterfly valves for intake screens shall be triple offset design with sealing elements to provide zero leakage through non-rubbing 90-degree rotation. Valve shall be suitable for sea water applications, designed to ISO 5752, API 609 and ASME B34. Flanges shall be per ASME B16.5, ASME B16.47. Pressure rating Class 150, temperature range minus 76 degrees F to 842 degrees F. Metal seal ring in Duplex and highly wear-resistant seat shall ensure prolonged superior tightness. Asymmetric design and disparate torque shall ensure tightness in both directions.

Valves must be electrically actuated but shall also include manual top-side handwheels.

##### 2.3.1.3.1 Butterfly Valve Materials

- a. Body: Double flanged, Super Duplex stainless steel.
- b. Disc: Stainless steel ASTM A351/A351M.
- c. Weld surfacing on seat: Stellite Grade 21.
- d. Shaft: ASTM A479/A479M Type XM19.
- e. Packing: Graphite
- f. Bolts and Nuts: ISO 3506 A4 (AISI 316).
- g. Packing and Bottom Flanges: ASTM A240/A240M Type 316.
- h. Bracket: Carbon steel.

##### 2.3.1.3.2 Electric Actuator

Provide quarter-turn electric actuators for intake screens butterfly valve control. The actuator shall be compact and reliable in operation, with high torque output. Actuators shall utilize double reduction worm gear drives - bronze worm gears and alloy steel worms for self-locking with minimum backlash. Motor shall be with Class F insulation, and built-in thermals for motor protection. Actuator shall have 7-10 watt space heater to prevent condensation. Operators shall be AWWA C542 complaint. Mount valve actuator on a floor stand.

#### 2.3.1.3.3 Enclosure

Enclosure shall be waterproof, IP67, NEMA 4, suitable for submersible and hazardous operation. Materials shall be high grade aluminum alloy with corrosion resistant polyester coating, and internally and externally anodized casing. The main housing cover shall be spigot tapper, fitted with captive bolts for removal. Inside the enclosure electrical and mechanical design shall be color-coded for easy maintenance. Limit switch settings can be adjusted without disturbing other switch settings.

#### 2.3.1.3.4 Controls

Local Control Units (LCU) shall provide a way to check actuator status and control operation. Controls shall have two selector switches: Open/Close and Local/Off/Remote. Provide continuous mechanical position indicator with large window display. LED display shall indicate valve positions: Open, Close, Remote, Fault, Power On. Supply with control transformer 110V/230V.

Proportional Control Unit (PCU) shall have control (input) and feedback (output) of valve position for modulating service. Provide manual handwheel with declutching mechanism for emergency manual operation.

#### 2.3.1.3.5 Rigid Rod System

Rigid rod system shall be used for remote valve operation. Gear boxes or swivel gear joints shall be provided to accommodate bends. Materials shall be high grade bronze and stainless steel, suitable for sea water applications. System components shall be low maintenance, gear boxes shall be sealed for life.

#### 2.3.1.3.6 Delegated Design

Contractor is responsible for design and selection of the remote valve rigid rod components based on the valve size, operating speed, operating torque, transmission system losses, and as recommended by the system manufacturer.

#### 2.3.1.4 Emergency Bypass

The intake screen shall include an emergency bypass with a minimum 1 inch by 2 inch trash rack.

#### 2.3.1.5 Structural Support

The intake screen must be structurally independent of seawall. Structure must be supported by floating rack and may be secured to existing bollards on Berth. No modifications to the seawall are permitted.

The screen manufacturer is responsible for the design the intake support system.

#### 2.3.2 Airburst Backwash System

Intake screen supplier shall provide, as part of the overall temporary intake screen system, an air backwash system designed to remove debris from the screen surface by delivering a suitable volume of compressed air to the inside of the screen body. The exiting air shall scour the screen surface to maintain adequate design flow and through slot velocity

characteristics.

The backwash system shall consist of an integrated system of compressor, receiver tank, valves and control panel. All components shall be skid mounted and arrive on site ready to operate. Any system provided requiring field assembly and not ready to operate shall not be acceptable.

Compressed air lines after the air compressor serving the intake structure shall be 70-30 copper nickel Class 700 with socket weld joints. The compressor shall be a reciprocating type, 5 HP pressure lubricated, and shall be sized to recover from each backwash in 15 minutes. The receiver shall be a 120 gallon horizontal receiver, ASME coded for 200 psig, sized for the system piping and to displace three screen volumes of air at the screen in 3-5 seconds during a backwash to provide suitable debris removal and cleaning. The receiver shall be equipped with a 4-inch isolated pressure gauge, safety valve and automatic drain valve. The system shall include one butterfly valve rated at 200 psi with standard ANSI class 125/150 flanges. There shall be one valve per screen and shall be sized to match the tank flange and the backwash piping.

The above butterfly valve must be provided with a pneumatic actuator with direct mounted solenoid valves, position indicator and position switches. The system must include a suitably size air receiver interconnected and charged by the main receiver to allow valve operations.

A NEMA 4X control panel shall be included that will contain as a minimum, the motor starter for the compressor, control power transformer and a relay logic to perform the specified control functions.

Controls shall allow timed automatic or manual initiated air cleaning cycles. A cycle consists of cleaning all intake system screens. The control system included shall allow a full week duration of programmed Hydroburst cycles.

Contractor shall provide all interconnecting piping and control wiring between the intake screen assembly and the Hydroburst air backwash system.

#### 2.3.3 Pumps

Provide (2) temporary trailer-mounted suction lift pumps capable of pumping a minimum of 950 GPM at 260 ft Total Dynamic Head in lead-standby operation, for seawater intake application.

Pumps should be self-priming and all design, installation, operation, and maintenance of the system is the responsibility of the contractor.

#### 2.3.4 Y-Strainer

Strainer shall meet ASTM F1199, and shall be the cleanable "Y" type, the same size as the pipeline. Strainer bodies shall be fabricated of cast or forged 316 stainless steel with bottoms drilled, and tapped. Provide blowoff outlet with pipe nipple, gate valve, and discharge pipe nipple. The bodies shall have arrows clearly cast on the sides indicating the direction of flow. Y-strainers to be blown off weekly to prevent clogging.

Provide strainer with removable cover and sediment screen. The screen shall be made of minimum 22 gauge corrosion-resistant steel, with small perforations numbering not less than 400 per square inch to provide a net free area through the basket of at least 3.30 times that of the entering

pipe. The flow shall be into the screen and out through the perforations.

#### 2.3.5 Gate Valves

All gate valves 12 inches and smaller must be manufacturer's standard pattern flanged unless otherwise indicated, resilient seated, outside screw and yoke, rated at 225 psi working pressure at temperatures between 0 to 66 deg C (32 to 150 deg F). The valve body, bonnet, bonnet yoke, gland, and wedge must all be cast bronze meeting ASTM B61. The gasket must be constructed of synthetic rubber, packing of Teflon, and seat ring of cast bronze conforming to ASTM B505/B505M. The gate must be fully supported throughout travel by an integrally cast tongue and groove fit between it and the valve body. All gate valves must open by turning counterclockwise and be handwheel operated.

#### 2.3.6 Butterfly Valves

All butterfly valves 2 inches and larger, must be manufacturer's standard pattern, lugged to typical ANSI Class 150 flanges, and resiliently seated. The valves must be rated for a working pressure of 200 psi at temperatures between -29 to 121 deg C (-20 to 250 deg F). The valves must be designed for use in salt water. The body must be constructed of bronze conforming to ASTM B61. The shaft and disc must be constructed of Monel conforming to ASTM B164 Class A and ASTM A494 M30C respectively. The seat and seals must be constructed of Buna N. Butterfly valves must also be operated by manual locking hand levers.

All lugged butterfly valves must be equipped with custom fabricated flange spacers constructed of 1.125 inch thick Type 316 stainless steel plate conforming to ASTM A240/A240M. The fabricated flanged spacers must be drilled to conform with an ASME B16.5 bolt pattern. One spacer must be added to each side of the lugged butterfly valve to allow the internal disc to open properly when used with polypropylene piping.

#### 2.3.7 Check Valves

The check valves on the ASW Pump System discharge piping must be of swing check type designed to allow flow forward and downstream of the pump, but disallow flow reversal. The valves must be Class 150 flanged and rated for a 225 psi WOG.

The check valves must be designed for use in salt water and to take the full thrust from the Vertical Turbine Pump at shut-off head. The body, cap, and lever must be bronze conforming to ASTM B61.

The disc must be a nickel copper alloy conforming to ASTM B494 GR M30-C. The lever plug, pin, disc nut, washer, and cotter pin must be a nickel copper alloy conforming to ASTM B164. The gasket must be of synthetic rubber type conforming to MIL-R-1149D.

The manufacturer of the check valves must have been regularly engaged in the design and manufacture of the swing check valves for at least five (5) years and submit at least five (5) similar installations in service for a minimum of five (5) years.

#### 2.3.8 Air and Vacuum Valves

The air valves for the ASW Pump System must vent large quantities of air thru the orifice when the pump starts, close tight when liquid enters, and

permit large quantities of air to re-enter thru the orifice when the pump stops to prevent a vacuum from forming in the pump discharge column.

The body and cover must be fabricated of cast iron, conforming to ASTM A126, Gr. B. The baffle must be cast iron, conforming to ASTM A48/A48M and must shield the float from direct impact of air and water to prevent premature float closure. The seat must be Buna-N and slip fit into the baffle or cover and lock in place without any distortion, but be easily removable. The float must be Type 316 stainless steel center guided for positive seating and rated for 1000 psi non-shock service. The entire float and baffle assembly must be shrouded with a brass water diffuser, conforming to ASTM B16, to prevent water from slamming the float shut. The outlet of the valve must be flanged and piped as shown on the Drawings. The interior of the valves must be protected by a factory applied epoxy coating resistant to salt water with a dry film thickness of 10 mils. The exterior of the valves must be factory primed with two coats of phenolic red oxide primer, compatible with the finish painting as specified under 09 90 00 PAINTS AND COATINGS.

#### 2.3.9 Pressure Relief Valve

A 3-inch Pressure Relief Valve must maintain constant upstream pressure by by-passing or relieving excess pressure and must maintain close pressure limits without causing surges. The valve must be of the control globe type and must be capable of operating at a pressure of 120 psi with a differential pressure of 106 psi and must be adjustable. The valve body must be stainless steel with 150 lb flanged ends, single seat, unbalanced with cage retained seat, full port, trim must be stainless steel and equal %, EPDM packing, and PEEK bearings. The valve must be equipped with an electric actuator with a control signal of 4-20 mA CL, 115 VAC, IP 67 with heater, and a capacitive fail safe mode to be able to open with a loss of power or signal. The inlet and outlet of the valve must be flanged and piped as shown on the Drawings.

#### 2.3.10 Pressure Gauges

Each pressure gauge must be liquid filled with open front design and must be suitable for bottom stem mounting. The Bourdon tube must be phosphor bronze with brass socket. Each gauge must be 3-1/2 inches in diameter, must have a phenolic or nylon gauge case and must have graduated markings for every 1 or 2 psi. Gauge accuracy must be +/- 1.0 percent of span, ASME B40.100, Grade 1A.

- a. Each gauge must be furnished and installed with a diaphragm seal. The seal's diaphragm and bottom section must be constructed from 316 stainless steel. Each diaphragm seal must have a 1/4 inch NPT flushing connection with brass gauge cock.
- b. Each gauge and its diaphragm seal must be filled with silicone oil.
- c. Each gauge on the side of a pump must be a compound gauge.
- d. Each pressure gauge assembly must have bronze ball valve between the diaphragm seal and the pumped fluid.
- e. Each gauge must have a piston type pressure snubber between it and its diaphragm seal.

Gauges must be furnished in accordance with the following list:

- a. Vertical Turbine Pumps:  
Suction: 3 at 0-30 psi  
Discharge: 3 at 0-125 psi
- b. 8-inch Simplex Strainers at Suction & Discharge of Each Strainer  
Suction: 3 at 0-150 psi  
Discharge: 3 at 0-150 psi
- c. Downstream of Flow Meter at Pressure Transducer  
Discharge: 1 at 0-150 psi

#### 2.3.11 Magnetic Flow Meter

One (1) 8-inch magnetic flow meter, with a flow range of 30 gpm to 5975 gpm, must be supplied for flange mounting and installed as shown on the Drawings. The meter must be of the low frequency electromagnetic induction type and must produce a DC pulse signal directly proportional and linear to the liquid flow rate. The body must be of the flanged design and must be suitable for mounting between ANSI Class 150 flanges, by using the appropriate mounting studs and nuts supplied. Pressure limitations must be of maximum pressure dictated by flange rating. Flange material must be steel ASTM A105. The liner must be of hard rubber and the electrodes must be Hastalloy-C22. The maximum fluid temperature must be 80 deg C (176 deg F). The meter must be designed for operation on 100-230VAC and 60 Hz. The flow converter must be a compact model with a local display and control unit. The electronic standard output must be 4 to 20 mA dc. The current output must be basic I/O HART active/passive. The flow converter housing must be aluminum.

#### 2.3.12 Pressure Transmitter

One (1) 0-150 PSI (adjustable), titanium saltwater-rated pressure transmitter with 1/2-inch MS male threads and surge suppressor must be supplied and installed as shown on the Drawings. There must be a 4-20mA signal output (directly proportional to the adjusted span) from the transmitter to both the System Control Panel and at the Johnson/Yokogawa system. I/I Booster(s) must be installed in the loop as needed. Span limit of the transmitter must be 0.54-in H<sub>2</sub>O to 2320 psi, and its turn down ratio must be up to 100:1. The unit must have a 5-year stability and a base accuracy of  $\pm 0.075$  percent. The upper range and lower range must be 348 psi and 0.15 psi, respectively; and a minimum span of 3.5 psi. The insulation resistance must be 100M at 1000VDC (terminals to earth). The transmitter must have an operating temperature range of -20 to +70 deg C (-4 to +158 deg F) and operating humidity of up to 100 percent annual average. The filling used in the transmitter must be silicone oil; and must meet ANSI/ISA-S 82.03 hydrostatic test requirements and SAMA PMC 27.1. Vibration and shock resistance levels of the transmitter must meet IEC 60068-2-26 and 60068-2-27, respectively; and be dust and sand tight and protected against immersion effects (NEMA 4X). An integral, LCD, 7-digit, alphanumeric display/meter must be part of the transmitter and a factory calibration certificate must be supplied with the transmitter.

One (1) 200 PSI (adjustable) pressure ranged 304 stainless steel transmitter with 1/4-inch MNPT threaded connection must be supplied and installed as shown on the Drawings. There must be a 4-20mA signal output from the transmitter to the system control panel. The unit must have a base accuracy of plus or minus 0.5 percent. The upper and lower range

must be 200 psi and 0 psi. The insulation resistance must be 100M at 100VDC. The transmitter must have an operating temperature range of -28 to 82 deg C (-20 to + 180 deg F) and operating humidity of up to 95 percent annual average. The transmitter's response time must be less than 5 ms. Vibration effect must be less than plus or minus 0.1% F.S. effect for 0 to 2000 Hz at 20 g's in any axis. Shock effect must be less than plus or minus 0.05% F.S. effect for 100 g's and 20 ms shock in any axis. The transmitter must be dust and sand tight and protected against immersion effects (NEMA 4X).

#### 2.3.13 Pressure Switches

Three (3) 15-150 PSI (adjustable), 316 stainless steel port, Teflon coated polyamide diaphragm and Buna-N O-ring spring pressure switches must be installed. Electrical Form must be 15 amp at 125 or 250 VAC, 1/8 hp at 125 VAC, 1/4 hp at 250 VAC, 0.5 A resistive, 0.04 A inductive at 125 VDC. Each switch also must be protected against immersion effects (NEMA 4X).

#### 2.3.14 Stem Covers

Stem covers for gate valves must be clear plastic manufactured of strong butyrate plastic. Stem indication must be provided by clear mylar tape to indicate "open" and "closed" positions. A cast aluminum adaptor must be used to mount the cover to the gate valve bonnet.

#### 2.3.15 Discharge Piping

Provide all suction hoses, discharge piping, fittings, etc. needed to meet requirements per design drawings. Discharge piping should be EPDM hoses with one main discharge pipe and a full length spare on site as backup supply.

The Temporary system shall be hard piped in accordance with Section 2.3.16 Hard Piping - from pump discharge through the flow meter.

#### 2.3.16 Hard Piping

##### 2.3.16.1 Polypropylene-Random (PP-RCT)

All piping 3-inch and above must be polypropylene random copolymer with modified crystallinity and temperature resistance (PP-RCT) and must be SDR11 MF RP and conform to ASTM F2389, ASME B31.3, and NSF/ANSI 14. Piping must be rated to a minimum of 160 psi at 73 deg F. Fittings and pipe must be joined by heat welding with a proprietary device. Horizontally laid pipe must be secured in such a manner that temperature-induced expansion and contraction are accommodated. Manufacturer shall warrant pipe and fitting for 10 years to be free of defects in materials or manufacturing. Pipe shall be Aquatherm Blue Pipe MF RP or approved equal.

##### 2.3.16.2 Ductile Piping

All 8-inch ductile iron piping located just upstream and downstream of the flow meter must be Pressure Class 350 conforming to AWWA C150/A21.50 and AWWA C151/A21.51. Flanged pipe must have factory assembled, long hub screw on flanges and conform to ASME B16.1 for 125-pound bolting. All ductile iron pipe must be double cement mortar lined conforming to AWWA C104/A21.4 with seal coat inside. All ductile-iron piping to be painted must have the factory primed with two coats of epoxy primer and be coated in accordance to 09 90 00 PAINTS AND COATINGS. Thickness

of ductile iron piping must conform to AWWA C150/A21.50. Restrained joints must be locked type joints manufactured by the pipe and fittings manufacturer that utilize restraint independent of the joint gasket. Restrained joints must be for the specified 150 psig test pressure. Mechanical joint retainer glands must be as manufactured by EBAA Iron Inc., Clow Corporation, U.S. Pipe and Foundry Company, or equal.

#### 2.3.16.3 Stainless Steel Tubing

Fittings on corrosion-resistant lines must be grade F316L, 150 pound conforming to ASTM A182/A182M. Piping and fittings 1/2-inch and smaller shall have threaded connections conforming to ASME B1.20.1. The manufacturer of each fitting shall be permanently identified on the body of the fitting in accordance with MSS SP-25. Bronze screwed fittings may be used for small connections such as gage assembler or small leakage lines and must conform to FS WW-P-460B (4).

#### 2.3.17 Fitting and Flanges

##### 2.3.17.1 Polypropylene-Random (PP-RCT) Fittings

Polypropylene random copolymer with modified crystallinity and temperature resistance (PP-RCT) fittings must be provided with PP-RCT piping that is socket, butt, fusion outlet, or electrofusion heat welded and must be installed in accordance with the manufacturer's published installation instructions as well as conforming to ASTM F2389. Flange fittings must be 150 pound conforming to ASME B16.5. Pipe shall be labeled every three feet to identify the size and type of pipe and the test standards which they meet. PP-RCT flanges must be installed per manufacturer guidelines utilizing proper flange adapters and stainless steel 316L flange backing rings.

##### 2.3.17.2 Ductile Iron Fittings

Ductile iron fittings must be provided with ductile iron piping and must be flanged, push-on, or restrained mechanical joints where indicated, conforming to AWWA C110/A21.10 and AWWA C111/A21.11, and double cement mortar lining conforming to AWWA C104/A21.4 with seal coat inside. Ductile iron fittings must match Pressure Class 350 ductile iron pipe conforming in thickness to AWWA C150/A21.50. Flanged fittings must be 125 pound conforming to ASME B16.1. All ductile iron fittings to be painted must be factory primed with two coats of epoxy primer and be finish coated in accordance with 09 90 00 PAINTS AND COATINGS.

##### 2.3.17.3 Stainless Steel Tube Fittings

All piping 2-inch and smaller shall be corrosion resistant, stainless steel Type 316, Schedule 40, seamless, per ASTM A312/A312M

#### 2.3.18 Insulation and Heat Tracing

Provide insulation with jacketing for Temporary ASW piping equipment installed outside.

All ASW piping installed outside shall also be heat traced.

