

Exhibit 07

Stocking Survey Scoring System

1. Determination of Acceptable Work. Two procedures shall be used for determination of acceptable or unacceptable work.

1.1 Pass-Fail check of specified standards and procedures.

Stands that are deficient in the following specifications and procedures are considered unacceptable on a "Pass-Fail" basis and shall be returned to the Contractor with entire block for rework.

- a. Stand record sheets, which are illegible or have missing entries.
- b. Stands having less plots than the Contractor proposed sample intensity.
- c. Stands where a plot is outside the stand boundary.
- d. Stands where a plot center cannot be located or is not marked as required (**E- 3 Performance Summary**)
- e. Stands where plot locations do not equally sample all portions of the stand (uniform and unbiased plot locations)
- f. **Stands which have errors where the point deduction value is listed as "Unacceptable".**

1.2 Tolerances and standards for Quality Control and Assurance

- a. **Plot Location.** The ground location of the installed plots must be easily locatable by the Contracting Officers Representative (COR) according to the Contractor's proposal. If the reference points and plot locations for any stand are not easily locatable the entire block will be returned to the Contractor for rework.

- b. **Stocking Exam and Cover sheet Data.** Items on the cover sheet will be assessed and scored.

Field	Tolerance	Point Deduction
Stand Number	No Errors	Unacceptable
Exam By	No Errors	Unacceptable
Date	No Errors	1
Aerial Photo Number/Year	No Errors	Unacceptable
Planted/Natural Regeneration	No Errors	Unacceptable
Year Planted	No Errors	Unacceptable
Acres	No Errors	Unacceptable
Plot Size	No Errors	Unacceptable
Number of Plots	No Errors	Unacceptable
Aspect	± 45 degrees	2
Elevation Range	± 2 Contour Intervals	2
Slope	± 15 Percent	2 (1 pt. for range, 1 pt. for average)
Animal Damage/ Activity	No Errors	3
Insect/Disease Damage/Severity	No Errors	3
Existing Animal Damage Control Measures (Netting/Tubing)	No Errors	2
Stand Summary Table	± 2 Percent per Column	5
Regeneration Species Composition	± 5 TPA in Total Acceptable TPA; ± 2 Percent per Species	5 (weighted by Total Acceptable TPA & applicable species %s)
Overstory Species Composition	No Errors	3
Stocking Standard	No Errors	5
Stocking Standard Status	No Errors	5
Stand Comments	No Errors	5
Stand Diagram	No Errors	5
Starting Azimuth	No Errors	Unacceptable

Total Per Stand: 48

Each stand inspected within a block will be partially assessed for quality based on the cover sheet score. For example, 100 plots collected, 25 plots were measured for QC, the Government checked 10 plots for QA. Two stands were selected by the COR for QA. Each of the cover sheets were scored separately then the Quality percentage determined for both. Stocking Exam and Cover sheet Data. For the 2 stands, 2 points deductions were made on stand one and 6 on stand 2, for a quality percentage of 92%.

c. **Reforestation Quick Plot Survey.** Items on the quick plot survey form will be assessed and scored.

Field	Tolerance	Point Deduction
Header Data	No Errors	Unacceptable
Plot Number	No Errors	Unacceptable
Tree Species	No Errors	Unacceptable
Species and Height Categories	No Errors	Unacceptable
		SCORED PLOT ITEMS (1 POINT EACH)
Species/ Height Grouped Tree Counts	0-3 trees No Errors 4-5 trees ± 1 tree 6-10 trees ± 2 trees 11 + trees ± 3 trees	1
Height	± ½ foot	1
Total Live Trees in Plot	No Errors	1
Plot Stocking Class	No Errors	1
Remarks, Damage, Etc.	No Errors, must be filled in for Non-stockable plots	1
Totals		5 Points Per Plot

* The total tolerance per plot is ± 2 points

From the Contractor's Reforestation Quick Plot Survey form, **one point** will be deducted for each data entry that falls outside of the accuracy standard tolerances listed above. An applicable column left blank, incorrectly filled in, or a non-applicable column filled out will count as an error. The points deducted will be totaled. This total will be subtracted from the total number of plots on the Government Inspection Survey form for the number of correct plots. The number of correct plots will be divided by the total number of plots to determine the percent quality of work for the reforestation quick plot survey.

For example in the 2 stands in our example, in stand 1 we measured 4 plots and stand 2 we measured 6 plots. Stand 1 had 3 correct items out of a total of 4 plots. Stand 2 had all 6 plots correct. The quality percentage of the 10 plots is $9/10 = 90\%$

For Quality Control and Quality Assurance, stocking exam cover sheet data will comprise 50% of the total quality percentage and the reforestation quick plot survey data 50%. All stands that have plots QC and QA inspected will also have their respective cover sheets inspected based on all contactor plots taken in the stand; however, if any plots with errors outside of acceptable tolerances are noted by, the corrected plot data will be used in the computations on the cover sheet.

Block Quality Percentage=

Stocking Exam and Cover sheet Data % + Reforestation Quick Plot Survey %
2

Example: $[(88/96) + (9/10)] / 2 = 91\%$

2. The Government inspector or COR will monitor the Contractor's accepted Quality Control Plan (QCP). The Contractor may be put on notice of non-compliance (or other contract action taken) for failure to abide by Contractors QCP and the Stocking Survey Scoring System.
