

DEPARTMENT OF THE NAVY
COMMANDER
NAVAL FACILITIES ENGINEERING SYSTEMS COMMAND PACIFIC
258 MAKALAPA DRIVE SUITE 100
PEARL HARBOR HI 96860-3134

IN REPLY REFER TO:
J&A No. 25-027

**CLASS JUSTIFICATION AND APPROVAL
FOR USE OF OTHER THAN FULL AND OPEN COMPETITION**

1 Contracting Activity:

Department of the Navy, Naval Facilities Engineering Systems Command, Pacific (NAVFAC Pacific), Joint Base Pearl Harbor-Hickam, Hawaii.

2 Description Of The Action Being Approved:

This Class Justification and Approval (CJ&A) authorizes and approves, on a brand-name basis, the use of the following elevator control systems manufactured by Elevator Controls Corporation (ECC), a Vantage Company:

- Pixel Traction Control
- Pixel Hydraulic Control

These elevator control systems are required for all traction and hydraulic elevators to be installed under projects in support of the Marine Corps' Defense Policy Review Initiative (DPRI) Guam Program. Primary location of projects will be on Marine Corps Base Camp Blaz (MCBCB), Naval Base Guam (NBG), and Andersen Air Force Base (AAFB).

These elevator control systems, as specified under Paragraph 3 below, are authorized under this CJ&A regardless of method of execution or procurement strategy (i.e., contracted, in-house shop forces, base operating support contracts, or materials supply chain contractors).

This CJ&A supersedes CJ&A No. 21-0013 for the use of ECC elevator control systems for the DPRI Program, which expires on 30 September 2025. The authority to act under this CJ&A expires on 30 September 2030.

3 Description Of Supplies/Services:

The Pixel Traction Control and Pixel Hydraulic Control, both manufactured by ECC, are elevator control systems which are a type of programmable building controller that monitor and control the elevator(s) for a building. The Pixel Traction Control and Pixel Hydraulic Control:

- Consist of several hardware components including, but not limited to, the Elevator Controller User Interface System and the Human Machine Interface (HMI) System.
- Consist of all software necessary to operate the systems including, but not limited to, the Elevator Controller User Interface System Software and the HMI System Software.

- Are non-proprietary elevator control systems in that they are capable of controlling electric traction passenger elevators and hydraulic passenger elevators, regardless of the elevator manufacturer.
- Will both utilize the same ECC Pixel Control HMI which serves as the “stand-alone” centralized access control unit for these elevator control systems. This unit is typically situated at the building’s elevator machine room.

It should be noted that for hydraulic elevators, ECC manufactures other types of elevator control systems that are compatible with the ECC Pixel Control HMI, such as the ECC H900 (legacy) model. However, these other types of elevator control systems are unable to meet the Government’s requirement to be certified by the Technical Standards and Safety Authority (TSSA). As such, the Pixel Hydraulic Control is the only known elevator control systems manufactured by ECC that can meet the Government’s requirement.

The Marine Corp’s DPRI Program will require the construction of six (6) buildings in Guam that will require the ECC elevator control systems which are expected to be completed by the end of Fiscal Year (FY) 2031. The following is a breakdown of the required major components for each ECC elevator control system:

- (1) Pixel Traction Control
 - (1) Controller User Interface System
 - (1) HMI System
- (7) Pixel Hydraulic Controls
 - (7) Controller User Interface Systems
 - (7) HMI Systems

The total estimated cost of eight (8) ECC elevator control systems is [REDACTED]

- (1) Pixel Traction Control = [REDACTED]
 - (1) Controller User Interface System = [REDACTED]
 - (1) HMI System = [REDACTED]
- (7) Pixel Hydraulic Control = [REDACTED]
 - (7) Controller User Interface System = [REDACTED] [REDACTED]
 - (7) HMI System = [REDACTED] [REDACTED]

A detailed breakdown by specific projects is provided in the following table:

FISCAL YEAR	PROJECT ID	PROJECT NAME	ITEM	U/I	QTY	UNIT COST	EXTENDED COST
FY24	J-875	Battle Staff	ECC Pixel Hydraulic Controller	Each	2		
(FY27)		Training Facility	ECC Pixel Control HMI	Each	2		
						Total Cost	

*Unit prices obtained from ECC.

Funding in the amount of [REDACTED] will be made available for the eight (8) ECC elevator control systems required under the Marine Corps' DPRI Program. Funding will consist of MAMIZU (Government of Japan funded projects) and Military Construction (MILCON), based on the following schedule:

4. Statutory Authority Permitting Other Than Full And Open Competition:

5. Rationale Justifying Use Of Cited Statutory Authority:

The use of the Pixel Traction Control and Pixel Hydraulic Control for the 6 construction projects/buildings in Guam allows for a single manufacturer's uniform elevator control systems, rather than multiple manufacturers, which will provide the lowest operation and maintenance costs associated with cybersecurity. The Government has determined that the Pixel Traction Control and Pixel Hydraulic Control are the only known elevator control systems to allow for an "intermediate" accreditation boundary since it does not need to connect to an IP network and allow all elevator controllers to have exactly the same Elevator Controller User Interface System, Elevator Controller User Interface System software, Elevator Control System HMI, and Elevator Control System HMI software in order to perform its required functions. This inherently eliminates the initial costs for establishing additional Authority to Operate (ATO) and eliminates additional annual ATO sustainment costs associated with the use of multiple elevator control systems by other manufacturers.

