

Solicitation Number	N6852026Q1023
Vendor Questions	Government Response
1. What is the temperature uniformity?	Temperature uniformity for the oven needs to be at Class 1 +/-5F.
2. What is the time-to-quench requirement for this oven?	It varies by metal and thickness. The norm for what we heat treat would be 5 to 15 seconds for .032 to .063 thick aluminum. Thinner (-.032) would require a faster quench to retain uniformity.
3. What is the load weight?	The maximum load weight would be 15-20 lbs.
4. What is furnace hearth design? Is it same as quench which shows a roller hearth?	The Hearth design is a basket/roller design that would roll out and dip the parts in the required solution as designated.
5. How is material handling of loading and unloading of furnace done (forklift, charge car, crane, other?)	The Material would be unloaded and dipped via the mechanical Hearth roller set up or by hand if the basket is not used.
6. What is preferred heating method (gas or electric?)	Electric is the preferred method. Gas is not available.
7 .Which documents other than the proposal need to be submitted in the offer, i.e. buy American etc..	The offeror is responsible for providing the appropriate documents in response to the RFQ. However, the RFQ will be revised to include FAR clauses 52.225-1 & 52.225-2.
8. What is the transfer time to quench?	See response number 2