The insulation around the pipe must be aluminum jacketed cellular glass rigid urethane foam, specific weight of 1.8-2.2 pcf pipe insulation conforming to FS HH-I-551, Type II, Class 2 and 3 combined,

except as specified hereinafter. The insulation must be a minimum of 2 inches thick furnished in curved segments with beveled edges and ends to fit the curvature of the pipe, including the pipe fittings. Fibrated cutback asphalt coating together with a glass fiber mesh must be applied around the insulation prior to placement of the aluminum jacketing. The cutback asphalt must be Pittseal III, manufactured by Lion Oil Company; 65-07, manufactured by Benjamin Foster or approved equal. Nonhardening mastic tape must be at least 1 inch wide and 1/16-inch thick, of a nondrying nature, containing 100 percent solids and no volatile oils, must withstand temperatures from minus 80 degrees F. to plus 300 degrees F., must be nonstaining, nonbleeding, and nontoxic to the skin. Fitting covers must be made by an approved experienced fabricator. The pipe must be dry and clean before insulation is applied. The insulation must be shaped to the curvature of the pipe including the pipe coating. The insulation must be tightly butted and must be staggered. Sections of insulation must be covered with banks of nonmetallic tape of 1-inch width wrapped twice around the insulation, spaced 9 inches on center. The insulation joints must be sealed with the above-mentioned joint sealer. The insulation must be coated with the fibrated cutback asphalt. All insulation must be covered with 26 gauge (0.016 inch wall thickness) aluminum jacketing. Longitudinal and transverse joints must be lapped 3 inches. The joints must be sealed with nonhardening mastic tape compressed between the laps. The jacketing must be banded with stainless steel bands spaced 9 inches on center starting 1-1/2 inches from the end of any one section. Bands must not be less than 3/4 inches wide by 0.02 inches thick and must be fastened with crimped stainless steel seal clips. The aluminum jacketing material must be alloy 6061-T6 and must be finished using Alcoa's Allumilite finish No. 215, or an approved equal finish. The insulation and covering must extend along the pipe line as shown on the Drawings, and be fitted for the class of Ductile Iron Pipe specified. The aluminum jacketing must be given 2 field coats of coal tar protective coating.

#### 2.3.19 Electrical Work

The Temporary ASW System shall be powered by the 400a electric pedestal on Berth 5 for industrial power. Provide all cable routing and protection to the laydown area(s) as indicated in the design drawings. Supply and install temporary Automatic Transfer Switch, protection devices for two (2) temporary pumps as selected by Contractor, and one (1) backup diesel generator.

Provide electrical motor driven equipment specified herein complete with motors, pump control panels, and controls. Electrical characteristics are as indicated. Provide pump control panels complete with properly sized thermal overload protection in each phase and other appurtenances necessary for the motor control specified. Each motor must be of sufficient capacity to drive the equipment at the specified capacity without exceeding the nameplate rating of the motor when operating at proper electrical system voltage and frequency. Manual or automatic control and protective or signal devices required for the operation herein specified and any control wiring required for controls and devices but not indicated must be provided under this Section of the specifications.

#### 2.3.20 Electrical Equipment

Provide electrical motor driven equipment herein specified complete with motors, pump control panels, and controls. Motor controls, equipment, and wiring must be in accordance with NFPA 70.

#### 2.3.21 Controls

Follow the same control procedures as specified in 40 60 00 PROCESS CONTROL.

#### 2.3.22 Performance Testing

The Temporary ASW System may not be placed into active service until a two-week performance test has been passed and approved, meeting all pumping and operation requirements. The two-week period shall test and verify operation of both pumps, along with all valves, strainers, and appurtenances. The primary discharge hose shall be utilized and tested during the two-week period.

#### 2.3.23 Bolts, Nuts, Washers and Fasteners

All bolts, nuts and washers must be stainless steel conforming to Type 316, unless otherwise indicated. Pump anchor bolts and anchor bolts for bearings and other devices anchored to floors must be stainless steel, Type 316. Bolts for fastening all flanged or mechanical joint piping, fittings and valves must be stainless steel, Type 316. All bolts on valves, fittings, hangers and supports, etc. must be stainless steel, Type 316. Existing nuts, bolts, and washers must not be reused.

#### 2.3.24 Gaskets

Gaskets must conform to AWWA C111/A21.111 or MIL-A-174722, full face as appropriate to the connecting fittings. Surface to be gasketed must be thoroughly cleaned before assembly, removing paint, dirt, spatter, and similar items.

#### 2.3.25 Unions

Unions must conform to FS WW-U-516B or FS WW-U-531E to match connecting piping or tubing.

#### 2.3.26 Pipe Hangers, Inserts, and Supports

All piping, shafting, extension stems, intermediate bearings, and similar items must be effectively supported. Stainless steel tubing must be carried on corrosion resistant hangers. All bolts and nuts must be Type 316 stainless steel.

Pipe hangers, inserts, guides, and supports: to MSS SP-58 and MSS SP-69. Supports shall be stainless steel with rubber lining. Pipe support spacing for PP-RCT pipe shall be as recommended by the pipe manufacturer, based on the temperature of the operating fluid and the ambient temperature.

##### 2.3.26.1 Hangers and Clamps

Provide rubber-lined stainless steel clamps. Use tape to pad the space between the plastic pipe and metal on non-clamping hangers. Do not install metal in direct contact with the PP-RCT pipe. In high humidity areas provide non-crushable pipe shields.

#### 2.3.26.2 Fixed Points (Anchor)

Fixed points shall be measured and installed to accommodate forces of expansion in the pipe and probable additional loads. Swinging clamps can't be used as fixed points.

#### 2.3.26.3 Sliding Points (Guide)

Sliding points shall allow axial pipe movement, without damaging the pipe. When positioning a sliding point, movement of the pipe shall not be blocked by walls, fittings, or equipment.

### PART 3 EXECUTION

#### 3.1 EXAMINATION

After becoming familiar with all details of the work, verify all dimensions in the field and advise the Contracting Officer of any discrepancy before performing the work.

#### 3.2 INSTALLATION

Install each pump and motor in accordance with the written instructions of the manufacturer and under the direct supervision of the manufacturer's representative. Provide access space around the device for servicing no less than the minimum recommended by the manufacturer.

Pumps, shafting, piping, and other equipment and appurtenances must be installed in accordance with the Sequence of Construction, as indicated, in strict accordance with the manufacturer's approved shop drawings and printed installation instructions and the Standards of the Hydraulic Institute. All supports necessary whether indicated or not must be provided.

Pumps less than 30 feet in length shall be shipped fully assembled with motor and shaft seal unmounted. Discharge flange shall be protected with a wooden flange cover. The skidded pump and related equipment shall be unloaded, stored, and installed per the manufacturer's operation and installation manuals. The pump manufacturer shall include two days of start-up field services to supervise the start-up and instructions of proper maintenance and operations.

##### 3.2.1 Flanged Joints

Flanged joints must be made up with full-face or ring gaskets as appropriate. Faces of flanges must be clean, free of paint and other imperfections. PP-RCT flanges must be installed per manufacturer guidelines utilizing proper flange adapters and stainless steel 316L flange backing rings. Provide 316 stainless steel UNC nuts, torque per PP-RCT manufacturer's recommendations.

##### 3.2.2 Tubing Joints

Flared or flareless joints must be made up tight with accurately assembled parts. If solder joints are used, they must be made with high-temperature solder (over 1000 degrees F melting point).

### 3.2.3 Unions and Flanges

Unions or flanges must be placed where indicated and as necessary to permit easy disassembly of piping and apparatus. Each connection having a screwed-end valve must have a union.

### 3.2.4 Valves

Valves must be installed as indicated. Installation must be with the stem vertical up unless the valve is installed in the vertical position, or otherwise indicated or directed by the Contracting Officer. All valves must be installed in such a manner as to be accessible and not interfering with adjacent or nearby equipment.

### 3.2.5 Polypropylene-Random (PP-RCT) Piping

When installed in systems with pumps in excess of 7.5 HP, piping shall be protected from excessive heat generated by operating the pump at shut-off conditions. Where the possibility exists that the pump will operate with no flow, the protection method shall be a temperature relief valve or comparable level of protection, set to a maximum temperature of 185°F.

If heat tracing or freeze protection is specified for the piping, it should be installed on the pipe interior or exterior. It must be suitable for use with plastic piping and be self-regulating to ensure that the surface temperature of the pipe and fittings will not exceed 158°F.

Pipe alignment guides shall be provided where indicated for expansion loops, offsets, and bends and as recommended by the manufacturer for expansion joints, not to exceed 5 feet on each side of each expansion joint.

### 3.2.6 Expansion and Contraction

Provide expansion and contraction controls, guides and anchors to take into account the expansion and contraction of the pipe. Provide expansion loops or offsets as required and as indicated in the manufacturer's literature.

## 3.3 FIELD QUALITY CONTROL AND COMMISSIONING

After installation of the pumping units and appurtenances, including coupling guard, is complete, carry out operating tests to assure that the pumping installation operates properly. Make arrangements to have the manufacturer's representatives present when field equipment tests are made. Give each pumping unit a running field test in the presence of the Contracting Officer for a minimum of 2 hours. Operate each pumping unit at its rated capacity or such other point on its head-capacity curve selected by the Contracting Officer. Provide an accurate and acceptable method of measuring the discharge flow. Tests must assure that the units and appurtenances have been installed correctly, that there is no objectionable heating, vibration, or noise from any parts, and that all manual and automatic controls function properly. If any deficiencies are revealed during any tests, correct such deficiencies and reconduct the tests.

Submit test reports in booklet form showing all field tests performed to adjust each component and all field tests performed to prove compliance with the specified performance criteria, upon completion and testing of

the installed system. Each test report must indicate the final position of controls.

### 3.3.1 General

Submit Field Testing and Commissioning Procedures for approval before initiating quality control testing and commissioning.

Pump test data as observed, recorded and submitted to the Contractor quality control representative and to the Contracting Officer must comply with the latest edition of the Standards of the Hydraulic Institute. All instruments must be calibrated as specified in the paragraph Calibration of Instruments from the Test Code.

### 3.3.2 Formal Inspection and Tests

The Contracting Officer will witness formal tests and approve all systems before they are accepted. Submit the request for formal inspection at least 15 days prior to the date the inspection is to take place. An experienced technician regularly employed by the pump installer must be present during the inspection. Tests must simulate pump performance throughout the entire operating curve for conformance with manufacturer's characteristic curves. At this inspection repeat any or all of the required tests as directed. Correct defects in the work provided by the Contractor, and make additional tests until it has been demonstrated that the system complies with all Contract requirements. Manufacturer's certified shop test characteristic curves for each pump being tested must be furnished by the Contractor at the time of the pump acceptance test. All temporary piping, pressure gauges, personnel, and equipment required for field tests must be furnished by the Contractor. The Contractor must also furnish all required instruments and personnel for pump motor tests, such as tachometer and wattmeter. A recording watt meter must be used. All test instruments (including test pressure gauges, tachometer, recording watt meter/electrical analyzer, etc.) must have been calibrated within the prior one year period. All piping must be cleaned and flushed after completion of installation and prior to testing. The Government will furnish water and electricity for the tests.

-- End of Section --

SECTION 46 80 00

BRACKISH WATER REVERSE OSMOSIS UNIT  
09/24

PART 1 GENERAL

1.1 SUMMARY

- a. All equipment listed below shall be furnished by a single manufacturer and shall be products of manufacturer regularly engaged in the production of said equipment:
  - (1) Water and Wastewater Chemical Feed Systems - Refer to Division 46 Specification 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.
  - (2) Seawater Reverse Osmosis Unit - Refer to Division 46 Specification 46 81 00 SEAWATER WATER REVERSE OSMOSIS UNIT.
  - (3) Immersed Membrane Filtration System and Ancillary Equipment - Refer to Division 46 Specification 46 82 00 IMMERSED MEMBRANE FILTRATION SYSTEM AND ANCILLARY EQUIPMENT
- b. The manufacturer shall have the sole responsibility for proper functioning of the complete system
- c. Any structural, mechanical, civil, architectural, HVAC, plumbing, electrical or instrumentation changes required by the use of any product (named vendor or approved equal product) other than the design product or an alternate layout shall be the responsibility of the Contractor and shall be provided at no additional cost to Owner.
- d. List of Desalination System Manufacturers"
  - (1) Veolia Water Technologies (Basis of Design)
  - (2) Ovivo Inc.
  - (3) WesTech Engineering, LLC
  - (4) Approved equal

1.2 WORK INCLUDED

This Section covers the furnishing and installation of one (1) brackish water reverse osmosis (BWRO) unit and ancillary equipment. All products under the PART 2 PRODUCTS section of the specification herein shall be provided by one (1) manufacturer. The manufacturer shall be the same for the UF, BWRO, and SWRO systems.

All installed equipment shall be suitable for seawater application and should be designed and constructed to withstand the harsh conditions of seawater. The contractor shall be responsible for supplying all MCCs, SCADA systems, motor starters, and VFDs. Any items not provided by the manufacturer will be supplied by the general contractor.

#### 1.2.1 BWR0 System

The manufacturer's scope of supply for the BWR0 system is described in the following table.

- a. RO membrane element vessels
- b. Process skid including:
  - (1) three (3) RO feed cartridge filters
  - (2) one (1) post cartridge filter pressure transmitter
  - (3) one (1) RO feed pH analyzer
  - (4) one (1) RO feed pressure switch low
  - (5) one (1) RO feed pressure transmitter
  - (6) one (1) high pressure pump
  - (7) one (1) RO permeate conductivity analyzer
  - (8) one (1) RO permeate flow meter
  - (9) one (1) RO permeate pressure switch high
  - (10) one (1) RO concentrate pressure transmitter
  - (11) one (1) RO concentrate flow transmitter
  - (12) one (1) RO concentrate pressure switch high
  - (13) one (1) RO concentrate control valve
  - (14) one (1) lot of pressure gauges
  - (15) one (1) lot of process valves (both manual and automatic valves)
  - (16) one (1) lot of on-skid piping

#### 1.3 DESIGN CRITERIA

Adequate tolerances in the listed capacity, head and efficiency values have been included. No deviation below the listed parameters will be permitted.

#### 1.4 QUALITY ASSURANCE

- a. General
  - (1) This Section directs special attention to certain features but does not purport to cover all details of the design, manufacture or installation of the pumping units. The final responsibility for supplying and installing pumping equipment which functions as specified herein rests with the Contractor.
  - (2) Seismic rating:  $S_s = 1.24$ . Equipment importance factor:  $I_p = 1.25$ . Seismic response coefficient:  $SR = 0.358$ . Seismic

requirements are applicable. Seismic load parameters for the building are provided in the structural general notes sheet.

- (3) Paint System Shall be the following or similar: Two Coat. Primer: Tnemec Series 20 Pota-Pox or Tnemec Series 20 Pota-Pox FC, 3-5 mil thick. Topcoat: Tnemec Endura Shield II Series 1075 Epoxoline, 4-6 mil thick. Recommend for indoor and non-coastal applications. Recommended manufacturers paints and finishing shall be used.
- (4) Sling lift with overhead clearing and spreader bars with three slings. OR use forklift with roller dolly's. Forklift from cartridge filter end. To be lifted by qualified lifters.

#### 1.5 SUBMITTALS

Submittals including shop drawings, O&M manuals, and installation documents shall be submitted in electronic format in accordance with the requirements of Section 01 33 00. Additionally, four hard copies of the final O&M manual shall be provided. In accordance with requirements of general specifications, submit the following:

##### SD-02 Shop Drawings

Equipment Construction Details; G

Equipment Installation; G

- a. Show complete details of construction and installation of all equipment, including appurtenances; include all dimensions.
- b. Include all specifics of this installation.
- c. Delete all references not applicable to this installation.
- d. Outline specific areas where the proposed equipment differs from that specified.

Wiring Diagram; G

- a. Include complete wiring diagrams required for installation.

##### SD-03 Product Data

Pump Curves; G

Pump Certification; G

- a. Certified pump curves showing the actual performance of the feed pump to be supplied under factory testing. Pump certification shall include testing for head, capacity, efficiency and brake horsepower, at 50%, 65%, 85% and 100% for variable speed driven pumps; and at the rated speed for constant speed pumps. Six certified copies of the results in the form of pump characteristic curves shall be furnished to the Engineer for review prior to shipment.

Product Description; G

- a. A complete, easily readable functional description of the proposed

equipment.

Product Data; G

- a. A complete list of the manufacturer's name, address and phone number, the local representative's name, address and phone number, and the model and serial numbers of all equipment supplied.

SD-06 Test Reports

Feed Pump Motor Test Results; G

- a. Complete test results on the feed pump motor for the tests as defined in the NEMA standard for a motor of its class and rating, to determine that it is free from electrical and mechanical defects and to provide assurance that it meets the design specifications.

Motor Test Results; G

- a. The manufacturer's complete test results for each motor model design tested for efficiency by the following means:
  - (1) The full load Dynamometer test shall be based on IEEE 112 Method B, per NEMA MG1 12.53 A & B including six (6) load point testing and stray load loss segregation and correction steps.

Factory Acceptance Test; G

- a. Results and reporting of the factory acceptance test described under PART 3 EXECUTION.

Field Test Report; G

- a. Upon completion of installation, the results of the field and acceptance tests as specified under this section of the specification shall be submitted to the Engineer.

SD-07 Certificates

Parts List; G

- a. Complete parts list including the manufacturer's reference and ordering numbers.

Spare Parts List; G

- a. Recommended Spare Parts List.

Installation Certification; G

- a. Furnish written certification from the manufacturer's representative of the proper installation of each component.

SD-10 Operation and Maintenance Data

Operating And Maintenance Manual; G

- a. Complete operation and maintenance information for this specific equipment.

- b. The manuals will be reviewed by the Engineer for completeness; those that are deemed inadequate will be returned for correction.

SD-11 Closeout Submittals

Warranty; G

1.6 STORAGE

- a. Equipment damaged or bent during shipping or storage shall be replaced.
- b. Feed pump motor shall be stored on site according to motor manufacturer's recommendations until pumps are operational and accepted by the Engineer. Contractor shall be responsible for such arrangements.
- c. Disassembled equipment shall be kept clean and protected against rodents and pests until equipment is reassembled, operational and accepted by the Engineer.

1.7 WARRANTY

- a. The pump manufacturer and the pump motor manufacturer shall each individually and separately warranty that the equipment they supplied under this Section fully meets the criteria specified herein, and shall further warranty that the equipment is free from all defects in materials and workmanship.
- b. The manufacturer's warranty from defects shall contain a provision that the manufacturer shall repair or replace any defects, to the satisfaction of and at no additional cost to the Owner, for a period of twenty-four (24) months for the pump and motor from the date of Substantial Completion of the project.
- c. The variable frequency drive shall be warranted for a period of 24 months after date of shipment. Warranty shall include parts and labor by the manufacturer.

PART 2 PRODUCTS

2.1 GENERAL

A. The overall BWRO unit and products specified Herein shall be provided by one manufacturer. The Basis of Design for the BWRO system is RO-PROflex, 72-2, FRP, 50HP, AB, SG by Veolia Water Technologies, Trevose, PA or similar.

B. Performance Data

|                       |           |
|-----------------------|-----------|
| Design Permeate Flow  | 278 gpm   |
| Feed Flow             | 312 gpm   |
| Concentrate Flow Rate | 34.42 gpm |

|                           |           |
|---------------------------|-----------|
| Recovery                  | 89.0%     |
| Design Temperature        | 1 C       |
| Design pH                 | 5.5 - 8.5 |
| System Inlet Pressure     | 30 psi    |
| System Operating Pressure | 235 psi   |

## 2.2 PIPING

Refer to the pipe schedule in the mechanical process bid drawings for specified pipe materials. All fittings, flanges, connections, fasteners, nuts, washers, nipples, joints, and seals shall be suitable for the intended application.

