

FAMM-BAR RFI Q&A

Q: Is the intent to seek responses only from companies that can offer a complete system solution or is information from a modular capability/sub-system level relevant to any potential solution?

A: The RFI and Industry Day are specific to complete system solutions. However, additional information regarding the sub-system level is accepted and would be discussed at another time. Information provided does not need to be in a formal White Paper format.

Q: Can the Government provide the DAS 2.1 or 3.0 TDP for reference?

A: No, the DAS 2.1 or 3.0 TDPs will not be provided in support of this RFI. However, the DAS 2.1 ICD and top-level drawing, and the DAS 3.0 Pallet Control Module (PCM) ICD is available upon request.

Q: If we have more than one solution, should we submit two white papers?

A: If both solutions can fit within the 10-page RFI page limit, please submit one white paper.

Q: In paragraph “i” of the RFI they mention “DAS 2.1.” We would like to know the available specifications for the pallet (length, width, height, weight, target COB), rack dimensions, power, and interfaces and interface locations (end, center, etc.) if they have them available.”

A: The DAS 2.1 ICD and top-level drawing will be provided upon request.

Q: To be invited to Industry Day, does a white paper need to be submitted?

A: Yes, only those that submit a white paper will be eligible to receive an invite to Industry Day. Not all that submit a white paper will qualify for an invitation. Only those whose solutions meet the requirement will be invited to attend.

Q: When can Vendors expect to see more details for the Industry Day? Is there a limit on the number of attendees for planning purposes?

A: Attendees will be limited to 2-3 personnel with a request to have a technical SME in the travel party. More detailed information will be provided in the formal invitations that will go out after the eligible RFI response submissions have been received.

Q: Requesting clarification of what ‘unitary versus non-unitary’ means in reference to D.

A: Our interpretation of 'unitary lugged/palletized' is a single, integrated weapon system that inherently possesses dual-launch capabilities; meaning it can be mechanized off a traditional rail/pylon system (lugged) or deployed via a palletized system.

To clarify our technical approach for this Risk Reduction effort: our Threshold baseline is focused exclusively on the palletized-only configuration. However, our Objective end-state is to achieve the full 'unitary lugged/palletized' capability, enabling the system to operate from both pallet and rail interfaces.