Due to its physical makeup and operational capabilities to perform its designed functional use, an elevator control system, including the supporting software, are considered Information Technology (IT) and falls under the auspices of DoD Instruction 8510.01, Risk Management Framework (RMF) for DoD Information Technology (IT), which requires the authorization for its use to be processed through the Risk Management Framework (RMF) process.

The RMF is the DoD process for applying cybersecurity to IT due to its vulnerability to cyberattacks posing negative impacts to the military's operational missions. The methods used for obtaining cybersecurity through the application of the RMF process are promulgated in the Unified Facilities Criteria (UFC) 4-010-06 and is comprised of the following 6 steps:

1. Categorize the System
2. Select Security Controls
3. Implement Security Controls
4. Assess Security Controls
5. Authorize the System
6. Monitor Security Controls

Step 5 - Authorize the System grants "Authorization" of the system's use by the Authorizing Official (AO) via issuance of an Authorization to Operate (ATO) upon successful completion of Steps 1-4. Step 6 - Monitor Security Controls is the continual monitoring in support of maintaining certification of the ATO for the system's continual authorized use and is a required function to support ATO recertification every 3 years.

Since elevator control systems will require an ATO as a "stand alone" system (i.e. Intermediate FRCS Device that has a front end and end points at a single location), the NAVFAC Marianas (NFM) Command Information Officer (CIO) has determined that for any new system that does not have an ATO, the estimated cost is [REDACTED] for initializing each new system (Steps 1-5) and [REDACTED] for each additional system. The NFM CIO also estimated an annual recurring cost of approximately [REDACTED] per year based on the standard breakdown of this system's performance level for each system and [REDACTED] for each additional system. These costs were derived from a blend of labor support from CIO, Public Works, and Base Operations Support Contract (BOSC) or Wage Grade (WG) labor, including Vendor Support Contracts associated with both the

development of the RMF (Steps 1-5) and the continual monitoring of the system (Step 6). It also includes System Front-end and hardware refresh. As a result, it would not be in the Government's best interest to consider and allow for multiple types of elevator control systems from different manufacturers to be installed in Guam under the Marine Corps' DPRI Program since it would result in the Government incurring an additional [REDACTED] for the initial ATO and [REDACTED] for the ATO annual sustainment for each new Elevator Control System.

Although there are several different manufacturers of elevator control systems, limiting competition and only procuring ECC's elevator control systems for the six (6) construction projects/buildings would significantly diminish cybersecurity risk as it is the only known elevator control systems to allow for an "intermediate" accreditation boundary since it does not need to connect to an IP network and all Elevator Controllers will have exactly the same Elevator Controller User Interface System, Elevator Controller User Interface System software, Elevator Control System HMI, and Elevator Control System HMI software in order to perform its required functions. This unique feature would also permit the Government to avoid the [REDACTED] ATO annual sustainment cost in comparison to other manufacturers' products.

As stated previously, the installation of different types of elevator control systems from different manufacturers across the six (6) buildings in Guam under the Marine Corps' DPRI Program would result in substantial duplication of costs to the Government that is not expected to be recovered by competition. Although ECC's elevator control systems are not the lowest priced in comparison to other manufacturers' products, the ECC Pixel Control Systems is the only known product to have exactly the same Elevator Controller User Interface System, Elevator Controller User Interface System software, HMI System, and HMI System software between the traction and hydraulic type controllers which would minimize cybersecurity risks and reduce the associated ATO cost. As demonstrated in the following table, ECC's elevator control system would result in the lowest overall cost to the Government in comparison to other manufacturers' products when considering both the cost of the elevator control systems (Controller and HMI) and ATO:

MANUFACTURER	CONTROLLER	HMI	SUBTOTAL CONTROLLER AND HMI	INITIAL A&A/ATO	REOCCURRING A&A/ATO	TOTAL PRICE/COST
Elevator Controls Corporation	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]
GAL Manufacturing	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]
Motion Control Engineering	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]
Smartrise	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]	[REDACTED]

6. Description of Efforts Made to Solicit Offers from as Many Offerors as Practicable:

On 24 August 2025, an announcement was published on the System for Award Management (SAM) website, in accordance with DFARS 206.302-1 to identify other potential responsible sources of supply that can provide elevator control systems with equal performance and listing/approval requirements compatible to those manufactured by ECC. The announcement closed on 8 September 2025 with no responses received. As such, it can be interpreted that there are currently no other responsible sources of supply, other than ECC, that can meet the

Government's requirements.

7. Determination of Fair and Reasonable Cost:

The Contracting Officer has determined the anticipated cost to the Government of the supplies/services covered by this CJ&A will be fair and reasonable. The cost associated with a complete replacement is not practicable or cost effective.

8. Actions to Remove Barriers to Future Competition:

There will be no barriers to competition to evaluate the use of full and open competition for acquiring the same or similar supplies in the future. Market research will be conducted for future projects to ascertain the availability of new technology that may provide for other sources to meet the government's needs. The government will consider, as applicable, should any other potential sources of supply for a compatible product be submitted during the source selection process.

CERTIFICATIONS AND APPROVAL

TECHNICAL/REQUIREMENTS CERTIFICATION

I certify that the facts and representations under my cognizance which are included in this Justification and its supporting acquisition planning documents, except as noted herein are complete and accurate to the best of my knowledge and belief.

[REDACTED] [REDACTED] [REDACTED] [REDACTED]
[REDACTED] [REDACTED] [REDACTED] [REDACTED]
[REDACTED] [REDACTED] [REDACTED] [REDACTED]

LEGAL SUFFICIENCY REVIEW

I have determined this justification is legally sufficient.