## 2.3 WIRING

The following table applies to all wiring offered for the BWRO unit.

| Wiring                 | Size         | Description                                           |
|------------------------|--------------|-------------------------------------------------------|
| Control system wiring  | 110/240VAC   | 18AWG minimum, TFFN insulation                        |
| Power circuit wiring   | 110/240VAC   | 14AWG minimum, TFFN or THWN insulation                |
| Instrumentation wiring | 4-20mA loops | 22AWG minimum                                         |
| Motor wiring           | All sizes    | Dependent on motor size (usually outside scope of R0) |

## 2.4 VALVES

The material of construction shall be corrosion-resistant. Duplex 2205 or approved equal shall be used for high-pressure applications, while PVC can be used for low-pressure application.

The following table applies to all valves offered for the BWRO unit.

| Manufacturer | Description |
|--------------|-------------|
|--------------|-------------|

### BALL

|                          |                                                                                                                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flow-Tek, Star, or equal | Duplex 2205 stainless steel body, threaded ends (drains, vents), Victaulic ends (concentrate backpressure), and socket ends (process piping). MSS-SP72 compliant. Gear Operators included for pressure reducing Ball Valves. |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|              |                                                                                |
|--------------|--------------------------------------------------------------------------------|
| SMC or equal | 150 lb. class, PVC Body, threaded and hose-barb ends (drains and sample ports) |
|--------------|--------------------------------------------------------------------------------|

#### BUTTERFLY

|               |                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------|
| Bray or equal | 150 lb. class, ASME B16.34, Nylon coated ductile iron disc, EPDM seat, cast iron body, 316 SS stem |
|---------------|----------------------------------------------------------------------------------------------------|

#### CHECK

|                       |                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------|
| Techno-check or equal | 150 lb. class, EPDM seat, Duplex 2205 stainless steel disc, with Victaulic grooved ends |
| SMC or equal          | Polypropylene body with EPDM seal (used on pH sensor slipstream)                        |

#### PRESSURE REGULATING VALVE

|                     |                                                                                                                       |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| Pneumatics or equal | 5 Micron Element, NPTF thread 3/8 Port Size Gauge, Metal Bowl with sight glass<br>Standard output pressure 0-125 PSIG |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|

#### RELIEF

|                  |                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Farris, or equal | 300 lb. class, internals of Duplex 2205 stainless steel, body and bonnet of carbon steel (used when pump pressure exceeds housing pressure rating) |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|

### 2.5 INSTRUMENTATION

The following table applies to all instrumentation offered for the BWRO unit. Named instrumentation or equal shall be provided per Engineer approval.

#### Instrument List

| Instrument           | Display | Manufacturer               | Locations                   |
|----------------------|---------|----------------------------|-----------------------------|
| Instrument Center    |         | Thornton                   | Thornton M800               |
| Flow Meters          | HMI     | GF Signet 2537             | Permeate, concentrate       |
| Pressure Switch      | HMI     | United Electric Spectra 10 | Feed, permeate, concentrate |
| Pressure Transmitter | HMI     | E+H PMC11                  | Primary, Final              |

|                          |                  |                     |                                                                                            |
|--------------------------|------------------|---------------------|--------------------------------------------------------------------------------------------|
| Pressure Gauge           | Local indication | Ashcroft or equal   | Pre-filter, post-filter, primary, final, interstage, permeate, concentrate, pump discharge |
| Conductivity/Temperature | HMI              | GF Signet 2850      | Permeate, Feed                                                                             |
| pH Meter                 | HMI              | GF Signet 2724/2750 | Feed                                                                                       |
| ORP                      |                  | N/A                 | Feed                                                                                       |

Accessories shipped loose or Mounted on Control Panel

#### Chlorine Monitor

| Instrument                                                                        | Display                         | Manufacturer    | Locations |
|-----------------------------------------------------------------------------------|---------------------------------|-----------------|-----------|
| Pressure Switch (feed, permeate, concentrate)                                     | Model 10 Series pressure switch | United Electric |           |
| Devices will be identified with tags on the P&ID and adhesive labels near devices |                                 |                 |           |

#### Instrument - Local Indication

| Instrument                                          | Display | Manufacturer             | Locations |
|-----------------------------------------------------|---------|--------------------------|-----------|
| Pressure Gauges - 2.5" gauges with 1/4" connections |         | Ashcroft, WIKA, or equal |           |

## 2.6 EQUIPMENT LIST

The following table details the main process equipment to be supplied in this proposal. Named suppliers or equal shall be provided per Engineer approval.

#### Rotating Equipment

| Equipment               | Details                                                                      | Supplier          |
|-------------------------|------------------------------------------------------------------------------|-------------------|
| R0 High Pressure Pump   | Horizontal Multi-stage centrifugal, model AS30010 or equal, quantity one (1) | Tonkaflo or equal |
| Inlet/discharge housing | Duplex 2205 stainless steel                                                  | Tonkaflo or equal |

|             |                                                                                          |                            |
|-------------|------------------------------------------------------------------------------------------|----------------------------|
| Shell       | Duplex 2205 stainless steel                                                              | Tonkaflo or equal          |
| Impeller    | SS Series = Noryl; AS Series = 304 Stainless Steel.                                      | Tonkaflo or equal          |
| Shaft       | Duplex 2205 stainless steel                                                              | Tonkaflo or equal          |
| Lubrication | Flooded oil                                                                              | Tonkaflo or equal          |
| Seal type   | Mechanical Crane type 21, Type 1, or 2B                                                  | Tonkaflo or equal          |
| Coupling    | Flex rubber spacer type, with 1.15 service factor. Coupling guard meeting OSHA standards | Tonkaflo or equal          |
| Motor       | VAC, 3-phase, 60 HZ, 75 HP                                                               | Marathon, Balder, or equal |

#### Cartridge Filter Housing

| Equipment                          | Details                                                                                            | Supplier        |
|------------------------------------|----------------------------------------------------------------------------------------------------|-----------------|
| RO Cartridge Filter housings       | FRP Housings, 100 psi max pressure, non code stamped.                                              | ROPV, or equal  |
| RO Cartridge Filter housing OPTION | SS Housings, 100 psi max pressure, non code stamped.                                               | VEOLIA or equal |
| Cartridge Filter                   | FLT,CTG,DEPTH,HF.Zs<br>01-40-FSB,Melt-blown Polypropylene. 1- micron, 40 in, quantity of three (3) | VEOLIA or equal |
| Valves                             | Pre-filter manual isolation, post filter auto isolation, vent and drain                            | BRAY or Equal   |

#### Membrane Element Housing

| Equipment           | Details                                                                                                                                                                                                                                        | Supplier           |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| RO Element housings | FRP Housings, model 450P-8 or equal, 450 psi max pressure, 4 port style , thin film composite membrane element (or other options to choose). ASME B & PV Section X code Stamp. Quantity of 12, 6' length, 8" diameter, 8-4 banking arrangement | Codeline, or equal |

|                                      |                                                                                                                                                                                       |                 |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Membrane Element                     | Model AK-400H or equal,<br>quantity 72, FRP Wrapped                                                                                                                                   | VEOLIA or equal |
| Installation/Utility<br>Requirements | Inlet- 6" flange<br>Permeate- 4" Flange<br>Concentrate- 3" Flange<br>Inlet (CIP)- 6" Flange<br>Permeate (CIP)- 4" Flange<br>Concentrate (CIP)- 3" Flange<br>Compressed air- 0.25" FPT |                 |

## 2.7 ELECTRICAL AND CONTROL SYSTEM

1. This section herein details the electrical and control system to be supplied in this proposal. Named suppliers or equal shall be provided per Engineer approval.
2. A control system is provided to allow the plant operators to easily operate, monitor and control the equipment supplied by Membrane Manufacturer.
3. The control system is mounted on a corrosion resistant mounting panel. It incorporates optional motor controls, solenoid valves, slipstream instrumentation fully wired and tubed.
4. Control panel is cUL/ UL 508 Standard for Industrial Control Equipment.
5. Membrane System Alarms required:
  - a. Low Inlet Pressure
  - b. High/Low pH
  - c. High Temperature
  - d. High Permeate Pressure
  - e. High Concentrate Pressure
6. Control System: Refer to specification 46 82 00 section 2.13 Control System.

Main Control Panel containing PLC and HMI - NEMA 4 painted carbon steel (or NEMA 4X stainless steel option)

PLC and HMI

Allen-Bradley CompactLogix 1769 and PanelView Plus Standard

- (a) Processor: PLC - AB CompactLogix 1769
- (b) Operator Interface: PanelView Plus® 700
- (c) Communications: Ethernet

Control Screens Included:

- (a) Security access screen
- (b) System overview
- (c) System data display
- (d) Alarm History
- (e) Individual component display of operational status, 4-20 mA instruments and control
- (f) Alarm status and indication
- (g) Alarm description
- (h) Set point screens

#### NOTES

- a. The control panel will be fully assembled and wired and simulated control tests will be carried out to prove correct operation of controls, sequencing of valves, etc.
- b. Maximum ambient air temperature for the control panels is 35°C
- c. Provide UPS. Panel must operate at site atmospheric conditions.
- d. 120 VAC control power.
- e. Components are UL listed or recognized.

#### Electrical and Instrumentation Assembly Components

|         |                            |                                             |
|---------|----------------------------|---------------------------------------------|
| 1 lot   | Wiring                     | Per BWRO Manufacturer standards             |
| 1 lot   | Terminal Blocks            | AB, or equal                                |
| 1 lot   | Air Solenoid Valves        | Valve ASCO Pneumatics manufacture standard  |
| 1 lot   | Cable Tray                 | Painted steel                               |
| 1 lot   | Air Tubing and Fittings    | Polyethylene Tubing / PPL - ¼"              |
| 1 lot   | Sample Tubing and Fittings | Polyethylene Tubing / PPL - ¼"              |
| 1 piece | Sample Solenoids           | ¼" Parker Skinner stainless steel, or equal |

#### NOTES

- a. Solenoids for valves will be gang-mounted in on corrosion resistant panel.
- b. Limit switches are not provided.
- c. Pneumatic tubing will be run and supported within skid limits, from solenoid to valve actuators, as required.

## Motor Control Components

Motors shall be VFD controlled.

Local disconnect switches shall be included with motors.

## PART 3 EXECUTION

### 3.1 INSTALLATION

A. Contractor shall be responsible for disassembly and reassembly of all equipment in order to complete installation as shown in the Contract Documents. Required measures to inspect onsite conditions, as well as coordination with manufacturer and planning to ensure proper installation of all equipment and membranes as recommended by the manufacturer, shall be the sole responsibility of the Contractor.

B. Manufacturer will provide necessary oversight to ensure any disassembly/reassembly is properly done without any adverse effects on the equipment. Manufacturer's on-site representative will confirm the final equipment has been installed as per manufacturer requirements and provide written confirmation that all warranties remain in effect.

### 3.2 FIELD AND FACTORY ACCEPTANCE TEST

A. After the pump has been installed and connected, and after inspection, operation, and adjustment have been completed by the manufacturer's representative, the equipment shall be field tested in the presence of the Engineer, for overall wire to water efficiency and for general performance and fitness for the service specified. Results of these tests shall be submitted to the Engineer.

### 3.3 MANUFACTURER'S SERVICES

A. As applicable, all components as defined within are factory tested as per manufacturer standards before leaving the manufacturer's facility. The ITP (Inspection and Test Plan) includes a test and / or inspection as defined in the ITP procedure for platform skids, prefabricated pipe (all assembled pipe, not loose supplied pipe), machinery (pumps, blowers, etc.), tanks, valves, instruments, electrical panels / junction boxes, electrical instruments, loose materials (cables, cable trays, etc.), and VFDs, as applicable. A FAT report (Factory Acceptance Test) is provided to the customer. It includes certificates, test reports, and CE declaration of conformity, as applicable. The Contractor is responsible for obtaining the FAT report from the Manufacturer.

B. Services to be provided:

1. For the pumps, the service representative shall be responsible for complete component inspection on site after delivery and shall assist in the correct assembly of the components for a minimum period of one (1) eight hour day.

a. For inspection and check out of the erected equipment.

b. For start up services and supervision.

c. For complete instruction of the Owner's operating personnel.

C. The minimum period of time herein specified does not relieve the manufacturer from providing sufficient time to satisfactorily complete the required service functions.

D. The manufacturer's representative shall certify in writing that the pump has been properly installed. Contractor shall coordinate with Manufacturer to remedy any necessary/recommended corrections.

E. The Owner reserves the right to video tape the instruction of the operating personnel for future use in training.

F. For services related to the BWRO system, refer to Section 46 82 00 IMMERSSED MEMBRANE FILTRATION SYSTEM AND ANCILLARY EQUIPMENT 3.2.1 - Services.

#### 3.4 SPARE PARTS

A. The Contractor will provide all other spare parts as recommended in the manufacturer's standard operations and maintenance information.

B. Provide minimum two (2) mechanical seals for feed pump.

-- End of Section --

SECTION 46 81 00

SEAWATER WATER REVERSE OSMOSIS UNIT  
09/24

PART 1 GENERAL

1.1 SUMMARY

- a. All equipment listed below shall be furnished by a single manufacturer and shall be products of manufacturer regularly engaged in the production of said equipment:
  - (1) Water and Wastewater Chemical Feed Systems - Refer to Specification 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.
  - (2) Brackish Water Reverse Osmosis Unit - Refer to Specification 46 80 00 BRACKISH WATER REVERSE OSMOSIS UNIT.
  - (3) Immersed Membrane Filtration System and Ancillary Equipment - Refer to Specification 46 82 00 IMMERSED MEMBRANE FILTRATION SYSTEM AND ANCILLARY EQUIPMENT.
- b. The manufacturer shall have the sole responsibility for proper functioning of the complete system.
- c. Any structural, mechanical, civil, architectural, HVAC, plumbing, electrical or instrumentation changes required by the use of any product (named vendor or approved equal product) other than the design product or an alternate layout shall be the responsibility of the Contractor and shall be provided at no additional cost to Owner.
- d. List of Desalination System Manufacturers:.
  - (1) Veolia Water Technologies (Basis of Design)
  - (2) Ovivo Inc.
  - (3) WesTech Engineering, LLC
  - (4) Approved Equal

1.2 WORK INCLUDED

A. This Section covers the furnishing and installation of one (1) seawater water reverse osmosis (SWRO) unit and ancillary equipment. All products under the PART 2 PRODUCTS section of the specification herein shall be provided by one (1) manufacturer. The following shall be included as part of the SWRO unit:

- (1) High pressure pump skid
- (2) Seawater SWRO Membrane skid
- (3) Seawater SWRO cartridge filter skid

B. The manufacture shall be the same for the UF, BWRO, and SWRO systems.

All installed equipment shall be suitable for seawater application and should be designed and constructed to withstand the harsh conditions of seawater

All products under the PART 2 PRODUCTS section of the specification herein shall be provided by one (1) manufacturer.

The manufacturer's scope of supply for the SWRO system is described in the following table.

a. Description

(1) RO membrane element vessels

(2) Process skid including:

(a) eleven (11) RO feed cartridge filters

(b) one (1) RO feed ORP analyzer

(c) one (1) RO feed pressure switch low

(d) one (1) high pressure pump

(e) one (1) high pressure booster

(f) one (1) high pressure booster auxiliary bypass control valve

(g) one (1) RO feed pressure transmitter

(h) one (1) RO permeate temperature and conductivity analyzer

(i) one (1) RO permeate flow meter

(j) one (1) RO permeate pressure switch high

(k) one (1) RO concentrate pressure transmitter

(l) one (1) RO concentrate pressure switch high

(m) one (1) lot of pressure gauges

(n) one (1) lot of process valves (both manual and automatic valves)

(o) one (1) lot of pressure safety valves on the RO permeate and concentrate piping

(p) one (1) lot of on-skid piping

b. The contractor shall be responsible for supplying all MCCs, SCADA systems, motor starters, and VFDs. Any items not provided by the manufacturers will be supplied by the general contractor.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for

information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

Submittals including shop drawings, O&M manuals, and installation documents shall be submitted in electronic format in accordance with the requirements of Section 01 33 00. Additionally, four hard copies of the final O&M manual shall be provided.

SD-02 Shop Drawings

Equipment Construction Details; G

Equipment Installation; G

- a. Show complete details of construction and installation of all equipment, including appurtenances; include all dimensions.
- b. Include all specifics of this installation.
- c. Delete all references not applicable to this installation.
- d. Outline specific areas where the proposed equipment differs from that specified.

Wiring Diagram; G

- a. Include complete wiring diagrams required for installation.

SD-03 Product Data

Pump Curves; G

Pump Certification; G

- a. Certified pump curves showing the actual performance of the feed pump to be supplied under factory testing. Pump certification shall include testing for head, capacity, efficiency and brake horsepower, at 50%, 65%, 85% and 100% for variable speed driven pumps; and at the rated speed for constant speed pumps. Six certified copies of the results in the form of pump characteristic curves shall be furnished to the Engineer for review prior to shipment.

Product Description; G

- a. A complete, easily readable functional description of the proposed equipment.

Product Data; G

- a. A complete list of the manufacturer's name, address and phone number, the local representative's name, address and phone number, and the model and serial numbers of all equipment supplied.

Feed Pump Motor Test Results; G

- a. Complete test results on the feed pump motor for the tests as defined in the NEMA standard for a motor of its class and rating, to determine

that it is free from electrical and mechanical defects and to provide assurance that it meets the design specifications.

Motor Test Results; G

- a. The manufacturer's complete test results for each motor model design tested for efficiency by the following means:
  - (1) The full load Dynamometer test shall be based on IEEE 112 Method B, per NEMA MG1 12.53 A & B including six (6) load point testing and stray load loss segregation and correction steps.

Factory Acceptance Test; G

- a. Results and reporting of the factory acceptance test described under PART 3 EXECUTION.

Field Test Report; G

- a. Upon completion of installation, the results of the field and acceptance tests as specified under this section of the specification shall be submitted to the Engineer.

SD-07 Certificates

Parts List; G

- a. Complete parts list including the manufacturer's reference and ordering numbers.

Spare Parts List; G

- a. Recommended Spare Parts List.

Installation Certification; G

- a. Furnish written certification from the manufacturer's representative of the proper installation of each component.

SD-10 Operation and Maintenance Data

Operating And Maintenance Manuals; G

- a. Complete operation and maintenance information for this specific equipment.
- b. The manuals will be reviewed by the Engineer for completeness; those that are deemed inadequate will be returned for correction.

## 1.4 QUALITY ASSURANCE

### 1.4.1 General

1. This Section directs special attention to certain features but does not purport to cover all details of the design, manufacture or installation of the pumping units. The final responsibility for supplying and installing pumping equipment which functions as specified herein rests with the Contractor.

2. Seismic rating:  $S_s = 1.24$ . Equipment importance factor:  $I_p = 1.25$ . Seismic response coefficient:  $SR = 0.358$ . Seismic requirements are applicable. Seismic load parameters for the building are provided in the structural general notes sheet.

3. A paint system shall be designed that ensures maximum protection and extends the service life of equipment exposed to seawater and marine environments.

4. Sling lift with overhead clearing and spreader bars with three slings. OR use forklift with roller dolly's. Forklift from cartridge filter end. To be lifted by qualified lifters.

#### 1.5 STORAGE

A. Equipment damaged or bent during shipping or storage shall be replaced.

B. Feed pump motor shall be stored on site according to motor manufacturer's recommendations until pumps are operational and accepted by the Engineer. Contractor shall be responsible for such arrangements.

C. Disassembled equipment shall be kept clean and protected against rodents and pests until equipment is reassembled, operational and accepted by the Engineer.

#### 1.6 WARRANTY

A. The pump manufacturer and the pump motor manufacturer shall each individually and separately warranty that the equipment they supplied under this Section fully meets the criteria specified herein, and shall further warranty that the equipment is free from all defects in materials and workmanship.

B. The manufacturer's warranties from defects shall contain a provision that the manufacturer shall repair or replace any defects, to the satisfaction of and at no additional cost to the Owner, for a period of twenty-four (24) months for the pump and motor from the date of Substantial Completion of the project.

### PART 2 PRODUCTS

#### 2.1 GENERAL

A. The overall SWRO unit and products specified Herein shall be provided by one manufacturer. The Basis of Design for the SWRO system is RO, SeaPRO-126, 35K, 480, PX, AB, PRV by Veolia Water Technologies, Trevose, PA.

