

STATEMENT OF NEED (SON)

FROM: 140TH Maintenance Group

SUBJECT: Statement of Need (SON) for Automated Bench Stock Machine

1. Requirement. The 140th Maintenance Group (MXG) requires an Automated bench stock machine to directly support and improve bench stock management, FOD control, man-hour assets, accountability and other mandates in accordance with DAFI 21-101 and AFMAN 23-122.
2. Background. The 140 MXG uses bench stock for aircraft maintenance tasks. Bench stocks are consumable items kept on-hand in a work center to increase mission support. Bench stock items are physically stored in the maintenance work area, so bench stock customers have ready access to the items as needed. Consumption of bench stock items requires no paperwork or communication with LRS/Materiel Management Activity personnel. Bench stocks also result in reduced workload for base logistics support activities since the items are periodically replenished in bulk quantities rather than being issued, picked, and delivered individually each time a customer need occurs.
3. Justification. Bench stock is managed at the 100% stock level and will not allow you to stock an item over the 200% level. Items are listed on a Restock Report when an item reaches 50%, thereby eliminating human error and stock-outs. This automated system eliminates the need for the manual red/green flagging system. Automatic deduction of issued items from the total stock level eliminates the need to individually count multiple items issued such as pin rivets, which controls wastage and virtually eliminates the possibility of FOD. Bench stock physicals are cut down from days to hours or less. Funding this request is not only a matter of restoring capability but also of upholding established safety, FOD prevention and hardware accountability protocols as well as saving countless man hours.
