

Statement of Work to support HHC Nutrition Research

To support HHC Nutrition research for the Exploration Altitude study in support of Artemis 3 the following items are required:

Thromboelastography (TEG) is a viscoelastic hemostatic assay that measures the global viscoelastic properties of whole blood clot formation under low shear stress

- TEG shows the interaction of platelets with the coagulation cascade (aggregation, clot strengthening, fibrin cross-linking and fibrinolysis)
- does not necessarily correlate with blood tests such as INR, APTT and platelet count (which are often poorer predictors of bleeding and thrombosis)
- This page describes TEG® predominantly, ROTEM® is the alternative viscoelastic hemostatic assay that is widely available commercially

TEG 6S Unit Pack – quantity 2

Sampling cartridge – quantity 25

Sampling Reagent Level 1 – quantity 4

Sampling Reagent Level 2 – quantity 4

Sample Scanner – quantity 2

Printer Connection – quantity 2

Calibration Confirmation – quantity 2

Operator Training for 4 users

Delivery by July 1 2026