##### B. Performance Data

|                    |            |
|--------------------|------------|
| Feed Flow          | 659 gpm    |
| Design TDS         | 33,000 ppm |
| Design Temperature | 1 degree C |

|                       |           |
|-----------------------|-----------|
| System Inlet Pressure | 30 PSI    |
| Design Permeate Flow  | 312 gpm   |
| Design Permeate TDS   | 21.5 mg/L |
| Concentrate Flow Rate | 347 gpm   |
| SWRO Recovery         | 47.4%     |
| Nominal Rejection %   | >97%      |

## 2.2 PIPING

Pipe material shall be compatible with seawater. Refer to the pipe schedule in the mechanical process bid drawings for specified pipe materials. All fittings, flanges, connections, fasteners, nuts, washers, nipples, joints, and seals shall be suitable for the intended application and compatible with the seawater environment.

## 2.3 WIRING

The following table applies to all wiring offered for the SWRO unit.

| Wiring                 | Size         | Description                                           |
|------------------------|--------------|-------------------------------------------------------|
| Control system wiring  | 110/240VAC   | 18AWG minimum, TFFN insulation                        |
| Power circuit wiring   | 110/240VAC   | 14AWG minimum, TFFN or THWN insulation                |
| Instrumentation wiring | 4-20mA loops | 22AWG minimum                                         |
| Motor wiring           | All sizes    | Dependent on motor size (usually outside scope of R0) |

## 2.4 VALVES

The material of construction shall be corrosion-resistant for seawater applications. Duplex 2205 or approved equal shall be used for high-pressure applications, while PVC can be used for low-pressure application. The following table applies to all valves offered for the SWRO unit.

| Manufacturer | Description |
|--------------|-------------|
|--------------|-------------|

### BALL

|                          |                                                                                                                                                                                                                              |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flow-Tek, Star, or equal | Duplex 2205 stainless steel body, threaded ends (drains, vents), Victaulic ends (concentrate backpressure), and socket ends (process piping). MSS-SP72 compliant. Gear Operators included for pressure reducing Ball Valves. |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|              |                                                                                |
|--------------|--------------------------------------------------------------------------------|
| SMC or equal | 150 lb. class, PVC Body, threaded and hose-barb ends (drains and sample ports) |
|--------------|--------------------------------------------------------------------------------|

#### BUTTERFLY

|               |                                                                                            |
|---------------|--------------------------------------------------------------------------------------------|
| Bray or equal | 150 lb. class, ASME B16.34, Nylon coated ductile iron disc, EPDM seat, Duplex 2205 SS stem |
|---------------|--------------------------------------------------------------------------------------------|

Note: Lug style bodies on 2.0 inch and greater and wafer style bodies on 1.5 inch

#### CHECK

|                       |                                                                                         |
|-----------------------|-----------------------------------------------------------------------------------------|
| Techno-check or equal | 150 lb. class, EPDM seat, Duplex 2205 stainless steel disc, with Victaulic grooved ends |
| SMC or equal          | Polypropylene body with EPDM seal (used on pH sensor slipstream)                        |

#### PRESSURE REGULATING VALVE

|                     |                                                                                |
|---------------------|--------------------------------------------------------------------------------|
| Pneumatics or equal | 5 Micron Element, NPTF thread 3/8 Port Size Gauge, Metal Bowl with sight glass |
|---------------------|--------------------------------------------------------------------------------|

#### RELIEF

|                  |                                                                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Farris, or equal | 300 lb. class, internals of 316 stainless steel, body and bonnet of carbon steel (used when pump pressure exceeds housing pressure rating) |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------|

### 2.5 INSTRUMENTATION

1. The following table applies to all instrumentation offered for the SWRO unit. Named instrumentation or equal shall be provided per Engineer approval.

2. The following table applies to all instrumentation offered for the BWRO unit. Named instrumentation or equal shall be provided per Engineer approval.

#### Instrument List

| Instrument        | Display | Manufacturer      | Locations     |
|-------------------|---------|-------------------|---------------|
| Instrument Center |         | Thornton or equal | Thornton M800 |

|                          |                  |                                   |                                                                                                            |
|--------------------------|------------------|-----------------------------------|------------------------------------------------------------------------------------------------------------|
| Flow Meters              | Transmitter      | GF Signet 51530-P0 or equal       | Permeate, concentrate                                                                                      |
| ERD Flow Meters          | Transmitter      | GE Panametrics AT868 or equal     | HP ERD outlet, LP ERD inlet                                                                                |
| Pressure Switch          | Discrete         | United Electric or equal          | High pressure pump feed, boost pump feed, permeate, concentrate                                            |
| Pressure Transmitter     | Transmitters     | E+H or equal                      | Feed inlet to membrane pressure vessels, concentrate outlet from membrane pressure vessels.                |
| Pressure Gauge           | Local Indication | Wika, Ashcroft or equal           | Pre-filter, post-filter, feed inlet to membrane pressure vessels, boost pump outlet, permeate, concentrate |
| Conductivity/Temperature | Transmitter      | Thornton M800 58-031-409 or equal | Permeate                                                                                                   |
| pH Meter                 | Transmitter      | Thornton M800 52-005-381 or equal | LP ERD Inlet (Feed)                                                                                        |
| Temperature              | Transmitter      | Thornton or equal                 | Permeate                                                                                                   |

Accessories, shipped loose or Mounted on Control Panel

#### Chlorine Monitor

|                                                                                   |                                          |                          |
|-----------------------------------------------------------------------------------|------------------------------------------|--------------------------|
| Level Transmitter (CIP tank level control for permeate flush)                     | PX3228 or equal                          |                          |
| Pressure Switch (feed, permeate, concentrate)                                     | Model 10 Series pressure switch or equal | United Electric          |
| Devices will be identified with tags on the P&ID and adhesive labels near devices |                                          |                          |
| Instrument - Local Indication                                                     |                                          |                          |
| Pressure Gauges - 2.5" gauges with 1/4" connections                               |                                          | Ashcroft, WIKA, or equal |

## 2.6 EQUIPMENT LIST

The following table details the main process equipment to be supplied in

this proposal. Named supplier or equal shall be provided per Engineer approval. The material of construction shall be corrosion-resistant for seawater applications. Duplex 2205 or approved equal shall be used for high-pressure applications.

| Equipment | Type | Supplier |
|-----------|------|----------|
|-----------|------|----------|

#### Rotating Equipment

|                         |                                                                                                                                                                                               |                            |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| RO High Pressure Pump   | Horizontal Multi-stage                                                                                                                                                                        | FEDCO or equal             |
| Inlet/discharge housing | Duplex 2205 stainless steel                                                                                                                                                                   | FEDCO or equal             |
| Shell                   | Duplex 2205 stainless steel                                                                                                                                                                   | FEDCO or equal             |
| Impeller                | SS Series = Noryl; AS Series = Duplex 2205 Stainless Steel.                                                                                                                                   | FEDCO or equal             |
| Shaft                   | Duplex 2205 stainless steel                                                                                                                                                                   | FEDCO or equal             |
| Lubrication             | Flooded oil                                                                                                                                                                                   | FEDCO or equal             |
| Seal Type               | Mechanical Crane type 21, Type 1, or 2B                                                                                                                                                       | FEDCO or equal             |
| Motor & VFD             | 300 HP motor, VFD model # Danfoss VLT Aqua FC202 or GE AF-650 GP                                                                                                                              | Danfoss, GE or equal       |
| Turbocharger            | Model HPB-130 or equal                                                                                                                                                                        | FEDCO or equal             |
| Coupling                | Flex rubber spacer type, with 1.15 service factor. Coupling guard meeting OSHA standards                                                                                                      | Tonkaflo or equal          |
| Motor                   | Ultra Nema Premium Extra Severe Duty (IP55) Motor. TEFC, NEMA B Standard, EISAct2007 Compliant, Class H Insulation. Maximum Speed: 3,600 rpm, Service Factor: 1.15. Inverter Duty Nema MG1-31 | Marathon, Baldor, or equal |

#### Cartridge Filter Housings

|                             |                                                                              |                 |
|-----------------------------|------------------------------------------------------------------------------|-----------------|
| RO Cartridge Filter housing | SS Housings, 100 psi max pressure, non code stamped. Model HFRP1-60 or equal | VEOLIA or equal |
|-----------------------------|------------------------------------------------------------------------------|-----------------|

|                  |                                                                                                |                 |
|------------------|------------------------------------------------------------------------------------------------|-----------------|
| Cartridge Filter | 1-micron nominal, model HF.R0.Zs 01-60-TSE or equal melt-blown polypropylene, quantity six (6) | VEOLIA or equal |
|------------------|------------------------------------------------------------------------------------------------|-----------------|

#### Membrane Element Housing

|                                   |                                                                                                                                           |                 |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| RO Element housings               | R8040B1200S model or equal, ring and plate style, quantity 18. Each housing holds 7 elements                                              | ROPV or equal   |

#### 2.7 ELECTRIC AND CONTROL SYSTEM

1. This section herein details the electrical and control system to be supplied in this proposal. Named suppliers or equal shall be provided per Engineer approval.
2. A control system is provided to allow the plant operators to easily operate, monitor and control the equipment supplied by Membrane Manufacturer.
3. The control system is mounted on a corrosion resistant mounting panel. It incorporates optional motor controls, solenoid valves, slipstream instrumentation fully wired and tubed.
4. Control panel is cUL/ UL 508 Standard for Industrial Control Equipment.
5. Membrane System Alarms required:
  - (a) Membrane System Alarms required:
  - (b) High permeate conductivity
  - (c) High permeate temperature
  - (d) VFD fault
  - (e) High permeate pressure
  - (f) High concentrate pressure
  - (g) High / Low inlet pH

(h) High / low concentrate flow

(i) High pressure inlet / outlet of membrane pressure valves

6. Control System: Refer to specification 46 82 00 section 2.13

Control System

Description

Control Panels and Remote I/O Boxes

Main Control Panel containing PLC and HMI - NEMA 4 painted carbon steel (or NEMA 4X stainless steel option)

Notes:

- a. The control panel will be fully assembled and wired and simulated control tests will be carried out to prove correct operation of controls, sequencing of valves, etc.
- b. Maximum ambient air temperature for the control panels is 35°C.
- c. Provide UPS. Panel must operate at site atmospheric conditions.
- d. 120 VAC control power.
- e. Components are UL listed or recognized.

Electrical and Instrumentation Assembly Components

|         |                            |                                            |
|---------|----------------------------|--------------------------------------------|
| 1 lot   | Wiring                     | Per SWRO Manufacturer standards            |
| 1 lot   | Terminal Blocks            | AB, or equal                               |
| 1 lot   | Air Solenoid Valves        | Valve ASCO Pneumatics manufacture standard |
| 1 lot   | Cable Tray                 | Painted steel                              |
| 1 lot   | Air Tubing and Fittings    | Polyethylene Tubing / PPL - "              |
| 1 lot   | Sample Tubing and Fittings | Polyethylene Tubing / PPL - "              |
| 1 Piece | Sample Solenoids           | " Parker Skinner stainless steel, or equal |

Notes:

- a. Solenoids for valves will be gang-mounted in on corrosion resistant panel
- b. Limit switches are not provided.
- c. Pneumatic tubing will be run and supported within skid limits, from solenoid to valve actuators, as required.

Motor Control Components

Motors shall be VFD controlled.

Local disconnect switches shall be included with motors.

## PART 3 EXECUTION

### 3.1 INSTALLATION

Manufacturer's on-site representative will confirm the final equipment has been installed as per manufacturer requirements and provide written confirmation that all warranties remain in effect.

### 3.2 FIELD AND FACTORY ACCEPTANCE TESTS

A. After the pump has been installed and connected, checked out as required by Section 01 75 00 and after inspection, operation, and adjustment have been completed by the manufacturer's representative, the equipment shall be field tested in the presence of the Engineer, for overall wire to water efficiency and for general performance and fitness for the service specified. Results of these tests shall be submitted to the Engineer.

### 3.3 MANUFACTURER'S SERVICES

A. The services of a factory trained manufacturer's representative shall be provided as described in Section 01 75 00 START UP AND TESTING and as specified herein.

B. As applicable, all components as defined within are factory tested as per manufacturer standards before leaving the manufacturer's facility. The ITP (Inspection and Test Plan) includes a test and / or inspection as defined in the ITP procedure for platform skids, prefabricated pipe (all assembled pipe, not loose supplied pipe), machinery (pumps, blowers, etc.), tanks, valves, instruments, electrical panels / junction boxes, electrical instruments, loose materials (cables, cable trays, etc.), and VFDs, as applicable. A FAT report (Factory Acceptance Test) is provided to the customer. It includes certificates, test reports, and CE declaration of conformity, as applicable. The Contractor is responsible for obtaining the FAT report from the Manufacturer.

C. Services to be provided:

1. For the pumps, the service representative shall be responsible for complete component inspection on site after delivery and shall assist in the correct assembly of the components for a minimum period of one (1) eight hour day.

(a) For inspection and check out of the erected equipment.

(b) For start up services and supervision.

(c) For complete instruction of the Owner's operating personnel.

D. The minimum period of time herein specified does not relieve the manufacturer from providing sufficient time to satisfactorily complete the required service functions.

E. The manufacturer's representative shall certify in writing that

the pump has been properly installed. Contractor shall coordinate with Manufacturer to remedy any necessary/recommended corrections.

F. The Owner reserves the right to video tape the instruction of the operating personnel for future use in training.

G. For services related to the SWRO system, refer to Section 46 82 00 IMMERSSED MEMBRANE FILTRATION SYSTEM AND ANCILLARY EQUIPMENT 3.2 Startup Commissioning, operator training.

#### 3.4 SPARE PARTS

A. Provide all other spare parts as recommended in the manufacturer's standard operations and maintenance information. Provide a list of recommended spare parts for the cartridge filters and the RO membrane skid.

B. Provide minimum two (2) mechanical seals for feed pump.

-- End of Section --

SECTION 46 82 00

IMMERSED MEMBRANE FILTRATION SYSTEM AND ANCILLARY EQUIPMENT  
**09/24**

PART 1 GENERAL

1.1 SUMMARY

- a. This Section includes the automatic strainer, immersed membrane filtration system, permeate and backwash rotary pumps, drain pumps, and ancillary equipment. All installed equipment shall be suitable for seawater application and should be designed and constructed to withstand the harsh conditions of seawater.
- b. All equipment listed below shall be furnished by a single manufacturer and shall be products of manufacturer regularly engaged in the production of said equipment:
  - (1) Water and Wastewater Chemical Feed Systems - Refer to Division 46 specification 46 30 00 WATER AND WASTEWATER CHEMICAL FEED SYSTEMS.
  - (2) Brackish Water Reverse Osmosis Unit - Refer to Division 46 Specification 46 80 00 BRACKISH WATER REVERSE OSMOSIS UNIT
  - (3) Seawater Reverse Osmosis Unit - Refer to Division 46 specification 46 81 00 SEAWATER WATER REVERSE OSMOSIS UNIT
- c. The manufacturer shall have the sole responsibility for proper functioning of the complete system.
- d. Any structural, mechanical, civil, architectural, HVAC, plumbing, electrical or instrumentation changes required by the use of any product (named vendor or approved equal product) other than the design product or an alternate layout shall be the responsibility of the Contractor and shall be provided at no additional cost to Owner.
- e. List of Desalination System Manufacturers:
  - (1) Veolia Water Technologies (Basis of Design)
  - (2) Ovivo Inc.
  - (3) WesTech Engineering, LLC
  - (4) Approved equal

1.1.1 Membrane Filtration System

This Section outlines the furnishing of a complete and operable Membrane Filtration System and provides the Scope of Work that shall be performed by the Membrane Filtration manufacturer (named herein the VENDOR). The Membrane Filtration System (MFS) shall be based on a low pressure submerged ultrafiltration membrane configuration using a vacuum to extract the membrane filtrate. The system shall include, but not be limited to, the following major equipment:

- (1) Membranes.
- (2) Permeate & Backwash Rotary Pumps.
- (3) Turbidity meters, analyzer, and flow measurement.
- (4) Low pressure blowers.
- (5) Clean-in-place (CIP) system.
- (6) Membrane support structures and frames.
- (7) MFS electrical and control (E&IC) system.
- (8) Monitoring equipment.
- (9) Piping and valves internal to and directly above the membrane tanks with termination points at or near the edge of the tanks
- (10) Valves and Instrumentation devices.
- (11) Drain Pumps.

The Manufacturer's scope of supply for the UF system is described in the following table.

| Quantity                      | Description                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2                             | 2 Feed Strainers with two (2) pressure gauges, one (1) pressure differential switch, and one (1) automatic backwash valve, one (1) automatic drain valve per strainer. |
| 2                             | Strainer backwash                                                                                                                                                      |
| 2                             | Strainer backwash pumps suction isolation valves (one (1) per pump)                                                                                                    |
| 2                             | Sets of sample / drain valves surrounding strainer backwash pumps (two (2) valves per set)                                                                             |
| 1                             | Strainer backwash pumps suction pressure gauge with required isolation valve.                                                                                          |
| 2                             | Strainer backwash pumps discharge pressure gauges with required isolation valves (one (1) per pump)                                                                    |
| 1                             | Strainer backwash pump flowmeter                                                                                                                                       |
| Positive Displacement Blowers |                                                                                                                                                                        |
| 2                             | Membrane air scour blower package (one (1) duty and (1) standby) supplied loose, complete with required motor and appurtenances. VFDs required - by others.            |
| 2                             | Membrane air scour blower isolation valves, manual                                                                                                                     |

| Quantity                                     | Description                                                                                                       |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| 3                                            | Membrane air scour blower isolation valves, automatic air relief valves                                           |
| 1                                            | Membrane air scour blower low-flow switches                                                                       |
| UF Membranes and Membrane Tank Appurtenances |                                                                                                                   |
| 3                                            | Sets of membrane cassette support brackets                                                                        |
| 3                                            | Permeate pressure transmitters                                                                                    |
| 3                                            | Membrane tank level transmitters with required isolation valves                                                   |
| 3                                            | Membrane tank inlet flow control valves                                                                           |
| 3                                            | Membrane tank inlet automatic isolation valves                                                                    |
| 3                                            | Membrane tank drain automatic isolation valves                                                                    |
| 3                                            | Membrane tank inlet sample valve                                                                                  |
| 3                                            | Cleaning solution automatic isolation valve, to / from CIP pump                                                   |
| 3                                            | Ejector assemblies, complete with required isolation valves                                                       |
| 3                                            | Ejector air supply assemblies, complete with required isolation valves                                            |
| 2                                            | UF submersible Drain pumps (one (1) duty and one (1) standby)                                                     |
| 2                                            | UF Drain pumps suction isolation valves (one (1) per pump)                                                        |
| 3                                            | Mud valves (one (1)) UF drain valve per Tank                                                                      |
| 1                                            | UF Drain pumps suction pressure gauge with required isolation valve                                               |
| 2                                            | UF Drain pumps discharge pressure gauges with required isolation valve (one (1) per pump)                         |
| 2                                            | UF Drain pumps discharge check and isolation valves (one(1) set per pump)                                         |
| 1                                            | UF Drain pump flowmeter.                                                                                          |
| UF Permeate / BW Pumps                       |                                                                                                                   |
| 3                                            | Process pumps (VFD's required - by others), supplied loose, complete with required motor (one (1) duty per train) |
| 6                                            | Pressure switch high on permeate / backpulse line (two (2) per pump)                                              |
| 3                                            | Permeate / Backpulse isolation valve (one (1) per pump)                                                           |

| Quantity                             | Description                                                                                                                         |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| 3                                    | Sets of sample / drain valves surrounding process pump (two (2) valves per set) (one (1) per pump)                                  |
| 6                                    | Process pumps suction and discharge isolation valves (two (2) per pump)                                                             |
| 3                                    | Suction pressure gauges with required isolation valves (one (1) per pump)                                                           |
| 3                                    | Discharge pressure gauges with required isolation valves (one (1) per pump)                                                         |
| 3                                    | Permeate / backpulse flowmeter (one (1) per pump)                                                                                   |
| 3                                    | Permeate turbidimeter panels.<br>Panel is supplied loose with instrument, isolation valve, and needle valve installed on the panel. |

|          | <p>Refer to Drawings and Specification Section 46 30.00 Chemical Feed System. The Manufacturer shall provide a complete skid-mounted system. The Contractor is responsible for providing all components not included on the skid system. Each metering pump shall have one spare. For metering pumps of the same size, only one spare unit per size is required. Spare pumps must be suitable for retrofitting into the chemical metering system for the corresponding chemical.</p> |

#### 1.1.2 Equipment and Services

- a. Equipment and Services to be provided by the general contractor, herein referred to as the CONTRACTOR, separate from VENDOR responsibility:
  - (1) Application for all required permits and permissions including but not limited to: civil works, mechanical and electrical works, environmental permits and any and all other permits required for membrane system operation.
  - (2) Design, supply and installation of CIP Tank, UF break tank and permeate Water storage tank.
  - (3) Design, supply and installation of interconnecting piping to and from the VENDOR supplied equipment and/or skid packages including but not limited to:
    - (a) Temporary piping required for the start-up and commissioning of the VENDOR equipment.
  - (4) Design, supply and installation of all pipe supports including pipe hangers for all piping supplied by the VENDOR.
  - (5) Design, supply and installation of pneumatic lines supplying air to the VENDOR supplied pneumatic actuators.
  - (6) Design and supply of all processes and chemical piping.
  - (7) Design, supply and installation of membrane tank and equipment access platforms, walkways, stairs, safety tie-off points, handrails, grating, ladders, etc, as required.

