

CONTRACT DATA REQUIREMENTS LIST (1 Data Item)						Form Approved OMB No. 0704-0188				
The public reporting burden for this collection of information is estimated to average 110 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to the Department of Defense, Executive Services and Communications Directorate (0704-0188). Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. Please do not return your form to the above organization. Send completed form to the Government Issuing Contracting Officer for the Contract/PR No. listed in Block E.

CHANGE / REVISION RECORD

This record is maintained throughout the life of the document; each published update is recorded. A Change Package (re-issue of changed pages only) carries change bars in the page margins to identify differences from the preceding issue. Due to the scope of change that necessitates a Revision (re-issue of entire document); a Revision does not carry change bars.

Introduction

Defense Health Agency (DHA) oversees the Military Health System (MHS) Infrastructure and Operations (I&O). DHA is chartered to design, provision, and deploy a standard based, common telecommunications infrastructure throughout the MHS.

This information paper identifies the required parameters for Business Partners to connect to a DHA managed enclave, system, or Military Treatment Facility (MTF) remotely, leveraging DHA's Server to Server (S2S) dedicated platform. This is one of two approved solutions for external access/management.

This is intended do the following:

- Explain adherence to the DoD Guidelines for remoted access by appropriate partners
- Explain adherence to the policies of connectivity and device management for remoted access by appropriate partners
- Support the functional and technical requirements as designed for a given project
- Acknowledge through digital signature the agreed upon functional and technical requirements

In prioritizing security and confidentiality of DoD system resources and networks, the gateway approach is the standard for all non-DoD resources to connect, communicate, and manage systems within the DoD. This is the recommended solution to ensure data and system resource security and confidentiality.

The following criterion depicts a S2S dedicated platform solution:

- There is a single reference point for the partner affiliate into the DoD/DHA thus eliminating any back doors to the DoD
- MHS traffic can be more effectively managed
- Adheres to the DoD initiative to move away from partner (third party or non.mil) affiliates connecting directly to an MTF

This document is to serve as a template to identify the requirements of the sponsoring organization and the partner to DHA. Below will be detailed information that when completed will be used for:

- Establishing necessary requirements of DHA resources
- Configuring the S2S dedicated platform router

General Information

Project Information

Request Type	☐ New Connection(s) Select "New Connection(s)" if this is a new source destination flow (connection).	☐ Changes/Updates to Existing Connection(s) Select "Changes/Updates to Existing Connection(s)" for updates to current connections.	☐ Decommission Connection(s)
<i>NOTE: If "Changes/Updates" is selected then the connections in Appendix D will replace the current connections. If running in parallel is intended, please select "New Connections".</i> <i>Once fully migrated to the new connections, submit a request to decommission the old connections.</i>			
Connection Type:	What is Server to Server <i>Allows continuous connectivity between the partner-and DHA-hosted servers. The commercial partner (vendor) will be required to procure and install a DHA-configured and tested Cisco VPN router (Cisco ISR) on its premise at all appropriate locations. The device (which will be remotely managed by DHA) will provide a controlled entry/exit point and an encrypted pathway for all communications between the commercial partner and its DHA-hosted system(s). System-to-system communications are defined as automated processes between two systems that require always-on connectivity.</i>		
eMASS # (DHA ID for the system with which the support team is communicating.)	Provided by DHA Site ISSM. ID # can be found on .mil side's ATO		
Project Name (Vendor Name to MHS Name)	[Vendor] in support of [Contract or Contractual Requirement]		
Program Office	HPOSB		
Description: What is this for?	This S2S solution will allow [vendor] to remotely support [Project Name] (additional details)		
	Requested by Date:	?I would like this completed by?	
	Critical need Date:	?I NEED this completed by?

Vendor Partner POC Information

Please complete the following:

Organization	Name	Phone	E-Mail
PM			
Application /System Engineer			
Network Administrator			
Security Manager			
Network Manager			

Organization	Name	Phone	E-Mail	Procedures
Help Desk Contact Information				
After-Hours Support Contact Information				

Organization Address:

Physical Device Location: {NOTE: Be sure to include the full address, building, room, and rack where the MHS router node will be deployed}

Appendix A: Software and Settings/Hardware Requirements

For Server-to-Server Connections:

The commercial partner will be required to purchase one of the following Cisco device(s) for their location(s):

Question		Response
• ISR 1111x • ISR 4331x • ISR 4451x • CSR 8000v	Less than 5Mb	
	Between 5Mb-30Mb	
	Between 30Mb-300Mb	
	variable based on license and circuit availability	

Also, please make certain to provide (on Appendix F) 2 public IP addresses for each device to be installed.