- (8) Design, supply and installation of membrane tank grating and their support over the membrane tanks.
  - (9) Any on-site touch-up primer or painting of equipment supplied by the VENDOR.
  - (10) Design, supply and installation of an overhead traveling bridge crane and pulley/hoist above the membrane tanks for installation and removal of the membrane cassettes. Refer to Bid Option No. 12 New Bridge Crane.
  - (11) Design, supply and installation of all floor drains.
  - (12) Design, supply and installation of bulk chemical storage facilities.
  - (13) Supply and installation of any spacer rings that may be required for VENDOR supplied valves.
  - (14) Design, supply and installation of panel boards, transformers, and other equipment as necessary to provide power distribution and control for VENDOR supplied equipment.
  - (15) Design, supply and installation of the Motor Control Center complete with motor starters, variable frequency drives, motor disconnects and Uninterruptible Power Supply required for the VENDOR supplied equipment.
  - (16) Design, supply and integration of the plant SCADA, including SCADA configuration, testing and interfacing with the VENDOR supplied control system.
  - (17) Design, supply and installation of all power distribution and instrumentation interconnecting wiring, optical fibers, conduit and appurtenances, as follows:
    - (a) Power connections as needed from the electrical power source to the VENDOR control panels, the MCC (by Electrical CONTRACTOR) and from the MCC to the VENDOR supplied equipment.
    - (b) Connections as needed between the various field-mounted instruments and valve actuators to the VENDOR control panels.
    - (c) Includes all cabling trays, conduits, fittings and supports as necessary.
  - (18) Control of equipment and systems not supplied by the VENDOR.
  - (19) Unloading, unpacking, storage (according to the VENDOR's recommendation), installation, assembly and field erection of the VENDOR's supplied equipment.
  - (20) Any items not provided by the vendor will be supplied by the general contractor.
- b. Equipment installation includes:
- (1) Installation of all VENDOR supplied loose-ship equipment.

- (2) Alignment and coupling of all pumps and other rotating equipment by a qualified person.
- (3) Installation of VENDOR supplied control panels.
- (4) Supply one month of storage of all chemicals (pre-treatment chemicals and chemicals used for the cleaning of the membrane modules and plant operation) during start-up, commissioning and acceptance testing of the membrane system. The existing chemical storage tanks are designed to provide one month of chemical storage required for the operation and maintenance of the system.
- (5) Supply of all required oil and lubricants for equipment start-up and initial operation per the manufacturer's specifications for the VENDOR's equipment.
- (6) Replacement of lubricants in all drives and intermediate drives of mechanical equipment after initial break-in of the VENDOR's equipment.
- (7) Flushing of all piping and membrane tanks and verification of removal of all residual debris from construction.
- (8) Make available laboratory services, operating and maintenance personnel during VENDOR equipment start-up, commissioning and acceptance testing.
- (9) CONTRACTOR to coordinate with VENDOR regarding equipment installation, operation, startup and commissioning.
- (10) VENDOR to provide assistance and recommendations to the CONTRACTOR and Engineer during equipment installation, operation startup and commissioning.
- (11) Flushing and disposal of membrane preservative.
- (12) CIP/neutralization tank, concrete construction.

## 1.2 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

## 1.3 BASIS OF DESIGN

The Basis of Design for the intake screens and airburst backwash system is ZeeWeed Immersed 500D three-cassette model, Veolia Water Technologies and Solutions, Trevose, Pennsylvania, or approved equal. Products must meet requirements of the Buy American Act.

A. General

- (1) The UF Membrane process shall utilize a hollow fiber, reinforced, porous media, composed of a polymeric material.
- (2) Three (3) UF membranes are to be immersed in three (30 separate tanks, in direct contact with feed water. A vacuum shall draw water through the UF membranes producing filtrate water. A vacuum is to be applied through the use of a permeate (or filtrate) pump. Intermittent airflow shall be introduced beneath the membrane modules producing turbulence that scours the external surface of the hollow fibers. Filtered water is to be systematically reversed through the membranes while the raw water in the tank is evacuated, effecting a backwash operation.
- (3) The UF system should provide a flexible mode of aeration to automatically respond to challenging feed water quality events.
- (4) Membranes are to be cleaned daily utilizing a low strength oxidant and/or acid, and monthly using a high strength oxidant and/or acid.
- (5) Pre-treatment of the raw water, including chlorine injection, shall be accomplished prior to the membrane system. This pre-treatment, and the clarification pre-treatment process are not within the scope of the VENDOR.
- (6) Screen / strainer shall be 50 micron and supplied by UF vendor.
- (7) Pipe material shall be compatible with seawater. Refer to the pipe schedule in the mechanical process bid drawings for specified pipe materials. All fittings, flanges, connections, fasteners, nuts, washers, nipples, joints, and seals shall be suitable for the intended application and compatible with the seawater environment.

B. Raw Water Quality

The pretreatment system shall include a chlorine injection upstream of the UF. The membrane feed water shall be raw water from the Source Water of the quality described below:

| PARAMETER      | UNITS                     | AVERAGE | MINIMUM | MAXIMUM |
|----------------|---------------------------|---------|---------|---------|
| Alkalinity     | mg/L as CaCO <sub>3</sub> | 70      | 50      | 120     |
| Salinity       | PSS                       | 28.01   | 16      | 33      |
| Total Hardness | mg/L as CaCO <sub>3</sub> | 300     | 2000    | 6364    |
| pH             | -                         | 7.88    | 7.24    | 8.2     |
| Temperature    | C                         | 10.48   | 1       | 20      |

|                                  |      |        |        |        |
|----------------------------------|------|--------|--------|--------|
| Total Organic Carbon (TOC)       | mg/L | 2      | 1      | 3      |
| Dissolved Organic Carbon (DOC)   | mg/L | 1.5    | 0.5    | 2      |
| Apparent Color                   | TCU  | 20     | 10     | 45     |

| Langelier Saturation Index (LSI) | -    | -0.97  | -0.05  | 1.06   |

### C. Permeate Water Quality

Permeate from the membrane system shall be guaranteed to meet the following requirements:

#### Guaranteed Permeate Water Quality

| Parameter                  | Value         |
|----------------------------|---------------|
| pH                         | 7.5 - 9.5     |
| Conductivity               | 0 - 100 umhos |
| Hardness (mg / L as CaCO3) | <0.1 ppm      |

| Parameter  | Value                                          |
|------------|------------------------------------------------|
| Alkalinity | <150 ppm                                       |
| Iron       | <0.1 ppm                                       |
| Turbidity  | Less than or equal to 0.1 NTU 95% of the time. |

Note 1: All guarantees are contingent upon proper maintenance, calibration and service of instruments and other related equipment as per the VENDOR's and original equipment manufacturer's instruction.

#### 1.4 System Design Conditions and Criteria

A. The membrane system shall meet the following design conditions and performance requirements:

##### Design Conditions

| Parameter                                                      | Quantity / Units             |
|----------------------------------------------------------------|------------------------------|
| Number of Trains                                               | 3                            |
| Number of Cassettes Per Train                                  | 1                            |
| Design Minimum Temperature                                     | 1 degree C                   |
| Design Capacity (Net) With All Trains in Service at 1 degree C | 777 gallons per minute (GPM) |
| Recovery at Design Capacity                                    | 90%                          |

R0 Design Capacity (Net) With All UF Trains In Service at 1°C: 0.4 MGD

#### 1.5 SUBMITTALS

Government approval is required for submittals with a "G" or "S" classification. Submittals not having a "G" or "S" classification are for Contractor Quality Control approval. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

The ultrafiltration system and ancillary equipment are long-lead items and submittals are critical submittals.

##### SD-01 Preconstruction Submittals

MEMBRANES; G, AE

PERMEATE AND BACKWASH ROTARY PUMPS; G, AE

ASSOCIATED COMPRESSED AIR EQUIPMENT; G, AE

LOW PRESSURE BLOWERS; G, AE

CLEAN-IN-PLACE CIP SYSTEM; G, AE

MEMBRANE SUPPORT STRUCTURE AND FRAMES; G, AE

MFS ELECTRICAL AND CONTROL SYSTEM; G, AE

MONITORING EQUIPMENT; G, AE

PIPING AND VALVES INTERNAL TO AND DIRECTLY ABOVE THE MEMBRANE  
TANKS WITH TERMINATION POINTS AT OR NEAR THE EDGE OF THE TANKS; G,

DRAIN PUMPS; G, AE

EQUIPMENT LIST; G, AE

1. Major Equipment Mechanical Bill of Material for the project.
2. Includes all major equipment including pumps, tanks, heater, modules, blowers etc.

MECHANICAL BILL OF MATERIALS; G, AE

1. Includes quantity, tag numbers, P&ID reference number, and item description including manufacturer and manufacturer part number, materials of construction, connection sizes and types, and VENDOR part number.

I/O LIST; G, AE

1. A complete listing of the analog and digital I/O on the system.
2. Shows where the I/O is being sent to/from and which panel it is wired to.
3. It identifies the exact location of each IO point on the control modules of every PLC component of the system.  
Issued for information only.

#### SD-02 Shop Drawings

DETAIL DRAWINGS; G, AE

PIPING AND INSTRUMENTATION DIAGRAMS (P&IDS); G, AE

1. For VENDOR-manufactured/supplied major components.
2. Includes scope of supply, pipe and equipment sizing, and materials of construction.
3. Issued for approval.

PROCESS FLOW DIAGRAM (PFD); G, AE

1. Shows the relationship between the major components in

the system.

2. It must show all the unit operations in the process but does not need to show every piece of equipment.
3. Issued for approval.

#### GENERAL ARRANGEMENT DRAWINGS; G, AE

1. General Arrangement and dimensions of individual membrane tanks and all membrane tank trains together in plan, elevation and section views, and including maximum and minimum water levels.

#### NETWORK ARCHITECTURE DIAGRAM; G, AE

1. Provides definition of the control system architecture at a high level.
2. Indicates all PLCs and Remote I/O Panels including PLC make/model.
3. Shows all software communication protocols planned for the system and where employed including the use of any "smart" or networked components.
4. Indicates communication strategy with other entities (SCADA, other controls, etc.).

#### ELECTRICAL DRAWINGS; G, AE

1. Includes the following components: Electrical schematic diagrams, and electrical bill of material.
2. Issued for approval.

#### PLC AND CONTROL PANEL LAYOUT DRAWINGS; G, AE

1. A physical layout of the main control panel and remote I/O panels.
2. Includes the panel front elevation view for both the interior and exterior, the terminal block layouts, and the bill of material.

#### CONTROL LOGIC AND SEQUENCE CHARTS; G, AE

1. An Excel Workbook consisting of several worksheets which describe the required process automation in detail including system modes, equipment modes, interlocks, permissives, sequences, and alarms.
2. The two (2) most significant worksheets are the Sequence Chart (SC) and the Control Logic Chart (CLC).
3. Issued for approval.

## 1.6 SAFETY REQUIREMENTS

Exposed moving parts, parts that produce high operating temperature, parts which may be electrically energized, and parts that may be a hazard to operating personnel must be insulated, fully enclosed, guarded, or fitted with other types of safety devices. Safety devices must be installed so that proper operation of equipment is not impaired.

## 1.7 QUALITY CONTROL

### 1.7.1 Detail Drawings

Submit drawings of sufficient size to be easily read, within 90 days of notice of Award of Contract. Submit information in the English language. Provide with English (IP) dimensions. Drawings must consist of complete designs of the manufacturer's systems and other equipment, installation instructions, performance charts, brochures, and other information required to illustrate that the entire system has been coordinated and shall function as a unit.

- a. Outline drawings of the system showing pertinent dimensions and weight of each component of the system. Prepare drawings to scale.
- b. Drawing showing details and dimensions of mounting design or layout including any embedded items.
- c. Cross-sectional drawings of the system showing each component. Show major or complicated sections of the system in detail. Indicate on each drawing an itemized list of components showing type, grade, and class of material used and make and model number of standard component used.
- d. Detail and assembly drawings required for manufacturing showing dimensions, tolerances, and clearances.
- e. Drawings covering erection and installation that are intended to be furnished to the erecting engineer.

### 1.7.2 Quality Assurance

- a. The equipment and material to be furnished under this contract shall be free from defects in materials and workmanship. The complete membrane filtration system shall be provided by one Manufacturer having complete responsibility for the design of the system, including all necessary ancillary equipment, to provide a complete operating

system.

- b. The materials and equipment furnished by the VENDOR shall be installed by a CONTRACTOR. The VENDOR shall be required to provide factory trained technical representatives to monitor installation and to provide technical assistance for start-up, commissioning and testing of the VENDOR's equipment. The VENDOR shall be responsible for the membrane system's ability to meet the specifications and performance guarantees.

#### 1.8 DELIVERY, STORAGE, AND HANDLING

Protect stored items from the weather, humidity and temperature variations, dirt and dust, or other contaminants. Proper protection and care of all material both before and during installation must be the CONTRACTOR's responsibility. Any materials found to be damaged must be replaced at the CONTRACTOR's expense. During installation, cap piping and similar openings to keep out dirt and other foreign matter. Any porous materials found to be contaminated with mold or mildew shall be replaced at the CONTRACTOR's expense. Non-porous materials found to be contaminated with mold or mildew must be disinfected and cleaned prior to installation.

#### 1.9 PROJECT/SITE CONDITIONS

##### 1.9.1 Verification of Dimensions

The CONTRACTOR must become familiar with all details of the work, verify all dimensions in the field, and advise the Contracting Officer of any discrepancy(ies) before performing any work.

##### 1.9.2 Drawings

Because of the small scale of the drawings, it is not possible to indicate all offsets, fittings, and accessories that may be required. The CONTRACTOR must carefully investigate the conditions that would affect the work to be performed and must arrange such work, accordingly, furnishing required offsets, fittings, and accessories to meet such conditions.

##### 1.9.3 Accessibility

Install all work so that parts requiring periodic inspection, operation, maintenance, and repair are readily accessible.

#### PART 2 PRODUCTS

All installed equipment shall be suitable for seawater application and should be designed and constructed to withstand the harsh conditions of seawater.

##### 2.1 AUTOMATIC STRAINERS

Two automatic self-cleaning strainers shall be installed, configured as shown in the bid drawing, with one serving as duty and the other as standby. The strainers shall meet the following design criteria:

- a. Strainer Manufacturer/Model: Boll model Aquaboll, or an approved equal.
- b. Material of Construction: Cast iron with epoxy lining.
- c. Screen Type & Size: 50 micron mesh.

- d. Strainer Motor: 480 Watt, 120 VAC/60 Hz.
- e. Certification: The strainers shall be certified for seawater application to ensure their suitability and durability in marine environments.

## 2.2 MEMBRANE TANK

General-Each membrane train shall be in a separate, isolatable concrete tank constructed by the CONTRACTOR.

Provide tank level transmitter (one per train), a feed turbidimeter (one common) with instrument, instrument auto-cleaner, isolation valve, and needle valve installed on the panel. Other valves and instruments as required for a complete system.

### 2.2.1 Membrane Modules

- a. Three (3) ultrafiltration modules shall be of hollow fiber construction and configured for a normal filtration flow direction from outside the fiber through to the inside (lumen) of the fiber. The Basis of Design utilizes a total of 204 modules, with 68 modules per cassette, one cassette per train, and three trains in total.
- b. A module is a unit assembly of UF hollow fibers and is the base serviceable element of the membrane filtration process.
- c. The modules are to be constructed such that the fibers are arranged vertically, and permanently bonded in position at both the top and bottom of the module.
- d. The internal lumens of the fibers shall terminate within a channel area at both ends of each module that facilitates permeate collection and flow.
- e. Membrane modules are to be constructed of chemically resistant materials matching or bettering the chemical resistance of the membranes.
- f. The filtration area of each module is to be based on the wetted external surface area of the fibers.
- g. The membranes shall be of reinforced hollow fiber construction and have a nominal pore size of no greater than 0.05  $\mu\text{m}$  and an absolute pore size no greater than 0.1  $\mu\text{m}$ .
- h. Membranes shall be constructed of PVDF.
- i. Membranes are to be capable of being cleaned with sodium hypochlorite, caustic, or citric acid at temperatures up to 30°C.
- j. Cleaning pH can vary between 2 and 10.5. Membranes are tolerant to chlorine to at least 30,000,000 mg-min/L of free chlorine, for cleans up to 1,000 mg/L and a pH of up to 10.5 for up to 10 hours at a time.

### 2.2.2 Certification

Membranes shall be certified for seawater application to ensure their

suitability and durability in marine environments.

#### 2.2.3 Membrane Racks/Cassettes

- a. Membrane modules shall be assembled into units called racks or cassettes.
- b. Each rack/cassette shall be supported within a frame manufactured of material suitable for the intended application and compatible with the seawater environment.

#### 2.2.4 Piping

Provide all piping within the internal limits of the Membrane Tank. Refer to the Membrane System Process and Instrumentation Drawings which delineate the scope of supply included with the MFS. The contractor should supply all piping embedded in concrete. Vendor scope would be limited to the air supply downcomer

The VENDOR shall ensure that all pipes are sized to minimize pipe losses.

### 2.3 PERMEATE (FILTRATE) SYSTEM

#### 2.3.1 General

Provide a pumped permeate collection system including pumps, controls, isolation valves, check valves, flow meters, and pressure gauges. All equipment is furnished loose by the VENDOR for installation and wiring by the CONTRACTOR. Automated valves shall have solenoids mounted on the valve actuator. Solenoids shall be as per Section 2.11 Valves of this specification.

#### 2.3.2 Permeate (Filtrate) and Backwash Pumps

Provide individual permeate pumping system for each of the three (3) trains. The permeate pumps shall be rotary lobe type to provide vacuum pressure, achieve backwashing when operated in the reverse direction, seawater corrosion resistance material, and meet the following design criteria:

- a. Pump Manufacturers/model - Boerger, Model FL 518, or equal
- b. Pump Type - Rotary Lobe Type
- c. Flanges - ANSI #150
- d. Casing - Bronze (e.g. ASTM B148 C95800 Nickel-Aluminum Bronze, Super duplex stainless steel (e.g. SAF 2507) or approved equal
- e. Impeller - Super duplex stainless steel or approved equal
- f. Shaft Sleeve - 316 Stainless Steel
- g. Control: VFD
- h. Motor: 460 Volt, three-phase electric motor, totally enclosed fan cooled (TEFC), class B temperature rise, class F insulation, normal starting torque. Motors shall be Siemens, GE USEM, Brooks Hansen,

Reliance, Westinghouse, Toshiba, or approved equal.

### 2.3.3 Permeate System Valves and Instrumentation

Supplied loose by the VENDOR for installation and wiring by the CONTRACTOR:

- a. Permeate pressure transmitter per train on the permeate line.
- b. Isolation hand valves on suction and discharge of each pump.
- c. Compound pressure gauges on suction and discharge of each pump, with isolation valves.
- d. Drain valves on suction and discharge of each pump.
- e. Sample valves on discharge of each pump, to feed turbidimeter panel.
- f. A dedicated turbidimeter shall be supplied, by VENDOR, per membrane train, to measure the turbidity of the treated water before it is discharged to the T2 UF Break Tank. See section 2.12 Instrumentation for specifications for all metering equipment related to ultrafiltration.

### 2.4 BACKWASH SYSTEM

Components to be provided by the VENDOR, installation to be performed by the CONTRACTOR. The CONTRACTOR shall coordinate with the VENDOR, and the VENDOR shall provide guidance, requirements and recommendations to the CONTRACTOR.

- a. Under normal operation, the membrane trains shall automatically cycle between permeation mode and backwash mode. The treated water used for the backwash procedure is collected in the UF Break Tank. A Backpulse Pump Skid is used to draw the water from the Break Tank and pump it to the inside of the membrane fibers ("inside-out" flow path). Permeate pumps (loose shipped) are used for backwash.
- b. Furnish equipment to create a complete, integral, and automatic backwash system designed to maintain and restore membrane performance. All equipment is furnished loose by the VENDOR for installation and wiring by the CONTRACTOR.
- c. Design the backwash system to clean the membranes in place without requiring their disconnection from the membrane train. The backwash system shall be connected to all membrane trains and shall be designed to backwash one membrane train at a time while the other membrane trains remain in operation.

#### 2.4.1 UF Break Tank

Contractor to provide one (1) 18,800 gallon Tank and interconnecting piping.

- a. The Tank shall have sufficient ports installed in number and size to fill with permeate, Backwash Pump inlet, overflow, discharge to SWRO distribution pump, and drain. Each port shall be fitted with an ANSI #150, gasket, and bolt style mechanical flanges.
- b. The Tank shall be equipped with a level transmitter with local display

and isolation valve.

- c. Provide isolation hand valves on the tank outlet, and on the tank drain line.
- d. The Tank shall be constructed of HDPE or FRP.
- e. Tank shall be configured as per contract drawings.

#### Drain Pumps

Two submersible pumps will be installed inside the wet well to manage the backwash drainage from the UF tanks and to handle any overflow scenarios. The pumps will operate based on level control and will be driven by variable frequency drives (VFDs). The basis of design is the Flygt NP 3127 HT 3 Adaptive 488 model, equipped with a 10 HP motor rated at 3-phase, 480 volts. Each pump is designed to deliver 558 GPM at 18 PSI.

- a. Pump Manufacturers - Flygt Model NP 3127 H3 or approved equal
- b. Impeller Material - Material shall be certified for seawater application.
- c. The pumps shall be certified for seawater application to ensure their suitability and durability in marine environments
- d. Refer to specification 22 13 29 for submersible centrifugal pumps

#### 2.5 CIP/NEUTRALIZATION SYSTEM

- a. Furnish equipment to create a complete, integral, and automatic CIP system designed to maintain and restore membrane performance by reducing or controlling the transmembrane pressure. The CIP system should also be capable of neutralization of the spent chemical solution post clean. All equipment is furnished loose by the VENDOR for installation and wiring by the CONTRACTOR. Automated valves shall have solenoids mounted on the valve actuator per Section 2.11 Valves of this specification.
- b. Chemical cleaning shall be fully automatic, specifically:
  - (1) No operator intervention shall be required to initiate the cleaning process;
  - (2) No operator intervention shall be required during the chemical cleaning process;
  - (3) Upon completion of the cleaning process, the system shall automatically return to normal operation; and
  - (4) Initiation of the chemical cleaning process shall be by either a scheduled event from the PLC/SCADA, or by an operator-initiated command at the OIT / SCADA system.
- c. Design the CIP system to clean the membranes in place without requiring their disconnection from the membrane train. The CIP system shall be connected to all membrane trains and shall be designed to clean one membrane train at a time while the other membrane train

remains in operation.

#### 2.5.1 CIP Pump

A single UF CIP (Clean-in-Place) pump shall be provided for chemical cleaning of the UF membranes.

- a. Manufacturer - Boerger, Netzsch, or approved equal
- b. Pump Type Rotary Lobe Type Reversible Pump
- c. Design Point: 250 GPM at 30 feet TDH
- d. Maximum priming lift: 18 ft
- e. Flange - ANSI #150
- f. Casing/Impeller/ Shaft Sleeve: Pump material shall be certified for highly corrosive materials such as Citric Acid (500 mg / L) and sodium Hypochlorite (500 mg / L).
- g. Control: VFD
- h. Motor: 460 Volt, three-phase electric motor, totally enclosed fan cooled (TEFC), class B temperature rise, class F insulation, normal starting torque. Motors shall be Siemens, GE USEM, Brooks Hansen, Reliance, Westinghouse, or Toshiba.

A single RO CIP pump shall be provided for chemical cleaning of the RO membranes.

- a. Manufacturer: Goulds; Grundfos; or approved equal
- b. Pump Type: Centrifugal operated with VFD
- c. Basis of Design Goulds GL03SH
- d. Application: Highly acidic or alkaline chemical solution
- e. Design Points: 320 GPM at 150 ft TDH; 720 GPM at 150 TDH
- f. Casing/Impeller/Shaft Sleeve: Stainless steel 316 L
- g. Motor: 460 Volt, three-phase electric motor, 60 Hz, 40 hp.

#### 2.5.2 CIP Heater

The CIP system shall include at minimum one (1) three-phase electrical heater suitable for the heating of the chemical cleaning solution to the required heated cleaning temperature (40°C), at minimum one (1) degree Celsius raw water temperature. The heater shall provide numerous protections to avoid overheating the solution and severely damaging piping, membranes, or tanks. These must include:

- a. A dedicated heater electrical panel, with a controller to maintain the desired heater element temperature and hard-wired interlocks as described below.
- b. Low flow switch with hard wired interlock to ensure water is always

flowing across the heater.

- c. High Temperature switch with hard wired interlock.
- d. Heater must be installed in a S10 316SS pipe (part of interconnecting piping supplied by the CONTRACTOR).
- e. If heater is in contact with cleaning solution, it must be of a titanium alloy construction, to avoid corrosion. Ideally, the heater shall not come in contact with cleaning solution, in which case it's acceptable for the heater to be of 316SS construction.
- f. Heater system must include an automated drain valve to ensure heater is dry whenever not in operation in order to prevent corrosion.
- g. Anticipated electrical Requirements: 250 kW, 480 Volt, 3 Phase
- h. Basis of design: Hubbell electric water Model CR250SST4-E-9

#### 2.5.3 CIP Tank

The tank(s) are to be assumed to be of HDPE construction, to be in the scope of the CONTRACTOR. VENDOR to provide a size and quantity estimate for this tank in proposal, 5,000 gallons storage capacity. VENDOR to provide:

- a. Level transmitter(s) with local display and isolation valve.
- b. Provide isolation hand valves on the tank(s) outlet, and on the tank drain line.

#### 2.5.4 CIP System Valves and Instrumentation

Supplied loose by the VENDOR for installation and wiring by the CONTRACTOR, at minimum the below:

- a. One (1) CIP temperature transmitter.
- b. One (1) CIP flow meter.
- c. Isolation hand valves on the suction and discharge of pumps.
- d. Drain valves on suction and discharge of pumps.
- e. One (1) check valve on discharge of pumps.
- f. Pressure gauges on suction and discharge of pumps, with isolation valves.
- g. CIP tank filled from the BWRO permeate pipe (valve by others). Back up fill line from city water.
- h. Automatic valving that allows CIP solution to flow to the CIP heater, returned to the CIP tank, or waste to drain as VENDOR requires.

#### 2.6 pH/CHLORINE ANALYZER PANEL

A pH/Chlorine Analyzer Panel shall be used to ensure the neutralized cleaning solution is at an acceptable pH and a low enough residual free

chlorine concentration to permit discharge to sewer. The pH/Chlorine Analyzer Panel includes the following equipment installed and pre-wired on the panel with interconnecting tubing between the various pieces of instrumentation and valves:

- a. One (1) in-line chlorine sensor, complete with display, capable of measuring 5 ppm or less of free chlorine, and tolerant of up to 200 ppm of chlorine.
- b. One (1) in-line pH sensor meter to measure pH of cleaning solution during neutralization of cleaning solution waste.
- c. Flush line to ensure both sensors are in contact with water during CIP downtime.
- d. Isolation, dosing, and needle valves.

## 2.7 MAINTENANCE CLEAN AND RECOVERY CLEAN DESCRIPTIONS

- a. Table below provides a summary for typical cleaning type and frequencies:

|                                 |                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maintenance Clean (MC) Protocol | 2 / day / train<br><br>12 times per week using 250 mg/L NaOCl<br><br>1 time per week using 500 mg/L citric acid with mineral acid for pH adjustment to 2.1<br><br>Maintenance cleans are not heated. |
| Recovery Clean (RC) Protocol    | 24 / year / train<br><br>500 mg/L NaOCl followed by 12 / year / train 2 g/L citric acid with mineral acid for pH adjustment to 2.1<br><br>Recovery clean solutions are heated prior to each clean.   |

- b. A Recovery Clean (RC) is utilized to recover lost capacity of the membranes due to particulate fouling which cannot be removed through the processes of air scouring, back pulsing, and maintenance cleaning. The RC operation shall be facilitated by the same CIP system and chemical dosing equipment supplied for performance of the maintenance clean and shall be a similar operation of longer duration. A recovery clean is heated.
- c. The cleaning procedure shall be initiated automatically through the PLC and shall be a fully automated procedure.
- d. The Contractor shall provide two (2) sets of 6-inch diameter, 25-foot long flexible hose connections suitable for use with highly corrosive chemicals during SWRO membrane cleaning, which is performed four (4) times per year.

## 2.8 CHEMICAL CLEAN DOSING EQUIPMENT:

Adhere to the following specifications as well as Section 46 30 00 WATER AND WASTEWATER CHEMICAL FEED EQUIPMENT of the contract documents.

- a. Chemical Dosing Pumps: Chemical dosing systems shall be supplied for all cleaning and neutralization chemicals required by the membrane system. The cleaning and neutralization chemicals requiring chemical dosing systems are:
  - (1) 12.5% sodium hypochlorite
  - (2) 50% liquid citric acid
  - (3) 38% sodium bisulfite
  - (4) 25% sodium hydroxide
  - (5) 50% sulfuric acid
- b. Chemicals with larger flows shall be pumped using a mag drive pump system. The mag drive pump system includes the following (all supplied loose for installation by the CONTRACTOR):
  - (1) One (1) strainer
  - (2) One (1) chemical pump suction isolation hand valve per pump
  - (3) One (1) chemical pump discharge isolation hand valve per pump
  - (4) One (1) duty mag drive chemical pump and one (1) standby
  - (5) One (1) pump discharge check valve per pump
  - (6) Two (2) sample/drain valves per pump
  - (7) One (1) chemical pump suction pressure gauge with isolation valve per pump
  - (8) One (1) chemical pump discharge pressure gauge with isolation valve per pump
  - (9) One (1) chemical pump flowmeter
  - (10) One (1) hand control valve
  - (11) Two (2) isolation valves.
  - (12) One (1) pressure relief valve (for sodium hypochlorite service only)
- c. Chemicals with smaller flows may be pumped from a panel-mounted chemical pump system. The Chemical Pump Panel includes the following equipment installed and pre-wired on the panel with interconnecting piping between the various pieces of instrumentation and valves:
  - (1) One (1) duty and one (1) standby chemical dosing pump
  - (2) One (1) calibration column

- (3) One (1) pressure relief valve per pump
- (4) One (1) pressure gauge with diaphragm seal
- (5) Lot isolation valves
- (6) PVC or PVDF piping and/or tubing, selected to be chemically compatible with the cleaning chemical
- (7) Electrical junction box for any solenoids, level switches, motor or other device requiring an electrical connection.

## 2.9 BLOWER SYSTEM

Furnish equipment to create a complete, integral, and automatic blower system designed to air scour the membranes during backwash and sized for the maximum air demand with all module spaces on a train filled. All equipment is furnished loose by the VENDOR for installation and wiring by the CONTRACTOR.

- a. One (1) duty and one (1) standby blower shall be supplied. The Blower shall conform to the following:
  - (1) Blower Type - Positive Displacement Rotary Lobe - Oil Free
  - (2) Manufacturer - Aerzen, Kaeser, or approved equal
  - (3) Model - Aerzen GM Series (Basis of Design)
  - (4) Connections - Flexible Sleeve Type Connection
  - (5) Casing & Head Plates: cast iron EN-GJL-200, equivalent to ASTM A48/A48M class 30
  - (6) Shaft - C45N, equivalent to AISI 1043
  - (7) Rotors - ductile iron or forge steel C45N, equivalent to AISI 1043
  - (8) Drive - V-Belt Drive, automatic tension
  - (9) Guard - plate OSHA-rated V-belt drive guard
  - (10) Control: VFD
  - (11) Motor - TEFC 1,800 or 3,600 rpm, inverter-rated
  - (12) Accessories: one (1) air inlet filter, one (1) air intake/silencer, one (1) air discharge silencer, one (1) pressure relief valve, one (1) discharge pressure gauge with isolation valve, and one (1) check valve, and one (1) acoustic enclosure.
  - (13) Blower System Valves and Instrumentation: Supplied loose by the VENDOR for installation and wiring by the CONTRACTOR at minimum the below:
    - (a) One (1) Blower isolation hand valve.
    - (b) One (1) membrane air scour flow switch.

## 2.10 VALVES

Valves in contact with raw water or permeate shall contain wetted components of stainless steel, PVC, or food grade elastomers.

### 2.10.1 Automated Valves

- a. Automated on/off valves that cycle regularly shall be butterfly type and incorporate a pneumatic actuator controlled by a 2-way solenoid valve. Butterfly valves shall be lug-style suitable for installation between ANSI # 150 flanges.
- b. Pneumatic actuators shall be double acting cylinder - rack and pinion type. Actuators shall operate at a drive air pressure of 80 psig or greater.
- c. Air to valve actuators must be controlled by 2-way electrical solenoid valves that receive electrical signals from the control system. Solenoid valve is mounted on the actuator. Manual actuation capability is available so that the system's normally automatic valves can be manually controlled in the event that the main system controller fails.
- d. Electrically operated valves can be provided at the location indicated on the bid drawings.

### 2.10.2 Manual Valves

Manual valves for on/off service shall be ball or butterfly type. For throttling service, manual valves shall lock in place to prevent position changes without manual intervention.

### 2.10.3 General System Valves

- a. Butterfly valves shall be cast iron, epoxy coated, lug style body with Nylon coated ductile iron disc or stainless-steel disc (dependent on application), EPDM seat (NSF 61 certified), and 316 stainless steel shaft.
  - (1) Manufacturer/Model: Bray Series 31 or 3L
- b. Chemical feed ball valves (< 3") shall be Tru-Union style with PVC body, plug, and shaft, with EPDM or Viton seals (as required for chemical service).
  - (1) Manufacturer/Model: George Fischer Type 546 or equal
- c. Instrument isolation ball valves shall be 316 stainless steel body valves with PTFE seats and socket weld or threaded end connections.
  - (1) Manufacturer/Model: Apollo model 76F or equal
- d. General Service water check valves shall be wafer swing check valves suitable for installation between ANSI #150 flanges, with stainless steel body and disc, and EPDM seat.
  - (1) Manufacturer: Ritepro or equal
- e. Check valves on chemical lines are ball-style with PVC body and disc.

(1) Manufacturer: George Fischer or equal

- f. Two-way isolation solenoid valves for air or water service shall be F-NPT style with 316 stainless steel or brass body and EPDM seal.

(1) Manufacturer: Asco, Burkert or equal

- g. Needle valves shall have 316 stainless steel body and seat materials.

(1) Manufacturer: Whitey or equal

#### 2.10.4 General System Pneumatic Actuators

- a. Pneumatic actuators on general service butterfly valves shall be double acting cylinder - rack and pinion type. Actuators shall operate at a drive air pressure of 80 psig or greater. Actuators shall have body material of extruded aluminum alloy, anodized. Include travel stops  $\pm 5^\circ$  at  $0^\circ$  and  $90^\circ$  positions. End caps and pistons of die cast aluminum alloy. Output shaft of carbon steel (zinc plated). Acetal shaft bearings. Stainless steel fasteners. Buna-N O-rings.

(1) Manufacturer/Model: Bray Series 92

- b. Pneumatic actuators on PVC valves shall be double acting. Actuators shall operate at a drive air pressure of 80 psig or greater. Actuators shall have body material and end caps of PP, fiberglass reinforced.

(1) Manufacturer: George Fischer

#### 2.11 INSTRUMENTATION

General: Unless otherwise indicated, VENDOR shall supply, calibrate, configure, test and start-up all instruments and equipment related to the VENDOR provided packaged system.

##### 2.11.1 Level Transmitters

Level transmitters shall be supplied for monitoring the liquid levels in the Membrane Tanks, Backwash, and CIP Tank(s). The transmitter shall be hydrostatic type, immersion entry with Stainless Steel and PPS NEMA 4X housing. Acceptable manufacturers and specifications are:

- a. Manufacturer/Model: E&H FMX21
- b. Application - Salt Water, Immersion
- c. Mounting - Suspension clamp, cable mounting screws
- d. Output - 4-20 mA
- e. Voltage - 11.5 to 30 VDC
- f. Housing - PPS/Polyolefin & 316L

##### 2.11.2 Pressure Transmitters

Pressure transmitters shall be supplied to monitor the positive pressure

on both the inside and outside of the membrane in order to measure TMP, and should be located on the permeate line. Acceptable manufacturer and specifications for the pressure transmitters are:

- a. Manufacturer/Model: E&H Cerabar PMC11 or equal
- b. Mounting - 0.5" NPT
- c. Output Signal - 4-20 mA
- d. Voltage - 11.5 to 30 VDC
- e. Diaphragm - Ceramic
- f. Housing - 316L NEMA 4X
- g. Integral LCD - Yes

#### 2.11.3 Electromagnetic Flowmeters

All flow meters must be installed according to the manufacturer's recommendations including the following considerations:

- a. Minimum upstream and downstream pipe diameters.
- b. Installed vertically (with flow going up) or horizontally in flooded pipe.
- c. Grounding rings installed, supplied with instrument.
- d. Upstream of any chemical injection or given additional downstream distance for dampening of noise caused by chemical pulses.
- e. Manufacturer/Model: E&H Promag W400 or equal
  - (1) Process Connections ANSI #150 flanged
  - (2) Housing 316L Stainless Steel NEMA 4X
  - (3) Wetted Materials:
    - (a) Electrodes: Hastelloy / C22
    - (b) Liner PTFE
  - (4) Accuracy +/- 0.5%
  - (5) Operator Interface Local
  - (6) Output 4-20 mA DC

#### 2.11.4 Turbidity Meter and Controller

All turbidity meters and controllers must be installed according to manufacturer's recommendations. In addition, they must be supplied with the following:

- a. Sensor and controller mounted on a panel with minimal or no installation required by the OWNER.