Note: The Cisco pubs indicate higher bandwidth capabilities for models noted above; however, the Cisco figures are under ideal conditions (UDP, low overhead, etc.). These considerations were evaluated by the DHA engineers and factored in the configurations and other overhead/loading factors (noted above). If you opt to select the next lower/smaller model, then there is a potential risk of overloading the device, which will require the procurement of a replacement with the next higher model.

A 3-year maintenance agreement and required; at minimum the Security PAK (i.e., SL-44-SEC-K9) and the AppX licenses (i.e., L-SL-44-APP-K9) on top of IP base. This allows Cisco to bring the appliance into DHA's Smart License account. If you are unsure of your actual throughput requirement, DHA recommends the HSEC license be also purchased.

Also, please make certain to provide (on appendix C, section 4.) two public IP addresses [external and RLOC] for each appliance to be installed.

Appendix B: System Performance Requirements

Project Name	
Program Office	HPOSB
Project POC	Dr. Steven Alvarado

System (Third Party Partner) to System (MHS) Requirements

Subject Matter	Metric
Expected screen refresh time	
Expected response time	
Expected % availability uptime	
Meantime between failure	
Meantime to repair	
Sustained throughput requirement	
Max packet loss acceptable	
Max latency	
Expected bandwidth between systems	
Peak bandwidth requirements

Last Mile Information – WAN Access

Gov Sponsor: Please check the following for the .MIL side of the connection:

Question	Answer
1. Who is your Internet Service Provider? <i>(Please Specify)</i>	
2. Assessment and Authorization: What is the name of the system in eMASS that contains the .mil side of the connection? (Please attach Authorization Determination Document for the ATO)	
a. • DODI8510 program applies to my system and / or • DODI8582.01 program applies to my system	

Commercial partner: Please check the following for the .COM side of the connection:

Question	Answer
1. Who is your Internet Service Provider? <i>(Please Specify)</i>	
2. Assessment and Authorization: What is the name of the system in eMASS that contains the .mil side of the connection? (Please attach Authorization Determination Document for the ATO)	
a. • DODI8510 program applies to my system and / or • DODI8582.01 program applies to my system	

Network Boundary Information

1. What are the Interfaces of the Border Router?

Interface	IP Address	Subnet Mask	Default Gateway

2. What are the External and DMZ Interfaces of the Firewall?

Interface	IP Address	Subnet Mask	Default Gateway

3. What is the Network Space between the Firewall and Border Router where the Cisco ISR will be installed?

- Ensure the Network between the Firewall and the Border Router has sufficient address space to support splitting the network.
- Ensure the Bit Boundaries are valid and are NOT CROSSED when splitting into smaller subnets.

IP Network/ Mask	Subnet Mask

4. What are the new Network Addresses for the Cisco ISR device?

	External Interface	Subnet Mask	Default Gateway
Primary ISR			
Secondary ISR			
	RLOC IP	Subnet Mask	Default Gateway
Primary ISR		255.255.255.255	NA
Secondary ISR		255.255.255.255	NA
	Internal Interface	Subnet Mask	Default Gateway
Primary ISR			
Secondary ISR			
Floating			

Note 1: For HA setup, each device would require a unique External, Internal and RLOC IP address. One additional floating Internal IP is required for VRRP failover.

Note 2: All IP addresses for the ISR need to be publicly routable. Private address space using a NAT is not permitted.

Note 3: RLOC IP addresses should be /32 addresses and not a part of the subnet used by the External or Internal interfaces.

5. What are the new Network Addresses for supporting your Warm DRE ISR device?

	External Interface	Subnet Mask	Default Gateway
Primary ISR			
Secondary ISR			

Note 1: In the event a vendor cannot maintain a fully functional DRE circuit a small bandwidth (10 – 30 Mbps) circuit is required. DHA requires connectivity to all ISR devices at any given time to maintain the configuration and IOS updates. This is a STIG requirement. The secondary interface on the ISR will be used and it will require an additional IP address on a different subnet from the main WAN interface.

Firewall Specifics/Proxy Servers

Please check the following:

Question	Yes	No
1. Is this site using Network Address Translation (NAT) Static (1 to 1)?		

Appendix D: DHA B2B Connectivity Requirements Submission

- Reference “Converted Appendix D v2” excel workbook (Separate document)
- Highlight rows for test flows Orange
- Highlight rows for production flows Green
- Application – what is the supported system called
- Description – what does the application do
- IP Protocol – TCP or UDP
- Service – well named port service name (i.e., HTTPS)
- Low port – if ranged, what is the starting port number (i.e., 8530)
- High port – if ranged, what is the highest port number (i.e., 8531)
- Source server – host/machine name
- Source server IP – IP address of server
- Destination server – host/machine name
- Destination server IP – IP address of server
- Destination site location – Base; Post; Station name/MTF name/DECC/CAP
- Connection – flow source; .com or .mil

Include workbook with questionnaire in email package submission