- b. Automatic isolation valve, so equipment is not drained when not in production.
- c. For the Permeate Turbidimeter, include a bubble trap, large enough to remove any air bubbles introduced to the permeate stream during normal operation. It is not acceptable to ignore high turbidity alarm conditions caused by air bubbles beyond what is deemed acceptable by the State/Provincial Regulator/Authorities.
- d. Manufacturer/Model: Hach TU5300sc low range laser turbidimeter
  - (1) Ranges as VENDOR requires
  - (2) Output Signal - 4-20 mA
  - (3) Power - 120V/1ph/60 Hz
  - (4) Display - Hach SC 4500
  - (5) Accessories: Include Auto Cleaner

#### 2.11.5 pH/Residual Chlorine Sensor and Transmitter

All pH/chlorine meters and transmitters must be installed according to manufacturer's recommendations. In addition, they must be supplied with the following:

- a. Sensor(s) and controller mounted on a panel with minimal or no installation required by the OWNER.
- b. Automatic isolation valve, so equipment is not drained when not in CIP, and not exposed to high chemical concentrations that may damage the equipment.
- c. Automatic isolation valve for flush water to clean and maintain chlorine probe between CIP operations.
- d. Tolerant of up to 500 ppm of chlorine, but accurate to 0.1 ppm to confirm neutralization of cleaning solution.
- e. pH range 0-12, accuracy of +/- 0.01 units.
- f. Chlorine Sensor Manufacturer/Model: E&H Memosens CCS51D
- g. pH Sensor Manufacturer/Model: E&H Memosens CPS31D
- h. Chlorine/pH Transmitter Manufacturer/Model: E&H Liquiline CM444

#### 2.11.6 Temperature Transmitters

Temperature sensors shall be RTD assemblies. These shall be installed according to the manufacturer's recommendations. Transmitters supplied shall be:

- a. Acceptable manufacturer and specifications for the temperature transmitter(s) are:
  - (1) Manufacturer/Model: E&H TH 11 or 13 RTD assembly

- (2) Mounting - 0.5" NPT process connection
- (3) Power Supply - 24 V DC
- (4) Output Signal - 4-20 mA
- (5) Ambient Temperature Range: -40 to 85°C

#### 2.11.7 Pressure Gauges

Pressure gauges shall be included for the various pumps included with the membrane system. Pressure gauges shall be liquid filled with 316SS wetted parts. Pressure gauges shall be supplied complete with an isolation ball valve / gauge cock between the pressure gauge and the process line.

- a. Manufacturer/Model: Ashcroft Type 1008S
- b. Air Flow Switches
- c. An air flow switch shall be included to provide flow confirmation on the blower line.
- d. Manufacturer/Model: Kobald KAL-L

#### 2.11.8 Pressure Switches

Refer to Division 40 specifications.

#### 2.11.9 Liquid Flow Switches

Refer to Division 40 specifications.

#### 2.11.10 Temperature Switches

Refer to Division 40 specifications.

### 2.12 SPECIAL TOOLS

- a. Furnish all special tools required for routine operation of the membrane filtration system. Special tools include but are not limited to the following:
  - (1) One (1) membrane repair kit
  - (2) Hand tools and hoisting rings used for cassette and module removal (if required).

### 2.13 CONTROL SYSTEM

- a. A single programmable logic controller (PLC) with hard wired I/O shall be provided. The PLC CPU and Ethernet communication modules shall be located in the UF Control Panel fully assembled and tested, to be mounted indoors in a non temperature controlled environment. The control panel shall have a dead front panel.
- b. A Human-Machine Interface (HMI) shall be located on the interior door of the UFCP. Ethernet connections to the VENDOR's control panel and other communication nodes is by the CONTRACTOR. The UFCP shall also

provide terminations for all non-train equipment, such as chemical equipment, air compressors, blowers, CIP, and Backwash equipment, and any other loose shipped equipment supplied by the VENDOR.

- c. There shall be one (1) remote I/O panel per membrane train. This panel shall provide terminations for all train specific equipment, such as the permeate pump, pneumatic and solenoid valves, mag flow meter, pressure transmitters and switches, turbidity transmitter, temperature transmitter, etc.
- d. Control System: The control system shall be designed based on a distributed I/O architecture. The control system shall be based around Allen Bradley Control Logix platform of Programmable Logic Controllers (PLC). The control system shall include the following equipment:
  - (1) One (1) Control Panel (UFCP), rated NEMA 4X with dead front. Shall include PLC, HMI and all required control system equipment.
  - (2) The PLC shall include a minimum of 20% spare I/O for future use. Power integrity shall be furnished via Uninterruptible Power Supply (UPS), supplied by the CONTRACTOR.
  - (3) The UFCP shall include a color touch screen HMI mounted in the door of the enclosure. The HMI shall provide a graphical interface to the membrane filtration system process. The terminal shall communicate via an Ethernet connection to the PLC. The terminal shall be an Allen Bradley PanelView Plus or approved equal.
  - (4) The UFCP shall include a five port industrial Ethernet switch to facilitate communication between the PLC, HMI, and to the plant-wide control network as required. The switch shall be DIN rail mounted and be 24VDC powered.
  - (5) To protect against lightning and transient voltage surges, each control panel shall be protected at the incoming power by a transient surge suppressor located in the control panel.
  - (6) All Digital I/O shall be provided with interposing relays.
  - (7) All Analog I/O shall be provided with surge protection.
  - (8) Dry relay contacts shall be provided for all alarms.
  - (9) Field wiring of all the I/O to and from the control panels shall be by the CONTRACTOR in accordance with wiring diagrams provided by the VENDOR. Unless otherwise specified, control panels shall be designed primarily to accommodate field wiring entering from the bottom of the enclosure.
  - (10) MCP should include programming for all equipment within the UF, SWRO and BWRO systems. Local remote I/O panels shall be rated NEMA 4 and be provided the UF system (One RIO panel for the UF system). The local I/O shall be Allen-Bradley Flex I/O. The remote I/O shall communicate via Ethernet.
- e. The membrane system PLC shall be compatible for communication and integration with the Plant PLC/SCADA system.

- f. Base the control architecture on a PLC located in a MCP with distributed I/O to control the membrane trains. Provide controls for all elements scope supplied. Provide all instrumentation required to control and monitor the operation of the membrane filtration system. Provide all PLC and HMI programming for all supplied equipment. Supply all software updates to control, monitor and operate the membrane filtration system.
- g. To provide warranty support, VENDOR shall provide field service personnel as required by the warranty conditions

#### 2.14 CONTROL OPERATION

- a. All valves and control devices shall be interlocked through the PLC to allow smooth and continuous automatic operation. Valves shall open, close and/or modulate, depending on signals from the PLC. These signals shall be predetermined through PLC programming and allow the system to operate at optimal conditions. Variable speed pumps shall also be controlled by the PLC and vary their vacuum/flow output based on level signals from the process tanks.
- b. All operating parameters shall be continuously monitored by the PLC. If an alarm or emergency condition occurs, the PLC program shall instruct the various components to change operation conditions and/or shut down the system and alert the operator. The system control logic shall be designed with the ability to shut down the system in the event of an alarm condition that could be detrimental to the equipment.

#### 2.15 HMI SYSTEM

- a. The HMI shall be an Allen-Bradley PanelView Plus. It shall be installed on the door of the Master Control Panel. It shall be programmed to provide the following features:
  - (1) Monitoring of the system and of individual devices.
  - (2) Control of the system and of individual devices.
  - (3) Adjustment of operating parameters.
  - (4) Operator and supervisor level passwords.
  - (5) Current alarm summary.
  - (6) Alarm history.
- b. All monitoring, control, and alarm logic shall reside in the PLC CPU. Data points defined in the CPU shall be communicated over the Ethernet network to provide the operator monitoring and control functionality at the HMI. These data points shall be available to any device on the Ethernet network, such as the Plant SCADA system (by the CONTRACTOR), to provide some or all of the operator functionality that is found on the HMI. VENDOR recommends that the Plant SCADA system incorporate full Operator functionality to act as a backup in the unlikely event of an HMI failure and to provide a more convenient location for operator interaction.
- c. Since the Plant SCADA system shall have access to the data in the VENDOR's PLC, features such as alarm annunciation and logging, data

logging and trending, and report generation can be easily implemented on the Plant SCADA system.

## 2.16 HMI SOFTWARE STANDARDS

- a. HMI applications shall be developed using VENDOR's standards as described below. In general, these standards apply equally to HMI and Plant SCADA applications as the intent is to maintain a common "look and feel" regardless of platform. HMI applications shall be developed using Rockwell FactoryTalk View Studio to run on an Allen-Bradley PanelView Plus HMI.
- b. All screens shall have the following basic features:
  - (1) The top left corner of the screen shall have the OWNER's logo. For convenience, the OWNER's logo shall also function as a previous screen pushbutton. if the OWNER's logo is not available then it shall be replaced by the VENDOR's logo.
  - (2) The top right corner shall have the VENDOR's logo.
  - (3) The date and time shall be displayed on two lines immediately to the left of the VENDOR's logo.
  - (4) The screen title shall be displayed centered at the top of the screen.
  - (5) Common navigation and control buttons shall be located at the bottom of the screen.
  - (6) Navigation arrows shall provide a convenient means to change from one screen to another to follow the process.
  - (7) A "screen select" pushbutton shall list all the main screens that are available and shall provide a convenient means to change to any screen from the current screen.
  - (8) When a device on the screen is pressed, a popup screen shall appear providing control of that device.
  - (9) An alarm banner shall pop-up when a new alarm occurs.
- c. Alarms triggered by the PLC shall be displayed and recorded with a date and time stamp. The Active Alarm screen shall list all alarms that are currently active. The Alarm History page shall list all alarms that have occurred. All alarm messages shall be configured with red text on a black background. The system shall be set-up to automatically delete daily log files older than two months.
- d. The HMI shall be configured for various security levels to ensure that users are permitted the monitoring and control functionality that they have been granted. Unless otherwise specified, there shall be four (4) security levels: GUEST, OPER, SUPER, and VENDOR's security level, each level having an increasing level of privileges. The system shall be configured to log out the current user automatically after a pre-determined amount of time or inactivity.

## 2.17 ELECTRICAL

### 2.17.1 Junction Boxes

- a. Junction boxes to facilitate field wiring shall only be supplied for skid or panel-mounted equipment where it is possible to group numerous electrical connections together in order to minimize field installation.
- b. Design, supply, and installation of all other junction boxes shall be by the CONTRACTOR.

### 2.17.2 Electrical Panel Wiring

All wiring within the control panel shall conform to the following standards, at a minimum:

- a. All conductors shall be copper and have 600 Volt rated insulation.
- b. Control circuit and instrument wires shall be a minimum of 18AWG (max 7 Amps) Type MTW construction B, or TFFN for UL or type TEWN for CSA.
- c. Power circuits (branch and feeder circuits) and bonding conductors shall be a minimum of 14 AWG (max 15 Amps) Type THWN-2 or THHN/THWN for UL or type T90 Nylon for CSA.
- d. Wiring of all the I/O to and from the control panels to devices shall be by CONTRACTOR.

## 2.18 SPARE PARTS

An itemized spare parts list shall be generated by the VENDOR after the final scope of supply by the VENDOR has been determined (after Final Shop Drawing submittal). This list shall include pricing. The CONTRACTOR will provide all other spare parts as recommended in the manufacturer's standard operations and maintenance information. The Contractor will provide minimum two (2) mechanical seals for feed pump.

## PART 3 EXECUTION

### 3.1 INSTALLATION

The CONSTRUCTION CONTRACTOR shall install the MFS in strict accordance with VENDOR's instructions and recommendations.

VENDOR's field service representative (FSR) shall instruct the CONTRACTOR on installation, and inspect and oversee the proper placement and installation of membrane modules and ancillary equipment furnished by the VENDOR. VENDOR shall recommend any necessary adjustments to CONTRACTOR after VENDOR's inspection to remedy any membrane modules or ancillary equipment not properly installed.

VENDOR shall provide oversight of all work to install components provided to ensure that MFS warrantee remains intact. This includes any required disassembly/reassembly of membrane skids, pump skids, etc. needed to deliver the components into the final locations within the building.

CONTRACTOR shall be responsible for making any recommended adjustments to the MFS as a result of VENDOR's inspection and other inspections performed by the OWNER or Engineer.

### 3.2 START UP, COMMISSIONING, OPERATOR TRAINING

#### 3.2.1 Services (Base services)

The following services shall be provided by the Vendor, coordinated by the CONTRACTOR:

- a. VENDOR shall provide a minimum of start up, commissioning and training services as specified below, allocated across the specific number of trips to site included. Additional trips and time on site can be discussed further with the OWNER to suit project and site considerations, at additional cost.
- b. The VENDOR shall furnish qualified field personnel (full time employee of the membrane manufacturer). The field personnel shall demonstrate experience with installation, start-up, and operation of MFS's of comparable size, application, and complexity and shall be acceptable to the OWNER. The VENDOR's FSR shall be a qualified individual who has previously provided onsite services for the installation, testing, and startup of a membrane system at a minimum of three immersed UF or MBR's of comparable size.
- c. The VENDOR shall furnish qualified field personnel for the RO systems. The field personnel shall demonstrate experience with installation, start-up, and operation of RO systems.

#### Startup, Commissioning, and Operator Training Requirements

| # Trips | Minimum Days On-Site | General Scope of Work / Description                                                                                                                                                                                                                       |

| 1           | 10                   | Operator Training: VENDOR shall provide formal training that shall take place prior to the Performance Test. Trainer shall instruct OWNER's operation and maintenance personnel on proper operation, installation, sampling, cleaning, maintenance, and troubleshooting for the membrane system. OWNER shall be allowed to video tape training for future use.                              |
| Total<br>10 | Total<br>48          | <p>VENDOR shall additionally include for travel time to and from the job site for VENDOR's Field Service personnel. Travel / living expenses shall be also included by the VENDOR.</p> <p>VENDOR shall assume an 8-hr workday and no weekends or holidays are required.</p> <p>The OWNER shall provide the VENDOR a minimum of two weeks' advance notice to schedule all trips to site.</p> |

### 3.2.2 VENDOR's Responsibilities Following Substantial Completion

Following Substantial Completion, the CONTRACTOR shall coordinate with the VENDOR to ensure the following services are provided: (Unless specifically noted below, the costs for these services are included in the lump sum price for the membrane system.)

- a. Emergency Support Services: Telephone Assistance - Provide 24-hour per day, seven-day per week support for two (2) years for troubleshooting assistance by technical support specialists at a toll-free number.
- b. Ten (10) service visits (each service visit being two (2) days) during the first five (5) years of operation, to be scheduled at the agreement of the OWNER and VENDOR.

### 3.2.3 Vendor's Service Visit

The service visit shall include the following activities:

#### 3.2.3.1 Process Monitoring

- a. Inspect and confirm proper operation of the membrane system in accordance with the manufacturer operation & maintenance manual.
- b. Review operating logs, analytical tests and InSight data (if available) with the operator(s). Discuss operator concerns and manufacturer issues emerging from this review.
- c. Discuss imminent seasonal shifts. Plan and implement forward looking adjustments.
- d. Advise the operations manager of technical updates as they become available from manufacturer.

#### 3.2.3.2 Membrane Integrity

- a. Assess pressure decay test or bubble test data as it correlates to the membrane condition and/or permeate water quality. Assist plant operators to repair membrane fibers as required.
- b. Assess the effectiveness of on-going membrane cleaning procedures (recovery cleaning, maintenance cleaning, backwashing) and provide recommendations to the plant operators as necessary.

#### 3.2.3.3 Controls

- a. Review system alarm history, discuss any related issues with operator(s) and recommend appropriate actions to be taken.
- b. Perform limited PLC code modifications as planned in advance, secured by proper documentation, dial-in capabilities and file backup precautions.
- c. Verify operation of all safety interlock/controllers, pressure switches and temperature switches.

#### 3.2.3.4 Verification of Instrument Calibration

- a. Review set points, verify the condition of all control instruments, sensors, probes, and transmitters, including switching action and output. Assist operators with re-calibration, as necessary.
- b. Collaborate with the plant operator in maintaining a log of calibration activities.

#### 3.2.3.5 Preventative Maintenance Planning

- a. Develop a preventive maintenance plan with the plant operator.
- b. Review the spare parts provisions with the plant operator and identify any additional parts to provide the desired level of security.

#### 3.2.3.6 Training

- a. During scheduled site visits, the manufacturers service representative can provide operators with informal training on any areas of concern; to explain the operation, process, maintenance or troubleshooting activities and, in general, to enhance operator ability and confidence.

#### 3.2.3.7 Reporting

- a. Manufacturers shall provide a report to record membrane condition, tasks accomplished during the visit and identify key operating and maintenance issues.

#### 3.2.3.8 Spares

- a. The service representative shall review the spares provisions with the plant operator to identify any additional spare parts which should be brought into inventory to provide the desired level of security to the plant.

#### 3.2.4 Bid Option No. 7

Post construction completion follow-on services: Price to provide continuing operation of the desalination plant after project completion and commissioning for one year. Under this bid option, the manufacturer shall provide a full-time Lead Plant Operator (40 hours per week for one year) with experience operating similar equipment and facilities. The Lead Plant Operator will be responsible for overseeing plant operations and training the team in equipment operation, process control, record-keeping, reporting, troubleshooting, and maintenance.

#### 3.3 INSPECTING AND CLEANING

The pipes must be flushed with cold water after finishing the installation. Flush the system until the water runs clear of debris and dirt. Inspect and test piping systems following procedures of authorities having jurisdiction and as specified by the piping system manufacturer.

Clean water distribution piping following procedures of the manufacturer and/or the Authority Having Jurisdiction.

#### 3.4 ELECTRICAL INSTALLATION

Install electrical equipment in accordance with NFPA 70 and manufacturer's instructions. Wiring must be in conduit. Electrical installation by others.

#### 3.5 FIELD TESTS

Field tests must be conducted in the presence of the QC Manager or their designated representative to verify systems compliance with specifications. Material, equipment, instruments, and personnel required for the test must be provided by the CONTRACTOR.

#### 3.6 INSTRUCTION TO GOVERNMENT PERSONNEL

- a. Furnish the services of competent instructors to give full instruction to the designated Government personnel in the adjustment, operation, and maintenance, including pertinent safety requirements, of the desalination system (Strainer, UF, SWRO, BWRO, CIP cleaning process. Instructors must be thoroughly familiar with all parts of the installation and must be instructed in operating theory as well as practical operation and maintenance work. Submit a lesson plan for the instruction course for approval. The lesson plan and instruction course must be based on the approved operation and maintenance data and maintenance manuals.
- b. Conduct a training course for the operating staff and maintenance staff selected by the Contracting Officer. Give the instruction during the first regular work week after the equipment or system has been accepted and turned over to the Government for regular operation. The number of days (8 hours per day) of instruction furnished must be ten (10) business days. Use approximately half of the time for classroom instruction and the other time for instruction at the location of equipment or system.
- c. When significant changes or modifications in the equipment or system

are made under the terms of the Contract, provide additional instruction to acquaint the operating personnel with the changes or modifications.

- d. Training Course Documentation: Training must be based on the operation and maintenance manuals and control system training manual. Deliver manuals for each trainee with two additional sets for archiving at the project site. Include an agenda, defined objectives, and a detailed description of subject matter for each lesson.

-- End of Section --

# ***Basis of Design Desalination Plant Sequence of Operation & Control***

***Attachment to Section 46 82 00***

**August 8, 2025**

## 1.0 INTRODUCTION

### 1.1 REPORT ORGANIZATION

This basis of design Desalination Plant sequence of operation and Control is organized into the following sections:

- Section 1: Overall Process Description
- Section 2: Sequence of Operation & Control (SOC)
- Section 3: Chemical Cleaning (CIP) Sequences

This document can serve as a guide to how the control systems (PLC, SCADA) should operate. However, during commissioning and operation, the equipment manufacturers recommended procedures take precedence.

### 1.2 OVERALL PROCESS DESCRIPTION

The desalination unit processes consist of the following major process treatment components:

1. **Raw Water Intake Pumps (2):** Initially, introduces seawater from the river into the desalination system.
2. **Strainer:** A space-efficient, automatically backwashing strainer will serve as pretreatment upstream of the UF system.
3. **Ultrafiltration (UF) as Pre-Treatment:** The UF system consists of three separate trains , each equipped with a single cassette and associated equipment. This configuration allows two-thirds of the design flow to continue during backwashing or cleaning.
4. **Reverse Osmosis (RO1) - Pass 1:** After ultrafiltration, the first pass involves a single-stage seawater reverse osmosis (SWRO) unit. This includes a cartridge filtration skid, pump skid, membrane skid, high-pressure pump, booster pump, and energy recovery equipment to manage osmotic pressures and remove dissolved solids.
5. **Reverse Osmosis (RO2) - Pass 2:** The second pass involves a two-stage brackish water reverse osmosis (BWRO) unit, fed at lower pressures than the RO1 unit to further reduce total dissolved solids. The RO2 feed pump will require a minimum pressure of 25-35 psi, but it will reach the required 200 psi net driving pressure without booster pumps.
6. **Storage Tanks and Associated Pumps:** The facility will feature multiple storage tanks, including an 18,800-gallon UF break tank, a 30,000-gallon permeate tank, and several chemical storage tanks and associated pumps.
7. **CIP Cleaning System:** The CIP cleaning process consists of equipment required to perform maintenance and recovery cleaning of the UF system, as well as periodic cleaning of the RO membranes.
8. **Duplex Submerged UF Drain Pump Station:** designed to transfer UF backwash flow and/or any overflow to the outfall.

**Figure 1** depicts the overall process flow schematic for the desalination facility.

Figure 1 Overall Process flow schematic for the desalination facility.

Figure 1 Overall Process flow schematic for the Desalination Facility (Continued)

## 2.0 SEQUENCE OF OPERATION & CONTROL (SOC)

### 2.1 SYSTEM STARTUP PREREQUISITES

1. The Power supply is available and all safety interlocks (pressure, level, leak detection) have been verified.
2. The operator must confirm that all manual valves are set in the in Open positions.
3. The Plant local/remote by the (DCS/PLC) control confirmed.
4. Process tanks (e.g., permeate, CIP) at operational levels.

### 2.2 INTAKE PUMP OPERATION

- **Start Condition:**
  - 2 Intake Pumps Lead / lag arrangement
  - Automatic start command initiated.
- **Control Logic:**
  - Normal operation one pump starts (duty); second on standby or alternates based on runtime.
  - When any UF unit is in backwash or cleaning mode, operate with a single intake pump at approximately 70% capacity.
  - Once the UF unit returns to service, both intake pumps (duty / duty) and divert more flow to the recently cleaned unit to expedite filling. When the water level in the unit reaches its normal operating level, return to standard operation with one pump running at approximately 777 GPM.
  - Monitor Flow and pressure at the SCADA and PLC
- **Shutdown Condition:**
  - Emergency stops or faults will shut down the entire system. A manual restart is required to begin operation again.

### 2.3 STRAINER OPERATION

- **Start Condition:**
  - Inline continuous operation with intake pump start.
- **Control Logic:**
  - Monitors differential pressure (DP).
  - Auto backflush on high DP which is set during startup and can be adjusted by the operator.
  - Alarm logic if high DP persists.
  - Differential setpoints and alarms shall be configured during startup and testing by the manufacturer's field technician. The manufacturer shall provide the setpoints.

### 2.4 SUBMERGED ULTRAFILTRATION (UF) SYSTEM

- **Start Condition:**

- Flow confirmed from intake/strainer.
- UF tank at minimum operating level to set during startup and could be adjusted by the operator.

- **Control Logic:**

- Permeate production is based on level in break tank and number of cassettes in operation.
- Periodic backwash/air scour based on timer, DP, or percent recovery.
- Automatic periodic backwash, alarms, and air scour settings shall be configured during startup and testing by the manufacturer's field technician. The manufacturer shall provide the setpoints.

- **Shutdown Condition:**

- UF tank low-low level.
- High turbidity or fouling alarm.
- UF module failure.

## 2.5 BREAK TANK (18,000 GAL)

- **Control Points:**

- Level transmitters monitor tank level.
- High/low level alarms.
- Transfer pump interlocked with tank level.

### Water Level Control and Shutdown Setpoints

The preferred water level operating range should be maintained between **3 feet above the bottom** of the tank and **3 feet below the top** of the tank.

The initial setpoints are configured as follows; however, the operator shall have the option to adjust these setpoints automatically:

- **High Water Depth:** 18 feet from the bottom of the tank. An alarm shall be initiated and displayed on the SCADA/PLC system. At this level and above, the intake pump speed shall be reduced to approximately 70%. The corresponding change in flow rate shall be indicated on the SCADA/PLC interface.
- **Low Water Depth:** 3 feet from the bottom of the tank. An alarm shall be initiated and displayed on the SCADA/PLC system.
- **High-High Water Depth (19 feet):** Automatically shuts down upstream processes, including the intake pumps and UF permeate/backwash pumps. An alarm shall be initiated and displayed on the SCADA/PLC system.
- **Low-Low Water Depth:** 2 feet from the bottom of the tank. Automatically shut down downstream processes, including the transfer pumps and RO pumps. An alarm shall be initiated and displayed on the SCADA/PLC system.
- Automatic resume normal operations once the water level returns to within the preferred operating range.

- The plant operator should have the option to update these level settings at any time via the SCADA system.

## 2.6 TRANSFER PUMP

- **Start Condition:**
  - Break tank - A minimum low level of 3 feet from the bottom of the tank shall be set during startup. This level can be adjusted by the operator as needed.
  - SWRO demands signal.
- **Control Logic:**
  - VFD controlled stable feed flow indicated at the SCADA / PLC
  - Positive Flow/pressure feedback from booster inlet.
- **Shutdown Condition:**
  - Low-Low Water Depth (2 feet) in the break tank: Automatically shuts down downstream processes, including the transfer pumps and RO pumps. An alarm shall be initiated and displayed on the SCADA/PLC system.
  - Pump fault or no flow an alarm shall be initiated and displayed on the SCADA/PLC system.

## 2.7 BOOSTER PUMP (RO)

- **Start Condition:**
  - Transfer pump running.
  - SWRO skid ready.
- **Control Logic:**
  - VFD control for stable SWRO pressure.
- **Shutdown Condition:**
  - No feed pressure. An alarm shall be initiated and displayed on the SCADA/PLC system.
  - High pressure or overcurrent alarm. An alarm shall be initiated and displayed on the SCADA/PLC system.

## 2.8 SWRO SKID

- **Start Condition:**
  - Feed pressure and flow within setpoints.
- **Control Logic:**
  - Operate based on permeate tank demand.
  - Monitors permeate conductivity, flow, and pressure. Indicated at the SCADA / PLC

- CIP on scheduled maintenance.
- **Shutdown Condition:**
  - High feed pressure.
  - High permeate conductivity.
  - Low feed pressure or flow.
  - An alarm shall be initiated and displayed on the SCADA/PLC system.

## 2.9 BWRO SKID

- Start Condition:
  - SWRO permeate available.
- Control Logic:
  - Same control logic as SWRO.
- Shutdown Condition:
  - High DP, conductivity, or fault. An alarm shall be initiated and displayed on the SCADA/PLC system.

## 2.10 PERMEATE TANK (30,000 GAL)

- **Control Points:**

### Water Level Control and Shutdown Setpoints

The preferred water level operating range should be maintained between **3 feet above the bottom** of the tank and **3 feet below the top** of the tank.

The initial setpoints are configured as follows; however, the operator shall have the option to adjust these setpoints automatically:

- **High Water Depth:** 30 feet from the bottom of the tank. An alarm shall be initiated and displayed on the SCADA/PLC system.
- 
- **Low Water Depth:** 3 feet from the bottom of the tank. An alarm shall be initiated and displayed on the SCADA/PLC system.
- **High-High Water Depth (31 feet):** Automatically shuts down upstream processes, an alarm shall be initiated and displayed on the SCADA/PLC system.
- **Low-Low Water Depth:** 2 feet from the bottom of the tank. Automatically shut down downstream permeate supply pumps and switch to City water makeup system. An alarm shall be initiated and displayed on the SCADA/PLC system.
- Automatic resume normal operations once the water level returns to within the preferred operating range.
  - The plant operator should have the option to update these level settings at any time via the SCADA system.

## 2.11 PERMEATE SUPPLY PUMPS

- **Equipment Involved**

- Duplex Pump Set – South Cooling Tower (1 duty/1 standby)
- Duplex Pump Set – North Cooling Tower (1 duty/1 standby)
- Duplex Pump Set – Condensate Tank (1 duty/1 standby)

- **Control Points:**

The start and stop of the permeate pumps shall be controlled based on water demand from the South Cooling Tower, North Cooling Tower, and the water level in the condensate tank, respectively. However, If Permeate Tank Level in the permeate tank reaches Low-Low (2 foot above bottom of tank)

- Do NOT start/stop permeate pumps.
- Automatically switch water supply to City Water Backup.
- Trigger alarm/notification to operations. An alarm shall be initiated and displayed on the SCADA/PLC system.
- Continue using city water until the permeate tank level returns to the preferred operating level.

### Condensate Tank Level Setpoints and Pump Control

The level setpoints for the condensate tank are already established and integrated into the existing B72 control system (refer to Process Flow Diagram – Figure 1). The contractor shall ensure the following level setpoints are configured:

- **High-High:** 26 feet
- **High:** 23 feet
- **Low:** 15 feet
- **Low-Low:** 12 feet

### Control Logic:

- At **High Level (23 feet)** – the permeate feed pump dedicated to the condensate tank shall stop.
- At **Low Level (15 feet)** – the permeate feed pump shall start.

## 2.12 GENERAL CONTROLS AND ALARMS

- All critical equipment should have:
  - Local and remote start/stop. The remote stop command shall be initiated through the SCADA/PLC interface by an operator or automatically by system logic (e.g., based on tank levels, alarms, or interlocks).
  - Flow, pressure, and status feedback at SCADA / PLC.

- Interlocks to protect downstream units.
- Fault alarms and trips for:
  - High/low pressure
  - No flow
  - Overload

The plant operator should have the option to update these settings at any time via the SCADA system.

All alarms and warnings shall be indicated at SCADA & PLC's

## 2.13 UF DRAIN DUPLEX PUMP STATION SEQUENCE OF OPERATION

The UF drain pump station operates as a typical duplex pump system, with pump operation controlled by water level. A level sensor will be installed for primary control, along with a backup float switch for redundancy.

### **Operational Sequence:**

- After each UF unit backwash, the corresponding UF tank drain valve automatically opens, allowing backwash water to flow by gravity into the pump station.
- As the inflow increases, the wet well water level begins to rise.

### **Pump Control Logic:**

1. Lead Pump Start:
  - When the water level reaches the lead pump start point (detected by the level sensor), the lead pump is activated.
  - The lead pump begins discharging water from the wet well.
2. Lag Pump Start:
  - If inflow continues and exceeds the capacity of the lead pump, the water level will rise to the lag pump starting point.
  - The lag pump is then activated.
  - Both pumps operate together at full capacity to prevent overflow.
3. Lag Pump Stop:
  - When the water level drops below the lag pump stop level, the lag pump turns off.
  - The lead pump remains in operation.
4. Lead Pump Stop:
  - When the water level falls below the lead pump stop point, the pump turns off.
  - The system returns to standby mode.
5. Pump Alternation:
  - PLC logic to be used to alternate the lead pump designation between Pump 1 and Pump 2 with each operating cycle.
6. High-Level Alarm:
  - If both pumps are unable to keep up with the inflow, and the water level reaches the high-level alarm point:
7. All alarms shall be indicated at SCADA / PLC.

### **Initial setting Point:**

See Figure below.

The plant operator should have the option to update these settings at any time via the SCADA system. However, it is required to maintain a water level above the pump motor to keep it submerged when the pumps are off.

## 2.14 POWER OUTAGE

Post- Outage Restart Procedure:

### 1. Login and Initial Checks

- Log into the SCADA system using authorized credentials.
- Check system status overview for alarms, offline devices, or fault indications.
- Verify that main power or backup power is stable.
- Confirm that communication links with all PLCs and remote devices are re-established

### 2. Safety and System Readiness

- Ensure field inspections have been completed:
  - No leaks, electrical hazards, or mechanical faults.
  - Emergency stop buttons are disengaged.
- Check that emergency shutdown interlocks are reset.
- Acknowledge and clear non-critical alarms on SCADA.

### 3. Manual Restart Sequence (via SCADA)

Restart systems in logical process order:

- Intake System
  - Open intake valves.
  - Start intake pumps manually via SCADA.
  - Confirm stable flow rate and pressure at intake.
- Pre-Treatment System
  - Start strainer /UF filters and backwash system
  - Start chemical dosing systems
  - Verify dosing pump status and flow rates.

- Reverse Osmosis (RO) Unit
  - Start booster pumps
  - Confirm feed water pressure is within safe range.
  - Start RO trains.
  - Monitor key parameters:
    - Pressure differentials
    - Permeate water conductivity
    - Temperature and flow
- Permeate Water
  - Confirm permeate water quality meets standards
  - Confirm water level in the permeate tank and condensate tank
  - Start permeate water transfer pumps to condensate or cooling towers.

### 3.0 CHEMICAL CLEANING (CIP) SEQUENCES

#### 3.1 UF CIP CLEANING SEQUENCE OF OPERATION

To chemically clean the UF membranes by recirculating a cleaning solution, removing organic/inorganic foulants, and restoring flux/permeate quality. The table below provides a summary for typical cleaning type and frequency:

|                                 |                                                                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maintenance Clean (MC) Protocol | 2/day/train<br>12 times per week using 250 mg/L NaOCl<br>1 time per week using 500 mg/L citric acid<br>with mineral acid for pH adjustment to 2.1<br>maintenance cleans are not heated           |
| Recovery Clean (RC) Protocol    | 24/year/train<br>500 mg/L NaOCl<br>followed by<br>12/year/train<br>2 g/L citric acid<br>with mineral acid for pH adjustment to 2.1<br>recovery clean solutions are<br>heated prior to each clean |

#### Notes:

1. Preconditions Before CIP Start:
  - UF skid in standby mode (not producing permeate).
  - Operator shall Verify that all manual valves are fully opened prior to operation.
  - The operator shall confirm the UF tank is isolated from raw water intake.
  - CIP tank filled with appropriate CIP chemical solution.
  - Proper CIP chemical selected.
  - The operator shall confirm the CIP pump, heating system (for UF RC only), and verified operational valves.
  - The operator shall confirm the Safety interlocks active: temperature, pressure, level sensors OK.
  - Operator input or auto-trigger based on scheduled maintenance.

2. The UF cleaning process is intended to be performed automatically without operator intervention.
3. The operator is responsible for monitoring equipment performance and system alarms. The operator shall have the ability to adjust system setpoints as needed. However, any adjustments to the setpoints must be confirmed with the equipment manufacturer prior to implementation.
4. Additionally, the operator shall be able to schedule maintenance cleaning automatically through the control system.
5. The operator shall have the ability to either automatically schedule or automatically initiate the cleaning process for each cassette unit via the SCADA system. The cleaning cycle shall apply only to the selected cassette unit. To maintain continuous plant operation, only one cassette shall undergo cleaning at a time, while the remaining two cassettes remain in service.
6. It is also recommended to start the cleaning process when the break tank is full to ensure sufficient water availability.

The automatic UF CIP cycle phases are as follows:

1. Flush / Drain (Optional)
  - Purpose: Remove the remaining feed water and loose particles from membrane housing.
  - Steps:
    - Open drain valve from UF feed line and drain by gravity to UF drain pump station.
    - Start UF drain pump automatic based on level.
    - Duration: ~2–5 minutes
2. Fill CIP Tank
  - Purpose: Prepare and mix the cleaning chemical.
  - Steps:
    - Fill CIP tank with permeate.
    - Heat to required temperature (e.g., 35–40°C) for UF recovery cleaning only.
    - Automatic dosing into CIP tank.
    - Add chemicals (NaOH, citric acid, etc.).
    - Mix solution using CIP circulation pump.
    - Confirm pH/temperature setpoints.
    - Interlocks: pH in range, level in CIP tank OK.
3. Circulation Phase
  - Purpose: Recirculate cleaning solution through UF membranes.
  - Steps:
    - Automatic close normal process valves (feed/permeate).
    - Open CIP inlet/outlet valves.
    - Start CIP pump (A bidirectional rotary lobe pump will be used for the recirculation process).
    - Flow cleaning solution through UF membranes (inlet → membrane → outlet → return to CIP tank).
    - Maintain target flow and pressure (low pressure to avoid membrane damage).
    - Monitor temperature and pH throughout.
    - Duration: 20–60 minutes per solution.
4. Discharge UF CIP wastewater to River
  - Drain CIP solution to CIP tank for neutralization prior to discharge to river.
  - Fill UF unit with water from break tank.

- Drain rinse water to CIP tank.
- Confirm the CIP wastewater pH has been neutralized to acceptable environmental standards (typically 6.5–8.5).
- Test for and ensure residual chlorine is fully removed or below regulatory discharge limits.
- Record test results in the daily log.
- Open the valve to the CIP discharge line leading to the river.
- CIP wastewater begins to discharge at a controlled flow rate of approximately 200 GPM.
- The discharged CIP waste will be combined with the concentrate prior to being released to the river through the proposed 12" HDPE outfall pipe. This blending process will reduce contaminant concentrations at the outfall.

#### 5. Return to Operation

- Reset valves to normal process position.
- Reopen feed water inlet, start back normal filtration.
- Monitor initial permeate flow, turbidity, and DP for confirmation of cleaning effectiveness.
- Log CIP operation: date, chemical used, parameters, results.

### 3.2 SWRO & BWRO MEMBRANE CLEANING (CIP) – SEQUENCE OF OPERATION

To remove foulants (e.g., scaling, biofilm, organics) from RO membranes using chemical cleaning in a controlled loop.

- The SWRO CIP process is intended to occur four (4) times a year, with a high pH cleaner and a low pH cleaner.
- The BWRO CIP process is intended to occur four (4) times a year, with a high pH cleaner and a low pH cleaner.
- The cleaning process is intended to be performed Manually but the chemical dosing is conducted automatically.
- Preconditions Before Starting Cleaning (Operator is to confirm the following):
  - RO system in off mode.
  - CIP tank filled with prepared cleaning solutions (acidic or alkaline).
  - Verify that all manual valves are fully opened prior to operation.
  - CIP pump and valves operational.
  - Temporary flexible piping is connected.
  - System interlocks functional (pressure, flow, level, temp).

The CIP cycle phases are as follows:

#### 1. Flush & Drain

- Purpose: Remove residual feed water from pressure vessels.
- Actions:
  - Open drain valves on RO skid.
  - Use permeate or clean water to flush out concentrate.
  - Close drain valves after flushing.

#### 2. Chemical Preparation

- Fill CIP tank with RO or permeate water.
- Add appropriate cleaning chemicals.

- Alkaline (NaOH) for organics/biofouling (pH 10–11).
- Acid (citric) for scaling (pH 2–4).
- Mix with CIP pump recirculation.
- Confirm pH and level within range.

### 3. Recirculation (Cleaning Loop)

- Close process valves; open CIP inlet/outlet valves.
- Start CIP pump.
- Loop cleaning solution through RO elements (feed → concentrate → return to CIP tank).
- Maintain recommended flow and pressure.
- Monitor  $\Delta P$ , flow, pH, temp.
- Typical duration: 30–60 min.

### 4. Soak Phase (Optional)

- Stop CIP pump.
- Let solution soak for 30–60 minutes.
- May alternate soak and circulation phases for tough fouling.

### 5. Rinse Phase

- Drain used CIP solution to CIP tank for neutralization or waste tank.
- Fill CIP tank with clean RO/permeate water.
- Recirculate rinse water through membranes.
- Continue until:
  - pH is neutral.
  - Conductivity stabilizes.
  - No foam or chemical odor
- Drain rinse water.

### 6. Discharge CIP wastewater to River

- Confirm the CIP wastewater pH has been neutralized to acceptable environmental standards (typically 6.5–8.5).
- Test for and ensure residual chlorine is fully removed or below regulatory discharge limits.
- Record test results in the daily log.
- Open the valve to the CIP discharge line leading to the river.
- Begin CIP wastewater discharge at a controlled flow rate of approximately 100 GPM.

To reduce contaminant concentrations at the outfall it's recommended the operator perform the following:

- Open all UF drain valves.
- Simultaneously, start the intake pump to draw raw river water at approximately 800 GPM into the UF tank. From the UF tank, the water will drain into the UF drain pump station and then be returned to the river. The UF drain flow will be combined with the CIP waste, helping to reduce the overall discharge concentration to the river.
- Do NOT start the UF permeate pumps during the SWRO and BWRO CIP cleaning/discharge operation.

### 7. Return to Operation

- Reset valve positions to normal feed/concentrate/permeate routing.
- Start feed pump and RO unit in slow ramp-up mode.
- Discard initials permeate (first 15–30 min).
- Monitor:
  - $\Delta P$
  - Permeate flow and conductivity.
  - Recovery rate

Note that Plant operators should follow the manufacturer's recommendations for the UF and RO CIP cleaning procedure.

The figure below shows the CIP cleaning flow diagram.

CIP CLEANING PROCESS FLOW DIAGRAM
